The dregs of vinegre, must of necessity be much more sharpe, biting, and vlcerauue, than wine lees, in regard of the matter whercof it commeth: it driueth backe impostumes or biles, and keepeth them from suppuration. A liniment of it, helpeth the stomack, belly, and entrails: it staieth the flux of those parts, and the ouerflow of womens months: it dissolseth pusshes and small biles, and squinances, if they be taken betimes before they fester and impostumat: and a cerot made with it and wax together, is good against *S. Anthonies* fire. The same drieth vp the milke in womens breast, who would not be nourses, or bee troubled with ouermuch milke. It taketh away with ease the illfaoured rugged nails, and giueth room for new to come vp in their place. Applied with grosse barley meale or groats, it is singular and most effectually against the venome of the horned serpents, called in Greeke *Cerastra*: and with Gith or *Nigella Romana*, it is vsed for the biting both of crocodile and mad dog. The burning also of these dregs, quickeneth & fortifieth the strength thereof, & being thus burnt and incorporat with the oile of *Lentiske*, * it coloureth the haire of the head in one night red, if they bee annointed withall: The same lapped in a fine linnen cloth, and put vp in forme of a pessarie, cleanseth and mundifieth the secret parts of women.

To conclude with the grounds or lees of the cuit Sapa; vinegre dregs are knowne to be very good for to heale burnes; and the cure proceedeth better, in case they be mixed with the furry cotton or downe of reeds: the same being sodden, and the decoction thereof taken as drinke, cureth inueterat coughs. Salt of all, they vse to seeth or stew it betwene two platters with salt and grease, wherewith they make a liniment or ointment to take down the swelling of the chaws and the nape of the necke.

CHAP. III.

¶ *Of Oliu trees: of the leaues of Oliues: their floures and their ashes. Of the white and blacke Oliue berries: and of the mother or lees of Oile-oliue.*

NExt after the Vine, there is not a tree bearing fruit, of so great authority and account as the Oliue. The oliue leaues, are exceeding restringent, good to cleanse, good also to restraine or stop any flux: being chewed and applied to vlcers, they heale them: and reduced with oile into a liniment, they assuage the pain of the head. A decoction of their leaues, together with honey, is singular to bath and foment the parts cauterized by the Chirurgian, according to the direction of the learned Physician: the same vsed by way of a collution, cureth the inflammation of the gumbs, whitflaws, and excrescences of ranke flesh in filthy vlcers: with honey also it stauncheth the flux of bloud, proceeding from any neruous parts. The juice of oliue leaues is singular for the little vlcers in manner of carbuncles, with a crust or rouse vpon them, rising about the eies; and all other small wheals or blisters: as also in case the bal or apple of the eye be readie to start forth, and therefore it is vsed in collyries or eye-salues: for it healeth weeping eies that haue run with water a long time, and the exoriation or frettings of the eie-lids. Now this juice is drawn out of the leaues, first stamped, and then well sprinckled and wet with wine & rain water, & so pressed forth; which being afterwards dried, is reduced into trochiskes, The same rolled in wooll or bombast to the forme of a pessarie, and so put vp into the naturall parts of women, staies the immoderat flux of their flours. Good it is also for those, who rid corrupt bloud by the inferiour parts. Moreover, it easeth the swelling piles or bigs sticking out in the fundament; killeth the cholerique exulcerations called *S. Anthonies* fire; healeth corrosiue and eating sores, and allaieth the paine of night-foes or child-blaines, called by the Greeks *Epinyctides*. The same effects haue their floures. The tendrons or young twigs of Oliues being in floure, if they be burnt, yeeld a kind of ashes that may serue as a succedan in stead of Spodium: but the same must be burnt a second time, after they haue bene well drenched and foked with wine. These ashes applied as a liniment, or the very leaues only stamped and tempered with honey, are good for impostumes growne to suppuration, and for the pusshes or biles named *Pani*: but if they be mixed with grosse barley meal or groats, they are in a liniment comfortable to the eyes. Take the green branches of an Oliue and burne them, there will distill and drop from the wood a certaine juice or liquor, which healeth ringwormes, tetter, and shingles, scoureth away the scales of the skin and dandruffe, and cureth the running skalls of the head.

Touching

A Touching the gum that issueth from the oliue tree it self, and namely that wild oliue which is called *Æthiopica*; I cannot wonder enough at some, who giue counsell therewith to annoint the teeth which ake, considering that they themselves giue out, That it is a poison, and to be found as well in wild oliues as others. The rind or bark pared from the root of a most tender and yong oliue, reduced into an electuary, and often licked and let downe by leasure into the throat after the manner of a lohoch, cureth those who reach vp bloud, and cough out filthy and rotten matter. The ashes of the very oliue it self, mixed with swines greafe, cure all tumors; draw forth corruption of fistulous vlcers; and when they are thus mundified, heale them vp cleane. White oliues agree very well with the stomack, but they are not so good for the belly. A singular commodity they yeeld before they be put vp in their compost or pickle, for to be eaten greene by themselves as meat: for they scoure away grauel with vrine; & good they are for the teeth, whether they be worne, rotten, worne eaten, or loose in the head. Contrariwise, the blacke oliue is not so friendly to the stomack, better for the belly, but offensive both to the head and the eies. Both the one and the other, as well the white as the black, being punned and applied to burned or skalded places, do cure them: but the black haue this propertie, That if they be chewed, and presently as they be taken out of the mouth, laid to the burne or scald, they will keep the place from blistering. Oliues in pickle are good to cleanse foule and filthy vlcers, but hurtful to those, who pisse with difficultie.

As touching the mother or lees of oile oliue, I might be thought to haue written sufficiently, following the steps of *Cato*, who deliuered no more in writing: but I must set down also the medicinable vertues obserued therein: First and foremost therefore, it helpeth the soreness of the gumbs, cureth the cankers & vlcers of the mouth; and of all other medicins it is most effectually to fasten the teeth in the head. If it be dropped or poured vpon *S. Anthonies* fire, and such other corrosiue and fretting vlcers, it is of singular operation to heale them: but for kided heeles, the grounds or dregs of the black oile-oliue is the better, as also therewith to foment smal children. As for that of the white oliues, women vse to apply it with wooll to their secret parts, for some accidents thereto belonging. Be it the one or the other, generally it is more effectually sodden than otherwise. Boiling it ought to be in a copper or brasie vessell, vntill it come to the consistence of honey. Vsed it is with vinegar, old wine, or with must according as the cause requireth, in curing the infirmities of the mouth, teeth, and eares; in healing running skalls; and finally, in the cure of the genitoirs or priuie members, & of the fissures or chaps in any part of the body. In wounds it is vsed with linnen cloth or lint; but in dislocations, it is applied with wooll. And verily in these cases and in this practise, it is much employed, especially if the medicine be old and long kept: for being such, it healeth fistulous sores. And being injected by a syring into the vlcers of the fundament & genitoirs, or otherwise by a metrenchyte into the secret sores within the naturall parts of women, it cureth them all. Also a liniment thereof is singular for to be applied to the gout of the feet: also in the rest, whether they be in the hands, knees, hucklebone, or any other joint, so they be not ferled or inueterat, but taken at the first. But in case it be sodden againe in the oile of green oliues, vntill it come to the consistence of honey, and so applied, it causeth those teeth to fall out of the head without paine, which a man would willingly be rid of. It is wonderfull to see how it healeth the farcines and manges of horses, being vsed with the decoction of Lupines and the herbe *Chamaeleon*. To conclude, there is no better thing than to foment the gout with the ashes of oile, raw.

CHAP. IIII.

¶ *Of the wild Oliue leaues. The oile of the floures of the wild wine Ocmanthe. Of the oile Cinnamon. Of the oile of Palma Christi. The oile of Almonds: of Bayes, of Myrtles, of * Kusso or Chamaemyrsine, of Cypresse, of Citrons, and of Nuts.*

F The leaues of the wild oliue haue the same nature that the leaues of the tame. As for Antipodium, or the ashes made of the tender branches of the wild oliue, it is of greater force and operation in staying and repressing of rheume, catarrhes, and fluxes, than that abouenamed in the former chapter.ouer and besides, it assuageth the inflammations of the eies, it mundifieth vlcers, it doth incarnat and fill vp the void places where the flesh is gone, it gently

P 2

cateth.

* *Severus Samonitus* calleth this ointment *Unguentum Cineris*, alledging *Lentis* for his author.

* *Butcher's Broom*.

cateth away, and without mordication, the excrecence of ranke and proud flesh, drieth the fores, healeth and skinneth them vp. In other cases this oliue is vfed as the other oliues: & yet one peculiar propertie hath the wild oliue, That a spoonefull of the decoction of their leaues with hony, is giuen with good successe to them that spit and reach vp bloud. Howbeit, the oile made hereof is more ægre and sharpe, yea and mightier in operation than that of the other Oliues; and a collution thereof to wash the mouth withall fetheth the teeth that be loose. The leaues of the wild oliue reduced into a cataplasme with wine, and so applied, do cure whitflawes about the root of the nails, carbuncles, and generally al such apostemations: with hony the said cataplasme serueth well to clenfe and mundifie where need is. The decoction of the leaues, yea and the juice of the wild oliue is put into many compositions and medicines appropriat to the eies. To good purpose also the same is dropped into the ears with hony, yea although they ran filthy utter. A liniment made with the floures of the wilde Oliue, is singular for the swelling piles and the chilblanes that be angry in the night: and the same applied with barley meale to the belly, or with oile to the head for the ache thereof, occasioned by some rheume, is known to do very much good. The young tendrils or springs of the wild oliue, being boiled and laid to with hony, do re-ioyn and re-vnite the skin of the head which was departed from the bones of the skull. The same tendrils pulled ripe from the wild oliue, and eaten with meat, do knit the belly, and stay laskes: but torrifed, and so beaten to powder and incorporat with honey, they do mundifie the corrosiue and eating vlcers: they breake also carbuncles.

As touching oile of oliues, the nature and manner of making it I haue already treated of at large. But forasmuch as there are many kindes thereof, I purpose to set down in this place such as serue for physick only. And first to begin with the oile made of vnripe oliues, called in Latin Omphacinum, and which commeth neere to a green colour, it is thought of all others most medicinable: moreover, the same is best when it is fresh and new (vnlesse it be in some case when it were requisite to haue the oldest that may be found) thin and subtil, odoriferous, and nothing at all biting, which be qualities al of them contrarie to that oile which we vse with our meats. This Greene or vnripe oile (I say) is good for the fores of the gumbes: and if it be held in the mouth, there is no one thing preferueth the whitenesse of the teeth better: it represseth also immoderat and diaphoretical sweats.

The oile Oenanthemum, made of the floures of the wild vine Oenanthe, hath the same operations that oile rosat hath. (But note by the way, that any oile, howsoeuer it doth mollifie the body, yet it bringeth vigor and addeth strength thereto.) Contrary it is to the stomacke, it encreaseth filthinesse in vlcers, doth exasperat the throat, and dul the strength of all poisons, especially of ceruse or white lead, and plastre, namely if it be drunk with honied water or the broth of dried figs: but it is taken against Meconium or Opium, with water: against the Cantharides, Buprestis, Salamanders, & the worms Pityocampæ, if it be drunk alone without any thing els: but if it be vomited and cast vp againe out of the gorge, it hath no fellow in all those cases aboue named. Moreover, in lassitudes and extreme colds, oile is a present refreshing & remedy. Taken hot to the quantity of six cyaths, it mitigateth all wrings and torments of the belly, the rather if rue be sodden with it, and in that maner it expelleth wormes out of the guts. Drink it to the measure of one hemina with wine and hot water, or els with the juice of husked barley, it looseth the belly. It serueth in good stead for vulnerarie salues and plastes: it scoureth & clenfeth the skin of the face. Conueyed vp into the head of kine and oxen, vntill they belch & deliuer it againe, it doth allay & resolue all their ventosities: but old oile doth heat more, and is of greater force to resolue a body into sweats than the new, as also to dissipat all hard tumors and swellings. More healthfull also it is to those who lie of the lethargie, and especially when the disease is in declining and wearing away. Somewhat it is thought to clarifie the eies, namely if it be applied with an equal quantitie of hony that neuer came neere smoke. A proper remedie it is for the head-ache: likewise in ardent feuers it is very good with water, to allay their heat; and if there cannot any old be gotten, it ought to be well sodden, that thereby it may seeme to haue age sufficient.

The oile of Ricinus or Tickseed, called Cicinum, taken as a drink with the like quantitie of M hot water, is singular to purge & euacuat the belly: & it is said to haue a special vertue to clenfe the midriffe and those precordial parts neere the heart. Soueraigne it is for all gouts, hard tumors, the infirmities of the matrice, of the ears, and for all burns or scaldings. And if it be med-

A led with the ashes of shell-fishes called Burrets, it cureth the inflammation of the fundament, and any scab or mange whatsoeuer. It giueth a fresh color to the skin of the visage, and causes the haire to grow plentifully where it is applied. The seed wherof it is made, there is no liuing creature will touch. Of the grapes which this Palma Christi or Ricinus carieth, there be made excellent weiks or matches for lamps and candles, which will cast a most cleer light, & yet the oile that is drawne out of the seed, giueth but a dim blaze or obscure flame, by reason of the exceeding grossnesse & fatnes thereof. Of the leaues tempered with vinegre, there is a liniment made, which is good for S. Anthons fire: and of themselves alone being fresh and Greene, they be applied with good successe to the paps, and any violent fluxion whatsoeuer: the same, boiled in wine, and laid too, with grosse barley meale or groats and saffron, are singular for all inflammations: and if they be applied by themselves without any other thing, to the visage, they do embelish and polish the skin passing wel within 3 daies. Oile of Almonds is laxatiue: it serueth to soften the body and make it tender, the skin which was riuelled, it causeth to look neat, smooth, and cleare: and being applied with hony, it taketh away freckles and spots out of the face. Boiled with oile rosat, hony, the * rind of pomegranats, it is comfortable to the eares, it killeth the worms therein, resolueth those grosse humors that were the cause of hard hearing, of the thumping, ringing, and other inordinat sounds within the eares; and withall, easeeth the head-ache and cureth the dimnes of the eies. Reduced into a cerot with wax, it healeth felons, and cleareth the skin of those who be tanned and sun-burnt: wash the head with it and wine together, it kills the running skull, and riddeth away the dandruffe: applied with Melilot, it discusseth the swelling piles and bigges in the fundament: if the head be annointed with it alone, it procureth sleepe. Oile de baies, the newer that it is and greener of colour, the better it is thought to be: hot it is of nature, and therefore good in a pallsie, crampe, sciatica, and for bruised places looking blacke and blew vpon stripes: and being heat in the rind or coat of a pomegranat, and so applied as a cataplasme, it helpeth the head-ache, old rheumes, and infirmities of the eares. Oile of Myrtles is made after the same manner: astringent it is, and serueth to harden any part of the body: it knitteth the flaggie gumbes, helpeth the tooth ach and bloody flux; it cures the exulceration of the matrice and bladder; healeth all old vlcers which run and yeeld filthy matter, if it be brought into a cerot with the scales of brasse, and wax. Also it cureth the meazles, and angry wheales: & so it doth all burns and skalds. It healeth and skinneth any gall and raw place, it skoureth dandruffe, and represseth the breeding thereof: it cureth clifts and chaps: piles and swelling bigs in the fundament, it bringeth down and resolue, it knitteth dislocations of joints, and taketh away the strong and rank fauor of the bodie. A countrepoyson it is against the Cantharides and the Buprestis: as also against all other venome which is corrosiue and hurteth by exulceration. Touching the ground-Myrtle Chamaemyrsine, or Oxymyrsine, it hath the same nature that the other Myrtle hath; and the oiles be of semblable vertues. The oile of Cypress also & likewise of Citrons, be not vnlike to the oile of Myrtles in operation, but the oile drawne from the walnut kernels (which we called Caryinum) is singular to bring haire againe, where it is fallen away by some infirmity: and instilled into the eares, it helpeth the hardnesse of hearing: if the forehead be annointed therewith, it cureth the head-ache. Otherwise, it is but dull in operation, and yet a stinking smel it hath with it. If but one nut kernel be corrupt and rotten, it marreth all the oile that is made of the rest, were there a pecke of them. The oile which is made of the graine or seed of the plant Thymelæa, is of the same vertue that the oile of Palma Christi, or Tickseed aboue-named. The oile of the Lentiske is passing good to make an ointment of, against lassitude and wearinesse: and verily it were a quinalent euery way to oile-rosat, but that it is found to be more astringent: it is vfed much in repressing of immoderat sweats, and those angry pimples which rise after much sweat. Nothing is there so effectuall to heale the farcines or skab in horses, and such like beasts. The oile of Ben, mundifieth freckles, cureth felons and biles, take away spots and moles, and healeth the apostemations in the gumbes.

As for Cypiros, what a plant it is, and how there is an oile made thereof, I haue shewed already. By nature it is hot, and softneth sinews which be stiffe and stark. The leaues serue to make a good liniment for to annoint the pitch of the stomacke: and their iuice applied in manner of a pessarie, fetheth the mother when it roseth euery way and is out of other place. The Greene leaues chewed and applied, cure the running skalls in the head, the cankers and sores in the mouth, all risings and apostemations, and likewise the piles. A decoction of the said leaues, is singular for

burns and skals, likewise for lims out of joynt, if they be bathed therin. The very leaues in substance stamped and incorporat with the juice of a peare-quince into an ointment, set a reddish yellow colour vpon the haire of the head. The floures brought into a liniment with vinegre assuage the paine of the head: the same calcined and burnt into ashes within a pot of vnbacked or raw earth, either alone or with hony, healeth corrosiue sores and putrified vlcers. These floures haue a certaine savor with them, which procureth sleep. The oile called * Gleucinum is astringent; and yet it cooleth after the same sort that the oile Oenanthium. The Balsame oile, called Balm, is of all others most pretious (as hertofore I haue said in my treatise of odoriferous ointments) and of great efficacie against the venome of al serpents. It clarifieth the eie-sight mightily, and dispatcheth mists and clouds which dimmed the same: it easeth all those who draw their breath with difficultie: it assuageth impostumations and hard swellings: it keepeth blood from cluttering, and is excellent to mundifie foule vlcers: singular comfortable to the eares in case of paine, hardnesse of hearing, & ringing within: to the head also for to assuage the ach: for the nerves, against shaking, trembling, and convulsions; & withal, a proper remedy for ruptures. It danteth and mortifieth the poison of Aconitum, if it be taken with milk. If the patient lying sicke of an ague, be annointed all ouer therewith, it mitigateth the fits comming with shaking and shuering. Howbeit, folke must be warie and vse it with moderation, for being hot in the highest degree, it is caustick, and so doth enflame and burne: and therefore if a mean be not kept it bringeth a mischiefe for a remedie, and doth more harme than good.

Concerning Malobathrum, the nature and sundrie kinds thereof, I haue discoursed heretofore. Now for the vertues which it hath in Physicke, first, it prouoketh vrine: being stamped, the juice drawne out of it with wine by way of expression, is excellent to be applied vnto the eyes, for to stay their continuall watering: the same laid to the forehead as a frontall, procureth sleep to them that would gladly take their repose. And more effectually it worketh, in case the nose-thrills also be annointed therewith, or if it be drunke with water. The leafe of * Malabathrum, if it be but held vnder the tongue, causeth the mouth and the breath to smell sweet: like as, if it lie among apparell, it giueth them a pleasant fauour. The oile of Henbane is emollitiue, howbeit an enemy to the sinewes: certes, if it be taken in drinke, it troubleth the braine. The oile of Lupines, called Therminum, is likewise an emollitiue, and commeth nearest of any to the operation and effects of oile-rosat.

Touching the oile of Daffodills, I haue spoken of it in the treatise of the floures thereof. Raddish oile cureth the Low sicke disease; and namely, when lice are engendred vpon some long and chronick disease: it clenseth the skin of the face from all roughnesse, and maketh it sicke and smooth. The oile of Sefama, cureth the paine of the eares, and healeth vlcers which eat as they spread, even such as be morimals and check the Chirurgians hand. Oile of Lillies, which wee haue named Lirinon, Phaselinum, and Sirium, is most agreeable and wholsom for the kidnies: also to procure and maintaine sweate, to mollifie the matrice and naturall parts in women, & to promote digestion inwardly. The oil or ointment Selgiticum (as we haue already said) is comfortable to the sinues: like as the * grasse-green oile, which the Inguinians (dwelling vpon the caufy or street-way Flamminia) vse to sel. * Elæomeli, an oil which (as I haue declared before) issueth from oliue trees in Syria, carrieth a certaine tast of hony: howbeit their stomachs it maketh to rise at it, who licke thereof; and it is of power to soften the belly. It purgeth choler *Ele-
stinè*, if two cyaths thereof be giuen to drinke in one hemine of water: howbeit these symptomes or accidents do follow them who drinke thereof: They lie as it were in a dead sleepe, and must eftssoons be awakened. Our lustie drunkards who make profession of carousing, vse to take one cyath thereof before they sit down to drinke one another vnder board. The oile of Pitch is vsed euery where, for to heale the skurfe, mange, and farcins in beasts.

Next to vines and oliues, Date trees are to be raunged in the highest place, and doe cary the greatest name. Dates, if they be fresh and new, doe inebriat and ouerturn the braine: and if they be not very well dried, they do cause head-ach: neither are they (so far as I can see) any way good for the stomacke: againe, they do exasperat the cough and make it worse, yet they be great nourishers, and cause them to feed who eat of them. Our ancients in old time drew a certaine juice or liquor out of them when they were boiled, which they gaue vnto sicke persons in stead of an hydromell or honyed water to drinke; and that for to refresh them, to restore their strength, and to quench thirst: and for this purpose, they preferred the Dates of Thebais in high Egypt before

* Some read
delcinum.

* Potium Indi-
cnum.

* Eleobatum.
* Called like
wife Otrum Sy-
riacum.

A before all others. Being eaten as meat especially at meals, they are good for them who reach vp blond. The dates Caryote serue to make a liniment for the stomack, the bladder, belly & guts, with an addition of Quince among. Being incorporat with wax & saffron, they reduce the black and blew marks remaining after stripes in the skin, to their naturall colour. Date stones with their kernels are burnt in a new earthen vessel which was neuer occupied before, and being thus calcined, and their ashes washed, they serue in stead of Spodium, and doe enter with other ingredients into collyries or eie-salues: and with some Nard among, they make fukes to paint and imbelish the eye-browes.

CHAP. V.

¶ of the Myrabolan Date, and the Date Elate.

T He best Palm or Date tree which beareth a fruit like to Myrabolanes, is that which groweth in Egypt. These Dates haue no stones, like to others. Being taken in vuripe and hard wine, they stop the flux of the belly, and stay the extraordinary course of womens fleures, and do consolidat wounds.

As touching the Date-tree, called Elate or Spathe, it affordeth for vse in Physick, the yong buds, the leaues, and the barke. The leaues serue to be applied vnto the midriffe and precordial parts, the stomacke, liuer, and such corrosiue vlcers, as hardly will be brought to heale and skinned vp. The tender rind thereof incorporat with wax and rosin, healeth all manner of scales, within 10 daies. The same boiled and applied accordingly, cureth the accidents befalling to the cods and genitoirs. The very perfume thereof colereth the haire of the head black: and the suffumigation fetcheth downe the dead infant out of the mothers belly. It is giuen inwardly in drinke for the infirmities of the kidnies, bladder, & precordial parts: howbeit, an enemy it is vnto the head and sinews. A decoction or bath thereof, if a woman sit in it, staeth the immoderat fluxe both of Matrice and belly. Likewise, the ashes taken in white wine, are singular for the pains and torments of the collick: as also a collution therewith, is as effectual to cure the fall of the * Vvula and other defects incident to that part.

CHAP. VI.

D ¶ The medicinable vertues considered in the floures, leaues, fruit, boughes, branches, bark, wood, iuice, root, and ashes of many trees of fine rall kinds.

I T remaineth now to decipher the manifold medicines which apples & such like fruits tender skinned, do afford, according to the variety of trees which bring them forth. Of which, thus much in generall is to be noted, That all fruits which ripen in the Spring, while they be soure and harsh, be enemies to the stomack; they trouble the belly, disquiet the guts and bladder, and withall, be offensive to the sinewes: but if they be full ripe or foddren, they are the better. But to grow vnto particulars. Quinces if they be boiled, baked, or roasted, are sweeter and more pleasant to the tast, than raw. Yet being thoroughly ripe vpon the tree, although they be eaten raw, they are good for those that spit and reach blood, and are diseased with the bloody flux: such also as vpon the violent motion of vnbridled cholerick humors void vpward and downward: as also for them who be subiect to continuall loosenesse of the belly, occasioned by the feeblenes of the stomack. Being once boiled or baked, they are not of the same operation: for they lose thereby that astringent vertue which their iuice had. In hot and sharp feuers they serue for to be applied to the breast. And yet if they be foddren in rain water, they will do well in those cases aboue recited: but for the paine of the stomack, it matters not whether they be raw, foddren, or baked, so they be reduced into the form of a cerot, & laid too. Their down or mossinesse which they beare, if it be boiled in wine, and reduced into a liniment with wax, healeth carbuncles. And the same maketh the haire to grow again in bald places occasioned by some disease. Raw Quinces, condired and preserved in hony, do stir the belly, & moue to siege. They impart vnto the hony a pleasant tast, whereby it is more familiar and agreeable to the stomack. But such as being parboiled before, are then kept and conserued in honey, be thought good for the stomacke, in the opinion of some, who ordaine and prescribe to steep them first, and then to take them in manner of a meat or conserue. Being incorporat with Rose leaues boyled, for the infirmities of the Stomacke.

The

The juice of raw Quinces is a souveraine remedy for the swoln spleen, the dropse, and difficulty of taking breath, when the patient cannot draw his wind but vpright. The same is good for the accidents of the breasts or paps, for the piles, and swelling veines. The floure or blossom of the Quince, as well green and fresh gathered, as drie, is held to be good for the inflammation of the eies, the reaching and spitting of blood, and the immoderat flux of womens monthly terms. There is a mild juice drawn also from these floures, stamped with sweet wine, which is singular for the flux proceeding from the stomack, and for the infirmities of the liuer. Moreover, the decoction of them is excellent to foment either the matrice when it beareth down out of the body, or the gut Longaon, in case it hang forth. Of Quinces also there is made a souveraine oile, which is commonly called Melinum: but such Quinces must not grow in any moist tract, but come from a found and dry ground: which is the reason, that the best Quinces for this purpose be those that are brought out of Sicily. The smaller Pear Quinces called Struthia, are not so good, although they be of the race of Pome. Quinces. The root of the Quince tree tied fast vnto the Scrophules or Kings-cuill, cureth the said disease: but this ceremony must be first obserued, That in the taking vp of the said root, there be a circle made round about it vpon the earth with the left hand, and the party who gathereth it is to say, What root he is about to gather, and to name the Patient for whom he gathereth it: and then, as I said, it doth the deed surely.

The Pome-Paradise, or hony Apples called Melimela, and other fruits of like sweetnesse, do open the stomacke, and loosen the belly, they set the body in a heat, and cause thirstinesse, but offensive they be not to the sinews.

* Orbiculata.

The * round Apples bind the belly, stay vomits, and prouoke vrine. Wildings or Crabs are like in operation to the fruits that be eaten soure in the Spring, and they procure costiuenesse. And verily for this purpose serue all fruits that be vnripe.

As touching Citrons, either their substance, or their graines and seed within, taken in wine, are a counterpoison. A collution made either with the water of their decoction, or their juice pressed from them, is singular to wash the mouth for a sweet breath. Physicians giue counsell to women with child for to eat the seed of Citrons, namely, when their stomackes stand to coles, chalk, and such like stuffe: but for the infirmity of the stomack, they prescribe to take Citrons in substance: howbeit, hardly are they to be chewed but with vinegar.

* *Nonem*, and

* *Disforides* af-
flicteth the
conary.

As for Pomgranats, needlesse altogether it were now to iterate and rehearse the * nine kinds thereof. Sweet Pomgranats, all the sort of them, which by another name we called Apyrena, are counted * hurtfull to the stomack: they ingender ventosities, and be offensive to the teeth and gums. But such as in pleasant tast are next vnto them, which we called Vinosa, hauing smal kernels within, are taken and found by experience to be somewhat more wholesom: they do stay the belly, comfort and fortifie the stomack, so they be eaten moderately, and neuer to satisfie the appetite to the full: & yet some there be who forbid sick persons once to tast of these last named: yea, and in no hand wil allow any Pomgranats at all to be eaten in a feuer; forasmuch as neither their juice and liquor, nor the carnos pulp of their grains is good for the patient. In like maner they giue a charge and caueat not to vse them in vomits, nor in the rising of choler. Certes, Nature hath shewed her admirable worke in this fruit: for at the very first opening of the rind, she presently maketh shew of a perfect wine, without appearance of any grape at all, nor so much as of Must, which ordinarily is the rudiment of wine. All Pomgranats, as well sweet as tart, are clad with a very hard coat & rough rind. And verily the coat which the four kind hath, is much vsed and in great request: and namely the Curriers know full well how to dresse their skins therewith: and this is the cause, that the Physicians name it in Latine * Malicorium. And they would bear vs in hand, That the same doth prouoke vrine: as also, that the decoction thereof in vinegar, with gal-nuts among, doth confirm and keep the teeth fast, which do shake and are loose in the head. Women with child, and giuen to longing after a strange and vnreasonable manner, finde much good and contentment hereby: for no sooner tast they of it, but the child doth stir and sprunt in their wombe. The Pomgranat diuided into quarters or parcels, and laid to steepe and infused in raine water, for three daies or thereabout, yeeldeth a good and wholesome drinke for them to take actually cold, who are troubled with loosenesse of the body, occasioned by a flux from the stomacke; and with casting and reaching vpon blood. Of the tart and soure Pomgranat, there is a singular composition, which the Greeks call Stomatice: for that it is a most souveraine medicine for the infirmities incident to the mouth: and yet it is as wholesome for the accidents of the

* For *Corium*
signifies a skin
or leather.

nostrils

A nostrils and ears, as also for the dimnesse of the eies, for the troublesome ouergrowing & turning vp of the skin and flesh about the roots of the nailes, for the genitoirs or priuie members, for corrosiue vlcers which they call Nomax, and for the proud flesh and all excrescences in fores. Against the poison or venom of the sea-hare, there is an excellent composition made with Pomgranats in this manner: take the grains or kernels of Pomgranats, being despoiled and turned out of their outward rind or skin, stampe them well, and presse out their iuice and liquor from them: seeth the same vntill a third part be consumed, together with Safron, Roch-allon, Myrrh, and the best Attick hony, of each halfe a pound. Others do compound and prepare a medicine after another sort in this wise: they take and pun many soure Pomgranats, and draw out of them a iuice, which they seeth in a new cauldron or pot of brasse, neuer vied before, to the thicknesse

B of honey: this they vse in all infirmities of the fundament and priuy parts; for all griefs and maladies which be cured with the medicinable iuice Lycium: with this they cleanse ears that run with filthy matter; restraîne all violent fluxes of humors newly begun, and especially taking a course to the eies; and rid away the red pimples and spots that arise in any part of the body. Whosoever carieth in his hand a branch of the Pomgranat tree, shall soone chase away any serpents. The pill or rind of a soure Pomgranate boiled in wine, and so applied, cureth kibes. A Pomgranat stamped and then sodden in three Hemines of wine vntill one remain, is a singular remedy for the torments of the Collick, and driueth wormes out of the belly. A Pomgranate torrifed in an oven within a new earthen vessell neuer occupied before, well stopped and couered with a lid, and so being calcined and drunk in wine, staeth the flux of the belly, and assuageth the wrings in the guts. The first knitting of this fruit, when the tree * begins to floure, is

C called by the Greeks Cytinus. Of which there be obserued strange properties, approued by the experience of many men: for if any person, man or woman, vnbraced, vnclaced, vnpointed and vnbuttoned, with girdle loose, hose vnartered, & shooes vnbuttoned, and hauing not so much as a ring about any finger, come and gather one of these tender buds or knots, with a fingers only, to wit, the thumb and the fourth ring-finger of the left hand; and after this ceremony performed proceed forward to another, namely, to touch lightly with the same bud the compas of the eies round about, as if the priest should sacre or hallow them; and withal, when this is done, coueigh the same into the mouth, and swallow it down whole, so as a tooth touch it not: there goeth an opinion, That he or she for certain shall feele no impediment or infirmity of the eyes that year throughout. The same knots or yong Pomgranats, if they be dried and beaten to powder, are very good to keepe downe all excrescences of ranke flesh, and be wholesome for the gummies and teeth: moreover, the very iuice drawn out of them after they be sodden, do fasten the teeth in the head, although they were loose and ready to fall out before. The very * yong Pomgranats themselves alone newly knit, and making shew vpon the tree, if they be stamped to the form of a liniment, are singular for any corrosiue vlcers, & such as tend to putrification. Likewise, they be excellent good in that sort prepared and applied, for the inflammation of the eies, & of the entrailes, and in manner for all those occasions wherein the outward rinds and pills do serue. And here before that I proceed any farther, I cannot sufficiently admire and wonder at the careful industry and diligence of our antients before time, which they imploied in the consideration of

D Natures workes, searching as they did into euery secret, and left nothing behind them vnassayed and vntried: in so much, as they took regard of those little pretty floures appearing vpon these knots or buds before said, such I meane as break forth and spring, before the Pomgranat it selfe is formed, and maketh any appearance, which smal blossoms, as I said before, * are called Balau-

E fia. For euen these, as little as they be, our ancestors haue found by their experiments to be aduerse vnto scorpions. And true it is, that being taken in drinke, they do restraîne the extraordinary flux of womens fleurs: they heale the cankers and sores in the mouth, the diseases of the Tonfils or Amygdales, and of the Vvula: they do helpe the spitting and reaching vp of blood: they cure the feeblenesse both of belly and stomack, with the fluxes thereupon insuing: they are singular besides for the grieuances of the priuy members, and for all running vlcers spreading in any part of the body whatsoever. Moreover, they made prooue of the said floures dried, and this high magistery they found, That being beaten to powder, they cured those of the bloudie flux, who lay at the very point of death on that disease: as also that there was not a better thing in the world to stay any lask or flux of the belly. Nay, they staid not here (so inuentiue were our forefathers) nor thought much to make trial of the very kernels or stones, within their grains, to see

* *Floures incipientis*, rather

see if they could meet with any goodnesse therein, for to deliuer vnto posterity and the age following. And in good faith, they found, That euen those as contemptible as they seem, being torried and so pulverized, doe help and comfort the stomacke, if either the meat be strewed or sprinkled, or the cup spiced with the said powder. And in truth, if they be drunk with rain water, they bind the body: the root of the Pomgranat tree, if it be boiled, yeldeth a liquor or iuice which being taken in drinke to the weight of a Roman victoriat [i. halfe a denier, or half a dram] killeth the worms in the belly. The same thoroughly foddren in water, is of the same operation that Lyeium is for any purpose that it shall be put vnto.

that Lycium is for any purpose that it shall be put vnto.
Finally, there is a wild Pomgranat, so called for the resemblance that it hath to the planted Pomgranat: the roots are red without forth, * which being taken to the poise of one denier or dram in wine, do procure sleepe. The graines or seeds in drink, drie vp the watery humours that be gotten between the skin and the flesh, in that dropie which is called Intercus. To conclude, a perfume made with the rind or pill of a Pomgranat, chafeth Gnats out of the place, where it burneth.

CHAP. VII.

¶ Of Peares, and the properties of served in them. Of tame Fig-trees, and their Figs. Of the wild Fig tree. Of Evinius, and other plants, with the medicines which they afford.

ALL Peares whatfoeuer, are but a heauie meat, euen to them that are in good health. And sick folke are debarred for eating them, as well as for drinking wine. And yet if the same be well boiled or baked, they are maruellous wholesome and pleasant to the tast, especially those of Crustuminum. There is no kind of Peare at all, but if it be foddren or baked with hony, agreeth with the stomack. Of Peares there be vually made certaine cataplasmes, which are singular good to discusse all pusses, risings, and pimples vpon the body: and their decoction serueth wel to resolu all hard tumors. Peares insubstance be a good counterpoison against venomous Tadstools and Mushrooms; for either they drie them down by their very weight and ponderosity, or els chase them out of the stomacke, through a certain secret antipathy in Nature, that their iuice hath. The wild choke Peares be very late ere they ripen. The manner is to cut them into certaine slices or roundles, and so to hang them vp a drying, for to stay the laske and knit the belly, which their decoction also will do sufficiently, if the patient doe drinke it. The leaues likewise, together with the Peare, are vsed to be foddren for the same purposes. The ashes also of the Peare tree * wood, in case of pestilent Mushrooms is of more efficacie than the Peare it selfe. Poor iades that carry Apples and Pears vpon their backs in paniers, are shrewdly loden: and wonderfull it is to see, how heauy they do weigh, and how a few of them will make the poore beasts to shrink vnder their burden: but what is the remedy? Let them eat some of those Peares before, or do but shew them vnto them, they will vndergoe (as folke say) their load more willingly, and go away with it more roundly.

The milke or white juice that the Fig-tree yeeldeth, is of the same nature that vineger: and therefore it will cruddle milk as well as rennet or rindles. The right season of gathering this milky substance, is before that the figs be ripe vpon the tree, and then it must be dried in the shadow: thus prepared, it is good to breake impostumes, and keepe vlcers open: also to bring down the monthly termes of women, either applied with the yolk of an egge, or taken in drinke with * Amyl or * Starch powder. If the same be tempered with the flour of Pœnigreek seed and vineger, and so applied in manner of a liniment, it helpeth the gout. Also it is depilatory, and fetcheth off haire: it taketh away the skurfe of the eie-lids. In like maner it killeth tettars, ring-worms, & any wild scabs. It openeth the body, and makes it soluble. This fig-tree milke is naturally aduersē vnto the venomous stings of Hornets, wasps, and such like. But particularly to the prick of Scorpions. The same if it be incorporat with hoggs greafe, taketh away warts. Fig tree leaues & green figs vnripe, reduced into a liniment, do discusse and resoluē the Scrophules, called commonly the kings euil, yea, and all such nodosities as are to be mollified. The leaues also alone will do as much. There is another vse of them besides, namely, to rub therewith tettars and bald places, which through some infirmity haue lost haire: & generally all those parts that had need to be blistered: the tender tops & twigs of fig-tree branches are singular to cure the biting

A of mad dogs, if they be applied to the skin where it is broken. The same brought to a liniment with honey, healeth the wens or impostumations which be called Ceria, yeelding forth an humor like to hony out of the comb. And if they be tempered with the leaues of the wild Poppy, they draw forth broken spils or shiured bones. Fig-tree leaues stamped with vineger, do restrain the venom, occasioned by the biting of mad dogs: the white tendrils or sprigs of the blacke fig-tree made into a cerot with wax, and so applied, do cure felons and the biting of hard thriues. The athes made of black fig-tree leaues, heale gangrenes, and consume all excrescence of dead or proud flesh. Ripe figs prouoke vrine, make the belly soluble, moue sweat, and bring forth small pocks and meafels: in regard of which operation thus to open the pores, they be vnwholome to be eaten in Autumne or at the fall of the leafe: for when by their means our bodies be set into a sweat, they are more subiect to take a through cold. Neither be they wholsome for the stomack: but the best is, their offence continueth but a while. Mary, they are well knowne to be enemies to the voice. The figs which be of a later breed (as it were) and come last, are wholesome than those which ripen betimes: (whereas verily, if they be brought to their maturity by medicining, i. by caprification, then they are neuer good:) and these figs increase the strength of young folk: preferue elder persons in better health, and make them looke more yong and with fewer wrinkles. They do quench and allay thirst, and coole vnkinde heat. And therefore such must not be denied vnto the patient, in feuers proceeding from the constriction of the pores, which agues the Greeks call Stegnas. Dry figs offend the stomack: but for the throat and wheezant they are exceeding good. These dried figs are by nature hot in operation, and therefore ingender thirst. They set the belly into a loosenesse: in which regard they are not good to be eaten in any flux or Catarrhs, taking a course either to it or the stomack: wholsome they be at all times for the bladder, such also as be short winded and purtie. Semblably, they open the obstructions of liuer, kidneys, and spleen, and cure their infirmities. Nutritiue they be, and therefore much eating of them causeth a man to grow corpulent, and nathelesse to be strong and lusty withall: which is the cause, that professed wrestlers and champions were in times past fed with figs. For *Pythagoras*, a great master and warden of these exercises, was the first man who brought them to eat flesh meat. Moreouer, figs be restorative, and the best thing that they can eat who are brought low by some long and languishing sickness, and now vpon the mending hand and in recouerie. In like manner they are singular for the falling euil and the dropsie. Figs

D applied as a cataplasme, are excellent either to disperse or els bring to maturity any impostumes or swellings: but they doe the feat more effectually, if either quicke-lime or sal-nitre be mixt therewith. Boiled with Hyssop they cleanse the brest, break and dissolve the flegmatick humors either fallen to the lungs, or there ingendred; & so by consequence rid away an old cough. Soden in wine, & so applied as a liniment, they cure the infirmities incident to the feat or fundament, they mollifie and resolve the swelling tumors of the paps, they disperse and heale felons, pushes, biles, & risings behind the ears. A fomentation made with their decoction, is good for women. And the same being sodden with Feni-greek, are excellent for the pleurisie & Peripneumony, i. the inflammation of the lungs. Boiled with Rue, they assuage the ventosities or collicke in the guts. The same being incorporat with verdi-grease or the rust of brasse, cureth the morimals of the legs: and with Pomegranats they heale the rising & exulceration of the flesh and skin about the naile roots. But made into a cerot with wax, they heale burnes, scaldings, & kided heels. Seeth Figs in wine with wormwood and barley meal, and put nitre to them, they are passing wholesome for those who are in a dropsie. Chew them, they *binde the belly. Make a cataplasme of Figs and fait together: the same is singular for the sting of scorpions. Boyle them in wine, and so apply them, you haue an excellent remedy to draw forth carbuncles to the outward parts, and bring them to an head. Take the fattest & fullest Figs you can get, lay them vpon the vgly and ill fauored tumor called Carcinomay, the Canker, so it be not yet exulcerat. I assure you it is a fouraine remedy, and hardly can be matched againe: and so it is also for the festering and eating vicer Phagedæna. There is not another tree againe growing vpon the face of the earth that yeeldeth better or sharper asses than the wood of the Figge-tree doth: either to cleanse *vicers, or to incarnate, consolidate, and restrain flux of humors. It is taken in drink for to resolve clutered blood within the body. Semblably, if it be giuen to drink with water & oile, of each one eayth, it serues wel for those who are dry beaten & bruised, who are fallen from some high place: such also as haue spasms & inward ruptures. And thus they vse to giue it in a

cramps, and namely, in that vniuersall convulsion, which holdeth the body so stiffe, that it can stir no way nor other, as if it were made of one intire piece without any ioint. Likewise, both taken in drink, and also infused or iniected by clystere, it helpeth the fluxe, occasioned either by a feeble and rheumatick stomacke, or els by the vicer of the guts. If a man rub the body all over with it and oile together, it setteth it into an heat, were it before benumbed. A liniment made of it, and wrought with wax and oile Rosat together, skinneth a burnt or scalded place, most finely, leauing no skar at al to be seene. Temper it with oile, and therewith annoint their eies who are pore-blind, sand blind, or otherwise short-sighted, it amends their eie-sight: & to conclude, rub the teeth often therewith, it preferueth them white, neat, and from rotting. Thus much of Fig-tree ashes.

Moreover, it is commonly said, That if one come to a Fig-tree, bend a bough or branch thereof downward to the ground, and bearing vp his head without stooping, reach and catch hold of a knot or ioint with his teeth, and so bite it off, that no man see him when he is doing of it, and then lap the same within a piece of fine leather, tied fast by a thred, and hang it about his necke, it will dispatch the kings euill and swelling kernels or inflammations behind the eares.

The bark of the Fig-tree reduced into powder, mixed with oile, and so applied, healeth the vicers of the belly. Green Figs taken raw, stamped and incorporat with niter and meale, take away all warts, whether they be smooth or rough. The ashes made of those shoots that spring from the root, is a kind of Antispodium, and may go for Spodium indeed. If the same be twice calcined and burnt, and then mixed with cerusse or white lead, and so reduced into trochiskes, they make a good collyrie or eie-salue, to cure the roughnesse and exulceration of the eies.

As many vertues as the mild fig-tree hath, yet the wild is much more effectuell in operation: how soeuer she yeeldeth lesse milke or white juice than the other doth. For a branch onely of it, is as good as rennet or rindles to make milke turn and run to a cheefe curd. Howbeit, that milky liquor which it hath, if it be gathered and kept vntill it be dry and wax hard, serueth to season our flesh meats, and giue them a good tast. For which purpose it is wont to be mixed and dissolued in vinegar, & then the flesh must be well rubbed and poudered therewith. The same is vsually mingled with caustick and corrosiue medicines, when there is an intention to raise blisters, and make an issue. It caufeth the belly to be laxatiue, and openeth the matrice, if it be vsed with Amyl powder. Being taken in drink with the yolk of an egg, it prouoketh womens fleurs. Applied in a liniment with the floure of Feni-greece, it easeth the pains of the gout: it clenseth the leprosie, and foul wild scab: it killeth ring-worms and fell tectars: it scoureth away freckles and such flecks as disfaue the face: likewise it cureth the parts stung with venomous serpents, or bitten with mad dogs. Moreover, this juice of the wild Fig-tree, applied vnto the teeth with a lock of wooll, allaieth their ach: so it doth also if it be put into them that be worne-eaten and hollow. The tender yong branches, together with the leaues, if they be mingled with Eruille, are good against the poison of venomous sea-fishes. But then, according to some Physitians, there must be wine added to this receipt. The said tender branches being put into the pot with Boeuf, and so boiled together, saue much fewell, for lesse fire by far will serue to seeth the meat. The green figs of this wild fig-tree brought into a liniment, do mollifie and discusse the kings euill, and all other tumors and apotemes. And in some measure the leaues also haue the same operation: Chuse the softest and tenderest of them, let them be stamped and mixed with vinegar, they will cure running scalls and sores, ease bloody fals and chilblanes, yea, and scoure away filthy scurf or dandruffe. The said green figs, together with the leaues, incorporat with honey, doe cure the wens or exulcerat bunches, which yeeld matter out of them resembling hony: likewise they heale the biting of mad dogs. The greene and fresh figs newly gathered, if they be laied roo with wine, doe heale filthy eating vicers: and mixed with Poppie leaues, they draw and fetch away broken bones out of the body. The greene Figs of the wild Fig-tree, doe scatter and discusse inflammations, onely by their perfume, if they be burnt. They are a counterpoison, in case one haue drunk Bils blood, or cerusse: the same also put away the danger of milke crudded within the stomacke, if they be taken in drinke. Likewise, soddren in water, and reduced into a liniment, they cure the risings & tumors behind the eares. The tender branches & the least green Figs of this wild Fig-tree, being taken in wine, are very good for the sting of Scorpions: with this change, that the milky juice thereof be instilled into the wound, and the leaues laied aloft. The same also serueth for the hardi shew. The ashes of the small tendrons being burnt, duely applied,

A applied, bring the Vvula againe into the right place, and assuage the paine therof. The ashes of the very tree it selfe, being incorporat with honey, do cure the rhagadies, fistules, and chaps in the feet, or elswhere. The root boiled in wine, easeth the tooth-ache. The winter wild fig-tree, (which beareth fruit late in the yere) if it be soddren in vinegar, and so stamped and brought into a liniment, is singular to kill tectars and wild scals. But to prepare this medicine, the wood & boughs of the tree must be depouled of the barke, and then shauen or scraped so fine as any powder or saw dust, that they may be reduced into an ointment. Yet there is one medicine more belonging to the wild fig-tree, which is admirable, and may make a man to wonder at it: if a yong boy not yet vndergrowne nor 14. yeares of age, break a branch or bough of the wild fig-tree, and with his teeth do pill the said branch, and fetch off the rind before it haue gathered any downe

B or mosse about it; then the marrow or pith within the said branch, if it be taken forth and tied fast about one that hath the kings euill (so that all this be done in a morning before the Sun-rising) doth repercusse and smite back the said disease, so that it shall not arise and grow. Moreover, this wild fig-tree hath one singular property besides, That if a collar made of the branches thereof be but about a bulls neck, it will make him perforce to stand still and not to stir, how fell and fierce soeuer he be otherwise; such a wonderful vertue it hath to bridle and keep vnder his courage.

Moreover, since that the Greeks do terme this wild fig-tree in their language Erineos, which putteth me in mind of a certain herb called Erinos also in their tongue, I cannot wil nor chuse but for affinity and neighbor-hood sake, describe the same in this place, and set downe the properties and vertues thereof. An herb it is, one good handful high, rising vp commonly with five or six little stalks or branches, much like vnto Basil; bearing a white floure, a black seed, and the same small which seed beaten to powder and medled with the best Atticke honey, cureth the rheume which falleth into the eies and caufeth them to weep and water continually: as touching the herb it selfe, if it be applied or vsed accordingly, with a little sal-nitre put thereto, it is a passing good remedy for the paine of the eares. The leaues are a counterpoison.

To come now to the Plum tree: the leaues thereof boiled in wine, are good for the infirmities incident to the amigdales, the gums, and the Vvula, in case the mouth be oftentimes washed with a collution made of their decoction. Plums themselves make the body soluble, & very commodious they are to the stomack; but this benefit continueth but a small while.

D Peaches are much better than Plums; and so is their iuce, principally if it be drawn in wine or vinegar: and verily for a fruit, there is not in the world any more harmlesse than it. You shall not see a fruit againe, to haue lesse sinell, & more iuce within than the Peach; and yet as liquid as it is, it caufeth them to be dry and thirsty who eat thereof. The leaues of the Peach-tree, punned and applied, do stanch bleeding. The kernels of Peaches, incorporat in vinegar and oile to a liniment, and laied too as a frontal, allay the head-ache.

Bulleis, Skegs, and Slone (which are the berries, as it were, or fruit of the wild Plum tree) or the very barke and rind growing to the root, boied in one hemine or smal pint of some hard and crabbed wine, vntill a third part only remaine, do yeeld a decoction effectuell to allay the pains of the cholick, and to stop the flux of the belly: of this liquor, a cyath is a sufficient draught to be taken at a time. As well in this wild kind as in planted Plum trees of the hortyard, there is to be found a certain skinny gum, in Greek called Lichen, which hath a wonderfull operation to cure the rhagadies or chaps, yea, and the swelling piles or knobs that appeare in the fundament. In Egypt and Cypres both, there groweth the Sycomore, which is a kind by it selfe between a fig tree and a mulberry tree, as I haue before said; the fruit or berries whereof be full of liquor, which so soon as the vppermost rind or pill only is pared away, appeareth in great abundance: cut and gash them deeper in, they seeme drie, after a wonderfull and incredible manner. This iuce issuing out of them, is a singular defenfatue against the poison of Serpents: a wholesome medicine for the bloody flux; and * a notable carminatiue to discusse and resolu pusshes, biles, and al impostumations. It foudereeth and healeth ywounds, it allaieth head-ach, and assuageth the wens or pains of the eares. Such also as be spleeniticke or diseased in the spleene, finde much ease and comfort by drinking thereof. Moreover, a liniment made therewith, is good to chaufe and heat those, who chill and quake for extremity of cold: howbeit, last it will not, but breed worms very quickly. Certes, the iuce of our mulberries which we haue, is of no lesse operation and effect; for if it be taken in wine, it is a singular counterpoison for them who haue drunke ei-

The like is

Aegineta.

ther the iuice of Aconit, [i. Libard-bane] or swallowed a venomous spider. The same doth loo-
 sen the belly, euacuat slimy and roping fleame, and expelleth the broad wormes and other such
 vermin ingendred in the belly. Of the like efficacy is the bark, if it be puluerized and so taken
 in drink. The leaues boiled in rain water, together with the bark of the blacke fig-tree and the
 vine, do make a lauature or water to * colour the haire [blacke.] The iuice of mulberries doth
 work speedily, and prouoke to the siege: and the very fruit or mulberry it selfe, for the present is
 comfortable to the stomacke; it cooleth for the time, but bringeth thirst with it. If a man eat
 them alone, or last, and lay no other meat vpon them, they swell in the stomack and be very fla-
 tuous. The iuice drawn out of vnripe mulberries, are of vertue to bind the belly. In sum, there be
 strange and wonderfull properties worthy to be obserued in this tree, which seemeth to haue
 some sence and vnderstanding, as if it were a liuing and sensible creature, whereof I haue already
 * written more at large in the description of it, and the nature thereof. There is a notable * com-
 position made of mulberries, respectiue to the mouth and throat, called thereupon Panchrestos
 Stomatice, and by another name, Arteriace: the receit and making whereof, is in this manner;
 Recipe, of the iuice drawne out of Mulberries, three sextars, seeth it ouer a gentle and soft fire [or
 rather let it stew in balneo Maria] vntill it be reduced to the consistence of hony: afterwards put
 thereto of veruice made of dried grapes, the weight of two * deniers or drams; of myrrhe, the
 poise of one denier; of saffron likewise, one dram or denier. Let these ingredients (I say) be first
 beaten to powder (such I mean as need puluerising) and so mingle them together with the fore-
 said decoction, and put it vp for your vse. A better and more pleasant medicine there is not, for
 the mouth, the windpipe, the vula and the stomack. There is another way of making it in this
 sort, Take of the iuice aforesaid, the quantity of * two measures called sextars, of Atticke hony
 one sextar, seeth them together as before. Many maruels besides are reported of this tree, of
 which I will giue you a little tast: Spie where the little mulberries that shall be are newly knit,
 to wit, when the tree first buddeth and before the leaues be fully out; gather their yong knots of
 the fruit toward, which the Grecks call Ricinos, but in any case with the left hand; take heed al-
 so that they touch not the ground, how soeuer you do: and if when you haue obserued these cir-
 cumstances, you wear them about your wrefts, hang them about your necke, or otherwise tie
 them about you, be sure they will stanch bloud, whether it gush downe from your nostrils, flow
 out of a wound, run out of the mouth, or issue by the hemorrhoid veins. And in truth, folke vse
 to keepe these little buds or knots very carefully for this purpose. The same vertue and operati-
 on the branches haue (as they say) but then they must be broken from the tree at the full of the
 moon, when they begin to knit & giue some hope of fruit: & if the same touch not the ground,
 then they haue a speciall property respectiue vnto women, for to restrain the immoderat flux of
 their monthly terms, being tied or fastened to their arms. And it is thought, that they work this
 effect, if the woman her selfe do gather them at any time when soeuer: provided alwaies, that the
 branch in any wise touch not the ground, and that she weare it fast about her in manner afore-
 said. The leaues of the mulberry tree stamped greene, or beeing dry and boiled, serue in a cata-
 plasme to be applied vnto those places which are stung by serpents: the same good they do al-
 so, if they be taken in drink. The iuice of the bark which grew to the root, if it be drunk either in
 wine or oxycrat [i. vinegar and water together] is singular against the pricke of scorpions. But
 here I must set downe the compositions that our antients deuised and made of mulberries: first
 and formost, they tooke a quantity of the iuice pressed out of mulberries, as well ripe as vnripe,
 which they sod in a brasse pan, vnto the consistence or thicknesse of honey. Some vsed to put
 thereto, myrrh and Cyresse, setting all to frie and take their fermentation in the sun, vntill it
 grew to hardnesse in the foresaid vessell, stirring it thrice a day with a sparule: This was the sto-
 maticall medicine of the antients, which they vsed also in healing & skinning vp wounds. And
 yet there was another kind made after this sort: they pressed forth the iuice of the vnripe mul-
 berries, but first they let the said fruit to be very wel dried, & this serued them in lieu of sauce,
 which gaue an excellent tast to their other meats. In physick also, they imploied it much, name-
 ly, about corrosiue and eating vlcers, and for to euacuat tough fleame out of the brest: they vsed
 it also as need required, as an astrictiue, to corroborat the noble and principall parts within the
 body. It stood them also in good stead for collutions, to wash the teeth withall. Moreover, a
 third kind of iuice they had, which they drew from the leaues and roots after they were wel boi-
 led: and with this iuice & oile together, they were wont to annoint any burnt or scalded place

of

A of the body: for which purpose, the leaues also they applied alone without more ado. As touch-
 ing the root of the Mulberry tree, it yeeldeth in haruest time (by way of incision) an excellent
 iuice for the tooth-ach, for biles, and impostumes, especially such as are growne to suppuration
 and be at hand to break: the same purgeth the belly. The leaues of the Mulberry tree infused &
 soked in vrine, fetch off the haire from those skins which are to be courried and dressed.

Cherries loosen the belly, and be hurtfull to the stomack; yet, if they be hanged vp and dried,
 they do bind the belly, and prouoke vrine. I find a notable experiment in some authors, That if
 a man eat Chery-stones and all in a morning, new gathered from the tree with the dew vpon
 them, they will purge so effectually, that he shall find himselfe cleane rid from the gout of the
 feet, if he were diseased that way.

B Medlars, all of them, except those great ones called Setania (which indeed are more like to
 Apples) do close vp the stomack, and bind the belly. In like manner Sorueises, if they be dried;
 for being fresh and new gathered, they be good to scoure and send excrements speedily out of
 the stomacke and belly both.

CHAP. XVIII.

¶ Of Pine-nut s, or Pine-apples: of Almonds, Filberds, and Hazell-nuts: of Wal-nuts, Fi-
 sticks, Chestnuts, Carobs, and Corniols. Of the fruit of the Arbut or Straw-
 berry tree, and the Bay.

C T He Pine apples or nuts, which haue rosin in them, if they be lightly bruised, and then sod-
 den to the half in water, with this proportion, to wit, one sextar of water to euery such ap-
 ple, do yeeld a decoction singular good for such as reach and spit vp bloud; so that the pa-
 tient drink two cyaths thereof at one time. The decoction likewise of the Pine-tree bark boi-
 led in wine, is giuen to drink for the pains and torments in the belly. The kernels of the Pine-
 nuts quench thirst; they pacifie and stil the frettings and gnawings of the stomack: they rectifie
 the corrupt and putrified humors there settled and bedded: they strengthen weak bodies in man-
 ner of a restorative, and are right good & agreeable to the reins and bladder: howbeit they seem
 to exasperat the throat, & to encrease a cough. Being taken inwardly, either in water, wine, sweet
 cuit, or the decoction of * dates or tamarinds, they purge cholerick humors: when the gnawing
 D gripes within the stomack be exceeding violent and painfull, it is good to mix therewith Cu-
 mber seed and the iuice of Pourcellane: likewise in case either bladder or kidnies be exulce-
 rat: for diureticall they be also, and prouoke vrine.

*Balanum de-
casto.*

Touching the bitter Almond tree, the decoction of the roots thereof, doth supple the skin
 and lay it even and smooth without wrinkles; it imbeliseth the visage with a fresh, luely, and
 cheerfull colour. The bitter Almonds themselves bring folk to sleep, and get them appetite to
 their meat: they moue vrine, and stir the ordinary course of womens monethly fleurs: they serue
 in a liniment for the head-ach, especially in feuers, but if the said head-ach come by occasion of
 drunkennesse or a surfet of wine, they would be applied with vineger, oile rosat; and a sextar of
 water. They haue a property to stanch bleeding, mixed with Amylfloure and mints. They are
 E good in a lethargy, and the falling sicknesse, if the head be therewith annointed all ouer. They
 cure the angry night-foes, called chilblanes and bloody-falls: applied with cold wine, they cure
 vlcers which grow to putrifaction; and with hony, the bitings of mad dogs: they take away the
 scales and dandruffe about the face, if so be there haue bin vsed before, some conuenient fomen-
 tation to prepare the skin for this medicine. An Almond milk drawn with water, and taken as a
 drinke, easeeth the pains of the liuer and kidnies. Bitter Almonds reduced into a loch with Ter-
 pentine, worke the same effect, so that the Patient be often licking thereof. For those who be
 troubled with the stone and grauell, with difficultie also of pissing, they be very effectuell if
 they be taken with sweet wine cuit: also beaten with honied water, they be singular to cleanse the
 skin, and make it look neat and faire. Reduced into the form of a loch with hony, they be whol-
 F some for the liuer, good to ripen and dispatch a cough, & excellent for to mitigate the paines of
 the cholique: and this electuarie must bee taken, to the quantity of one hazell nut at a time,
 with a little sauge put thereto. It is said, that our lusty tosse-pots and swil-bols, if they eat foure
 or five bitter almonds before they sit them down to drink, shall beare their liquor well, and ne-
 uer be drunke, quaffe they and poure they downe as much as they wil: also, that if foxes chance

to eat of them, and cannot come by water neere at hand to lap, they wil die thereof. Sweet almonds are not so medicinable as the bitter, and yet they be purgative, abstersive, and diureticall. If they be new and fresh, they charge and stuffe the stomacke.

Hazel-nuts and Filbirds, otherwise called the Greekish nuts, beeing taken in vineger with wormwood feed, cure the yellow jaunise, as it is commonly said: & a liniment made with them doth help the diseases incident to the feet, and particularly the piles and swelling bigs there appearing. The same medicine is good for the cough, and such as spit and cast vp blood.

ῥαυον, of ῥαυον, the head: like as in Latin, *Nux, a noxa, vel nocendo*

As for Walnuts, the Greeks haue giuen them a * name importing as much as the heaviness of head, and not without good cause, for the very shade of the tree and the sent of the leaues, do pierce and enter into the head: so do the kernels also in lesse while, if they be eaten: now the newer they be, the more pleasant tast they haue: the drie are more oily and vnctuous, hurtfull to the stomack, hard of digestion, causing head-ach, naught for them who haue a cough, and for such as would vomit in a morning fasting: good only in that troublesome running to the stoole and straining for nought, by reason of their property to euacuat fleam. The same being eaten before meat, do dull the force of any poisons: they help the squinancy also, applied with Rue and oil. Aduerse & contrary they are to the nature of onions, & do keep down & repress their strong smell which riseth from them, after a man hath eaten them. Applied with a little hony, they are thought to be very good for the inflammation of the ears, & with Rue, for the breasts and paps; as also for dislocations and parts out of ioint. But if they be vsed with onions, salt, and hony, they are singular for the biting both of dog & man. The shel of a wal-nut, is thought to be of a caustick quality, and good to burn or seare an hollow tooth: the same being burnt, pulverized, and incorporat with oile or wine, serueth to annoint the heads of yong babes for to make the hair grow thick: & in that maner it is vsed to bring the haire again of elder folk, when through some infirmity it is shed. The more Walnuts that one eateth, with more ease shal he driue worms out of the belly. VWal-nuts that haue bin very long kept, do cure carbuncles, gangrenes tending to mortification, and reduce the black and blew spots (remaining after stripes) to their own color. The bark of the wal-nut tree, is a soueraign remedy for the bloody flux, and the foule tectars or ringworms. The leaues bruised & stamped with vineger, & so applied, put away the pain of the ears. After that *Mithridates* (that most mighty and puissant king) was vanquished, *Cneus Pompeius* found in his secret closet or cabinet, among other precious jewels, the receipt of a certain antidote or preservative against poison, set down vnder the hand of the sayd prince, in a priuat note-book of remembrances, in this maner following: Take a dry walnut kernel, as many figs, of rue, 20 leaues: stamp al these together into one masse, with a graine or corn of salt among. Vnder which receipt, was thus much subscribed, VWhofoeuer vse to eat of this confection in a morning next his heart, there shall no poison hurt him that day. It is said moreover, that the kernels of walnuts chewed by a man or woman fasting, doe cure the biting of a mad dog, so that the place be annointed and dressed therewith.

But to return again to Hazle-nuts and filberds, they do cause head-ach, they breed winde in the stomack: and a man would not think nor beleue, how soon they wil make one fat, but that experience approueth it. If they be roasted or torried, they cure a rheume: and if they be beaten to poudre, and giuen to drink in honied water, they rid away an old cough that hath stucke to one a long time: some put thereto certain pepper cornes, and others drinke them in wine cuit that is sweet. Fifticks are vsed in the same sort, and haue the same operation and effects as the Pine-nut kernels haue: ouer and aboue, they are soueraigne for the sting of serpents, whether they be eaten or taken in drinke.

* *Alvo cile, & molliu ciente.*

Chestnuts be exceeding astringent, and mightily stay all fluxes both of the stomack and the belly: for such as scoure ouermuch and haue * a great lask vpon them: also for them who reach vp blood, they be passing wholesome, and withall, nutritiue and breeding good flesh.

Carobs, which be fresh and Greene, are hurtfull to the stomacke, and doe loose the belly; yet the same, if they be dried, do bind, and are more wholesome for the stomacke: diureticall they be also, and prouoke vrine. As for those Carobs or Cods of Syria, some vse to leech three of them in a sextar of water vntill halfe be consumed, and drink that iuice or liquor thereof for the paine of the stomack. If a man take the green twigs of a Corneil tree, there will (by the meanes of a red hot plate or slice of yron set vnto them) sweat or fry out a certain liquid humor, which must be receiued so, as nowood touch it: the rust of yron befieared with this liquor, cureth foul tectars

A tars and ringwormes called Lichnes, if they be taken at the first before they haue run far. The Arbut or Strawberry tree, otherwise named Vnedo, beareth a fruit hard of digestion, and offensive to the stomack. The Lawrell, both leafe, bark, and berry, is by nature hot, and therefore it is agreed among all writers, That their decoction, especially of the leaues, is comfortable to the bladder and natural parts of women: the same being applied as a liniment, be singular good for the prick or sting of wasps, hornets, and bees; and likewise against the poisons of serpents, especially of the viper, and Seps otherwise called Dipas. Boiled with oile, they are good to bring down womens fleurs. The tender leaues of the Bay stamped, and mixed with grosse barley meale or groats, cure the inflammations of the eies: with Rue, they help the hot tumors and swellings of the cods: but incorporat with oile Rosat, or with oile of Ireos or floure-de-lys, they assuage the head-ach. Whofoeuer doth chew and swallow downe three bay leaues, for three daies together, shall be deliuered by that means from the cough. The same, if they beaten to poudre & reduced into an electuary or loch with hony, are good for such as be purrile and labor for wind. The bark or rind growing to the root, is dangerous for women great with child, and such must take heed how they meddle with it. The very root it selfe, breaketh or dissolueth the stone, and is wholsome for the liuer, if it be taken to the weight of three oboli in odoriferous wine. Bay leaues giuen to drink, do prouoke vomit. Bay berries bruised and so applied, or otherwise pulverized and taken in drink, draw down the issue of womens terms. Take two Bay Berries, rid or cleanse them from their huske and drinke them in wine, it is a singular medicine for inueterate coughs, & the difficulty or straitnesse of breath, when a man is forced to sit vpright for to fetch C and deliuer his wind: howbeit, if the Patient be in a feuer, it is better to take these berries in water, or els by way of a loch or electuary, after they haue bin sodden in honied water or sweet cut. And in this manner they be good in a phthisick or consumption of the lungs, & all catarrhs which fall to the pectorall parts; for they ripen fleam, and send it out of the chest. Four Bay berries drunk with wine, are a good remedy for the sting of scorpions. The same being brought to poudre and reduced into a liniment with oile, & so applied, do heale the bloody-falls called Epinyctides; rid away freckles and pimples, cure running scalls and vlcers, cankers and sores in the mouth; and cleanse the body of scurfe, scals, and dandruffe. The iuice drawn out of Bay berries, killeth an itch that fretteth the skin, & besides, the lice that cawle and swarm all ouer the body. The same, mingled with old wine and oile rosat, and so dropped into the ears, cureth their D pain and deafnesse: and whofoeuer be annointed all ouer therewith, need feare no venomous things, for they will flie from them. The same iuice, especially if it be drawn from the berries of that Lawrell which hath the smaller and thinner leaues, may be taken in drink, and so it is effectually against all stings. The berries drunk in wine, withstand the venom of serpents, scorpions, and spiders. Brought into a liniment with oile and vineger, and so applied, they help the spleen and liuer; but with hony, they heale gangrenes. Such as be wearied with trauel, or otherwise stiffe and benumbed with cold, find much good by being annointed with the said liniment or iuice, if some sal-nitre be put thereto. Some are of opinion, That if a woman in labor drinke the quantity of one acetable of the Lawrell root in water, shee shall haue the more speedy deliuerance: and for this purpose (they say) that a fresh and green root is better than a dry. Others prescribe, E to giue in drink ten bay berries against the prick of scorpions. Also when the Vvula is false, some giue counsell to take three ounces of the leaues and berries, and seeth them in three sextars of water to the thirds, & to gargarize with this decoction hot: also for the head-ach, to take some odde number of bay berries, and stamp them with oile into a liniment, & therewith to annoint the fore-head & temples, as hot as the patient can well abide it. The leaues of the Delphick Lawrell beaten to poudre, and held to the nose and smelled vnto euer and anon, serue for a good preservative in time of the contagious pestilence; and the rather, if they be burnt, their perfume doth rectifie the infection of the aire. The oile of the said baies of the Isle Delphos, is good for to make those cerots which put away lassitude & wearinesse, to discusse & resolute the cold humors which cause quivering and quaking, to mollifie and stretch the sinews, to allay the F pain of the sides in a pleurisie, and last of all, to driue away the cold fits of agues. Semblably, if the same be warmed in the rind of a Pomgranat, & instilled into the ears, it easeth their pain: the leaues boiled in water to the consumption of a third part, keepe vp the Vvula, vsed by way of a gargarisme: but the said decoction taken inwardly, allaieth the pains of belly and guts: the tenderest leaues that may be had, stampt with wine into a liniment, do repress & keep down wheals

and itching, if the body be annointed therewith euery night. Next vnto this, the other kinds are to be ranged according to the validitie of their operation. As for the Lawrell Alexandrica or Idæa, if a woman in trauell of child-birth take three deniers weight of the root, and drinke the same in three cyaths of sweet wine, she shall be quickly deliuered and brought to bed: the same drink sendeth forth the after-birth, and prouoketh womens monthly terms.

Daphnoides, or the wild Lawrell (or call it by any other of those names before rehearsed) hath many good vertues: it purgeth the belly, if you take the leafe either green or drie, to the weight of three drams with salt, in hydromel or honied water: being chewed, it draweth downe flegmatick and watery humors. The leafe also moueth to vomit, and is officious to the stomack. The berries likewise be purgatiue, if a man take five or ten of them at once.

CHAP. IX.

¶ Of the tame or gentle Myrtle tree planted. Of Myrtidannum, and the wilde Myrtle.

OF garden Myrtles, the white is not so medicinable as the black: the fruit or berries of the Myrtle, help those that reach vp blood: taken with wine, they put by the danger of venomous murtherers: chew them in your mouth, your breath will be the sweeter for it two daies after. It appeareth by the Poet Menander, that the good-fellows Synaristense were wont to eat Myrtle berries: the weight of one denier in wine, is good for the bloody flux. If they haue a little sueting or waulm ouer the fire in wine, they make a good water or liquor to cure vntoward vlcers to heale, especially such as be in the extreame parts of the body. Of them and barley groats, there is made a cataplasme for bleered eies: for the fainting also and trembling of the heart, being applied to the left pap or brea st. In like manner, the same being vsed with pure vndelaied wine, is singular for the prick of scorpions: for the infirmities of the bladder the head-ach, and the apostemations betwene the angle of the eies and the nose, if they be taken before they yeeld filthy matter: and so they cure other tumors or swellings: and if their pepins or kernels be taken forth, and then incorporat with old wine, they be singular for the small pocks and meazles. The juice of Myrtle berries bindeth the belly, but prouoketh vrine. A liniment also is made thereof with wax, for the said pox and meazles: also against the sting of the venomous spiders Phalangia. The said juice doth colour the haire blacke. Of the same Myrtle there is an oile made, more lenitiue and mild than the iuice or liquor aboue-named: & yet there is a wine of Myrtles more kind & gentle than it, which wil neuer ouerturn the brain or make one drunk. The same, if it haue lien and be stale, bindeth the belly and staieth a laske: it strengtheneth the stomack also, and represseth vomits: it assuageth the griping pains in the guts, and restoreth appetite to meat: the powder of drie Myrtle leaues, restraineth sweats, if the body be strewed therewith, though it were in a feuer. The same powder is good for the feebleness of the stomack, and the flux from thence proceeding: it reduceth the matrice into the right place, when it beareth down out of the body: it cureth the infirmities of the seat; healeth running scalls and vlcers; warissheth S. Anthonies fire, and the shingles, being vsed thereto in some fomentation; retaineth and staieth the haire ready to shed; scoureth away dandruffe; drieth vp wheals, pocks, and meazles; and last of all skinneth burnes and scaldings. The powder entrencheth into those vnguinous or oleous plasters which the Greeks call Liparas. And such a kind of plaster in like manner as the oyle of these Myrtle berries, is most effectually in those sores which light vpon moist parts, as for example the mouth and the matrice. The leaues in substance, beaten to powder and tempered with wine, are a counterpoison against venomous murtherers; but incorporat with wax into a liniment, they do ease the gout of any joints, and driue back rifings and impostumations. The same leaues boiled in wine, are given to drink for the bloody flux, and the drop sic. VVhen they be dried and brought into powder, they serue to cast and strew vpon vlcers; also to restraine any bleeding. They scour away freckles, and such like spots of the skin: they heale the rising, ouer-growing, and parting of the skin about the naile roots; also whit flauis, chilblanes, piles, & swelling bigs in the fundament; the accidents befalling to the cods; filthy maligne and morimall vlcers; and last of all, burnes (applied in manner of a cerot.) For the ears running with filthy matter, there is good vse of the leaues burnt; also of their iuice and decoction. The same are likewise burned, to serue for certain antidots or counterpoisons. In like manner, to the said purpose the tender sprigs of the Myrtle with the floure vpon them, are gathered and calcined within an ouen,

A ouen, in a new earthen pot, well couered and close luted: after which they be reduced into powder, and mixed with wine. The ashes of the leaues burnt, healeth burnes. To keepe the share or groin from swelling, although there be an vlcer there, it is sufficient, if the party haue about him a shoot or branch only of the Myrtle, prouided alwaies, that it touched neither yron nor the earth.

As touching Myrtidarum, how it is made I haue shewed already. Applied vnto the matrice or natural parts of a woman either by way of fomentation or liniment, it doth much good. And much better, if it be made with the bark, leafe, and berry of the Myrtle. Moreover, of the softest leaues braied and stamped in a mortar, there is a iuice pressed forth, by pouring green wine by little and little among, and otherwhiles raine water: which is vsed much for the vlcers and sores of mouth, seat, matrice, and belly: to dye the haire black: to wash and *bath the arm-holes with: to scour away spots and freckles: and in one word, when and wherefoeuer there is need of a striction.

The wilde Myrtle or Oxymyr sine, called also Chamæmyrsine, differeth from the ciuill and gentle Myrtle, in the redness of the berries, and the smal growth. The root is highly esteemed: for boiled in wine, and so taken in drink, it cureth the paine in the raines, the difficulty of vrine, especially when it is thick, and of a strong sauer. The jaundise also it helpeth, and cleanseth the matrice, if it be brought into powder, and mixed with wine. The yong and tender buds eaten after the manner of Sperage crops with meat, first roasted in the embers, the seed likewise taken in wine, oile, or vinegar, break the stone. The same seed stamped and drawne with vineger and oyle rosat, allaieth the head-ach; but in drink it cureth the jaundise. Castor called Oxymyr sine (with the sharp prickie leaues like the Myrtle, and wherewith beefomes be made) by the name of Ruscus, and saith it hath the same properties. Thus much for planted trees, and their medicinal vertues: proceed we now forward to the wild.

THE TWENTY FOVRTH BOOK OF THE HISTORIE OF NATURE,

WRITTEN BY C. PLINIVS

SECVNDVS.

The Proeme.

CHAP. I.

¶ Medicinable vertues obserued in wild trees.

NATURE, that sacred and blessed mother of all things, willing and desirous that man, whom she loueth so well, should find euery place stored with proper and conuenient remedies for all maladies incident vnto him; hath disposed of her workes, and taken that order, that the rough woods and forests, even the most hideous parts of the earth, and fearfull to see vnto, bee not without their plants medicinable. Nay, the very wilds and desarts are enriched and furnished therewith: insomuch, as in euery coast and corner of the world there may be obserued both sympathies and antipathies (I meane those naturall combinations and contrarieties in those her creatures.) From whence proceed the greatest miracles which are to bee seene in this round Fabricke and admirable frame.

frame. For first and formost, the Oke and the oliue tree beare such mutual rancor and malice (as it were) and are so stiffly bent to war one with another, that if a man replant one of these trees in the trench or hole from whence the other was taken vp, it wil surely die. Also, if an Oke be set neare vnto a walnut-tree, it wil not liue. The Colewort and the Vine hate one another to the very death; in such sort, that if a Vine stand neare vnto it, a man shall sensibly perceiue the same to shrink away and recule backward from it: and yet this wort, which maketh the Vine thus to retire and flie, if it chance to grow ouer-against Origan or Cyclamine, will soone wither and die. Moreouer, it is commonly said, That trees in the Forrest fully grown, which haue stood many a yeare, and namely such as are ready to be fallen and laid along for timber, proue harder to be hewed, and sooner wax dry, if a man touch them with his hand before hee set the edge of the axe to their butt. And some say, that pack-horses, asses, and other labouring beasts which haue Apples and such like fruit aloof, wil quickly shrinke and complaine vnder their burden, yea, & presently run all to sweat (carry they but a very few to speak of) vnlesse the said fruit, wherewith they are to be charged, be first shewed vnto them. Asses finde great contentment and good by feeding vpon Fenel-geant or Ferula plants: and yet to horses, garrons, & other beasts of cariage and draught, they are present poison, if they eat them: which is the cause that the Ass is a beast consecrated vnto the god *Bacchus*, as well as the foresaid plant Ferula. Ouer and besides (see the admirable operation in Nature) the very insensible and liuelesse creatures, yea, the least that be, meet euery one of them with some contrary thing or other, which is their bane and poison: for as our cooks know well enough, the inner bark of the Linden tree sluied thin into broad flakes and fine boulded floure together, doe drink and suck vp the salt of viands, ouermuch powdered, and make it fresh again. Likewise, salt giueth a good relish to any meat that is ouer sweet, and tempereth those that haue a luscious and wallowish tast. If water be nitrous, brackish, & bitter, put some fried barley meale into it, within two houres and lesse it will be so well amended and sweet, that a man may drink thereof: and this is the reason that the said Barley meale is put ordinarily in those strainers and bags through which wines do passe, that thereby they may be refined and drawn the sooner. Of the same operation also and effect there is a kind of chalker in the Island of Rhodes: and our clay here in Italy will do as much. Thus you see what enmity & discord there is in some things. Contrariwise, we may obserue in others, how wonderfully they accord and agree together: for pitch will dissolue, spread, and be drawne out with oile, being both as they are of a fatty nature; oile alone will incorporat and mingle well with lime; & they hate water, the one as well as the other. Gums are sooner dissolued and more easily tempered with vineger than with any thing els; & ink with water: besides an infinit number of other such, that I shall haue occasion to write of continually in their due places. And indeed, this is the very ground and foundation of all our Physick. For (to say a truth) Nature ordained at the first such things and none but such, for to be the remedies of our diseases, which we feed & liue daily vpon; euen those which are soon found and as soon prepared, which be ready at hand, common euery where, and cost vs little or nothing at all. But afterwards the world grew to be so full of deceit and couenage, that some fine wits and nimble heads deuised to set vp Apothecary shops, promising and bearing vs in hand, that euery man might buy his life and health there for mony. Then anon a sort of compositions, mixtures, and confections were set on foot; then there was no talk but of strange and intricate receipts, and these were bruited abroad for the only medicines, of wonderfull and vnpeakable operations. So that now adaiies wee vse no other drugs but those that come from Arabia and India. And if a man aile neuer so little, or haue the least pufh or wheale about him, he must haue some costly Physick forsooth for it: & a plaster that came from as far as the red sea: whereas in truth, the right remedies appropriat for euery maladie, be no other than such as the poorest man that is feedeth vpon euerie night ordinarily at his supper. But if we went no farther than to the garden for medicines, and sought after herbs, shrubs, and plants only, for to cure our sicknesse, or maintain our health, certes there were not a baser occupation in the world than the profession of Physick, and Physicians would be nought for by: but will you haue the truth? To this passe are we come, the old world we haue bidden farewell vnto: the ancient manners and rites of Rome citie are dead and gone: our state is growne so much in greatness, as there is no goodnesse left. Our victories and conquests be these, and nothing else, which haue vanquished & subdued vs: for subiect we must acknowledge our selues to strangers and forraigne Nations, so long as Physicke (one of their Arts) is able to command our commanders,

A ders, and ouerrule our Emperors. But the discourse of this matter in more ample manner, I will referue to some other time and place.

CHAP. II.

¶ Of *Lotos*.

As touching the herbe * *Lotos*, the Egyptian plant likewise of that name: as also, of another tree about the Syrtis so called, I haue written sufficiently in their due places: as for this *Lotos*, which our countrymen call in Latine the Greekish Bean, hath a property for to bind and knit the flux of the belly, with the fruit or berries which it beareth. The shauings or scrapings of the wood thereof, boiled in wine, and so taken inwardly, cure the bloody flux and exulceration of the guts; represseth the immoderat flowing of womens moneths; help the dizziness and swimming of the braine; and those who be subiect to the falling sicknes: the same decoction also * keepeth the haire from shedding, if the place be bathed therewith. But wonderfull it is, that these small shauings should be so bitter, as nothing more, when the fruit it self is as sweet as any other. Moreouer, of the fine dust sawed or filed from this wood, sodden in Myrtle water, then kneaded or wrought into past, & so reduced into seuerall trochisks, there is a soueraigne medicine made for the bloody flux: if the patient drinke the weight of one Victoriat or halfe dram of these troches in three cyaths of water.

* Called otherwife *Colocasia*, and the Egyptian Beans.

* *Cobibene* called *pillam*, *Dioscor.* hath *Exodisc.* *i. Rafant.* *i. com.* loureth. *chem.* yellow.

CHAP. III.

¶ Of *Mast*.

As Cornes or Mast of the Oke, beaten to powder, & incorporat with Hogs lard salted, heale all those hard and swelling cankerous vlcers, which they call in Greeke *Cacoethe*. In all these trees bearing Mast, the very substance of the wood is more forcible than the fruit; the outward bark more than the wood; and the inner rind or tunicle vnder it, more than the bark or all the rest. This membrane or pellicle if it be boiled, is singular for the flux of the stomach, proceeding of weaknesse. The very Mast or Acome it self reduced into a liniment and applied, staith the bloody flux: and the same resisteth the venom of serpents stings, restraineth rheums, and catarrhs, and namely, that flux of humors which causeth apostemations. As well the leaues, the mast or berries of this tree, as the bark or juice drawn from it, after boiling, are excellent against the poisons called in Greeke *Toxica*. The bark sodden and brought into a liniment with Cow-milk, is very good to be applied vnto the place where serpents haue bitten or stung; it is giuen also in wine for the bloody flux: of the same vertue & efficacy is the holm-oke

CHAP. IIII.

¶ Of the [Scarlet] graine of *Holme-oke*: of *Galls* and *Mistle*: of certaine little balls growing vpon the Oke: of *Mast*: of the root of * *Cerrus*: and of *Corke*.

The * Scarlet graine growing vpon the Oke-helm, is very good to be laid to fresh wounds with vineger. It is applied with water for the flux of watery humors vnto the eies: & dropped likewise into them when they be bloud-shotten. Now there is a kind of it growing commonly in the region of Attica and throughout Natolia, which very quickly turneth to be a grub or Magot (wherupon it is called *Scolecion*) and is rejected, as being of no worth. Many more sorts there be of it, whereof the chiefe and principall I haue shewed already.

As touching the Gal-nuts, I haue likewise made of it as many kinds: for some be solid and masse, others full of holes, as if they were bored through. You shall haue of them white, and black: some great, & others small: but how different soeuer they be in substance, colour, or quantity, they be all of like nature. The best are those of *Comagene*. Galls are good to eat away the superfluous excrescences in the body. They serue very wel for the infirmities of the gums and vula; for the cankers & exulcerations breeding in the mouth. Being first burnt, & then quenched in wine, they are singular for the fluxes occasioned by a feeble stomach. Applied in manner of a liniment, they help the bloody flux. Incorporat in hony, they cure whitflaws, risings, & partings of the flesh and skin about the naile roots; the roughnesse of the nailes, the running scals

* The great *Holm-Oke*.
* *Coccum* *Illis* our *Kermes* or *Kutchenel*, as some thinke.

and vlcers in the head: the knobs or swelling piles in the fundament, and in one word, all those corrosiue and eating vlcers, which consume the flesh to the very bone. Boiled in wine, and so instilled into the eares, they cure the infirmities of that part. So do they likewise help the eies, if they be annointed therewith. Applied with vineger, they discusse flegmatick wheales and such like breakings out, as also the flat biles and impostumes called Pani: the round kernell within them if it be chewed, allaith the tooth-ach. The same is good to skin raw and galled places, & any burn or scalded place. Take vnripe Gal-nuts, & drink them with vineger, they wil consume and weare away the swelled spleen. Burn the same, and quench them with salted vineger; a fomentation thereof, staith the immoderat flux of womens fleurs, & reduceth the matrice (fallen downe) into the right place. All the sort of these Gals do colour the haire of the head blacke.

Concerning Misseito: That the principall and best is found vpon the Oke, how it is cut and in what maner birdlime is made therof, I haue already shewed. Some for to make the said glew or birdlime, stamp Misseito first, and then seeth it in water, vntill it swim aloft. Others vse to chew the grains or kernels onely which they beare, and spit out their outward pills or skins. But the very best is that, which hath no husk or skin at all: which also is the * smoothest: without-forth of a light tawny or yellowish red: within, as Greene as a lecke: for indeed, there is not a thing more glutinous or glewy than it. This Misseito is a great emollient, for it softneth, dissoluth and resoluth also hard tumors: it is excitatiue besides, and drieth vp the Scrophules or swelling kernels, knowne by the name of the kings euill. If it be incorporat with rosin & wax, it mitigateth all sorts of impostumes or flat biles whatsoeuer. Some put thereto Galbanum also, in equall quantity or weight: and so vse it in the same manner for to heale wounds. It pollieth and maketh smooth the rough & vneuen nails, if it be laid too for seuen daies, and the medicine not removed before: but the nails ought to be wel washed with salnitre. Some obserue certain superstitious ceremonies herein, and are of opinion, That it will worke the better & with more efficacy, in case it be gathered from the Oke, the first day of the new Moon: also if it be not cut downe with any bill, hook, knife, or edged yron toole. Moreover, they do hold, That if it touch not the ground, it cureth those who are troubled with the falling sicknes. Semblably, if women do but carry it about them, it helpeth them to conceiue. Finally, if it be chewed and so applied vnto vlcers, it is most effectuall to heale them perfectly.

As for the little round bals or apples found vpon the Oke Robur, if they be incorporat with Bears greafe, they cause the haire to come thick again, where it is shed, in case the bare or bald place be annointed therewith.

Of the great Oke Holm Cerrus, thus much I haue to say, That the leaues, the bark, and mast thereof do discusse and drie vp all gathering of impostumations, enen such as grow to suppuration or mattering, and stay the flux of humors which feed them. A decoction thereof doth corroborat any member or part of the body which groweth to be sencelesse or benumbed, if the same be fomented therewith. Also for to dry, bind, & confirm any part which is feeble & weak, it is singular good to sit in a bath of this decoction. The root of this Cerrus is powerful against the prick of scorpions.

The bark of the Corke tree beaten into poulder and taken in hot water, is excellent for to repress any flux of bloud, whether it be vpward or downward. The ashes of the said bark giuen in wine hot, is greatly commended for the reaching and spitting of bloud.

CHAP. V.

¶ Of the Beech and Cypress trees, Of the great Cedars and their fruit called Cedrides: of Galbanum.

The leaues of the Beech tree being chewed, do much good to the gums and lips, in any accidents that befall vnto them. The ashes of Beech mast is singular for the * stone, if it be applied as a liniment. The same also bringeth haire againe, when by occasion of sicknesse it is shed and fallen away, if the place be annointed with it and hony together.

Cypresse tree leaues stamped and so applied, are a conuenient remedie for the sting of Serpents. Also laid vnto the head with dried groats of Barley, they ease the pain therof, occasioned by the heat of the Sunne. In like sort, the same cataplasme cureth ruptures. For which cause a drinke made of them is very good. A liniment also of Cypresse leaues and waxe mingled together.

of Plinies Naturall History.

Ather, assuageth the swelling of the cods. Tempered with vineger, they will make the haire cole black. Moreover, if they be stamped with two parts of soft dough or the tender crums of bread, & so incorporat together with Ammnean wine, they allay the paine of the feet or the sinews. The little bals or Apples hanging vpon Cypresse trees, are soueraigne for to be taken in drinke against the sting of serpents, and for the casting vp of bloud out of the body. Brought into an ointment, they serue for the swellings or impostumes gathered to a place. Take them whiles they be yong and tender, stamp them with swines greafe and Bean flour, they do much good to those that are bursten: and for that purpose a drinke made of them, is passing effectuall. With ordinary meale they serue in a cataplasme to be applied vpon the swelling kernels behinde the eares, as also the kings euill. There is a iuice drawn out of these apples after they haue bin stamped together with their grains or seed within: which if it be mingled with oile, helpeth them to their cleare sight again, whose eies are ouercast with a web & dimmed. The same effect it hath if it be taken in wine to the weight of one Victoriat or halfe dram. But Cypresse apples rid and cleansed from their grains within, and reduced into a liniment with fat dried figs, and so applied vnto the cods, cure their infirmities, and namely, resolueth the tumors incident to those parts: but incorporat with leuaine, they dispatch the Scrophules or kings euill. The root and leaues punned together, and then taken in drinke, do comfort the bladder, and help such as are diseased with the strangury: they serue also against the prick of the venomous spiders Phalangia. Their small shauings or scrapings if a woman take in her drinke, procure her monthly terms, and are singular for the sting of scorpions.

The great Cedar, called by the Greeks Cedrelate, as one would say, the Fir-Cedre, yeeldeth a certain pitch or parrosin named Cedria, a singular medicine for the tooth-ach, for it breaketh them, fetcheth them out of the head and easeth all their pain. As touching the liquor that runneth from the Cedar, and the manner how it is made, I haue written already: this kind of pitch were excellent for the eies but for one discommodity, in that it causeth head-ach. It preferueth dead bodies from corruption, a world of yeares: contrariwise, liuing bodies it doth putrifie and corrupt. A strange and wonderfull property, thus to mortifie the quick, and quicken (as it were) the dead. It marreth and rotteth apparell, as wel linnen as woollen: and it killeth all liuing creatures. And therefore I would not aduise as some haue done, to tast this medicine and take it inwardly for the squinancie or crudities of the stomack: neither would I be bold, but fear rather, to prescribe it in a collution with vineger to wash the mouth withall for the toothach, or to drop it into their eares who be hard of hearing or otherwise haue vermine within them. But a monstrous and beastly thing it is which some report of it, That if a man do annoint therewith the instrument or part seruing for generation, at what time as he is minded to know a woman carnally, it will bring her to an abortiue slip, if she were conceiued before, or hinder conception, if she were cleare. Howbeit, I would not make doubt to annoint therewith the head & other parts, for to kill lice, or to rid away the scurffe or scally dandruffe among the haire, either in head or face. Some giue counsell for to drinke it in sweet wine cuit, vnto them who are poisoned with the sea Hare. For mine own part, I hold it a safer way and an easier to annoint therewith the leprosie. But some of the foresaid authours haue applied it to filthy, putrified, and stinking vlcers, & the excrescences therein: as also to rub or annoint therewith the eies against the pin and web, & such accidents as dim and darken the sight. Moreover, they haue prescribed to drinke a cyath of it for to cure the vlcere of the lungs, and to expell wormes and vermin out of the belly. Of this pitch or rosin there is an oile made, which they call Pisselæon, and the same is far more strong in operation for all the infirmities aboue named, than the simple rosin it selfe. Certaine it is, that the fine dust scraped or filed from the Cedar wood, chaseth away serpents: so do the berries also of the Cedar beaten to poulder and reduced with oile into a liniment, in case a man annoint his body all ouer with the same.

As touching Cedrides (i.) the fruit of the Cedar, it is soueraigne for the cough, and prouokes vrine, bindeth the belly, & healeth ruptures. It cureth spafmes, convulsions or cramps: yea, and helpeth the infirmities of the matrice, if it be applied accordingly. Also it is a counterpoison against the venomous sea Hare: and a medicine for other maladies aboue named, and namely for apostemes and inflammations.

Of Galbanum I haue written heretofore. Good Galbanum should be neither moist nor dry: but such in all respects as I haue described already. Being taken of it selfe alone in drinke, it cureth

* Cedrium

* Arborum
suri Glycerum
quod est adu-
m.

* Admodum
read pot, i. a-
ken in drinke.

reth an inueterat cough shortnesse, and difficultie of winde, ruptures, crampes, and convulsions. Outwardly applied, it is singular for the Sciatica, pleurisie, or pains of the side, angry biles, and fellons. It is good also to be vsed, in case the flesh (corrupted by meanes of corrosiue vlcers, as woules and such other) is departed and eaten from the bone: moreover, for the wens called Scrophules or the kings euill: the knots and nodosities growing vpon the ioints: and the tooth-ach: it serueth also in a liniment with hony for to annoint scald heads. With oile of Roses or with Nard, it is good to be infused or dropped into ears that run with matter: the very perfume alone or smell thereof is good to raise them who are taken with the epilepsie or falling sicknesse: also to recouer women, lying as it were in a trance or dead, vpon a fit of the mother: & to bring them again who are gon in a swoone. If a woman fall to trauell before her time, it is good to fetch out that vntimely fruit of hers (if it be loth to come away) either by way of cataplasme or suffumigation. The same effect it hath, if the branches or small roots of Ellet ore be well annointed therewith, and so put vp as a pessary. The smoke of it frying in the fire (as I said before) driueth serpents away: and more than so, serpents will not come neere to them that are besmeared with Galbanum. And say that one be stricken with a scorpion, a plaster of Galbanum will heale the wound. If a woman haue bin long in labor of childbirth, and cannot be deliuered, let her drinke in one cyath of wine, as much Galbanum as the quantity of a Bean, she shal fall to her busines and be deliuered anon. The same is a good medicine to reduce the mother into the right place, if it be vnsettled or turned. If Galbanum be taken in wine with Myrrhe, it fendeth out the dead infant in the mothers womb. Also with Myrrh and * wine, it is good against all poisons, and especially those which be called Toxicia. Incorporat Galbanum with oile and * Spondylium together, it will kill any serpents, if they be but touched therewith. Howbeit, there is an opinion of Galbanum, that * in difficulty of vrine it is not good to be vsed.

CHAP. VI.

¶ Of Gum Ammoniack: of Storax: Spondylium: Spagnos: Terebinth: Chamæpitys: of Pituy: of Rosinus: of the Pitch tree: and the Lentiske.

Since we are fallen into the mention of Gums, it will not be amisse to treat of Ammoniack, being as it is so like in nature (as I haue said) to Galbanum: for it hath vertue to mollifie, to heat, discusse, and dissolue. Vsed in collyries, it is a proper medicine to clarify the sight: and serueth wel to take away the itch, the spots or cicatrices, the pin and web also of the eyes. It allaieth the tooth-ach, but more effectually, if it be set a burning, & the fume receiued into the mouth. Taken in drinke, it helpeth those who hardly fetch and deliuer their winde. It cureth the pleurisie, Peripneumony or inflammation of the lungs, the infirmities of the bladder, pissing of bloud, the swelled spleen, and the Sciatica. And in that manner it easeth the belly, and maketh it soluble. Boiled with the like weight of pitch or wax and oile rosat together, and so reduced into an ointment, it is good for all gouts, and especially that which lieth in the feet. It ripeneth the biles called Pani, if it be applied to them with honey: and fetcheth away any corns by the roots. In which sort it doth soften any hardnesse. Incorporat with vineger and Cyprian wax, or els with oile: of it, it maketh an excellent plaster for to mollifie the hard spleen. Moreover, if it be reduced into an ointment with vineger, oile, & a little sal-nitre, it is singular to annoint those that haue a lassitude or wearinesse vpon them.

Touching Storax and the nature thereof, I haue said enough in my Treatise of strange and forraigne trees. But ouer and aboue the qualities or properties before required, I take that for the best Storax, which is fairest, pure, and cleane, and whereof the pieces or fragments do break white. This drug cureth the cough, the sorenesse of the throat, and the accidents of the breast: it openeth the obstructions of the matrice, & mollifieth the hardnes thereof. Whether it be taken inwardly in drinke, or outwardly applied, it prouoketh womens flours, & moueth to the seege. I reade in some authors, that if one drinke Storax Calamita, in small quantity, it will procure gladnesse and mirth of heart: but if it be taken in greater quantity, it breedeth heavinesse of the mind. Indilled or poured into the ears, it riddeth away all the singing therein: and in a liniment it resolueh the wens called the Kings euill, and the nodosities of the sinews. Soueraigne it is against those poisons which burne by meanes of their coldnesse, and therefore it is good for them that haue drunk the iuice of Hemlock.

Likewise

A Likewise of Spondylium, a kind of wild Parsnep or Madnep, I haue spoken thereof heretofore, together with Storax. An embrochation made of it, to be infused vpon the head, is excellent for such as be in a frensie or lethargy: also to cure the inueterat pains of the head. Taken in drinke with old oile, it helpeth the infirmities of the liuer, the jaundise, the falling sicknesse, the straitnesse of breath (whereby one cannot take his winde but sitting vpright) and the rising or suffocation of the mother, in which cases, a suffumigation thereof is good. This Spondylium is effectual to mollifie the belly, and make the body soluble. Reduced into a liniment with rue, it serueth fitly to be applied vnto vlcers that spread and eat as they go. The iuice of the floures is of great effect, if it be poured into the ears that run with filthy matter: but when this iuice is a pressing or drawing forth, it had need to be kept well couered, for feare of flies and such like, which are very greedy thereof, and loue a life to settle vpon it. The root of Spondylium, or a piece thereof scraped, if it be put in maner of a tent into a fistula, cateth away all the hardnes and callosities thereof. Being dropped into the ears, together with the iuice, it is exceeding good for them. The root giuen alone in substance, cureth the jaundise, the infirmities of the liuer & matrice. If the head be all ouer annointed therewith, the haire will curl and frizzle.

Concerning the sweet Mosse, called of the Greeks * Sphagnos, Sphacos, or Bryon, growing (as I haue shewed before) in France, it is good for the naturall parts of women to sit ouer the decoction of it, in manner of a bath: likewise if it be mingled with cresses, and so stamped together in salt water, it serueth well to be applied as a cataplasme to the knees and thighs, for any tumors or swellings in those parts. Taken in wine with dry per-rosin, it causeth one most speedily to make water. Stamped with Iuniper, and drunk with wine, it doth euacuat the aquosities in the dropsie.

The leaues and the root of the Terebinth tree, applied in form of a cataplasme, are good for the collection of humors to an impostumation. A decoction made with them, doth comfort and fortifie the stomack. In case of head-ache, of stopping and difficultie of vrine, it is passing good to drinke the seed or grains of the Terebinth tree in wine. The same gently easeth and looseth the belly: it prouoketh also carnal lust. The leaues of the * Pitch tree & * Larch tree bruised and sodden in vineger, do ease the tooth-ache, if the mouth be washed with the decoction. The ashes made of their barks, skin the places that be chafed, fretted, and galled betweene the thighs, and heale any burn or scald. Taken in drinke, they bind the belly, but open the passages of the vrin. A perfume or suffumigation thereof, doth settle the matrice, when it is loose and out of the right place. But to write more distinctly of these two trees, the leaues of the Pitch tree haue a particular property respectiue to the liuer, and the infirmities thereof, if one take a dram weight of them and drinke it in mead and honied water. It is well known and resolued vpon, that to take the aire of those woods and forests only where these trees be cut, lanced, and scraped, for to draw pitch and rosin out of them, is without all comparison the best course which they can take who either be in a consumption of the lungs, or after some long and languishing sickness, haue much ado to recouer their strength. Certes, such an aire is far better, than either to make a long voiage by sea into * Egypt, or to goe among the cottages in summer time for to drinke new milk comming of the fresh and green gras of the mountains.

D As for Chamæpitys, it is named in Latine by some Abiga, for that it causeth women to slip their conception beforetime: of others, *Tibis terra* [i. ground Frankincense:] this herb putteth forth branches a cubit long, and both in floure and fauor resembleth the * Pine tree. A second kind there is of Chamæpitys, lower than the other, seeming as though it bended and stooped downward to the ground. There is also a third sort, of the same odor that the rest, and therefore so named. This last Chamæpitys, riseth vp with a little stalke or stem of a finger thickenesse: it beareth rough, small slender, and white leaues, and it groweth commonly amongst rocks. All these three be herbs indeed, and no other, and should not be ranged among trees: yet for names sake, because they carry the denomination of Pitys [i. the Pitch-tree] I was induced the rather to treat of them in this present place, & to stay no longer. Soueraigne they bee all against the pricks or stings of Scorpions: applied in manner of a liniment with dates and quinces, they be wholsome for the liuer: their decoction together with barley meale, is good for the infirmities of reins and bladder. Also the decoction of these hearbes boiled in water, helpeth the jaundise and the difficulty of vrine, if the Patient drinke thereof. The third kind last named, taken with hony, is singular against the poison of serpents: and in that maner only applied as a cataplasme,

R

* or rather, the
Pitch tree.

it clenseth the matrice & natural parts of women. If one drink the same herbe, it will dissolve and remoue the cluttered thick bloud within the body: it prouoketh sweat, if the body be therewith annointed; and it is especially good for the reins. Being reduced into pills, together with figs, it is passing wholesome for those that be in a dropsie; for it purgeth the belly of waterish humors. If this herb be taken in wine to the weight of a victoriat piece of siluer; i. halfe a Roman denier, it wariseth for euer the paine of the loins, and stoppeth the course of a new cough. Finally, if it be boiled in vineger, and so taken in drink, it is said that it will presently expel the dead infant out of the mothers wombe.

For the like cause and reason, I will do the herb Pityusa this honor as to write of it among trees, since that it seemeth by the name to come from the Pitch tree: this plant some do reckon among the * Tithymals: a kind of shrub it is, like vnto the Pitch tree, with a small floure, and the same of purple color. If one drink the decoction of the roote, to the quantity of one hemina, it purgeth downward both fleame and choler: so doth a spoonfull of the seed thereof, put vp into the body * by suppositories. The decoction of the leaues in vineger, doth cleanse the skin of dandruffe and scales: & if the decoction of rue be mingled therewith, it is singular for sore breasts, to appease the wrings and torments of the cholicke, against the sting of serpents, and generally for to discusse and resolu all apostemations and botches a breeding.

But to returne againe to our former trees, how Rosine is ingendred in them, of their severall kinds, and the countries where they grow, I haue shewed before, first in the treatise of wines, and afterwards in the discourse and histories of Trees. And to speak summarily of rosins, they may be diuided into two principall kinds; to wit, the dry and the liquid rosin. The dry is made of the Pine and the Pitch trees; the liquid commeth from the Terebinth, Larch, Lentisk, & Cypresse trees; for these beare rosin in Asia and Syria: & whereas some there be of opinion, That the rosins of the Pitch and Larch trees be all one, they be much deceived; for the Pitch tree yeeldeth a fatty rosin, and in manner of frankincense, vnctuous: but from the Larch tree there issueth * a subtill and thin liquor, running like to life hony, of a strong and rank vnpleasant smell. Physitians seldome vse any of these liquid Rosins, and neuer prescribe them but to be taken or sucked off with an egge. As for that of the Larch tree, they giue it for the cough and exulceration of some noble parts within: neither is that per-rosin of the Pine tree much vsed: as for the rest they be not of any vse vnlesse they be boiled. Touching the diuers manners of boiling them, I haue shewed them sufficiently.

* In balenizv-
lesse we reade,

Tamarinds.

But if I should put a difference between these rosins according to the trees from whence they come, the right Terpentine indeed which the Terebinth yeeldeth, liketh and pleaseth me best, being of all others lightest and most odoriferous. If I should make choice of them in regard of the countries where they are found, certes they of Cypresse and Syria be best, and namely those that in colour resemble Attick hony: and for the Cyprian rosin, that which is of a more fleshie substance and drier consistence. Of the dry per-rosins, those are in most request, which be white, pure, transparent or cleare, quite through. In generall, those that come from trees growing vpon mountains, be preferred before them of the plains: also regarding the Northeast, rather than any other wind. For salues to heale wounds, as also for emolliuie plasters, rosins ought to be dissolved in oile: for drinks or potions, with bitter almonds. As touching their medicinable vertues, they be good to cleanse and close vp wounds: to discusse and resolu any apostemes which bee in gathering. Moreover, they be vsed in the diseases of the breast (and namely true Terpentine) by way of liniment; for then it is singular good, especially if it be applied hot: also for the pains of the lims, and for those that be plucked with the cramp, in case the grieved parts bewell rubbed therewith in the sun, which they know well enough who buy slaues and sell them for gain, after they haue trimmed and set them out for sale: for they especially are very curious to annoint their bodies alouer with this Terpentine, for to loosen the skin when they be hide-bound, lank, and carrion lean, to giue more liberty and space for euery part to receiue nutriment, and so to make their bodies seeme fat and faire liking. Next vnto the right Terpentine, is the rosin of the Lentiske Tree: this hath an astrigent or binding qualitie; but of all others it prouoketh vrine most: all the rest doe mollifie the belly and make it soluble, concoct and digest all crudities, stent the inueterate cough, and draw downe all the superfluous burdens of the matrice: for which purpose last named, their fume receiued by a suffumigation, is very effectuell. They are more particularly as good as a counterpoison against the venomous gum Ixia, growing vpon the

CHAP. VII.

¶ Of Stone-pitch: of Tarre: of Pitch twice boiled: of Pissaspfalt or Mummie: of Zopis-
sa: of Torch-wood, and the Lentiske.

From what tree Pitch commeth, and the sundry waies of making it, I haue declared heretofore: also that there be two principall kinds thereof; to wit, the thick or fast Pitch, and the thin or liquid: of the former sort, the best for vse in Physick is the Brutian Pitch, for that (being of all others fattiest & fullest of gum) it yeeldeth a twofold commodity both for medicines, and also to trim and rosin wine-vessels; for which purposes, that which inclineth to a reddish yellow is counted the chiefe. But whereas some do say moreover, that the better Pitch commeth from the male tree, I cannot conceiue what they should mean thereby, neither doe I think it possible to discerne any such difference. True it is, that Pitch by nature is hot, & a good incarnatiue: a speciall and particular property it hath against the venom inflicted by the sting or tooth of the horned serpent Ceraustes, if it be made into a cataplasme with tried barley groats: and being applied with hony, it healeth the squinancy, cureth catarrhs, and restraineth sneezing: with oile of roses, it serueth well to be poured into running ears, out of which there doth ooze filthy matter: or being applied in manner of a liniment with wax, it is passing good: it healeth the ill-fauored tetter called Lichenes, and it looseneth the belly: licked or let downe leisurely in manner of a loch, it is a good means to void and reach vp from the breast, tough fleame: and to annoint the tonsils or almonds in the mouth with it and hony together, is a proper medicine: being in that manner prepared and vsed, it clenseth vicers: and if it be incorporat with raisins and swines greafe, it doth incarnat and fill them vp again with new flesh: carbuncles also it doth mundifie, so doth it sores that begin to putrifie & gather corruption: but if they be such as spread & be corrosiue withal, then there would be an addition of the Pine tree bark, or brimstone. Some haue prescribed, for the consumption of the lungs, and a cough of long continuance, to drinke the quantity of one cyath in Pitch. The fissures and chaps as well about the feet as in the feet, it cureth: for the flat biles named Pani, it is very good: as also to take away the rough nails that be so troublesome. The very odor or perfume thereof, helpeth the hardnesse of the matrice, and setleth it again, being either fald down, or turned out of the due place: likewise it helpeth such as be surprised with the lethargy. Moreover, if it be boiled in the vrine of a yong boy vnder 14 yeares of age with barley meale, it is a good maturatiue, and bringeth the wennes called the Kings euill to suppuration. As for dry pitch or stone pitch, it helpeth much to make the haire grow again, where it is shed by some disease. The Pitch called Brutia, or of Calabria, boiled in wine to a waulm or two, with the fine floure of the bearded wheat Far, and so applied in a cataplasme as hot as may be suffered, is singular good for womens paps. Concerning liquid Pitch or Tar, as also the oile which they call Pisselxon, and how it is made, I haue already written at large. Some boile it a second time, and then they name it Palimpissa. With this liquid Pitch it is good to annoint the squinzy that groweth inwardly; as also the vula within the mouth: the same is singular for the pain in the ears, to clarifie the sight, to cleanse the mouth furred as it were, so as it hath no tast of meat: likewise for those who are short winded: for women who are diseased in their matrice: to ripen & rid away old coughs; and to ease them that can doe nothing but spit & reach out of the chest: for spasmes, cramps, shaking, and trembling: moreover, it helpeth them whose heads or bodies are drawn backward: it cureth palsies, and any pains or griefs of the sinews. There is not a better thing to kill either the mange in dogs, or the scab and farcines in horses, asses, and such like traouelling beasts.

Moreover, as touching Pissaspfalt, which is of a mixt nature, as if pitch and Bitumen were mingled together, it groweth naturally so, in the territory of the Apolloniars, yet some there be who make an artificial pissaspfalt, and meddle the one with the other, and hold it for a remedy

to cure the farcins and scabs of cattell; as also when the young sucklings doe hurt the teats of their dams. Of this kind, that is best which is of it selfe, and come to maturity and perfection: the same in boiling swimmeth aloft. * Zopiffa, is that Pitch, which (as I said heretofore) is scraped from ships, and is confectioned of wax well foked in the salt water of the sea: the best is that which commeth from ships that haue bin at sea and made some voiares: it goeth into emollientie plasters, for to resolute the gathering of impostumes. As for Tarda or Torch-wood, if it bee sodden in vineger, it maketh a singular collution for to wash the teeth withall when they ake.

Let vs come now to the Lentisk tree: the wood, the seed or fruit, the bark and gum thereof, do prouoke vrine, and bind the belly: a fomentation made with their decoction, is excellent good for eating and corrosiue vlcers: it serueth in a liniment for all sores in moist & flegmatick parts: likewise to cure S. *Antonies* fire, and to wash the gums withall: chew the leaues thereof and crush them well between the teeth, the same will ease their ach: wash them with their decoction, and they wil set them fast in the head. The same are good to colour the haire black: the gum which this tree doth yeeld, is soueraign for the infirmities of the feet, especially such as require either drying or heating. The very decoction of Mastick is comfortable to the stomach, it causeth it to rift, & is besides diuretical. Applied vnto the head as a liniment, incorporat with the fried groats of barley, it cureth the ach or pain thereof: the tender leaues be applied to right good purpose, for the inflammation of the eyes. Moreover, this Mastick, which is the gum of the Lentisk tree, is vsed ordinarily to lay the hairs of the eyelids euen, & to extend or make plaine and smooth the riuclid skin of the face: therefore it is vsed in sope, and wash-bals. Moreover, there is a good vse thereof, for spitting and reaching vp of blood, & for an old cough. In one word, it serueth all those turns whereto the gum Ammoniacke is vsed. It healeth all places galled and chaufed, where the skin is rubbed or fretted off: and if the cods and members of generation be fomented either with the oile made of the seed of the mastick tree mixed with waxe, or with a decoction of the leaues boiled in oile or els in water, it will skin any raw part thereof. To knit vp this discourse, I am not ignorant that *Democritus* the Physitian, who had in cure *Confidia*, the daughter of *M. Serullius* late Consull of Rome, for an * infirmity or malady of hers (for that this damosell could not abide to heare of any vnpleasant Physick) caused her to be fed a long time with the milk of goats which were kept with the Lentisk tree leaues, and did eat nothing els, and so he cured her of her malady.

C H A P. VIII.

Of the Plane tree, the Ash, and Maple: of the white Poplar and Elme, the Tillet or Linden tree, the Elder, and the Juniper.

The Plane tree is an enemy to Bats or Reremice: their little bals which they beare, if they be taken to the weight of foure Roman deniers in wine, do cure all poisons of serpents and scorpions: likewise they heale any burn. Being braied or stamped with strong & sharp vineger (which if it be Squilliticum is the better) they stanch any bleeding whatsoeuer. Incorporat in hoisy, they mundifie and cleanse all cancerous vlcers, the red pimples and specks, with all black spots and marks in the skin which haue remained a long time. The leaues and bark reduced into a liniment, their decoction also, help to rid away any gathering of humors to an head, and namely if they matter and run. The decoction of the barke sodden in vineger, is a singular remedy for the tooth-ach; like as the tendrest leaues boiled in white wine, for the infirmities of the eyen. The ashes which come of the foresaid little bals, do heale vp any burn, occasioned either by fire or extreame cold. The barke taken in wine, represseth the venome of the scorpions sting, so that it shall go no farther.

As touching the Ash tree, of what effectuall operation it is against serpents, I haue declared heretofore: it beareth a * seed inclosed within certain * cods, which being taken in wine, is an ordinary remedy for the obstructions & infirmities of the liuer, as also for the pain in the sides. The same also doe euacuate the aquosities or waterish humors spread between the skinne and the flesh in the dropsie Leucophlegmatia: the leaues do take down by little & little and make lean a body ouer-grosse, and do ease it of the troublesome cariage that it hath of so much fat, if the same be stamped and giuen in wine: but herein good regard ought to be had of the strength of the party, after this proportion: If it be a child, fiue leaues of the ash are sufficient to be infused in

* Called *Lingna*.
* Which are named *Keyes*.

* It should sceme the vicer of the lungs or kidneys, or els some outrageous flux of blood.

A in three cyaths of wine; but elder folk and of a stronger complexion, may abide seuen well enough in fiue cyaths, and drink the infusion. But before I do leaue this tree, it would not be forgotten that the small chips and shauings, yea, and the saw dust or filed powder of this wood, are thought to be hurtfull vnto some, and they are forbidden to meddle withall. The root of the Maple tree, stamped into a cataplasme, is singular to be applied for the griefs of the liuer, and worketh mightily.

As touching the white Poplar or the trembling Asp, I haue shewed heretofore how the perfumers vse the berries or * grapes thereof in their sweet ointments. The barke infused and taken in drink, is good for the sciatica and the strangury. The iuice drawn out of the leaues, dropped hot into the ears, easeth their pain. Whosoever carieth a twig of Poplar in their hands, shall not need to feare any surbating of the feet, or galling between the legs. The best blacke Poplar and of greatest operation in Physick, is that reputed which groweth in the Island Creta; the fruit or grain thereof if it be drunk in wine, is singular for those who be taken with the falling sicknesse. This Poplar yeeldeth a certain small gum or rosin, which is much vsed by Physitians in emollientie plasters: the leaues sodden in vineger, make a proper cataplasme to be applied vnto the gout: the liquor or humor that issueth out of the pores or concauities of the blacke Poplar, taketh away warts and wheals, it skiunneth also galled & raw places in any part of the body: these Poplars as wel white as black, beare vpon their leaues certain warts like to drops of water standing vpon them, out of which the Bees do gather that cereous substance named Propolis. The drops also of water, which the said Propolis doth yeeld, if they be mingled with water, is a very effectuall remedy for many things.

Now for the Elme: the leaues, the bark, and the wooddy substance of the branches, haue a glutinous nature to consolida, vnite, and heale wounds: the thinner rind or tunicle verily lieth between the outward bark and the tree, doth assuage the leprosie, called of some S. *Magnus* euill: so do the leaues also, applied with vineger. The barke of the Elm puluerized and taken to the weight of a Roman denier in one hemine of cold water, is a very purgatiue, and doth euacuate flegmatick and waterish humors particularly. The liquor that issueth from the tree as a jelly, is singular good for apothemations, wounds, and burnes; but if the places were fomented before with the decoction, it would be the better. The Elm beareth certaine small bladders or huskes, wherein there is ingendred and contained a waterish humour, which is very proper to imbelish the skin, & beautifie the face. The first tender sprouts of the leaues boiled in wine, do assuage all tumors, & * draw filthy matter and corruption forth of fistulous sores: the same do the inward thin rinds within the bark. Many are of opinion, that the very bark chewed only, and applied to green wounds, is singular good to heale them. They affirme moreover, that the leaues bruised and applied to the feet, allay their swelling, so there be water sprinkled among. Furthermore, the water or liquor which runneth from the heart or pith of the wood when the tree is lopped or disbranched (as I haue said before) if the head be annointed or bathed withall, causeth the haire to grow again if it be lost, and keepeth it on if it be ready to shed and fall.

As touching the Tillet or Linden tree, the very wood thereof is vsed for all things in a manner that the wild oliue is imployed vnto, if the same be lightly bruised or stamped: howbeit, the leaues only are occupied; which, if they be chewed and so applied, do cure the cankers breeding in the mouth of small infants. Being boiled and their decoction inwardly taken, they prouoke vrine: outwardly applied, they do stay the inordinat and excessiue flux of womens fleurs; but giuen in drink, they euacuate the same superfluous blood.

There is a second kind of Elder more wild of nature, which some of the Greeke writers call * *Chamae*, others *Helion*, and it groweth much lower than the other. The decoction of the leaues as well of VVallwoort as Elder, boiled in old wine, is contrarie and nowsome to the stomach, and purgeth downward waterie humors: euen so doth the decoction either of the seed or the root, if it be taken inwardly to the quantity of two cyaths: the same is excellent to coole any inflammation; and namely, to take out the fire of any new burn or scald. The yong and tender leaues, as well of Elder as VVallwoort, reduced into a cataplasme and laied too with barley groats, doe cure the biting of a dogge. The iuice both of the one and the other, infused and conueighed accordingly into the head, is a soueraigne lenitiue for all impostumes of the braine, and especially those which are growing in the fine membrane or pellicle called *Pia Mater*, which immediately lappeth and enfoldeth the braine. The fruit or berries of the Elder or

* And verily heretofore he saith that it hath neither the one nor the other.

* Extravagant pus fistulis.

* I. Ground. Elder, Wallwoort, or Dane-wort.

of Walwort, are weaker in operation than the other parts of the tree or plant: howbeit, they serue wel to colour the haire of the head black. The same also taken in drinke, to the measure of one acetable, be diureticall and prouoke vrin. The softest and tenderest leaues are eaten ordinarily in a salad with oile and salt, for to purge fleame and choler. In summe, the lesser plant, which is the V Valwort, is in all things more effectuall than the elder it selfe; for if the root thereof be sodden, and a draught of two cyaths be giuen to them who are in a drop sicke, it will purge mightily and euacuat watery humors. A decoction of the roots and leaues of Danewort, is singular to mollifie the matrice and naturall parts of a woman, if she sit ouer the same and take the vapour thereof into her body. The tender sprigs of the milder Elder, boiled between two platters, do make the body soluble, and moue to the seege. The leaues drunke in wine, resist and kil the poisoned sting of serpents. The tendrons of the elder, incorporate with goats tallow, and reduced into a liniment, are singular good for the gout, if they be applied to the grieved place: the water of their infusion, if it be cast or sprinkled in any room of the house killeth fleas: and if the place be likewise sprinkled with the decoction of the leaues, it will not leaue a flie aliue. There is a kind of disease [much like to purples or neazles] when the body is bepainted all ouer with red blisters: a branch of the Elder tree is excellent good to lase the said wheales or risings, for to make them fall again and go down. Take the inner bark or rind of the Elder, beat it into powder, and so drink it in white wine, it is a sufficient purgation.

The Iuniper of all other trees, passeth either for to heat any part, or to extenuate & make subtil any humors: in operation much like to the Cedar. Of it there be two kinds; the greater, and the lesse: a perfume made with the one as well as the other, driueth away serpents: the seeds or berries of Iuniper, assuage the pains of stomach, brest, & sides: the same serue wel to break wind and resole all ventosities, yea and to euaporat all cold and chilnesse: they ripen any cough, and mollifie all hardnesse: a liniment made thereof applied outwardly, causeth any tumor to go down and represseth the rising thereof: likewise if the berries be drunk in some grosse or thick red wine, it will stay a lask: like as they will abate the swelling of the belly, if they be laid too by way of a cataplasme or liniment. The Iuniper berry is reckoned among the ingredients which go into antidors, or preseruatiues against poison, such I mean, as be penetratiue and of quick operation. It is diureticall and moueth vrin. In case the eies do water much by reason of a continuall rheum taking to them, it is good to apply a liniment vnto them made therewith. Foure Iuniper berries are giuen in white wine, or 20 of them boiled in wine, for convulsions, crampes, ruptures, wrings, and torments in the belly, for the griefes of the matrice and the Sciatica. To conclude, some there be, who fearing to be stung with serpents, vse ordinarily to rub or annoint their bodies with a liniment made of Iuniper seed or berries.

CHAP. IX.

¶ Of the Sallow, Willow, or Withy: of the twig Withy or Oisier Amerina. Of twigs or binding rods. Of Heath or Lings.

The fruit which the willow or Sallow yeeldeth, if it be suffered to hang, before it doth ripen is conuerted into a certaine substance resembling a cobweb; but being gathered ere it be thus transformed, it is singular good for such as reach or cast vp blood. The ashes of the rind pilld from the first branches that the willow putteth forth, and tempered with water, taketh away corns and callosities of the feet: they serue also to rid the spots and specks which disfigure the visage, the rather if they be incorporat with the juice of the willow. Now there be found in the said willow, 3 sorts of juice: the first sweateth out of the tree it self in manner of a gum: the second issues forth by way of incision, when the tree is in the bloom; prouided alwaies that the cut or gash in the bark, be made three fingers broad: this liquor is singular good to cleanse the eies, and to rid away such impediments as hinder the sight; likewise to increasate or thicken where need requireth, to prouoke vrin, and draw forth all inward impostumes outwardly: the third juice is that which distilleth from the branches presently after the bill or cutting-hook, when the tree is lopped, or the boughs cut from the body. Take any one of these juices, and heat the same well with oile of Roses in the rind of a Pomegranat, excellent it is for to be dropped into the ears: likewise the decoction of Sallows, or the leaues stamped and incorporat with wax, and so applied, do the like: as also laid too in maner of a cataplasme, they ease the pain of

A of the gout. The decoction of the leaues and bark boiled in wine, is passing wholsom to foment the nerues withall. The blooms or chattons of the willow, stamped together with the leaues, cleanse the branny scales that appeare in the face. The leaues of the willow punned and taken in drinke, do coole them that are giuen too much vnto lasciuious lust, and ouer hot in the action of Venus: and if they vse to take the same often, they will disable them altogether for the act of generation. The seed of the black Oisier or willow called Amerina, mixed in like weight with white litharge of siluer, and brought into a liniment, is a depilatory, and fetcheth off the haire if the place be annointed therewith presently after the baine.

There is a kind of tree named Vitex, not much different from the willow, in regard of the vse that the twigs be put vnto, and also of the leaues which resemble those of the willow in outward shew, but that their smell is more pleasant and odoriferous: the Greeks, some call it Lygos others Agnos, i. chaff, for that the dames of Athens, during the feast of the goddesse Ceres, that were named Thesmophoria, made their pallets and beds with the leaues thereof, to coole the heat of lust, and to keep themselves chaste for the time. And two sorts there be of it. The greater riseth vp to a tree in maner of a willow: the other, which is lesse & lower, brancheth thick, bearing white leaues, and those full of down and cotton. The former of these two, which is called the white Agnus Castus, putteth forth white floures & purple one with another: whereas contrariwise, all the floures of the lesse, which is called the black, be purple only. Both the one and the other loue to grow in plains and moors. The seed of Agnus Castus, if it be taken in drinke, hath a certain rellish or salt of wine, and it is commonly thought that it cureth feuers: & whoseuer is annointed therewith, being incorporat into a liniment with oile, shall soon sweat: and by that means it is good to rid away wearinesse. Agnus Castus, as well the one as the other, prouoketh vrin, and the monthly terms of women. Both of them fume vp into the head as wine doth: and no maruell, for they haue the very smell of wine. They be singular to send all ventosities downward. They stop the flux of the belly, and be excellent good for those who are in a drop sicke, or troubled with the spleen. They haue this speciall property besides, to breed good store of milk in milch nurces. Aduersely they be to all poisons of serpents, such especially as doe mischief by their cold quality. The lesse is more effectuall against serpents. And for this purpose they vse to giue either one dram of the seed to drinke in wine or Oxycrat, which is vineger and water, or els two drams of the most tender leaues. There is neither of them both, but as well the seed as the leaues, reduced into a liniment, be singular good for the pricke of spiders. And there is not any venomous creature that wil come neere those who are but annointed therewith: nay they wil flie from the very perfume thereof, or the couch which is made of the leaues: they abate the heat of wanton lust: and in that regard especially they be contrary to the venomous spiders Phalangia, which by their sting do prick a man forward that way, and cause his flesh to rise. The floures and yong tendrils of Agnus Castus incorporat in oile rosat, do allay the head-ach, occasioned by drinking ouerliberally: but if the said headach be exceeding great, it is good to foment the head in a decoction of the seed of the said Agnus: for it will resole & dispatch the extremity thereof. The same likewise by way either of suffumigation or cataplasme, munieth and clenseth the matrice. And being taken as a drink with pennyroial and hony, it is a purgatiue, and scoureth the belly. Mixed with Barly meale, and applied pulteffewise, it mollifieth those bitches & byles which hardly grow to ripenesse. The seed tempered with salt petre and vineger, healeth tetters, ringwormes, and red pimples: and with hony cureth the cankers or sores of the mouth; yea, and any wheals and breaking forth whatsoeuer. The same reduced into a liniment with butter and vine leaues, warieth the infirmities incident to the cods: and if the seat be annointed with it & water medled together, it taketh away the chaps & fissures in that part. Brought into a cerot with salt, nitre, & wax, it is singular good for all dislocations: both the seed and leaues of Agnus, enter into many cataplasmes or mollitiue plasters, deuised for the sinewes and the guts: the seed boiled in wine, maketh a good decoction, which if it be dropped vpon the head by way of embracation, is right soeraign for lethargy and frensie both. It is said, that whoseuer beareth in his hand a twig of Agnus, or gird himselfe about the middle therewith, shall not be galled or fretted between the legs.

As touching Heath or Lings, which the Greeks call Erice, it is a shrub not much different from Tamariske, in colour and forme of leafe, such as it is, resembling Rosemary. The leafe of this plant (they say) is an enemy to serpents.

As

As for Broom, it serueth also very well to make halters and cords of. The floures please bees passing well. I am in doubt and not able to say, whether this Genista or Broome, be that which the ancient Greek writers called Sparton; for I haue shewed, that they vsed therof to make their fishing nets; and I wot not well whether *Homer* meant it, when he said, that the ship-spars were vntwisted and loose. For this is certain, that neither the spart of Africk, ne yet the Spanish spart was as yet in any vse; and at what time as barges and vessels were sowed together with seams, it is wel known, that the stiches were made with linnen thred, & not with spart. The seed that it beareth, which the * Greeks giue one and the same name to, growing within smal cods in maner of Phascols, is as strong a purgatiue [of Melancholy] as Ellebore; if it be taken when one is fasting, to the weight of a dram and halfe, in four cyaths of honied water: the branches & leaues (such as they be) of Genista or Broome, being stamped after they haue lien infused in vineger, yeeld a certain iuice singular good for the Sciatica, if it be drunk to the quantity of one cyath. Some chuse rather to steep it in sea-water, and to draw forth the iuice, and so minister it with a clyster for the said purpose. The said iuice incorporat with oile, serueth for an ointment also to be applied outwardly for the Sciatica. Some vse the seed for the strangury. The substance of Broome stamped with swines greafe, helpeth the ach or pain in the knees.

To come now to Tamarisk, which the Greeks call Myrice, *Lenax* affirmeth, That it is vsed in maner of the Amerian willow for beefomes; and more than so, that if it bee sodden in wine, stamped and reduced into a liniment with hony, it healeth cankerous vlcers: and in very truth, some hold, That the Myrice and Tamariske be both one. But doubtlesse, singular it is for the spleen, in case the patient drink the iuice pressed out of it in wine. And by report, there is that wonderfull antipathy and contrariety in Nature betweene Tamariske and this one part alone of all the other bowels, that if the troughs out of which swine drinke their swill, be made of this wood, they will be found when they are opened, altogether without a spleen. And therefore some Physitians do prescribe vnto a man or woman also diseased in the spleen, and subject to the opilations therof, both to drinke out of cups or cans of Tamarisk, and also to eat their meat out of such treen dishes as be made of that wood. One renowned writer about the rest, and for knowledge in great credit and authorit among Physitians, hath affirmed and auouched constantly, That a twig of Tamarisk slipped or broken from the plant, so as it touched neither the ground, nor any yron tooke, assuageth all belly ache, in case the patient weare it about him so, as that his girdle and coat hold it fast and close to the body. The common people call it The vnlucky tree, as I haue heretofore said, because it beares no fruit, & is neuer with vs set or planted. In Corinth and all the territory or region round about, they name it Brya, and make two kinds thereof; to wit, the wilde, which is altogether barren, and that which is of a more tame and gentle nature. This Tamarisk in Egypt and Syria beareth in great plenty a certain fruit, in substance hard and woody, in quantity bigger than the gal-nut, of an vnpleasant and harsh tast; which the Physitians do vse in stead of the Gal-nut, and put into those compositions which they name Antheras. Howbeit, the very wood of this plant, the floure, leaues, and barke also, be vsed to the same purpose, although they be not so strong in operation as the said fruit. The rind or barke beaten to powder, is giuen with good successe to them that cast vp bloud: also to women who haue a great shift of their flours: likewise to such as be troubled with a continual flux, occasioned by the imbecility of the stomach. The same bruised and applied as a cataplasme, refresheth and smiteth backe all impostumations breeding. The iuice pressed out of the leaues, is good for the same infirmities: moreover, they vse to boil the leaues in wine, for the same intent. But of themselves alone being brought into a liniment with some hony among, they are good to be applied vnto gangrenes. The foresaid decoction of the leaues beeing drunke in wine, or the leaues applied with oyle of Roses and wax, mitigat the said gangrenes; namely, when the flesh tendeth to mortification. And in this manner they cure the night-foes or chilblanes. Their decoction is wholesome for the paine of teeth or eares: for which purpose serueth the root likewise and the leaues.ouer and besides, the leaues haue this property, That if they be brought into the form of a cataplasme with barley groats and so applied, they keep down and restrain corrosiue vlcers. The seed if it be taken to the weight of a dram in drinke, is a preseruatiue and counterpoison against spiders, and namely those called Phalangia. And if the same be incorporat with the tallow or greafe of any fatlings or beasts, kept vp in stall, stie, or mow, into a liniment, it is singular good for any vncom or fellow. Of great efficacy it is also against the sting of all serpents, except the

*For they call it Sparton, as well as the plant.

A the Aspis. The decoction likewise of the seed clysterized, is singular for the jaundise, it kills lice and nits, and staieth the immoderat flux of womens months. The ashes of the very wood of the tree, is good in all those cases before said: which if they be mingled in the stale of an oxe, and so taken of man or woman, either in meat or drink, it will disable them for hauing any mind to the sports of *Venus* euer after. And a burning cole of this wood, when it is quenched in the stale or beasts piss, they vse to saue & lay vp in the shade for that purpose: but if one list to kindle lust, * then they set it on fire againe. To conclude, the Magitians say, That it would do as much if the vrine only of a gelded man were taken for the said purpose.

*Rufus scribit.

CHAP. X.

B ¶ Of the Bloud-rod, Of Siler, Of Priuet, The Alder tree, and Ivy. Of Cisthus and Cissos, Of Erithranos, Of Chamacissos or Ground- Iviue, Of Smilax or Bindweed, Of Clematis.

THE Plant called the Sanguin-rod, is as vnhappy as the foresaid Tamariske. The inner bark thereof is singular good to open again those vlcers, which are healed aloft only and skinned before their time.

The leaues of * Siler, brought into a liniment and applied as a frontall to the forehead, allay the paine of the head. The seed thereof driuen into powder and incorporat with oile, is good for the lousie disease, and keepeth the body from lice. The very serpents cannot abide this plant or shrub, but flie from it: which is the caule, that the peasants of the country make their walking stauers thereof.

C Our Ligustrum or Priuet, is the very same tree that Cypros is in the East parts. To good vse it serueth among it vs here in Europ: for the iuice of it is wholesome for the sinews, the ioynts, and any extreme cold. The leaues applied with some corns of salt, heale all inueterat vlcers in any part whatsoeuer, and particularly the Cankers in the mouth. The graines or berries that it beareth, are good to kill lice: also for any gal, where the skin is fretted off between the legs: and so be the leaues likewise. The foresaid berries do cure the pip in Hens and Pullen.

As for the Alder tree: the leaues if they be applied hot as they be taken out of scalding water, do cure without faile any tumor or swelling.

D As touching the Ivy tree, 20 kinds thereof and no fewer I haue already shewed; and of all these there is not one, but the vse of it in Physick is doubtfull and dangerous. For first and formost, Ivy, if it bee drunke in any quantity, howsoeuer it may purge the head, surely it troubleth the brain. Taken inwardly, it hurteth the sinews: applied outwardly, it doth them much good. Of the very same nature it is, that vineger. All the sorts of Iviue be refrigeratiue. In drinke they prouoke vrin. But the soft and tender leaues, sodden in vineger and oile of rofat, and then stamped, and so tempered with more oile of roset put too afterwards, vntil they be reduced into an ointment, are a singular remedy for the pains of the head; and especially for the braine and the thin pelli-cle Pia mater, which inwrappeth the brains: to which effect the forehead ought to be annointed with the foresaid liniment, the mouth to be fomented and washed with the decoction, and the whole head afterwards well rubbed also with the abovesaid vnguent. They are good for the spleene, both taken inwardly in drinke, and outwardly applied as a liniment. The decoction of the same leaues may be drunke very well against the fit of an ague, to driue away the shaking cold: also for the smal pocks and meazles: for which turn likewise they serue, if they be puluerized and taken in wine. The berries of the Iviue cure the opilation and hardnesse of the liuer, either giuen in drinke, or applied outwardly. So do they open also the obstructions of the liuer, if a liniment be vsed only. Applied accordingly to the naturall parts of women, draw down their monthly sicknesse. The iuice of yvie (and specially of the white, which is planted in gardens) clenseth the nostrils of the foule vlcers and vermine therein breeding, it rectifieth also the filthy smell proceeding from thence. If the same be conueighed vp into the nose, it purgeth the head: but more effectually, if sal-nitre be put thereto. Moreover, it is to right great purpose dropped into the eares with oile, in case they either run matter, or be pained. It reduceth cicatrices or wounds and vlcers newly skinned, to the naturall colour of the other skin: the iuice of the white Ivy is of more force and better operation for the opilations of the spleen, & the swelling hardnesse thereof, if it be made hot with a red hot yron, than otherwise: whereof fixe berries in two cyaths

*Some think it is the broad-leaved Olier.

* Golden berry Ivy.

cyaths of wine, is a sufficient dose. Moreouer, three berries of the same white Ivi drunke at a time in Oxymell, do expell the worms in the belly: during which cure, it were not amisse to apply them outwardly also. As for the Ivi, which I called * Chrylocarpus, if one take twelue of the golden yellow berries thereof beaten to powder, and put them to a sextar of wine, three cyaths thereof giuen to drink, according to *Erasistratus*, purge by vrine the watery humors between the skin and the flesh, which ingender the dropie. The same *Erasistratus* was wont to take five such berries stamped into powder and mixed with oile of rose, which after they were made hot in the rind of a Pomgranat, he vsed to drop into the eare of the contrary side, for the tooth-ache: the berries of Ivy which yeeld a iuice as yellow as Saffron, if a man take before he sit down to drink, may be assured, that he shal not be drunk at that sitting. Likewise, they ease them much who are giuen to cast and reach vp bloud, or be subiect to the collicke and wrings of the belly. The white berries of the black Ivi if a man take in drinke, dull the vigor of his generall feed, and disable him for getting children: any Ivy whatsoever, being boiled in wine, & so brought to a liniment and applied, doth cure all vlcers, euen morimalls, and such as be vntoward for to be healed. The liquor issuing out of Ivy, is depilatory; but as it taketh away haire, so it riddeth lice and vermin. The floures of any kind of Ivy, taken (as much as a man may comprehend with 3 fingers) twice a day in some green and hard wine, help the dysentery or bloody flux, yea, and any other laske. The same reduced into a liniment with wax, are very good to skin and heal burns or scaldings. The berries of Ivy, colour the haire of the head black. The iuice of the Ivi root drawn with vinegar and taken in drinke, is singular against the poison of the venomous spiders Phalangia. Moreouer, I find in some writers, That the drinking out of a cup or dish of Ivy wood also, as well as of Tamarisk, cureth those who haue hard Splens. The same authors prescribe to bruise the berries, afterwards to burn them, and with the ashes to dresse and bestrew the place that is burnt or scalded, so that it be first washed & bathed in hot water. There are Physitians who giue order to cut and lance the Ivy tree, for to draw a iuice or liquor from the place of the incision, which is to be vsed for rotten and worm-eaten teeth: and by their saying, the faulty teeth will breake and crumble into pieces if they be annointed therewith: provided alwaies, that the found and good teeth standing next, be well defended with wax for catching harm by this medicine: moreouer, they seek and lay for the gum of Ivy, which they would perswade vs assuredly vpon their word to be singular for the teeth, being applied thereto with vinegar.

For the vicinity and likenesse of the name of Ivy in Greek, which is Cissos, I may take occasion to speak in this place of another shrub or plant called Cisthos, bigger than Thyme, & leaved like Basil. Of it be two kinds; namely, the male, with a red Rose colored floure; the female with a white: both sorts are good for dysenteries or bloody fluxes, and all loosenesse of the belly, if there be drunk twice a day in some green & hard wine, as much of their floures as may be held at three fingers ends: which if they be made into a cerot with wax, heale old vlcers, burnes, and scaldings: and alone of themselves cure the cankers or sores in the mouth.

Vnder this plant specially grows Hypocisthis, wherof I haue written in my treatise of Ivi. Likewise, there is another plant like vnto the Ivy, and the Greeks call it Cissos Erythranos: which being taken in drink, helpeth the Sciatica, and is good for the loins: but they say it is so vehement and forcible in operation, that together with vrine it will euacuat bloud.

Moreouer, there is an Ivy which creepeth and traileth alwaies close by the ground, and the same the Greeks call Chamæcissos. This herb being stamped and taken in wine to the quantity of one Acetabell, cureth the infirmity of the spleen. The leaues incorporat with swines greafe serue to cure burnes.

Furthermore, the Bindweed Smilax, known also by the name of Nicephoros, resembleth Ivy, but that it hath smaller leaues. They say, that a chaplet or guirland made of this Smilax, is singular for the headach; provided alwaies, That the leaues which goe to the making of it, bee in number odde. Some haue said that Smilax is of 2 sorts: the one, which continueth a world of yeres, grows in shadowie vallies, climbing trees, & tufted in the head with clusters (as it were) of berries in manner of grapes; a foueraigne plant against all poisons, in so much, as if the iuice or liquor of the berries be oftentimes dropped into the ears of young babes or little infants, no poisons (by report) will euer hurt them afterwards. As for the other Smilax or Bindweed, it loqueth places well toiled and husbanded, wherein it vsually groweth: but of no vertue it is & operation: the former Bindweed is that, the wood wherof we said would giue a sound, if it were held close

A close to the eare. Another herb there is like to this, which some haue called Clematis. This plant creepeth & climbeth vpon trees, hauing many ioints also or knots. The leaues are good to mundifie the foule leprosie. The seed drunk to the measure of one acetabell, in a hemin of water or mead, maketh the belly loose. The decoction thereof is giuen likewise to the same effect.

CHAP. XI.

The vertues and properties of Canes or Reeds, of the Papyr reed, of Ebene, Oleander, Smack, otherwise called Rhus Erythros, Madder, Alysson, Sopewort or Fullers-weed, Apocynon, Rosemary, Cachrys, Saurine, Selago, and Samulus. Also of Gummies.

B Heretofore haue wee shewed 29 fundry kinds of Reeds, all indued with their medicinable vertues: and in no plants more appeareth the admirable power of dame Nature, the only subject matter handled in all these books of ours. For in the first place, there presenteth it selfe vnto vs the root of Reeds or Canes, which being bruised and applied accordingly, draweth forth of the body any spils of Fearnie sticking within the flesh: to doth the Fearnie root by the Reed. And forasmuch as we haue set downe many sorts of Canes, that amongst the rest, which cometh out of India and Syria, and whereof perfumers haue so great vse in their sweet ointments and odoriferous compositions, hath this property besides, That if it be boiled with the grasse called Dent de Chien, Quioich grasse, or Parsley seed, it is diureticall and prouoketh vrine. Applied outwardly, it draweth down the desired sicknesse of women. Taken in drinke to the weight of two oboli, it cureth those who are subiect to conuulsions or cramps: it helpeth the liuer and the reines: it is a remedy also for the dropie. As for the cough, a very perfume thereof will stay it, and the rather, if it be mixed with Rosin. The root sodden in wine with Myrrh, cleneth scurfe and dandruffe, it healeth also the spreading vlcers & running scals of the head: there is a iuice besides drawn from it, which becometh like to Elaterium, or the iuice of the wilde Cucumber. Moreouer, in any Reed, the best and most effectual part thereof is that holden to be, which is next to the root. The ioints also and knots be of great efficacy. The Cyprian Cane is named Donax, the rind wherof, if it be burnt and brought into ashes, is singular for to bring haire againe in places where it is shed: it healeth likewise vlcers growing to putrifaction. The leaues thereof are vsed, to draw forth any pricks or thorns. The same be of great vertue against S. Antonies fire, the shingles, and such like, yea & against all impostumations: the common and ordinary Reeds haue an extractiue or drawing faculty, if they be stamped greene: which is not meant of the root only, but also the very substance of the reed it self, which they say is of great operation. The root being reduced into a liniment, and applied with vinegar, cureth all dislocations, and easeth the pains of the chine bone. The same punned green and new, stirreth to lust, if it be drunk in wine. The down or cotton growing vpon the cane, if it be put into the ears, causeth hardnesse of hearing.

E There groweth in Egypt a certain plant named Papyrus, which resembleth much the Cane or Reed: a thing of great vse and commodity, especially when it is dry; for it serueth as a sponge both to suck vp the moisture in Fistulaes, and also to enlarge them. For swelling as it doth, it keepeth the vlcer open, and maketh way for the medicines to enter accordingly by that means. The paper made thereof when it is burnt, is counted to be caustick. The ashes of it being drunk in wine, cause sleep: and applied outwardly, taketh away hard callosities.

F Touching Ebene, it groweth not (as I haue already said) so neare vnto vs, as in Egypt. And albeit my meaning and purpose is not to deale with any medicinable plants growing in the strange & vknown countries of another world: yet in regard of the wonderfull properties that Ebene hath, I will not passe by it in silence. For first and foremost, the fine dust or powder filed from it, hath the name to be a singular medicine for the eyes: as also, that the wood thereof being ground vpon an hard stone, together with wine cuit, dispatcheth away the cloudy mist which ouercasteth the eyes. As for the root, if it be vsed likewise and applied with water, it consumeth the pin and web, and other spots in the eyes. The same being taken with equall quantity of the herb Dragon in hony, cureth the cough. In sum, Physitians repute and range Ebene among the medicines which be corrosiue.

Oleander, called in Greek Rhododendros, which some name Rhododaphne, and others Nerion,

The foure and twentieth Booke

As concerning gums, I haue heretofore declared how many kinds thereof are to be found. **G** To speake of them in generall, The better that any gum is, the more effectually be the operations thereof hurtfull they are to the teeth: they haue a property to thicken or coagular blood, and therefore be good for those who cast and reach vp blood: likewise they be singular for burns, as also for the windpipe and instruments of respiration. The superfluous and corrupt urine within the body, they prouoke and giue passage vnto. They dul & diminish the bitteresse of other medicines wherein they be mingled, how soeuer otherwise they be astringent & do fortifie other qualities. That which commeth from the bitter almonds, and is of a stronger operation to thicken and incrassat, hath vertue also to heat the body. The best gums be those of Plum-trees, cherry trees, and vines: they haue all of them a drying and astringent quality, if any part be annointed with them: and dissolved in vineger, they kill the tetter and ringwormes in children, & heale them vp. Being drunk to the weight of foure oboli, in * new wine, they be good for any inueterat cough. Moreover, they be thought to make the colour more fresh, lively, & pleasant, to procure and stir vp the appetite to meat; also to help those who be pained with the stone, in case they be drunk in sweet wine cuit. And to conclude with some particularity, The * gum of the Egyptian thorne is soueraigne for wounds, and all accidents of the eies.

* Musto, et
Mistura, in
some made or
compound
wine.
* Thought to
be Acacia.

CHAP. XII.

¶ Of the Arabian Thorne: of * the white Thistle Bedeguar: of Acanthion and Acacia.

* Our Ladies
thistle,

Touching the Arabian Thorne or Bush, and the commendable qualities thereof, I haue sufficiently spoken in the treatise of perfumes and odoriferous consecrations: yet thus much moreouer I haue to say of the medicinable vertues, that it doth thicken and incrassat thin and rheumatick humors, it restraineth all catarrhes and distillations, it represseth the reaching vp blood, & staierth the immoderat flux of womens monthly terms: for which purposes the root is more effectual than any other part of the plant.

The seed of the white Thistle is singular for the sting of scorpions: a garland made of it and set vpon the head, assuageth the paine thereof. Much like vnto this, is that Thistle which the Greeks call Acanthion, but that the leaues be much smaller, and those are sharpe pointed and prickly all about the edges, and couered with a downe resembling a cobweb; which the people of the East countries do gather, and thereof make certain cloth for garments, resembling silke. **K** The leaues or roots drunk in substance, are supposed to be a singular remedy for the crampe or convulsion which draweth the neck and body backward.

Moreover, there is a kind of Thorne, whereof commeth Acacia, and it is the juice thereof. It is found in Egypt to issue from certain trees, which be white, black, and green: howbeit, the best Acacia by far, is that which the former (that is to say, the white and the black) do yeeld. There is made likewise a kinde of Acacia in Galatia, which is most soft and tender; and the tree that affordeth it, is more prickly and thorny than the rest. The seed or fruit of all these trees, is like vnto Lentils, but only that the grain is lesse, and the cod or huske wherein it lieth, smaller. **L** The right season to gather this fruit is in Autumn; for if it be taken before, it is too too strong. For to draw this juice which we call Acacia, the cods wherein the grains lie, ought to be thoroughly steeped first in rain water: soone after, when they be punned or stamped in a mortar, the sayd juice is pressed forth with certaine instruments seruing for the purpose: which done, they let it remaine within mortars in the sun, and there take the thickening; and soat length reduce it into certain trochisks, and reserue them for vse. There is a juice likewise drawne out of the leaues, but the same is not so effectual as the other. The curiours vse to dresse their skins with the seed or grains thereof, in lieu of Galls. The juice which the leaues of the Galatian thorne aboue said doth yeeld (and namely, the blackest) is reiected for naught; like as that also which is of a deepe red colour. Contrariwise, that which is either purple or ash-colored and russet to see too, as also that which will be soone dissolved, is of exceeding efficacy to thicken and coole withall; and is preferred before all other in collyries or eie-salues: now for these vses, some are wont to wash the troches abovesaid, others torrefie and burn them. They are good to colour the haire of the head black: they heale *S. Anthonis* fire, and corrosiue sores; yea and all grienances of the body that consist in moisture: they cure any impostumes, joints that are bruised, kided heels, and the turning

M
ring

of Plinies Naturall History.

A ning vp of the skin and flesh from the naile roots. They repress the exceeding flux of womens monthly fleurs: the matrice and tiwell if they be slipt and faln out of the body, they reduce into their place again. In sum, for the eies, for the sores and infirmities of the mouth, and naturall parts seruing for generation, they be soueraigne.

CHAP. XIII.

¶ Of the common Thorne: of the wilde or wood Thorne: of Erysisceptron: of Spina Appendix: of * Pyxacanthus, and * Paliurus: of Hulver or Holly: of Yeugh: and Brambles: with the medicinable vertues of them all.

* E. v. thorne:
* Some call it
Cistus thorn.

The common Thorne also, wherewith the Fullers vse to fill their vats and caudrons, hath the same operation that * Struthium, and is put to the same vse. Many there be verily in all parts of Spaine, who vse it both in sweet Pomanders, and also in ointments, calling it *Aspalathus*: and without all doubt, there is a kind of wild white thorne of this race growing in the easterly countries (as I haue said) among the woods, and riseth to the full height of a good tree. Yea and a shrubby plant there is, lower than the other, but as full of pricks, growing in Nisyrus and the Islands of the Rhodians, which some call *Erysisceptron*; others, *Adipsatheon*, or *Dipsacon*, or *Dracheton*: the best is that which groweth nothing like to the *Ferula*, and being despoiled of the rind, is of a reddish colour inclining to purple. It is found in many places, but not euery where odoriferous. Of what force it is, when the rainbow seemeth to rest vpon it, I haue shewed already. It healeth the filthy cankers or sores of the mouth, and the stinking vlcers or alepocks in the nostrils: likewise the sores, botches, and carbuncles in the priuy parts, the crenifes also and clifts in the fundament, or else where, applied vnto the place affected: but if it be drunk, it abateth all swelling of ventosities: the bark or rind thereof dispatcheth those obstructions and impediments which cause the strangury or pissing by drop-meale. The decoction is a singular remedy for them that either pisse or vomit blood. The foresaid rinde stoppeth the flux of the belly. The like effects is that thought to work which groweth in the woods [and is called *Aspalathus* of the Leuant.]

There is a kind of thorny bush called * Appendix, for that there be red berries hanging thereto, which be likewise named Appendices. These berries, either raw by themselves, or else dried and boiled in wine, do stay the flux of the belly, and besides assuage the torments and wrings thereof. As for the berries of *Pyxacanthus*, they be drunk to right good purpose against the sting of serpents. *Paliurus* also is a kind of thorny bush: the people of *Africk* call the seed of it *Zura*, which is found to be most effectual against scorpions; and for those who are troubled with the stone, and the cough. The leaues haue an astringent or binding qualitie. The root resolueth and dispatcheth biles, impostumes, and borches; and if the same be taken in drink, it procureth urine: if it be sodden in wine, and the decoction drunk, it stoppeth a laske, and is a defensarime against the poison of serpents: the root especially is giuen in wine: some there be who stamp the leaues, putting salt thereto, and being reduced into the forme of a cataplasme, apply the same to the gout. The leaues be good to stay the immoderat flux of womens termes, the loosenesse of the belly occasioned by a feeble stomack, the bloody flux, and the inordinat motions of cholerick humors both vpward and downward. The root boiled and brought to a liniment, draweth forth what soeuer sticketh within the body. Soueraign it is and of exceeding great operation, in case of dislocations and swellings.

As touching the Holly of Hulver tree, if it be planted about an house, whether it be within a city, or standing in the country, it serueth for a countercharm and keepeth away all ill spels or enchantments. *Pythagoras* affirmeth, that the floure of this tree wil cause water to stand all vpon an yce: also that a staffe made thereof, if a man doe sling it at any beast whatsoever, although it chance to light short for default of strength in his arms who flung it, wil notwithstanding etch forward and roll from the place where it fell vpon the earth, and approach neere to the beast afore said; of so admirable a nature is this Holly tree.

The fume or smoke of any Yeugh tree, killeth mice and rats. Neither hath Nature produced brambles for nothing els but to prick and do hurt; for such is her bounty, that the berries which they beare are mans meat, besides many other medicinable properties: for they haue a desiccative and astringent vertue, and serue as a most appropriate remedy for the gums, the inflammation

* Some take it
for the Barber
ry bush.

tion of the Tonills, & the priuy members: the flours also as well as the berries of the brambles, be singular against the Hemorrhoid and the Prester, which are the two wickeddest and most mischeuous serpents that be. The wounds inflicted by scorpions, they close & heale vp againe without any danger of rankling or apostemation: and withall, they haue a property to prouoke vrine. The iuice drawne and pressed out of the tendrons or yong sprouts of brambles stamped, and afterwards reduced vnto the consistence of honey by standing in the Sun, is a singular medicine either taken inwardly or applied outwardly, for all the diseases of the mouth and eies; for them that reach vp bloud, for the squinancy, the accidents of the matrice and fundament, finally, for the immoderat flux of the belly occasioned by the weaknesse of stomach. As for the sores and infirmities of the mouth, the very leaues alone of the bramble if they be but chewed, are passing good: but if they be reduced into a liniment and so applied, they heale running sores or any scalls whatsoeuer in the head: & euen so being laid alone vpon the left pap, they be wholesome for such as are giuen to the fainting & trembling of the heart, and subiect to fall into cold sweats: likewise being applied accordingly, they ease the pain of the stomach, and such as haue their eies ready to start out of their head: and to help the infirmities of the ears, their iuice is excellent to be dropped into them. The same iuice incorporat with the cerot of roses, healeth the clifts and swelling knubs in the fundament: & for the said infirmity, the decoction of yong tendrils in wine, is a present remedy, in case the place be bathed and fomented therein. The same yong springs eaten alone by themselves in a salad, in manner of the tender crops and spurts of the Colewort; or boiled in some harsh, grosse, and Greene wine, do fasten the teeth which be loose and shake in the head: they stop a lask, and restrain an vnaturall issue or flux of bloud, and besides, are good in the bloody flux. Being dried in the shade, and afterwards burnt, their ashes are singular to stay the vula from falling. The leaues also being dried and beaten to powder, are excellent good for the farcines and sores in horses, and such like beasts. As for the blacke berries which these brambles do beare, there is a kind of Diamoron made of them, which is far better for the infirmities of the mouth, and more effectual, than the other of the garden mulberries. The same being so prepared in that stomacall composition aforesaid, or drunk only with Hypocistitis and hony, be singular to repress the fury of choler prouoking both waies: they be cordiall likewise, in case of faintings and cold sweats: and lastly, a preseruatiue against the poison of the venomous spiders. Among those medicines which they cal Stypticke or astringent, there is not a better thing than to boile the root of this blackberry bramble in wine to the thirds, and namely to make a collution therewith to wash the cankers or sores breeding in the mouth, or to foment the vlcers growing in the fundament. And verily of such a binding and astringent force is this bramble, that the very spongyous bals that it beareth, will grow to be as hard as stones.

Another kind of brier or bramble there is, vpon which groweth a rose: some cal it Cynosbator, others Cynospastoss: it beareth a leafe like to the print or sole of a mans foot. A little bal or pill it breedeth, furred or bristled much after the manner of the Chestnut, which serueth as a speciall remedy for those that be subiect to the stone. As for Cynorhonos, it is another plant different from this; wherof I will speak in the next book.

CHAP. XIV.

¶ Of *Cynosbator, and the Raspe: of the Rhamnos, and of Lycium and Sarcocolla. Of a certaine composition in Physicke called Oporice.

* is the Cane-brier or Caner-brier.

* Rubus canis.

* Of how to confounde the Physicke with downe the flowers of Cynosbator, and Chamæbator, the Cynocolla, and the blackberry bramble.

AS for the bramble named Chamæbator, it beareth certain black berries like grapes, within the kernell wherof it hath a certain string like a sinew, whereupon it came to be called Newrospastoss: it is a different plant from the Caper, which the Physitians haue named also Cynosbator. Now the tender stems of the foresaid *Cynosbator or Chamæbator condite in vineger, are good for them to eat who are troubled with the opilation of the spleen, & with ventosities, for it is a singular remedy for those infirmities. The string or sinew thereof chewed with Mastick of Chios, purgeth the mouth. The wild roses that grow vpon this brier, being incorporated with swines greafe, are excellent for to make the haire grow againe, when it is shed by some infirmity. *The berries of these brambles if they be tempered with oile oliue made of green and vnripe oliues, colour the haire black. The proper season to gather the floures of these brambles that cary berries like to mulberries, is in harvest time: the white kind of them drunk in wine, is a soueraign remedy for the pleurisie, & the flux of the stomach: the root sodden to the thirds,

stoppeth

A stoppeth a lask, and staieth the flux of bloud: likewise a collution made therewith, fastneth loose teeth, if they be washed withall. The same decoction or liquor is good to foment the vlcers of the feat priuy parts. The ashes of the root burnt, keep vp the vula from falling.

The Raspis is called in Latin Rubus Idæus, because it groweth vpon the mountain Ida, and not elswhere* [so plenteously.] Now is this bramble more tender, & lesse in growth: it putteth forth also fewer stalkes vpright, and those more harmelesse and nothing so prickly as the other brambles before named: besides, it loueth well to grow vnder the shade of trees. The floures of this bramble reduced into a liniment with hony, restrain the flux of rheumaticke humors into the eies, and keepeth down the spreading of S. *Anthonyes* fire: and giuen in water to drink, it cureth infirmities of the mouth. In all other cases, it hath like operations to the former brambles.

* Ex Dioscor.

B Among the diuers kinds of brambles, is reckoned the Rhamne, which the Greeks cal Rhamnos, notwithstanding that it is whiter & more branching than the rest. This Rham beareth many flours, spreading forth his branches armed with prickles not crooked or hooked as the rest, but streight and direct, clad also with larger leaues. A second kind there is of them growing wilde in the woods, blacker than the other, & yet inclining in some sort to a red colour: this carieth as it were certain little coals. Of the root of this Rham boiled in water, is made the medicine that is called Lycium. The seed of this plant draws down the after-birth. The former of these two, (which also is the whiter) hath a vertue more astringent and cooling than the other, & therefore better for impostumations and wounds: howbeit the leaues of both, either green or boiled, are vfed in liniments with oile for the said purpose. But as touching Lycium, the best of all other is

C (by report) made of a certain Thorne tree or bush, which they cal Pyxanthos Chironia, the form wherof I haue described among the Indian trees: & indeed the most excellent Lycium, by many degrees, is that Indian Lycium thought to be. The manner of making this Lycium, is in this wise: they take the branches of this plant, together with the roots which be exceeding bitter, & after they be well punned and stamped, seeth them in water within a brasen pan, for three daies together or therabout: which don, they take forth the wood, & set the liquor ouer the fire againe, where it taketh a second boiling, so long till it be come to the consistence or thicknes of hony: howbeit sophisticated it is many times with some bitter juices, yea and with the lees of oile & beasts gall. The very froth & scum, in manner of a stony that it casteth vp, some vse to put into colyries & medicines for the eies. The substance of the iuice besides is absterfue, it mundifieth the face, healeth scabs, cureth the exulcerations or frettings in the corners of the eies: it represseth old rheumes & distillations, clenseth ears running with filthy matter, represseth the inflammations of the almonds in the mouth, called Tonillæ, & of the gums; staieth the cough, restraineth the reaching & casting of bloud, if it be taken to the quantity of a bean: being spread in manner of a plaster or liniment and so applied, it drieth vp running and watery sores; it healeth the chaps and clifts in any part of the body, the vlcers of the secret parts seruing for generation, any place fretted or galled, new and green vlcers, yea and such as be corrosiue and withall growing to putrefaction: it is singular for the calosities, werts, or hard corns, growing in the nostrils, and all impostumations: moreover, women find great help by drinking it in milke, for any violent shift or immoderat flux of their monthly sicknes: the best Indian Lycium is known by this,

D That the masse or lump therof is black without, forth, red within when it is broken, but soon it commeth to a black colour. An astringent medicine this is, and bitter withall, and hath the same effects which the other Lycium is reported to haue, but specially if it be applied to the priue members of generation. As touching Sarcocolla, some be of opinion that it is the gum or liquor issuing from a certain thorny plant or bush: and they hold, that it resembleth the crums of frankincense, called Pollen or Manna Thuris, & in tast seemeth to be sweetish, & yet quick and sharpe withall. This Sarcocoll stamped with wine, and so applied, represseth all fluxes: & in a liniment, good it is for yong infants. This gum also by age and long keeping, waxeth black; but the whiter is the better, & thereby is the goodnesse knowne.

E But before I depart from this treatise of Trees, and their medicinable vertues, I must needs say, we are beholden to them yet for one excellent medicine more, which is called Oporice by the Greeks, as one would say, made of fruits. This composition is singular for the bloody flux or exulceration of the guts; also for the infirmities of the stomach. The manner of making it, is in this wise: Take 5 quinces, with their kernels, seeds & all, as many pomgranats likewise, let them boile gently ouer a soft fire in one gallon of new white wine, put therto the weight or measure or

one sextar of Seruises, and as much in quantity of the Sumach which is called Rhus Syriacum, together with halfe an ounce of saffron, seeth all these together to the height or consistence of hony. Thus much concerning the properties of trees seruing in Physicke. It remaineth now to annex hereunto a discourse of those plants which the Greek writers (by giuing them names in some analogie respectiue vnto trees) haue left an ambiguity, and made vs doubt of them whether they be trees or herbs.

CHAP. XV.

¶ Of * Chamædrys, i. Germander : * Chamædaphne, i. Lawrell : * Chamæla : * Chamæsyce : * Chamæcissos, i. Ale-boone : * Chamæleuce, i. Fole-foot : * Chamæpeuce : * Chamæcyparissus, i. Lauander-cotton : * Ampeloprassos : Stachys : Clinopodium, Centunculus, and Clematis Ægyptia, with the medicines that they afford.

Germander is an herb, called in Greek Chamædrys, and in Latine Triffago: some haue named it Chamædrope, others Teucrion: it beareth leaues for bignes resembling mints, in colour like vnto the oke leaues, cut and indented also after the same maner. Of some it is called Serrata; and they affirme that the first pattern of a saw was taken from the leafe of this herb, whereupon it should be so called. The floure beareth much vpon the purple colour: it longeth to grow in stony places, and would be gathered whiles it is full of iuice: and thus gathered in due season, whether it be taken in drink, or taken outwardly in a liniment, most effectually it is against the poison of serpents: likewise it is wholesome for the stomach, good against an inueterat cough, singular to cut, dissolve, and raise the tough steam sticking in the throat: a special remedy for ruptures, convulsions, and pleurifies: it waneeth away the ouergrown spleen: it prouokes vrine, and womens fleurs: in which regard, a bundle or handfull of Germander boiled in 3 hemines of water, vntill a third part be consumed, maketh a souveraine decoction or drinke for those who are newly fallen into a drop sicke. Some there be, who stamp this herb and sprinkle water among, and so reduce it into trofchs.ouer and besides the vertues before rehearsed, it is good to heale botches newly broken and full of matter, yea old vlcers, though they be filthy and putrified, if it be applied thereto: for the spleen, it is usually taken with vineger: & this iuice doth chaufe and heat those parts which be annointed therewith.

As touching Lawrell, called by the Greeks Chamædaphne, it ariseth vp with one only stem of a cubit high or thereabout: the leaues are but smal, howbeit like to those of the Lawrell: it bringeth forth a reddish seed appearing among the leaues, which being vsed in a liniment fresh and green, caseth the head-ach. The same cooleth all excessive heats: and if it be drunk in wine, appeaseth the wrings and torments of the belly. The iuice thereof taken in drink, drawes downe womens fleurs, and prouokes vrine: the same applied in wooll to the naturall parts of a woman, causeth her to be soon deliuered when she is in hard trauell of child-birth.

As for * Chamæla, it hath leaues like vnto those of the oliue: the same be bitter in tast, and in smell odoriferous. This plant groweth in stony grounds, and exceedeth not in heighth a hand-breadth or span at most: a purgatiue herb it is; for thereof is made an excellent syrrop to euacuat fleame and choler; namely, if there be taken one part of the leaues of this herbe, with two parts of wormwood, and so boiled; for certainly this decoction drunk with hony, is singular for to purge the foresaid humors. A cataplasme made with the leaues, clenseth vlcers. It is commonly said, that if this herb be gathered before the sun-rising, and the party to say expressly in the gathering, That it is for the pin and web in the eies; it will dispatch and rid away the said infirmity, if one do but weare it tied about him. And howsoeuer it be gathered, whether it be with any such circumstance and ceremony, or without, yet is it singular for the haw gnawing in the eies of horses and sheepe.

Chamæsyce beareth leaues resembling those of the Lentil, but they alwaies creep along the ground and rise not vp. This herbe groweth in drie and stony grounds: the same boiled in wine and vsed as a liniment vnto the eies, cleareth their sight; for it is singular to dispatch and remoue catarracts, suffusions, and cicatrices, growing therein: as also to rid away the misty clouds and films that ouercast the sight. Being put vp into the matrice within a linnen cloath in manner of a pessarie, it allaieth the paines thereof. VVarts of all sorts it taketh away, if they be annointed

Annointed therewith. It is a souveraine remedy also for those who cannot take their wind but sitting vpright.

* Chamæcissos groweth vp spiked with an ear like vnto wheat, and ordinarily putteth forth five branches, and those full of leaues. VVhen it sheweth in the floure, a man would take it to be the * white Violet or Gilloffe. The root is but small. They that are troubled with the Sciatica, vse to drinke the leau thereof to the weight of three oboli in two cyaths of wine, for seuen daies together: but it is an exceeding bitter potion.

As for Fole-foot, it is called in Greeke Chamæleuce: but we in Latine name it Farranum or Farfugium. It longeth to grow by riuers sides. The leaues somewhat resemble those of the Poplar, but that they be larger. If the root of Fole-foot be burnt vpon the coles made with Cyprus wood, the smoke or perfume thereof receiued or drunk through a pipe or tunnell into the

Bmouth, is singular for an old cough.

Touching * Chamæpeuce, in lease it is like vnto the Larch-tree: a plant very appropriat to the paine of the back and the loins. The herb Chamæcyparissos, if it be drunk in wine, is singular good against all the venomous stings of serpents and scorpions.

The herb Ampeloprassos groweth in vineyards, bearing leaues resembling Porret: but it causeth them to belch soure that eat thereof. Howbeit, of great power it is against the sting of serpents. It prouoketh vrine & womens monthly terms. And yet whether it be drunke or applied outwardly, it is passing good for them that pisse blood, & represseth the issue & eruption thereof. Our midwives vse to giue it vnto women newly deliuered and brought to bed: likewise it is found to auail much vnto them that be bitten with mad dogs.

CMoreouer, the herb called Stachys hath a resemblance also to * Porret, but that the leaues be longer and more in number: it yeeldeth a pleasant smell, and the leaues be of a pale colour, inclining somewhat to yellow. The nature of this plant is to moue the monethly purgation of women. As for Clinopodium (called otherwise Cleonicion, Zopyron, & Ocymoeides) like it is to running wilde Thyme, and full of branches, growing vp a span or handfull high at the least. It groweth in stony places, with a spoky tuft of floures shewing in a round compasse, and for all the world resembleth the feet or pillars that * beare vp a table or bed. This herb taken in drinke is good for convulsions, ruptures, stranguries, and serpents stings. So is the syrrop or juleb that is made thereof, by way of decoction. Thus much of those herbs, which in name carry a shew and resemblance of trees.

DIt remaineth now to write of some other herbs, which I must needs say are of no great name and reckoning, howbeit such as be indued with wonderfull vertues. As for the famous and notable herbs indeed, I will reserve the treatise of them for the books following. And first I meet with that which we in Italy call Centunculus, but the Greekes Clematis, with leaues pointed like the beak of a bird, or resembling the cape of a cloke, growing close to the ground in toiled corn fields. This herbe is most effectual and singular aboue all other, for to stay a iaske, if it be drunk in some red or green hard wine. The same beaten into pouder, and taken to the weight of one denier Roman, in five cyaths of Oxymell or hot water, stancheth bleeding: and yet in that sort it is of great effect to fetch away the after-birth of women lately deliuered.

EBut there be other herbes among the Greeke writers, going vnder the name of Clematides, and namely one, which some call Echites, others Lagines, and there are besides who name it Pety Scammonie, and in very truth, branches it hath a foot long, full of leaues, and not vnlike vnto those of Scammonie, but that the leaues be more black or dusky and smaller. This herbe is found as well in vineyards as corne lands. People vse to eat this herb with oile and salt, as they do Beets, Coles, and other such pot-herbs: and so eaten, it maketh the body soluble. And yet neuertheless, those who be troubled with the bloody flux, are wont to take it in some astringent wine with Linseed, and find it to work with good successe. The leaues applied to the eies with parched Barly groats, do restraîne the waterish humors which fall thither, so there be a fine linnen cloth wet * between. The same applied in a pulstesse to the wens called the kings euil, bring

Fthem first to suppuration, and afterwards hauing hogs grease put thereto, heale them thoroughly. Incorporat with green oile Oliue, they ease the hemorrhoids: and with honey, helpe those that be in a Phthisicke or Consumption. If nourees eat them with their meat, they shall haue good store of milke in their breasts. And if they annoint therewith the heads of their young infants, the haire will come the thicker. A collution made with them and vineger, assuageth the tooth-ach,

* It is not out of Alchove.
* Viola alba.

* Some take it for Chamæpitys.

* Clematis, Pety: but it seems that Pliny should have read clematis, i. Marubium, of Horehound, out of Dioscorides, as Rodericus hath observed.
* Whereupon it took the name Clinopodium.

* ground-oke, or petic oke.
* ground-bay, or petty Lawrell.
* ground-oliue, &c.
* ground fig-tree, &c.
* ground Irie.
* ground Poplar.
* ground-pine, or Patch tree.
* ground Cyprus.
* Porret vine.
* or Leek-vine.

* otherwise called Mergaron, Widow-waile.

* Supposito: some read contrariwise, Supposito.

ache, if the mouth be washed therewith. To conclude, it stirreth vp to fleshly lust.

There is besides another kind of Clematis, known by the name of the Egyptian Clematis: howsoever some call it Daphnoeides; others, Polygonoeides. Leaved it is like the Lawrel, save that the leaues be long and thin. But against all serpents, and especially the Aspides, it is a soveraigine counterpoison if it be drunk in vinegar. Egypt bringeth forth this herb in great abundance.

CHAP. XVI.

¶ Of Aron, Dracunculus, or Dracontium. Of Aris. Of Millefoile. Of another hearbe of that name. Of Pseudobunium. Of Myrrhis and Onobrichis: with their medicinable vertues.

Wake-robin.
Dragon.

These descriptions agree not with our wake Robin & Dragon.

There is a great difference betwene * Aron (of which herbe I haue written amongst those with bulbous roots) and * Dracontium: although writers be at some variance about this point, for some haue affirmed that they be both one. Howbeit *Glancius* hath distinguished them, in that the one groweth wild, and the other is planted: and hee pronounceth and calleth Dragon, the sauage Aron: others are of opinion, that there is no other difference between them, but that the onion root is called Aron, and the stem of the same herb Dracontium: whereas indeed there is no likenesse at all between the one and the other, if so be that Dracontium of the Greeks be the same that we call Dracunculus in Latine. For Aros hath a black root growing broad, flat, and round, yea, and far greater, in so much as it is a good hand full: but the root of Dracunculus is somewhat red, and the same wrythed and folded round in manner of a Dragon, whereupon it took that name. Nay, the very Greeks themselves haue made an exceeding great difference, between Dragon, and Wake-Robin: for they affirme, That the seed of Dragon is hot and biting, and besides, of such a virulent and stinking smell, that the very sent thereof is enough to driue a woman great with childe to trauell before her time, and to slip an vntimely birth. Contrariwise, they haue wonderfully commended Aron: for first and foremost, they preferre the female of this kind as a principall meat, before the male, which is harder to be chewed, and longer ere it be concocted and digested: moreover, they affirm, That as well the one as the other, doth expectorat the fleam gathered in the chest: and whether it be dried and brought into powder and so the drink spiced withall, or otherwise taken in form of a lioch or electuary, it prouoketh both vrine and also womens monthly termes. Drunke with oxymell, it mundifieth and comforteth the stomacke: and Physitians haue giuen it in Ewes milke for the exulceration of the guts: & roasted vnder the embers, they haue prescribed it to be taken with oil for the cough: Some haue sodden it in milke, and giuen the decoction thereof to be drunke in that case. They haue appointed it also to be boiled, and then applied accordingly, to watery eyes for to repress the violence of rheum: likewise, vnto places black and blew with stripes: as also for the inflammation of the amygdals: also, they haue giuen direction to inject the same with oile by way of clystire, as an excellent remedy for the Hemorrhoids: and to apply it in a liniment with hony, for to take away the pimples and freckles of the skin. *Cleophrantus* hath giuen it the praise of an excellent antidote or counterpoison: prescribing also the vse thereof for the pleuritic and inflammation of the lungs, in the same manner, as in case of the cough: he appointed likewise to beat the seed into powder, & being mixed either with common oile or oile of rose, to drop it into the eares for to assuage the pain. *Diuenthes* ordained, to take and temper it with meale, and so to worke it into a paste, & to giue the bread so made, vnto them that cough: to those who be short winded: such also as cannot breath vnlesse they sit vpright: and lastly, to as many as reach vp filthy matter out of their breest. *Diодотus* the Physitian made thereof an electuary or lioch with hony, for them to lick who are in a Phthisick, or otherwise diseased in the lights: and hee appointed it to be laid as a pulsette for fractures of bones. There is not a beast or liuing creature whatsoeuer, but if the shap or naturall parts be annointed therewith, it will fetch away the fruit of their womb. The juice drawn out of the root, if it be incorporat with Attick hony, scattereth the misty clouds and filmes in the eyes that trouble the sight: the same also cureth the defects and infirmities of the stomack. And a syrrip made with the decoction thereof & hony, is good to finte a cough. All vlcers whatsoeuer, be they woules, cankerous sores, or otherwise corrosiue and eating forward fillyea, the very ill-fauoured Polype and Noli-me-tangere in the nostrils, the

G

H

I

K

L

M

A the iuice of this root doth cure and heale wonderfully. The leaues sodden in wine and oile, are good to be applied vnto any burne or place scalded. Being eaten in a salad with salt and vineger they purge the belly, sodden with hony, and applied as a cataplasme, they are good for dislocations and bones out of ioint. Semblably, the said leaues, whether they be green or dried, are excellent for the gout in any ioint, being laid too with salt. *Hippocrates* deuised a plaster of them and hony together, which was singular for all impostumations whatsoeuer. For to bring downe the desired sicknesse of women, 2 drams of the root or seeds (it skils not whether) taken in two cyaths of wine, is a sufficient dose. The same potion fetches away the after birth, in case it make no hast to come away after a woman is deliuered of child. And for this purpose *Hippocrates* appointed the very bulbous root of Aron in substance to be applied to the nature of a woman in the like case. It is said, that in time of pestilence it is a singular preseruatiue, if it be eaten with meats. Certes, it is excellent to keep them for being drunke, who haue taken their liquor liberally, or at leastwise to make them sober again. And yet the perfume or smoke thereof, when it burneth, chafeth serpents away, and especially the Aspides, or els doth intoxicate their heads, & make them so drunk, that a man shall find them lying benumbed and astonied, as if they were dead. The same serpents moreover will not come neere vnto those that be annointed all ouer with this herb Aros and oile of baies: hereupon it is thought, that it is a good preseruatiue against their stings, if it be drunk in grossered wine. They say moreover, that cheeses will keepe passing well, if they be wrapped within the leaues of Aron.

To come now to Dragons, called in Latine Dracunculus, wherof I haue spoken before: the only time to dig it out of the ground, is when barly beginneth to ripen, and within the two first quarters of the Moon, all the while that she doth increase in light. Let one but haue the root of this herb about him in any part of the body (it makes no matter how or where he carry it) he shall be sure that serpents wil flie from him. And therefore it is said, that the greater kind of them is singular to be giuen in drink vnto those who are stung already by them, as also that it stoppeth the immoderat course of womens fleurs, in case it touched no yron instrument when it was gathered. The iuice thereof is passing good for pain in the ears.

As for the Dragon which the Greeks name Draconatium, it hath bin shewed & described to me in three forms: the one leaued like vnto the Beets, growing with an vpright main stem with a floure of a purple colour: this Dragon is like vnto Aron. Others brought to me a second kind with a long root (as it were) marked forth and diuided into certaine ioints; it putteth out three small stems and no more: and they declared moreover and gaue direction to seeth the leaues thereof in vineger against the sting of serpents. There was a third sort shewed vnto me, bearing a leafe bigger than that of the Cornell tree, with a root resembling those of the canes or reeds: and (as they auouched) parted into as many joints and knots just, as it was yeares old, and so many leaues likewise it had, neither more nor lesse. Those that presented it to me, vsed to giue the same in wine or water against serpents.

There is an herb also named Aris, growing in the same Egypt: like vnto Aron abovesaid, save that it is lesse, hath smaller leaues, and not so big a root, and yet the same is full as great as a good round and large oliue. Of these, there be two kinds: the one which is white, riseth vp with two stalks: the other puts forth but one single stem. Both of them haue vertue to cure running scals and vlcers, to heale burns also and fistulous sores, if a collyrie or tent be made thereof and put into the sore: the leaues boiled in water, and afterwards stamped and incorporate with oile of rose do stay the spreading of corrosiue & eating vlcers. But mark one wonderful property that this plant hath: touch the nature or shap of any female beast therewith, she wil neuer linggading vntill she die with one mischiefe or other.

Touching Millefoile or Yarrow, which the Greeks call Myriophyllon, & we in Latine Millefolium: it is an herb growing vp with a tender and feeble stalk, like in some sort vnto Fenell, and charged with many leaues, whereupon it took the name: it groweth in moores and fennie grounds, vsed to very good purpose and with singular successe, in curing of wounds.ouer and besides, it is giuen to drink with vineger for the difficulty of vrine and the stoppage of the bladder, for those that take wind thick and shor, and such as are inwardly bruised by falling headlong from on high: the same is most effectually to take away the tooth ache.

In Tuscan they haue another herb so called, growing in medowes, which putteth forth on either side of the stalk or stem, a number of pretty leaues as smal in maner as hairs. The same also

is a most excellent wound-hearb. And it is auouched by the people of that countrey, That if an Oxe chance to haue his strings or sinews cut quite atwioth the plough-share, this hearb will conglutinat and foulder them againe, if it be made into a salue with swines greafe.

Concerning balsard Naveu, called in Greeke Pseudo Bunion, it hath the leaues of Naveu gentle, and brancheth to the height of a hand-bredth or span. The best of this kind groweth in the Isle Candy, where they vse to drink fise or six branches thereof for the wringing torment of the belly, for the strangury, the paine of the sides, midriffe, and precordiall parts.

Myrrhis, which some call Smyrrhiza, others Myrrha, is passing like vnto Hemlocke, in stakke, leaues, and floure; only it is smaller and slenderer, and hath no ill grace and vnpleasent tast to be eaten with meats. Taken in wine, it hasteneth the monthly course of womens fleurs if they bee too slow, and helpeth them in labour to speedy deliuerance. It is said moreover, that in time of a plague it is wholsom to drink it for feare of infection. A supping or broth made of it helpeth those who are in a Phrhythicke or consumption. This good property it hath besides, to stir vp a quick appetite to meat. It doth extinguishe and kill the venome inflicted by the sting or pricke of the venomous spiders Phalangia. The juice drawn out of this herb after it hath lien infused or foked three daies together in water, healeth any sore breaking out either in face or head.

Finally, Onobrychis carieht leaues resembling Lentils, but that they are somewhat longer: it beareth also a red floure: but resteth vpon a small and slender root. It groweth about springs and fountains. Being dried and reduced into a floure or powder, it maketh an end of the strangury, so it be drunk in a cup of white wine well strewed and spiced therewith. It stoppeth a lask. To conclude, the juice thereof causeth them to sweat freely who are annoiued all ouer with it.

CHAP. XVII.

¶ The medicinable vertues of Coriacea, Callicia, and Menais, with three and twentie other herbes, which some hold to be Magicall. Moreover, of Considia, and Aproxis, besides some other which are reuined and in request againe, hauing been long time out of vse.

TO discharge and acquit my selfe of the promise which I made of strange and wonderfull herbs, I cannot chuse but in this place write a litle of those which the Magitians make such reckoning of. For can there be any more admirable than they? And in very truth, *Democritus* and *Pythagoras*, following the tracts of the said wise men and Magitians, were the first Philosophers, who in this part of the world set those herbs on foot, and brought them into a name.

And to begin with Coriacea and Callicia, *Pythagoras* affirmeth, That these two herbes will cause water to gather it to an yce. I find no mention at all in any other authors, of these hearbes, neither doth he report more properties of them.

The same author writes of an herb called Menais, known also by the name of Corinthas, the juice whereof (by his saying) if it be sodden in water, presently cureth the sting of serpents, if the place be fomented with the said decoction. He affirmeth moreover, that if the said juice or liquor be poured vpon the grasse, whosoever fortuneth to go thereupon, and touch it with the sole of the foot, or otherwise chance to be but dashed or sprinkled therewith, shall die therupon remediless, and no way there is to escape the mischief. A monstrous thing to report, that this juice should be so rank a venome as it is, vnlesse it be vsed against poison.

The selfe same *Pythagoras* speaketh yet of another herb which hee calleth Aproxis: the root whereof is of this nature, to catch fire a farr off, like for all the world to Naphtha, concerning which, I haue written somewhat already in my discourse as touching the wonders of Nature: and he reporteth moreover, That if a man or woman happen to be sicke of any disease, at what time as this Aproxis is in the floure, although he or she be thoroughly cured of it, yet shall they haue a grudging or minding thereof as often as it falleth to floure againe yeare by yeare. And of this opinion he is besides. That Frumenty corne, Hemlock, and Violets, are of the same nature and property. I am not ignorant, that this booke of his wherein these strange reports are recorded, some haue ascribed vnto *Cleomporus*, a renowned Physitian: but the currant fame or speech holdeth still so constantly, time out of mind, that we must needs beleue *Pythagoras* to be the author of the said booke. True it is indeed, that the name of *Pythagoras* might giue authority and credit

Adit vnto other mens books attributed to him, if haply any other had laboured and trauelled in compiling some worke, which himselfe judged worthy of such a man as he was: but that *Cleomporus* should so do, who had set forth other books in his owne name, who would euer beleue? No man doubteth verily, but that the book intituled * *Chirocineta*, was of *Democritus* his making: and yet therein be found more monstrous things by a hundred fold, than those which *Pythagoras* hath deliuered in that worke of his. And to say a truth, setting *Pythagoras* aside, there was not a Philosopher so much addicted to the schoole and profession of these Magitians, as was *Democritus*.

In the first place he telleth vs of an herb called Aglaophotis, worthy to be admired & wondered of men, by reason of that most beautifull colour which it had: and for that it grew among the quarries of marble in Arabia, confining vpon the coasts of the realme of Persia, therefore it was also named Marmaritis. And he affirmeth, that the Sages or Wise men of Persia called Magi, vsed this herb when they were minded to coniure and raise vp spirits.

He writeth moreover, That in a country of India inhabited by the Tardisiles, there is another herb named Achemenis, growing without lease, and in colour resembling Amber: of the root of which herb there be certain Trochisks made: whereof they cause malefactors and suspected persons to drink some quantity with wine, in the day time, to the end they should confesse the truth: for in the night following they shall be so haunted with spirits and tormented with sundry fantasies and horrible visions, that they shall be driuen perforce to tel all, and acknowledge the fact for which they are troubled & brought in question. The same writer calleth this plant

* *Hippophobas*, because Mares of all other creatures are most fearfull and wary of it.

Furthermore, he reporteth, That so Schoenes from the riuer Choaspes in Persia, there groweth an herb named Theombrotion, which for the manifold and sundry colours that it hath, resembleth the painted taile of a Peacocke, and it casteth withall a most sweet and odoriferous sent. This herb (saith he) the Kings of Persia vse in their meats & drinks: and this opinion they haue of it, That it preferueth their bodies from all infirmities and diseases, yea, and keepeth their head so staied and settled, that they shall neuer be troubled in mind and out of their right wits: in such sort, that for the powerfull maiestie of this plant, it is also called Semnon.

He proceedeth moreover to another, knowne by the name Adamantis, growing onely in Armenia and Cappadocia: which if it be brought neare vnto Lions, they will lie all along vpon their backs, and yawne with their mouths as wide as euer they can. The reason of the name is this, because it cannot possibly be beaten into powder.

He goeth on still and beareth vs in hand, that in the realme Ariana, there is found the herbe Arianis, of the colour of fire. The inhabitants of that country vse to gather it when the Sun is in the signe Leo: and they ascribe, that if it do but touch any wood besmeared and rubbed ouer with oile, it will set the same a burning on a light fire.

What should I write of the plant Therionarca, which whensoever it beginneth to come vp and rise out of the ground, all the wilde beasts will lie benumbed and (as it were) dead: neither can they be raised or recovered againe, vntill they be sprinkled with the vrine of Hyena.

The herb Æthiopis, by his report groweth in Meroe, for which cause it is called also Merois: In lease it resembleth Lectuce: and being drunk in mead or honied water, there is not such a remedy againe for the dropisie.

Ouer and besides, he speaketh of the plant Ophiusa, found in a country of the same Æthiopia, named Elephantine: of a leaden hue it is and hideous to see to: whosoever drinke thereof, shall be so frighted with the terrors and menaces of serpents represented vnto their eies, that for very feare they shall lay violent hands on themselves: and therefore church robbers are enforced to drink it. Howbeit, if a man take after it a draught of Date wine, he shall not be troubled with any such fearfull visions and illusions.

Moreover, there is found (saith *Democritus*) the herbe Thalassigle about the riuer Indus, and thereupon is knowne by another name Potamantis: which if men or women take in drink, transporteth their senses so far out of the way, that they shall imagine they see strange sights.

As for Theangelis, which by his saying groweth vpon mount Libanon in Syria, and vpon Dicte, a mountain in Candy, also about Babylon and Susis in Persia: if the wise Physicopers (whom they term Magi) drinke of that herb, they shall incontinently haue the spirit of prophesie, and foretell things to come.

There

There is besides in the region called Baſtriana & about the riuer Boryſthenes, another ſtrange plant named Gelotophyllis, which (by his report) if one do drink with Myrrh and wine, it will cauſe many fantaſticall apparitions: and the party ſhal therupon fall into a fit of laughter without ceaſing and intermiſſion, and neuer giue ouer, vnleſſe it be with a draught of Date wine, wherein were tempered the kernels of Pine nuts together with pepper and hony.

Touching the herb of good fellowſhip Syſſitietis, found in Perſis, it tooke that name becauſe it maketh them exceeding mery who are met together at a feaſt. They call the ſame herb likewiſe Protomedia, for that it is ſo highly eſteemed among kings and princes. And another name it hath beſides, to wit, * Acaſignete, becauſe it commeth vp alone & no other herbs neere vnto it: yea, and one more yet, namely, Dionyſonymphas, becauſe wine and it fort ſo well together, and make as it were a good marriage.

The ſame Democritus talketh alſo of Helianthe: an herb leaued like to the Myrtle, growing in the country Themifcyra, and the mountrains of Cilicia, coaſting along the ſea. And he giues out, that if it be boiled with Lions greaſe, and then together with Safron and Date wine reduced into an ointment, the foreſaid Magi and the Perſian kings therewith annoint themſelues, to ſeem thereby more pleaſant and amiable to the people: which is the reaſon, that the ſame herb is called Heliocallis.

Ouer and beſides, he maketh mention of Hermefias (for ſo he termeth not an herb but a certain compoſition) ſingular for the getting of children, which ſhall proue faire, and of good nature beſides. Made it is of Pine nut kernels, ſtamped and incorporat with hony, Myrrh, Safron, and Date wine, with an addition afterwards of the hearbe Theombrotium and milke: and this confection he preſcribeth to be drunk by the man a little before the very act of generation; but by women vpon their conception, yea, and after their deliuey all the while they be nourses and giue ſuck: and in ſo doing they may be aſſured, thoſe children of theirs, thus gotten, bred, and reared, ſhall be paſſing faire and well fauoured, of an excellent ſpirit and courage: and in one word, euery way good. Of all theſe herbes before ſpecified, he ſetteth down alſo the very names which the ſaid Magi call them by. Thus much for the Magicke herbes found in Democritus his booke.

Apollodorus, one of his diſciples and followers, comes in with his two herbes to the other before named. The one he calleth *Æſchynomæne*, becauſe it draweth in the leaues, if one come neare vnto it with the hand: the other *Crocis*, which if the venomous ſpiders *Phalangia* do but touch, they will die vpon it.

Crates writeth of an herb called *Oenotheris*, which being put in wine, if any ſauage beaſts be ſprinkled therewith, they will become tame, gentle and tractable.

A famous * Grammarian of late daies made mention of another herb *Anacampſeros*, of this vertue, That if a man touched a woman therewith, were ſhe departed from him in all the hatred that might be, ſhe ſhould come again and loue him entirely. The ſame benefit alſo ſhould the woman find thereby, in winning the loue of a man. This may ſuffice for the preſent to haue written of theſe wonderfull Magicke herbes, conſidering that I meane to diſcourſe more at large of them and their ſuperſtition, in a more conuenient place.

CHAP. XVIII.

¶ Of *Eriphia*, *Lanaria*, and *Stratiotis*, with the medicines which they yeeld.

Many writers haue made mention of *Eriphia*. This herb hath within the ſtraw of the ſtem a certain ſie like a beetle, running vp and down, and by that meanes making a noiſe like vnto a yong kid, whereupon it tooke the foreſaid name. There is not a better thing in the world for the voice, than this herb, as folk ſay.

The herb *Lanaria*, giuen to ewes in a morning when they are faſting, cauſeth their vdders to ſtrout with milke. *Lactoris* likewiſe is a common herb and as well known, by reaſon that it is ſo full of milke, which cauſeth vomit, if one taſt thereof neuer ſo little. Some there be who ſay, that the herb which they call * *Militaris*, is all one with this *Lactoris*: others would haue it to be very like vnto it, and that it ſhould haue that name, becauſe there is not a wound made with ſword or edged weapon, but it healeth it within ſiue daies, in caſe it be applied thereto with oile.

Semblably, the Greek writers make great reckoning of their * *Stratiotes*: but this hearbe groweth

* As one would ſay, without brother or ſiſter.

* Apion called alſo *Pleiſionites*.

* The ſoulders hearbe.

* All one with *Militaria*.

A groweth onely in Egypt, and namely in ſloten grounds where the riuer Nilus hath ouerflowed: and like it is vnto Sengreen or Houſleek, but that it hath bigger leaues. It is exceeding refrigeraſtiue; and a great healer of green wounds, being made into a liniment with vineger: moreover it cureth *S. Anthonies* fire, and all apoſtumes which are broken and run matter: if it be taken in drinke with the male Frankincenſe, it is wonderfull to ſee how effectuell it is to repreſſe the flux of blood from the reins.

CHAP. XIX.

¶ Of the herbes that grow vpon the head and chapter of Images and Statues. Of herbes found in riuers. Of the herb called *Lingua*. Of herbes growing through a ſiue, and vpon dung hills. Of *Rhodora* and *Impia*, two herbes. Of *Peſcen Veneris*. Of *Nodia*. Of *Clauers*, or *Goole-graſſe*, called otherwiſe *Philanthropos*. Of the little *Bur* named *Canaria*: of *Tordile*. Of the ordinarie *Cotch-graſſe*, *Stitchwort*, or *Dent-de-chien*. Of the hearbe *Dactylus*, and *Fenigreeke*: with their medicinal vertues.

IT is commonly ſaid, That the herbes or weeds growing vpon the head of any ſtatue or Image, preſently allay the head-ach (if they be gathered in the lapper or any part of ſome garment) ſo as the Patient weare them tied about the necke, by red linnen thread, or inſolded with n ſome red linnen clout. Any herb whatſoeuer gathered out of ſome riuer, brook, or great riuer, before the Sun riſing, ſo as no man ſee the party during the time of the gathering, provided alwaies that it be tied to the left arm of the ſick Patient, and he or ſhe not know what it is, driues away any tertian ague, if it be true which is commonly ſaid. There is an herbe growing about fountains, called *Lingua*, i. a Tongue: the root therof being burnt into aſhes, & incorporat with the greaſe of a ſwine (but you muſt look, ſay they, that the ſwine be black and barraine) cauſeth haire to come againe, in caſe the place which is bare & bald, be annointed therewith in the ſun. Caſt a ſiue or riddle forth into any beaten path or high way, the graſſe or weeds comming vp vnderneath, and growing through the ſame, if they be gathered and bound about the neck or any other part of women with childe, doe haſten their trauell and deliuey. Thoſe herbes which be found growing vpon muck hills, about country farms, are paſſing good and effectual for the ſquancy, if they be drunk with water. The graſſe or hearb neere vnto which a dog liſts vp his leg and piſſeth, if it be plucked out of the ground without touching knife or yron inſtrument, cureth any diſlocation or bone out of joint, moſt ſpeedily.

Touching the tree (in manner of an *Opiet* or *Poplar*) called *Rumbotinus*, I haue deſcribed it in my treatiſe of Hortyards and Tree plots. Neare to one of theſe (and namely, when there is no vine coupled or married to it) there groweth a certain herb, which in France they call *Rhodora*: it riſeth vp with a ſtem pointed and knotted in manner of a fig tree rod or wand; beareth leaues reſembling nettles, ſo what whitith in the mids, but the ſame in proceſſe of time become red all ouer; and a ſiue of ſiue colour: this herb ſtamped and mixed with old hogs greaſe, makes a ſoueraigne liniment for all ſwellings, inflammations, and apoſtumes gathering to an head; provided alwaies that no edge tooke come neare to touch it, and that the party who is dreſſed or annointed therewith turn the head to the right hand, and ſpit thrice vpon the ground on that ſide. And the operation of this medicine will be the more effectual, if three ſundry men of three diuers nations, ſtand on the right hand when they annoint the Patient.

Concerning the herb *Impia*, which is of a hoary colour and white withall, it reſembleth in ſhew the *Rosemary*, riſing vp with a main ſtem, leaſed and headed in manner of a *Coleſtocke*: from which principall body, there grow forth other ſmall branches, euery one bearing little tufts or heads riſing and mounting about the mother ſtocke (whereupon they called it in Latine *Impia*, for that the children ouer-topped their parents) yet there be others who haue thought it rather ſo called becauſe there is no beaſt wil touch or taſt it. This herb, if it be ground between two ſtones, waxeth as hot as fire, & yeeldeth a iuice which is excellent for the ſquancy, if the ſame be tempered with milke and wine. But this is ſtrange that is reported moreover, namely, That whoſoeuer hath once taſted of this hearb, ſhall neuer be troubled with that diſeaſe; and therefore they uſe to giue it in waſh and ſwil, to ſwine: but look which of them reſuſe to drinke of this medicine, ſhal die of the ſaid ſquancy. Some are of opinion, That in birds neſts there is ſome of this hearbe commonly ſet and twiſted among other ſtickes, whereby it commeth to

T

paſſe

pasſe that the yong birds neuer be choked, gobbler they their meat as greedily as they will.

As touching the herb called Veneris Peſcen, which took that name of the reſemblance that the long cods thereof haue to combe or rake teeth: the root, if it be ſtamped with mallowes, and ſo reduced into a cataplaſme, draweth forth all ſpils, thornes, or whatſoeuer ſticketh within the fleſh. The herb * Exedum, is ſingular to cure the lethargy, and all drow ſineſſe.

* It ſeemeth
by name and
effect, to be of
ſome theriac
and ſtrength
giving
quality.

* The graſſe
of the
dog.

As for Nodia, it is an herb well knowne in curriers ſhops. They call it alſo Mularis, & other names beſides they haue for it: but tearme it how you will, it healeth corroſiue vlcers: and I find that it is of ſingular operation againſt the poiſon of ſcorpions, if it be drunk in wine or oxycrat, (i.) vineger and water mingled together. There is a certaine rough and prickly herbe, which the Greeks call by a pretty name * Philanthropos, for that it ſticketh to folks cloaths as they paſſe by. A chaplet or guirland made of this herb, and ſet vpon the head, eaſeth the pain thereof. As for the little Bur called Lappa Canaria, if it be ſtamped with Plantaine and Millefoile, and together with them conſecrated in wine, it healeth all cancerous ſores, ſo it be applied vnto the place, and removed once in three daies. The ſame herb digged forth of the ground without any ſpade or yron inſtrument, cureth ſwine, if it be put into the trough where they bee ſerued with draſſe and ſwill, or given them in milk and wine. Some adde moreover, that this charm muſt be ſaid in the digging, *Hæc eſt herba Argemon, quam Minerva reperit ſuis remedium, qui de illa guſtauerint: (i.)* This is the herb Argemon, which Minerva inuented as a remedy for diſeaſed ſwine, as many as taſted thereof.

As for Tordile, ſome haue ſaid that it is the ſeed of Sefeli, or Siler of Candy: others take it to be an herb by it ſelfe, which alſo they called Syreon: for mine own part, I find by my reading nothing of it, but that it delighteth to grow vpon mountains; and that being burnt, it is good to be drunke for to prouoke womens monethly terms, and to expectorat the ſuperfluous ſleame out of the breſt: for which purpoſes (they ſay) that the root is more effectual in operation: alſo that the iuice thereof taken in drinke to the weight of three oboli, is ſingular for the reins: finally, that the root is one of the ingredients which go to the making of emolliſtiue plaſters or cataplaſmes.

The Quich-graſſe, otherwiſe named Dent-de-chien, or Dogs-graſſe, is the commoneſt herbe that groweth: it runneth & creepeth within the earth by many knots or ioints in the root, from which, as alſo from the branches and top-frigs trailing aboue ground, it putteth forth new roots and ſpreadeth into many branches. In all other parts of the world, the leaues of this graſſe grow ſlender and ſharp pointed toward the end: only vpon the mount Pernaſſus (wherupon it is called Gramen Pernaſſi) it brancheth thicker than in other places, and reſembleth in ſome fort Ivie, bearing a white floure, and the ſame odoriferous. There is not a graſſe in the field whereon horſes take more delight to feed, than this, whether it be greene as it groweth, or dry and made into hay, eſpecially if it be given them ſomewhat ſprinkled with water. Moreover, it is ſaid, that the inhabitants about the ſaide mount Pernaſſus, do draw a iuice out of this graſſe, uſed much to increaſe plenty of milk; for ſweet and pleaſant it is: but in other parts of the world, in ſtead thereof, they uſe the decoction of the common graſſe, for to conglutinate wounds: [and yet the very herb it ſelfe in ſubſtance will do as much, if it be but ſtamped and ſo applied: and beſides, a good deſenſatiue it is to keep any place that is cut or hurt, from inflammation.] To the ſaid decoction, ſome put wine and hony: others adde a third part in proportion of Frankincenſe, Pepper, and Myrrhe: and then ſet all ouer the fire againe, and boile it a ſecond time in a pan of braſſe: which compoſition they uſe as a medicine for the tooth-ach and watering eyes, occaſioned by the flux of humors thither. The root ſodden in wine, appeaſeth the wrings & torments of the guts, openeth the conduits of the vrine, and giueth it paſſage; beſides, it healeth the vlcers of the bladder; yea, it breaketh the ſtone. But the ſeed is more diureticall, and with greater force driueth downe vrine than the root. And yet it ſtoppeth a laſke, and ſtaieſh vomit. A peculiar vertue it hath againſt the ſting of dragons or ſerpents. Moreover, ſome there be, who giue direction in the cure of the kings euil, and other flat impoſtumes called Pani, to take nine knots or ioints of a root of this graſſe: and if they cannot find one root with ſo many ioints, to take two or three roots, vntill they haue the ſaide number: which done, to enwrap or fold the ſame in vnwaſhed or greaſe wooll which is black [with this charge by the way, that the party who gathered the ſaid roots be faſting] and then to goe vnto the houſe of the patient that is to be cured, waiting a time when hee is from home: and be ready at his returne to receiue him with the

G

A theſe words three times pronounced, *Ieiunus ieiuno medicamentum do*, [i. I being yet faſting, giue thee a medicine alſo whiles thou art faſting:] and with that, to bind the ſaide knots & roots vnto the parts affected, and ſo continue this courſe for three daies together. Furthermore, that kind of graſſe which hath ſeuen ioints in the root, neither more nor leſſe, is ſingular for the head ach, and worketh great effects if the Patient carrieth it tied faſt about him. Some Phyſicians do preſcribe for the intolerable pain of the bladder, to take the decoction of this graſſe boyled in wine vnto the conſumption of one halfe, and giue it to drinke vnto the Patient, preſently vpon the coming out of the baine or hot houſe.

Touching the graſſe, which by reaſon of the pricks that it beares is named Aculeatum, there be three ſorts of it: the firſt is that which ordinarily hath five ſuch prickles in the head or top thereof, and thereupon they call it Penta Daſtylon, i. the five finger graſſe: theſe prickles when they be wound together, they uſe to put vp into the noſthrils, and draw them downe againe, for to make the noſe bleed. The ſecond is like to * Scengreen or Houſleek: ſingular good it is for the whitſlows, and excreeſences or riſings vp of the ſkin about the nail roots, if it be incorporat into a liniment with hogs greaſe: and this graſſe they call Daſtylos, becauſe it is a medicine for the fingers. * The third kind named likewiſe Daſtylos but ſmaller than the other, groweth vpon old decayed wals or tyle houſes: this is of a cauſtick & burning nature, good to reſſeſſe the canker in running and corroſiue vlcers. Generally, a chaplet made of the herbe Gramen or Dogs-graſſe, and worn vpon the head, ſtancheſh bleeding at the noſe. The Gramen that groweth along the high waies in the country about Babylon, is ſaid to kill camels that graſe vpon it.

Fenigreeke cometh not behind the other herbs before ſpecified, in credit and account for the vertues which it hath: the Greeks call it Telus and Carphos: ſome name it Bueras and Agoceras, for that the * ſeed reſembleth little hornes: we in Latine tearme it Silicia or Siliqua. The manner of ſowing it, I haue declared in due place ſufficiently. The vertues thereof, is to dry, molliſie, and reſolue: the iuice drawne out of it after the decoction, is right ſoueraigne for many infirmities and diſeaſes incident to women, and namely in the naturall parts, whether the matrice haue a ſchirre in it and be hard or ſwolne, or whether the necke thereof be drawne too ſtreight and narrow: for which purpoſes, it is to be uſed by way of fomentation, inſeſſion, or bath; alſo by inſuſion or inſection with the matrenchyte. Very proper it is to extenuate the ſcurf or ſcales like dandruffe, appearing in the viſage: being ſodden and applied together with ſal-nitre, it helpeth the diſeaſe of the ſpleen. The like effect it hath with vineger: and being boyled therin, it is good for the liuer: for ſuch women as haue painful trauel in child-birth, & be hardily deliuered. Diocles appointed Fenigreeke ſeed to the quantity of one acetabule, to be giuen in nine cyaths of wine cuit for three draughts: with this direction, that the woman firſt ſhould take one third part of this drinke, and then go to a hot bath, and whiles ſhe were ſweating therein, to drinke one halfe of that which was left: and preſently after ſhe is out of the bain, ſup off the reſt. And he ſaith there is not the like medicine to be found in this caſe, when all others will take no effect. The floure or meale of Fenigreeke ſeed boyled in mead or honied water, together with barley or Linſeed is ſingular for the paine of the matrice, either applied to the ſhare in manner of a cataplaſme, or put vp into the naturall parts as a peſſary, according as the abouenamed Diocles ſaith: who was wont likewiſe to cure the leproy or S. Magnus euil, to clenſe & mundifie the ſkin, of freckles & pimples, with a liniment made with the ſaide floure incorporat with the like quantity of brimſtone: with this charge, to prepare the ſkin by rubbing it with ſalnitre, before the ſaid ointment were uſed, and then to annoint it oftentimes in a day. Theodorius uſed to mixe with Fenigreeke a fourth part of the ſeed of garden crefſes wel clenſed, & to temper them in the ſtrongest vineger that he could come by, which he took to be an excellent medicine for the leproſie. Damion ordained to make a drinke with half an acetabule of Fenigreeke ſeed put into 9 cyaths of cuit or ſheere water, and ſo to giue it ſo prouoking of womens flours: & no man doubts but the decoction of Fenigreeke is moſt whoſome for the matrice and the exulceration of the guts: like as the ſeed it ſelfe is excellent for the ioints & precordial parts about the heart. But in caſe it be boyled with Mallows, it is good for the matrice & guts, ſo there be put to the ſaid decoction ſome honied wine, & then giuen in drinke: for euen the very vapor or ſume of the ſaid decoction doth much good to thoſe parts. Alſo the decoction of Fenigreeke ſeed rectifieth the ſtinking rank ſmel of the arm-pits, if they be waſhed therewith. The floure made of Fenigreeke ſeed, incorporat with nitre & wine, quickly clenſeth the head of ſcurf, ſcales, & dandruffe. But

boiled in hydromell (i. honyed water) and brought into a liniment with hogs greafe, it cureth the swelling and inflammation of the members ſeruing to generation:likewiſe it is ſingular for the broad and flat apoſtēms called Pani, the ſwelling kernels and inflammations behinde the ears, the gout as well of the feet as of the hands and other ioint; alſo the putrifaction of the fleſh ready to depart from the bone: and being incorporat in vineger, it helpeth diſlocations: being boiled in vineger and hony only, it ſerueth as a good liniment for the ſpleen: and tempered with wine, it clenſeth or mundifieth cancerous ſores; but put thereto hony, it healeth them throughly in a ſhort time. The ſaid flour of Fenigreeke ſeed taken in a broth or ſupping, is an approved remedy for an vlcer within the breſt, and any inueterat cough; but it asketh long ſee- thing, even vntill it haue loſt the bitterneſſe: and afterwards hony is put thereto, and then it is a ſingular grewell for the infirmities beforeſaid. Thus you ſee what may be ſaid of thoſe hearbes which are in compariſon but of a mean account: it remaineth now to diſcourſe of thoſe which are of more account and eſtimation than the reſt.

THE TWENTY FIFTH BOOKE OF THE HISTORIE OF NATVRE,

WRITTEN BY C. PLINIVS
SECVNDVS.

CHAP. I.

¶ *The nature and properties of Hearbs growing wild and of their owne accord.*

When I conſider the excellency of ſuch hearbes, whereof now I am to treat, and which the earth ſeemeth to haue brought forth onely for the vſe of Phyſick, I cannot chuſe but grow withall into a wonderfull admiration of the great induſtry and careful diligence of our Antients before-time, who haue made experiments of all things, and left nothing vntried: neither reſerued they afterwards this hidden knowledge to themſelues, nor concealed ought, but were willing to communicate the ſame vnto poſteritie for their good and benefit: but we contrariwiſe in theſe daies, are deſirous to keep ſecret and to ſuppreſſe the labors of other men, yea and to defraud the world of thoſe commodities which haue been purchaſed by the ſweat of other mens browes: for verily we ſee, it is an ordinary courſe, that ſuch as haue attained to ſome knowledge, enue that little ſkil vnto their neighbours: and to keepe all forſooth to themſelues and teach none their cunning, they thinke the onely way to winne a great name and opinion of ſome deepe and profound learning. And ſo far be we off from deu- ſing new inuentions, and imparting the ſame to the general profit of mankind, that for this long time men of great wit and high conceit haue ſtudied and praſiſed to compaſſe this one point, That the good deeds of their Anceſtours might with themſelues die and be buried for euer. But certes, wee ſee and know, that the ſeuerall inuentions of ſome one thing or other, haue cauſed diuers men in old time to be canonized as gods: in ſuch ſort, as their memoriall hath bene eternized by the names euen of hearbes which they found out: ſo thankfull was the age in ſuſing, as to recognize and acknowledge a benefit from them receiued, and by this meanes (in ſome meaſure) to make recompence. This care and induſtrie of theirs, if it had bene employ- ed in Domeſticall Plants neere home, which either for pleaſure and delight, or elſe for the Kitchen and Table, are ſet and ſowed, could not haue bene ſo rare and wonderfull: but they

A they ſpared not to climbe vp the top of high mountaines, and to rocks vnacceſſible; to trauell through blind and vnpeopled deſerts, to ſearch euery veine and corner of the earth, & all to find and know the vertues of herbs: of what operation the root was, for what diſeaſes the leaues were to be vſed, yea, and to make whoſon medicines for mans health of thoſe ſimples, which the verry four-footed beaſts of the field neuer fed vpon, nor once touched.

CHAP. II.

¶ *The Latine Authors who haue written of herbs, and their natures. At what time the knowledge of Simples began to be praſtiſed and profreſed in Rome. The firſt Greeke writers who traueled in this Argument. The inuention of herbs. The ancient Phyſicke, and the manner of curing diſeaſes in old time. What is the cauſe that Simples are not now ſo much vſed for remedies of diſeaſes as they haue bin. Finally, of the ſweet Briar or Eglantine, and the herb Dragons, with their medicinall vertues.*

WE Romans haue bin more ſlack and negligent in this behalfe than was beſeeming vs, conſidering how otherwiſe, there was not a nation in the world more apprehenſiue of all vertues and things profitable to this life, than ours. For to ſay a truth, *M. Cato* (that famous clerke and great profeſſor, ſo well ſeen in all good Arts and Sciences) was the firſt (and for a long time the only author) who wrote of Simples: and howſoeuer he handled that argument but briefly and ſummarily, yet he omitted not the leech-craft belonging alſo to ſine and oxen. Long after him, *C. Fulgius* (a noble gentleman of Rome, & a man of approved literature) compiled a treatiſe of Simples which he left vnperfect; howbeit he dedicated the book to *Iu- guſtus Caſar* the Emperour, as may appeare by a preface by him begun, wherein (after a religious and ceremonious manner of ſupplication) he ſeemeth to beſeech the ſaid prince, That it might pleaſe his Maieſty eſpecially, to cure all the maladies of mankind. And before his time, the on- ly man among our Latines (as far as euer I could find) who wrote of Simples, was *Pompeius* the Great, the vaſſall or freed man of *Pompey* the Great. And this was the firſt time that the knowledge of this kind of learning was ſet on foot and profeſſed at Rome. For *Mithridates* (the moſt mightie and puiſſant king in that age, whoſe fortune notwithstanding was to be vanquiſhed and ſub- dued by *Pompey*) was well knowne vnto the world not only by the fame that went of him, but alſo by good prooſe and euident arguments, to haue bin of all other before his time, a prince moſt added to the publick benefit of all mankind: for the only man he was who deuſed to drinke poiſon euery day (hauing taken his preferuatiues before) to the end that by the ordinary vſe and continuall cuſtome thereof, it might be familiar vnto his nature, and harmleſſe. The firſt he was alſo who deuſed ſundry kinds of antidotes or counterpoiſons, whereof one retaineth his name to this day: he it was alſo and none but he, as men think, who firſt mingled in the ſaid antidotes and preferuatiues, the blood of Ducks bred in his own realme of Pontus, for that they fed and liued there, of poiſons and venenous hearbs. Vnto him, that famous and renowned profeſſor in Phyſicke *Aſclepiades*, dedicated his books now extant: for this Phyſitian being ſolicited to re- paire vnto him from Rome, ſent the rules of Phyſick digeſted into order, and ſet downe in writ- ing, inſtead of comming himſelfe. And *Mithridates* it was (as it is for certaine knowne) w- o alone of all men that euer were, could ſpeake two and twentie languages perfectly; ſo as for the ſpace of ſix and fiftie yeares (for ſo long he reigned) of all thoſe Nations which were vnder his dominion, there neuer came one man to his court, but he communed and parled with him in his own tongue without any truchman or interpreter for the matter. This noble Prince (amongſt many other ſingular gifts that he had, teſtifying his magnanimitie and incomparable wit) ad- duced himſelfe particularly to the earneſt ſtudie of Phyſicke: and becauſe he would be exqui- ſite and ſingular therein, he had intelligencers from all parts of his dominions) and thoſe took vp no ſmall part of the whole world) who vpon their knowledge, exhibited vnto him the parti- cular natures and properties of euery ſimple: by which means, he had a cabinet full of an infinite number of receipts and ſecrets ſet down together with their operations & effects, which he kept in his ſaid cloſet, and left behind him with other rich treaſure of his. But *Pompey* the Great, hauing vnder his hands the whole ſpoile of this mighty Prince, & meeting in that ſaccage with thoſe notes aboueſaid, gaue commendement vnto his vaſſall or enfranchiſed ſervant the aboue- named *Leuſus* (an excellent linguift & moſt learned grammarian) to tranſlate the ſame into the

Latine tongue: for which act of *Pompey*, the whole world was no lesse beholden vnto him, than G the common-wealth of Rome for the foresaid victorie.ouer & besides these, what Greeke authors haue travelled in Physicke, I haue declared heretofore in conuenient place. And among the rest, *Euax* a King of the Arabians, wrote a booke as touching the vertues and operations of Simples, which he sent vnto the Emperour *Nero*. *Cratenus* likewise, *Dionysius* also, and *Atterodorus*, wrote of the same Argument after a most pleasant and plausible manner (I must needs say,) yet so, as a man could picke nothing almost out of all their writings, but an infinit difficultie of the thing, for they painted every herb in their colors, and vnder their pourtraicts they couched and subscribed their seuerall natures & effects. But what certainty could there be therein? pictures, you know, are deceitfull; also, in representing such a number of colours, and especially expressing the lively hew of Herbs according to their nature as they grow, no maruell if they that limned and drew them out, did fail and degenere from the first pattern and originall. H Besides, they came far short of the mark, setting out hearbs as they did at one only season (to wit, either in their floure, or in seed time) for they change and alter their form and shape euery quarter of the yeare. Herof it came, that all the rest labored to describe their forms & colours, by words only. Some without any description at all of their figure or colour, contented themselves (for the most part) with setting downe their bare names, and thought it sufficient to demonstrate and shew their power and vertue afterwards, to whosoever were desirous to seeke after the same: and verily the knowledge thereof is no hard matter to attain vnto. For mine own part, it hath bin my good hap to see growing in the plant, all these medicinable herbes (excepting verily few) by the meanes of *Antonius Cassor* (a right learned and most renowned Physitian in our daies) who had a pretty garden of his own well stored with simples of sundry sorts, which hee maintained and cherished for his owne pleasure and his friends, who vsed to come and see his plot, as indeed it was worthy the sight: this Physitian was then about a hundred yeres old, & in all his life neuer found what sicknesse meant, neither for all this age of his, was his wit decayed, or memory any whit impaired, but continued as fresh still as if he had bin a yong man. But to proceed forward with our discourse: Certes we shall not find a thing againe which our Ancestors so much admired and were more rauished withall, than the knowledge of simples. True it is, I confesse, that the inuention of the Ephemerides (to fore-know thereby not onely the day & night, with the eclipyses of Sun & Moon, but also the very hours) is ancient: howbeit, the most part of the common people haue bin and are of this opinion (received by tradition) from their forefathers) That all the same is done by enchantments, & that by the means of some forceries and herbes together, both Sun and Moone may be charmed, and enforced both to lose and recover their light: to doe which feat, women are thought to be more skilfull and meet than men. And to say a truth, what a number of fabulous miracles are reported to haue bene wrought by *Medea* queen of Colchis, and other women; and especially by *Circe* our famous witch here in Italy, who for her singular skil that way, was canonized a goddesse. And from hence it came (I suppose) that *Æschylus* a most ancient Poet, made report of * Italy to be furnished with herbes of mighty operation: and many others haue spoken much of the mountaine *Circeios* bearing her name, wherein the said Lady sometime dwelt & kept her residence. And for a notable proof of her singular skil in that kind, the same knowledge in some measure continueth vnto this day L in the Marsians (a nation descended from a son of hers) who are well knowne to haue a naturall power by themselves to tame and conquer all serpents, and not to be subiect to any danger from them. As for *Homer* verily (the father and prince of all learning & learned men, and the best author that we haue of antiquities) howsoeuer otherwise he was addicted to extoll and magnifie that we haue of antiquities) howsoeuer otherwise he was addicted to extoll and magnifie dame *Circe*, yet he attributeth vnto Egypt the glory and name for good herbes; yea though in his time there was not that base Egypt watered as now it is, with Nilus: for afterwards it grew by the mud left there by the inundation of the said river. Truly this Poet maketh mention of many singular herbes in Egypt, which the * Kings wife of that country gaue to that lady of his, *Helena*, of whom he writeth so much; and namely, the noble *Nepenthes*, which had this singular vertue and operation, To work obliuion of melancholy & heauinesse, yea and to procure easement and remission of all sorrowes: which, I say, the queene bestowed vpon *Helena* to this end, That she should communicate and impart it to the whole world for to be drunke in those cases abouesaid. But the first man knowne by all records to haue written any thing exactly and curiously of simples, was *Orpheus*. As for *Musæus*, and *Hesiodus* after him, in what admiration they held

* *Tullius* *de* *officiis* *lib. 2.*
* *Plinius* *de* *herbis* *lib. 20.*

* *Polydamus*,
* *Suetonius* *de* *Caesare* *lib. 1.*
* *Plinius* *de* *herbis* *lib. 20.*
* *Dionysius* *de* *herbis* *lib. 2.*
* *Dionysius* *de* *herbis* *lib. 2.*

A held, and how highly they esteemed the herb *Polion* about the rest, I haue shewed already. *Cerres*, *Orpheus* and *Hesiodus* both haue highly commended vnto vs perfumes and suffumigations. And *Homer* likewise writeth expressly of certain herbes by name, of singular vertue, which I will put downe in their due places. After him came *Pythagoras*, a famous Philosopher, who was the first that composed a booke, and made a treatise purposely of sundry herbes, with their diuers effects; ascribing wholly the inuention and originall of them to the immortall gods, and namely, to *Æsculapius* and *Democritus* compiled a volume of the same argument. But both hee and *Pythagoras* had travelled before al ouer Persis, Arabia, *Æthiopia*, and *Ægypt*, and there conferred with the Sages and learned Philosphers of that country, called *Magi*. In summe, so far were men in old time rauished with the admiration of herbes and their vertues, that they bashed not to atouch euen incredible things of them. *Xanthus* an ancient Chronicler, writeth in the first booke of his histories, of a Dragon, which finding one of her little serpents killed, raised it to life againe by a certain herbe, which he nameth *Balis*: and with the said herbe, a man also named *Thylo*, whom the Dragon had slaine, was reuiued and restored to health againe. Also King *Inba* doth report, That there was a man in Arabia, who being once dead, became aliue againe by the vertue of a certain herbe. *Democritus* said, and *Theophrastus* gaue credit to his words, That there is an herb, with which a kind of foule (whereof I haue made mention before) is able to make the wedge or stopple to flie out of the hole of her nest, into which the shepheards had driuen it fast, in case she bring the same herbe, and but once touch the foresaid wedge therewith. These be strange reports and incredible, howbeit they draw men into a wonderfull opinion of the thing, and fill their heads with a deep conceit, forcing them to confesse, That there is some great matter in herbes, and much true indeed which is reported so wonderfully of them. And from hence it is, that most are of this opinion and hold certainly, That there is nothing impossible, but may be performed by the power of herbes, if a man could reach vnto their vertues: many few there be who haue attained to that felicity: and the operation of most simples is vnkowne. In the number of these, *Herophilus* the renowned Physitian may be reckoned: who was of this mind and gaue it out in his ordinary speech, That some herbes there were, which were effectuell and did much good, if a man or woman chanced but to tread vpon them vnder their feet. And verily, this hath bin knowne and found true by experience, that some diseases would be more exasperat and angry, yea, and wounds grow to fretting and inflammation, if folk went but ouer certain herbes in the way as they passed on foot. Lo what the Physick in old time was! and how the same lay wholly couched in the Greek language, and not elswhere to be found. But what might be the reason, that there were no more simples knowne? Surely it proceeds from this, That for the most part they be rustickall peasants, and altogether vnlettered, who haue the experience and triall of herbes, as those who alone liue and conuerse among them where they grow. Another thing there is, Men are careless and negligent, and loue not to take any paines in seeking for them. Againe, euery place swarmeth with Leeches and Physitians, and men are so ready to run vnto them for to receiue some compound medicine at their hands, that little or no regard there is made of herbes and good Simples. Furthermore, many of them which haue bin found out and knowne, haue no name at all: as for example, that herb which I spake of in my Treatise concerning the cure and remedies of corne growing vpon the lands: and which we all know, if it be entered or buried in the foure corners of the field, will skar away all the foules of the aire, that they shal not settle vpon the corne, nor once come into the ground. But the most dishonest and shamefull cause why so few simples in comparison be knowne, is the naughtie nature and peeuish disposition of those persons who will not teach others their skill, as if themselves should lose forever that which they imparted vnto their neighbor. ouer and besides, there is no certain meanes or way to direct vs to the inuention and knowledge of hearbes and their vertues: for if we looke vnto these herbes which are found already, we are for some of them beholden to meere chance & fortune: and for others (to say a truth) to the immediat reuelation from God. For prooffe hereof, mark but this one instance which I will relate to you. For many a yeare vntill now of late daies, the biting of a mad dog was counted incurable: and looke who were so bitten, they fell into a certain * dread & feare of water: neither could they abide to drink, or to heare talk thereof, and then were they thought to be in a desperat case: it fortun'd of late, that a souldier, one of the gard about the * Pretorium was bitten with a mad dog, and his mother saw a vision in her sleep, giuing (as it were) direction vnto her for to send the roote vnto her sonne for

* *T. 1. 1. 1. 1.*

* or the prince;

to drink, of an Eglantine or wild rose (called Cymorhodon) which the day before she had espied growing in an hortyard, where she took pleasure to behold it. This occurred fel out in * Lactania, the nearest part vnto vs of Spain. Now, as God would, when the souldier before said vpon his hurt receiued by the dog, was ready to fall into that symptome of Hydrophobie, and began to feare water; there came a letter from his mother, aduertising him to obey the wil of God and to do according to that which was reuealed vnto her by the vision. Whereupon he dranke the root of the said sweet brier or Eglantine, and not only recovered himselfe beyond all mens expectation: but also afterwards as many as in that case tooke the like receit, found the same remedy. Before this time, the writers in Physick knew of no medicinable vertue in the Eglantine, but only of the sponge or little ball, growing amid the prickly branches therof, which being burnt and reduced into ashes, and incorporate with honey into a liniment, maketh haire to come againe where it was shed by any infirmity. But seeing I am fallen into the mention of Spain, it commeth to my mind, what I my selfe knew and saw in the same prouince, within the lands and domaines belonging to an host of mine; namely, a certaine plant or herb there lately found called * Dracunculus, which carried a main stem or stalk an inch or thumb thick, beset with spots of sundry colors, resembling those of vipers and serpents: and I was told, that it was a singular remedy against the sting or biting of any serpents. This Dracunculus differeth from another herb of that name, wherof I spake in the book going next before, for this hath a distinct form from that; and besides, another strange and wonderful property, namely, to shew two foot or thereabout aboue ground in the Spring time, when serpents first doe cast their sloughes or skins: & the same is no more seen, at the very time that serpents all retire into their holes and take vp their Winter harbor within the ground. Let this plant be gone once into the earth and hidden, you shal not see a Snake, Adder, or any other serpent stirring abroad. Whereby we may see what a kind and tender mother Nature is vnto vs (if there were nothing els to testifie her loue) in giuing vs warning beforehand of danger: and pointing vnto vs the very time when wee are to be afraid and to take heed of serpents.

CHAP. III.

¶ Of a certain venomous fount aine in Germany: of the herb Britannica. What diseases they be that put men to the greatest paine.

S O vnfortunat is our condition, and so much exposed are we to manifold calamities, that the searh is not pestered with wicked beasts only for to doe vs harme: but also there be otherwhiles venomous waters and pestilent tracts to work vs more wo and misery. In that voiage or expedition which prince *Cesar Germanicus* made into Germany, after he had passed ouer the riuier Rhene, and had giuen order to aduance forward with his army, he incamped vpon the sea-coasts along Friseland, where there was to be found but one spring of fresh water; and the same so dangerous, that whosoeuer drunk of that water, within two yerres lost all their teeth, and were besides so feeble and loose iointed in their knees, that vnneth they were able to stand. These diseases the Physitians termed * Stomacace and Scelctyrbe: as one would say, the malady of the mouth, and palfie of the legs. Yet they found a remedy for these infirmities, and that was a certain herb called * Britannica, which is very medicinable, not only for the accidents of the finewes and month, but also for the squinancy and stinging of serpents. It hath leaues growing somewhat long, and those inclining to a browneish or dark greene colour, and the root is blacke; out of which, as also from the leaues, there is a iuice drawne or pressed. The floures by a peculiar name be called Vibones: which being gathered before any thunder be heard, and so eaten, do assure and secure the parties altogether from that infirmity. The Frisians, nere vnto whom we lay incamped, shewed our men this herb. But I muse much and wonder what should be the reason of that name, vnlesse the Frisians bordering vpon the narrow race of the ocean, which lieth only between them & England (called in those daies Britanica) should therupon for the neighborhood & propinquity of that Island, giue it the name Britannica. For certain it is, that it took not that name because there grew such plenty therof in that countrv of England, that it should be transported ouer from thence to our camp; for as yet that Island was not wholly subiect to vs and reduced vnder the Roman seignorie. For an ordinary thing it was in old time practised by those that found out any herbs, to affect the adoption (as it were) of the same, & to call them by

* Some thinke this disease to be the Schor-buck or Scorbut, which raigeth yet at this day.
* Which is taken to be our Cochlearia, a Spoonwort, commonly called Scorbut-grasse or Scorbut-grasse.

A by their own names, wherein verily men took no small contentment: according as I purpose to shew by the example of certain kings and princes, whose names liue and continue yet in their herbs: so honorable a thing it was thought in those daies to find and it were but an hearbe that might do good vnto man. Whereas in this age wherein we now liue, I doubt not but there bee some who will mock vs for the pains taken in that behalfe, and think vs very simple for writing thus as we do of Simples; so base and contemptible in the eyes of our fine fooles and delicate persons, are euen the best things that serue for the benefit & common vility of mankind: howbeit, for all that, good reason it is and meet that the authors and inuentors of them, as many as can be found, should be named and praised with the best; yea, and that the operations & effects of such herbs should be digested and reduced into some method, according as they be appropriate to every kind of disease. In the meditation whereof, I cannot chuse nor contain my selfe, but deplore and pity the poore estate and miserable case of man: who ouer and besides the manifold accidents and casualties which may befall vnto him, is otherwise subiect to many thousands of maladies, which we haue much ado to deuise names for, euery houre of the day happening as they do, and wherof no man can account himselfe free, but every one is for his part to feare them. Of these diseases so infinit as they be in number, to determine precisely and distinctly which be most grievous, might seeme more folly, considering that every one who is sicke for the present, imagineth his owne sickness to be worst & fullest of anguish. And yet our forefathers haue giuen their judgement in this case, and by experience haue found, That the most extreme pain & torment that a man can indure by any disease, is the Strangury or pissing dropmeale, occasioned by the stone or grauell in the bladder. The next is the griefe and anguish of the stomack: and the third, Head-ach: for setting these three maladies aside, lightly there are no pains that can kill a man or woman so soon. And here by the way, I cannot for mine owne part but maruell much at the Greeks, who haue published in their writings venomous and pestilent herbs, as well as those that be good and wholesome. And yet there is an appearance and shew of reason, why some poisons should be knowen: for otherwhiles it falleth out that men liue in such extremity, as better it were to die, than so to lie in anguish and torment; inso much, as death is the best port and harbor of refuge that they haue. Certes, *Marcus Varro* reporteth of one *Servius Clodius* a gentleman or knight of Rome who for the extreame pain of the gout, was forced to annoint his legs and feet all ouer with a narcotick or cold poison, whereby hee so mortified the spirits of the muskles and sinews, that he became paralyticke in that part: and euer after vnto his dying day, was rid as well of all fence, as of the paine of the gout. But say, that in these cases it might be tollerable to set down in their books some poisons: what reason, nay what leaue had those Greeks to shew the means how the brains and vnderstanding of men should be intoxicated and troubled? what colour and pretence had they to set downe medicines and receits to cause women to slip the vntimely fruit of their womb, and a thousand such like casts & deuises that may be practised by herbs of their penning? for mine owne part, I am not for them that would send the conception out of the body vnaturally before the due time: they shall learne no such receits of me, neither will I teach any how to temper & spice an amatorious cup, to draw either man or woman into loue, it is no part of my profession. For wel I remember, that *Lucullus* a most braue Generall, and a captain of great execution, lost his life by such a loue potion. Much lesse then shall ye haue me to write of Magick, witch-craft, charmes, inchantments and forceries, vnlesse it be to giue warning that folk should not meddle with them, or to disprove those courses for their vanities, and principally to giue an Item, how little trust and assurance there is to be had in such trumpery. It sufficeth me and contenteth my mind, yea and I think that I haue done wel for mankind, in recording those herbs which be good and wholesome, found out by men of wit and learning for the benefit of posterity.

CHAP. IIII.

¶ Of Moly, and Dodecatheos: of Paony, otherwise called Pentorobus or Glycyfide. Of Panaces, *Asclepium*, *Heracium*, and *Chironium*. Of Panaces *Centarium* or *Pharnaceum*. Of *Heracium*, *Siderium*. Of Henbane called *Hyoisamus*, *Apollinaris*, or *Altercangenus*.

H Omer is of opinion, That the principall and foueraigne hearb of all others, is Moly; so called (as he thinketh) by the gods themselues. The inuention or finding of this hearbe hee

* ascri-

204310.

* ascribeth vnto *Mercury*; and sheweth that it is singular against the mightiest witchcraft & enchantments that be. Some say, that this herb Moly, euen according to *Homer's* description, with a round and black bulbous root to the bignesse of an onion, and with a leafe or blade like that of *Squilla*, groweth at this day about the riuier or lake *Peneus* and vpon the mountain *Cylleum* in *Arcadia*; also that it is hard to be digged out of the ground. The Grecian Simplists deseribe this Moly with a yellow floure, whereas *Homer* hath written, that it is white. I met with one phisitian, a skilful Herbarist, who affirmed vnto me, That this Moly grew in Italy also: and in verie truth he brought and shewed me a plant which came out of *Campaine*, about the digging vp whereof among hard and stony rocks, he had bin certain daies: but get he could not the entire root whole and sound, but was forced to break it off, and yet the root which he shewed mee was thirtie foot long.

Next vnto Moly in account and reputation, is that plant which they call *Dodecatheos*, for that it doth represent & comprehend the maiesty of all the chiefe gods. They say it it be drunk in water it is a foueraign medicine for al maladies. Seuen leaues it hath, resembling very much those of *Leetuce*, and the same spring from a yellow root.

As touching *Pæony*, it is one of the first herbs that were euer known and brought to light, as may appeare by the author or inuentor thereof, whose name it beareth still. Some call it *Pentorobos*: others *Glycyfide*. [where by the way I am to aduertise the Reader, of the difficulty in the knowledge of herbs by their names, considering that the same herbe hath in sundry places diuer appellations.] But to proceed forward with our *Pæony*: it groweth among bleake and shady mountains, rising vp with a stem between the leaues, * 4 fingers high, and bearing in the top 4 or 5 heads, fashioned somewhat like to *Filberds*, within which there is plenty of seed both red and black. This herb is good against the fantastick illusions of the * *Fauni* which appeare in sleep. It is said, that this herb must be gathered in the night season: for if the *Rainbird*, woodpeck or *Hickway*, called *Picus Martius*, should chance to spie it gathered, he would flie in the face, and be ready to peck out the eyes of him or her that had it.

The herb * *Panace*, promisseth by the very name a remedy of all diseases. A number there be of herbs so called: and all ascribed to some god or other for the inuention of them: for one of them hath the addition of *Aesclepien*, for that *Aesculapius* had a daughter named also *Panacea*. As touching the concret juice named *Opopanax*, it is drawn from the root of this plant (beeing of the *Ferula* or *Fennell* kind, such as I haue heretofore shewed) by way of incision, the which root hath a thick rind, and of a saltish fauor. When the root is pulled out of the ground, there is a religious ceremony obserued to fil vp the hole again with all sorts of corn, as it were in satisfaction to the earth for the violence offered in tearing it vp. As for the said juice *Opopanax*, where and how it should be made, and which is the best kind thereof and not sophisticated, I haue declared already in my Treatise of forrain and strange plants. That which is brought out of *Macedony*, they call *Bucolicum*, because the Neat-herds of the country mark when the liquor breaks forth and runneth out of it selfe, and so receiue and gather it from the plant: this wil not last, but of all the rest soonest loseth the force. Moreover, in all sorts of it, that is rejected principally, which is black and soft, for these be markes to know that it is corrupted; and sophisticated with wax. A second kind there is of *Panaces*, which they call *Heraclium*: the inuention of the vertues and properties whereof is attributed vnto *Hercules*. Some there be who call it *Origanum Heracliticum* the wild, because it is like to *Origan*, whereof I haue heretofore written: but the root of this *Panaces* is good for nothing. A third kind of *Panaces* took the name of *Chiron* the Centaur, who was the first that gaue intelligence of the herbe and the vertues thereof. The leafe is like vnto the Dock, but that it is bigger and more hairy: the floure is of a golden yellow color: the root but small: it loueth to grow in rich, fat, and battell grounds. The floure of this *Panaces* is most effectuall in Physick: in which regard there is more vse and profit thereof than of all the former kindes. A fourth *Panaces* there is besides, found out also by the same *Chiron*, whereupon it hath the denomination of *Centaurium*: called also it is *Pharnaceum*: the occasion of this two-fold name is this: because there is some controuersie in the first inuention thereof; whiles some attribute to it the Centaur *Chiron*; others to *K. Pharnaces*. This *Panaces* is vsually set and planted, bearing leaues indented in the edges like a saw, and those longer than any of the rest. The root is odoriferous, which they vse to drie in the shadow, and therewith to aromatize their wine, for a pleasant and delectable taste it giueth vnto it. Hereof they haue made two speciall kinds:

* *Pæon*, who was equal in time to *Hercules*, and lived 160 before the Trojan warre.

* *Sesquipedali*. Diale. a foot and half.

* I suppose he meaneth the disease called *Ephorsus* or *Incubus* the night Mare.

* *Andæw*, i. a medicine for all ills: as one would say, All-heale.

A kinds: the one with a * thicker leafe: the other with a thinner and smaller.

As for *Heraclion Siderion*, a plant it is also fathered vpon *Hercules*. It riseth vp with a slender stalk to the height of foure fingers, bearing a red floure, and leaues in manner of the *Coriander*. Found it is growing neare to pooles and riuers: and for a wound herb there is not the like, especially if the body be hurt by sword, or any edged weapon made of yron and Steele.

There is a wild Vine, named *Ampelos Chironia*, for that *Chiron* was the first author thereof. Of this plant I haue written in my discourse of Vines [vnder the name of *Vitis Nigra*] like as also of another * herb, which hath the goddesse *Minerva* for the inuentress.

Moreover, vnto *Hercules* is ascribed *Henbane*, which the Latines call *Apollinaris*; the Arabians, *Altercum* or *Altercangenon*; but the Greeks, *Hyoecyamus*. Many kinds there be of it: the one beareth black seed, floures standing much vpon purple; and this herb is full of pricks. And in very truth, such is the *Henbane* that groweth in *Galatia*. The common *Henbane* is whiter, and brancheth more than the other: taller also than the *Poppy*. The third kinde bringeth forth seed like vnto the graine of *Iris*. All the sort of these already named, trouble the brain, and put men besides their right wits: besides that, they breed dizziness of the head. As touching the fourth, it carieth leaues soft, full of down, fuller and fatter than the rest: the seed also is white: & it groweth by the sea-side. Physitians are not afraid to vse this in their compositions, no more than that which hath red seed. Howbeit, otherwhiles this white kinde especially, if it be not thoroughly ripe, proueth to be reddish, and then it is rejected by the Physitians. For otherwise none of them all would be gathered, but when they be fully drie. *Henbane* is of the nature of * wine, and therefore offensive to the vnderstanding, and troubleth the head: howbeit, good vse there is both of the seed it selfe as it is in substance, and also of the oile or iuice drawn out of it apart. And yet the stalks, leaues, and roots, are imploied in some purposes. For mine owre part, I hold it to be a dangerous medicine, and not to be vsed but with great heed and discretion. For this is certainly knowne, That if one take in drink more than foure leaues thereof, it will put him beside himself. Notwithstanding the Physitians in old time were of opinion, that if it were drunk in wine, it would driue away an ague. An oile (I say) is made of the seed thereof, which if it be but dropped into the ears, is enough to trouble the brain. But strange it is of this oile, That if it be taken in drink, it serues for a counterpoison. See how industrious men haue bin to proue experiments, and made no end of trying all things, in so much as they haue found means and forced very poisons to be remedies.

* *Minerva* was the inuentress of *Warre*, *Arts*, *Handicraft*, &c.

* *Vitis*. Some read *Veneni*, i. poison.

CHAP. V.

¶ Of *Mercury*, called *Linozostis*, *Parthenium*, *Hermupoa*, or rather, *Mercurialis*: of *Achilleum*, *Panaces*, *Heraclium*, *Sideritis* and *Millefoile*: of *Scoparia*, *Hemionium*, *Teucrium*, and *Splenium*: of *Melampodium* or *Ellebores*, and how many kinds there be of it: of the black or white *Ellebores*, & their medicinable vertues: how *Ellebores* is to be giuen, how to be taken, to whom, and when it is not to be giuen: and how it killeth *Mice* and *Rats*.

E The herb *Mercury*, called by the Greeks *Linozostis* and *Parthenion*, was thought to be first found out by *Mercury*: whereupon many of the Greeks call it *Hermupoa*: and wee all in Latine name it *Mercurialis*. Of it be two kinds, the male and the female: howbeit, the female *Mercury* is of better operation than the other. It riseth vp with a stem a cubit high, which otherwhile brancheth in the top: the leaues be like vnto *Basil*, but that they are narrower: full of knots or joints the stalk is, and those haue many hollow concavities like arme-pits. The seed hangeth down from those ioints. In the female the same is white, loose, & in great plenty: in the male it standeth close vnto those joints, but thinner: and the same is small and as it were wreathed. The leaues of the male *Mercury* be of a dark and blacker green, whereas in the female they be more white. The root is altogether superfluous, and very little. Both the one and the other delight to grow in plains and champion fields well ordered and husbanded. It is wonderful if it be true, that is reported of both these kinds, namely, That the male *Mercury*, causeth women to beare boies: and the female, girls. For which purpose the woman must presently after that shee is conceived, drink the iuice of which *Mercury* she will, in sweet wine cutt, and eat the leaues either foddren with oile & salt, or els Greene & raw in a sallad with vinegar. Some there be who boyle

boile it in a new earthen vessell neuer vsed before, together with the hearbe Heliotropium or G Turnsol, and 2 or 3 cloues of Garlick, vntill it be thoroughly sodden. VVhich decoction they prescribe to be giuen to women, as also the herb it self to be eaten the second day of their monthly sicknes, and so to continue for 3 daies together: & then vpon the fourth day, after they haue bathed, to company with their husbands. *Hippocrates* giueth wonderfull praise vnto Mercury, as wel the male as the female, for all those accidents which follow women: but the maner of vying it, which he prescribed, there is no Physitian hath skil of. He appointed to make pessaries thereof with hony, oile of Koses, oile of Ireos or Lillies, and so to put them vp into the seuerer parts: and in this manner he saith that the herb is excellent good for to prouoke the monthly termes of women, and to fetch away the after-birth. Hee affirmeth also, that a potion or fomentation therewith wil do as much. Moreover, by his saying, the iuice of Mercury infused into the ears, or applied by way of liniment with old wine, is singular for them when they runne with stinking matter: he ordained likewise a cataplasme of Mercury to be laid to the belly, for to stay the violent flux of humors thither: for the strangury also and infirmities of the bladder. In which cases he gaue the decoction therof with Myrhe and Frankincense. And verily for to loosen the belly, although the Patient were in a feuer, there is a potion of Mercury singular good, made in this wise: Take a good handfull of Mercury, seeth the same in two sextars of water, vntill one halfe be consumed; let the party drink the same with salt and hony mixed therewith: but the said decoction if it be made with an hogs foot, with a hen, capon, or cock boyled withal, is the wholefomer. Some Physitians were of opinion, That for to purge the body, both Mercuries, as wel the male as the female are to be giuen, either boyled alone by themselves or els with Mallows: they cleanse the breest parts, and euacuate choler, but they hurt the stomacke. Touching all the other properties of Mercury, I will write in place conuenient.

As *Chiron* the Centaure found out the medicinable vertues of certaine herbes, so we are beholden to his scholler *Achilles* for one, which is singular to heale wounds, and of his name is called *Achilleos*. This is that wound-herb, wherewith (by report) he cured prince *Telephus*. Some haue thought that hee deuised first the rust of brasse or verdegreece, which is so excellent for salues and plasters: & therefore you shall see *Achilles* commonly painted scraping off the rust of his speare head with his sword into the wound of the said *Telephus*. Others say, that he tooke both the said rust or verdegreece, and also the herb *Achilleos* to worke his cure. Some would haue this *Achillea* to be *Panaces* *Heracleos*; and others *Sideritis*: we in Latine call it *Millefolia*. An herb it is growing with a stalk or stem to the height of a cubit, spreading into many branches, clad from the very root vp to the top, with leaues smaller than those of Fenell. Others confesse indeed that this herb is singular good for wounds: but the true *Achilleos* (say they) hath a blewish stalk a foot high & no more, bare and naked without any branches at all, howbeit finely deckt and garnished on euery side with round leaues, standing one by one in excellent order, and making a faire sight. There be again who describe it with a foursquare stem, bearing heads in the top in manner of Horehound, and leaued like vnto an Oke. And this they say is of that efficacy, that it wil conglutinate & vnite sinews again, if they were cut quite asunder. Moreover, you shall haue some who take it for *Achillea* that kinde of *Sideritis* growing vpon mud walls, which if it be brused or stamped, yeldeth a stinking sent. Moreover, there is another going vnder the name *Achilleos*, like to this last described, but that the leaues be whiter and fatter, the little stalks or sprigs more tender, & it groweth in vineyards. Last of all, there is one more called *Achilleos*, which riseth vp to the height of 2 cubits, bearing pretty fine & slender branches, and those three square, leaues resembling Fearn hanging by a long stele, & the seed is much like to that of the Beet. In one word, they be al of them most excellent for healing wounds. And as for that especially, which hath the largest leaues, our countymen in Latine haue called it *Scopa Regia*. And the same is holden to be good for to heale the Squinancy or Gargle in swine.

In the same age wherim *Achilles* liued, prince *Tueur* also gaue the first name and credit to one speciall herb, called after him *Teucion*, which some noninat *Hemionium*: this plant putteth forth little stalks in maner of rushes or bents, and spreadeth low: the leaues be small: it loveth to grow in rough and vntoiled places: a hard and vnpleasant fauor it hath in tast: it neuer flourisheth, and feed it hath none. Soueraigne it is for the swolne and hard spleene: the knowledge of which property came by this occasion, as it is credibly and constantly reported. It fortuned on a time when the inwards of a beast killed for sacrifice, were cast vpon the ground where this herb grew,

A grew, it took hold of the spleen or milt, and claue fast vnto it, so as in the end it was seen to haue consumed and wasted it clean: hereupon some there be that call it *Splenion*, i. *Spleenwort*: and there goeth a common speech of it, That if swine doe eat the root of this herbe, they shall be found without a milt when they are opened. Some there be, who take for *Teucion* and by that name do call, another herb full of branches in manner of hyssop, leaved like vnto beans, and they giue order, that it should be gathered whiles it is in floure; as if they made no doubt but that it would floure. The best kind of this herb they hold to be that which cometh from the mountains of Cilicia and Pindia.

VVho hath not heard of *Melampus* that famous diuiner and prophet? he it was of whom one of the *Ellebore*s tooke the name, and was called *Melampodion*: and yet some there be who attribute the finding of that herb vnto a shepherd or heardman of that name, who obseruing wel that his the goats feeding therupon, fell a scouring, gaue their milk vnto the daughters of king *Prætus*, whereby they were cured of their furious melancholy, and brought again to their right wits. This herb then being of so excellent operation, it shall not be amisse to discourse at once of all the kinds of *Ellebore*, whereof this maketh one. And to begin withal, two principal sorts there be of it; namely, the white and the black: which distinction of colour, most writers would haue to be meant and vnderstood of the roots only, and no part else: others there be, who would haue the root of the blacke *Ellebore* to be fashioned like vnto those of the Plane-tree, but that they be smaller and of a more darke & duskyish green, diuided also into more jags and cuts; but those of the white *Ellebore*, to resemble the yong Beet new appearing about the ground, save onely that they be of a more blackish colour, and along the back part of their concavities melting to red. Both the one and the other bringeth forth a stalke in fashion like the *Fern* or *Fenel*-geant, a span or good hand-breadth high, and the same consisteth of certain tunicles or skins folded one within another in manner of bulbous plants, rising from the like root; and the said root is full of strings or fringes, as is the head of an onion. The blacke *Ellebore* is a very poison to horses, kine, oxen, and swine, for it killeth them; and therefore naturally these beasts beware how they eat of it, whereas confidently they feed vpon the white. The right season of gathering the *Ellebore*s, is in haruett time. Great store thereof groweth vpon the hill *Oeta*, but the best is that which is found in one only place thereof neere about * *Pyra*. The black *Ellebore* cometh vp euery where; but the best is in *Helicon*, a mountaine much renowned and praised for other herbs beside it, wherewith it is well furnished. As touching the white, that of the mount *Oera* is counted the principall: in a second degree, is the white *Ellebore* of *Pontus*: in the third place is to be ranged, that which cometh from *Elaea*, which (they say) groweth among vines: in the fourth and last place, for goodnesse, is that of the mount *Parnassus*, which is sophisticated with the *Ellebore* of *Ætolia* neare by. The blacke *Ellebore* is called *Melampodium*, wherewith took vse to hallow their houses for to driue away ill spirits, by strewing or perfuming the same, and vsing a solemne prayer withall: it serueth also to blesse their cattell after the same order. But for these purposes they gather it very deuoutly and with certain ceremonies: for first and foremost, they make a round circle about it with a sword or knife, before they go in hand to rake it out of the ground: then the party who is to cut or dig it vp, turneth his face into the East, with an humble prayer vnto the gods, That they would vouchsafe to giue him leaue with their fauor to do the deed; & with that he markes and obserueth the flight of the Egles; for lightly while they be cutting vp of this root, ye shall see an *Ægle* foring aloft in the aire: now in case the said *Ægle* flie neere vnto him or her that is cutting vp *Ellebore*, it is a certaine preface and foretoken, that he or she shall surely die before that yeare go about. Much ado also there is about the gathering of the white *Ellebore*; for vnlesse the party do eat some garlick before, and eatfoomes in the gathering sup off some wine, and withall make hast to dig it vp quickly, it wil stiffe and offend the head. The blacke *Ellebore* some call *Eutomon*, others *Polyrrhizon*; it purgeth downward; the white, by vomit, upward, and doth euacuate the offensive humors which cause diseases. In times past it was thought to be a dangerous purgatiue, and men were afraid to vse it: but afterwards it became familiar and common, inso much as many students tooke it ordinarily for to cleanse the eyes of those fumes which troubled their sight, to the end that whiles they read or wrote, they might see the better or more clearly. It is wel known, that *Carnedes* the Philosopher purposing to answer the bookes of *Zeno*, prepared his wits and quickened his spirits, by purging his head with this *Ellebore*. And *Drusus* our Countrey-man, one of the most famous and

renowned Tribunes of the Commons that were euer knowne at Rome (a man who aboute all others woon the fauour and applaufe of the commality, how fouer the nobility charged him to haue bin the cause of the Marfians war) was perfectly cured of the falling sicknes in the life Anticyra, by this only medicine: and indeede thofe Iflanders haue a way by themfelues to prepare their Ellebore with the mixture of Scamoeides (as I haue faid before) whereby the taking of it is moft fafe. Ellebore is called in Latine * Veratrum: the pouder as well of the one as the other snuffed vp into the noftrils, either alone by it felfe, or mixed with the pouder of the Fullers herbe Radicula, wherewith they wafh and fcoure their woollen cloth, * prouoketh sneezing; and yet both of them procure fleep. Now for vfe in Phyficke, there would be chofen the fmalleft roots of Ellebor, fuch as be fhort alfo, and as it were curtelled, and not fharp pointed in the bottome: and the beft part is that which is toward the nether end; for the vppermoft part of the root which is the thickeft and bulbous like to an onion head, is good for dogs onely, and giuen vnto them for to make them fcummer. In old time they vfed to chufe the Ellebore root by the bark, and took that for the beft which had the moft flefhy or thickeft riind, to the end that they might take out the finer pith or marrow within; which they vfed to lap and couer with moift fponges, and when it began to fwell, they diuided or fliued it longwife into fmal filaments with the point of a needle or bodkin. Thefe filaments or strings, they dried in the fhade, & laid them vp to ferue as need fhould require. But now adaies they cut the fmal fhoots or flips branching from the root, fuch as are moft charged with bark, and thofe the Phyficians giue vnto their Patients. The beft white Ellebore is that, which in taft is hot and biting at the tongues end, and in the breaking feemeth to fmoke or fend duft from it: it is commonly faid, that it will continue in force thirty yer. The black is good for the palfie, for thofe that be lunatick and beftaught in their wits, for fuch as be in a dropfie (fo they be cleare of a feuer) for inueterat gouts as well of feet and hands as other joints: it purgeth downward by the belly, both choler and flemme: being taken in water, it gently mollifieth and loofeneth the body: and from foure oboli (which is a fmall or mean dofe) you may rife to a full dramme, fo you exceed not that weight. Some were wont to mingle Scammonium therewith; but the fafer way is to put falt only thereto: being giuen in any fweet liquor to fome great quantity, it is dangerous: and yet a fomentation therewith is good to rid away and difpatch the miftineffe that troubleth the eies: and therefore fome vfe to beat it into pouder, and when it is reduced into a liniment or oile falue, therewith to annoint them for the faid purpose. This property moreover it hath, to bring to maturation the fwelling wens called the kings euill, to mollifie any hard tumors, to mundifie alfo the foresaid wens and any borches or impoftumes that be fuppurat and broken. It clenfeth likewife the hollow vlcers called fifuloes, provided alwaies that it be not taken out of the fore in 2 daies and 2 nights, but the third day it ought to be removed. Incorporat with the skales of braffe and red orpiment, it taketh away warts. Made into a pulteffe or cataplafme with barley meale and wine, it is fingular good for the dropfie, if it be applied vnto the belly: take a fliuing or flip of the root and draw it through the eare of fheep or horfe in manner of rowelling, and the morrow after take it forth again at the fame houre; this healeth the gid or wood-euill in fheep, and cureth the glandres in horkes: incorporat with frankincenfe or wax, together with pitch or oile of pitch, it is fingular good for the farcins or fcarb in any foure-footed beaft. Touching white Ellebore, the beft is that which moft fpeedily prouoketh sneezing: it is without comparifon far more terrible than the blacke, efpecially if a man reade what adoe and preparation there went vnto it in the old time, when they were to drink it againft fhuietings and fhakings, againft the rifing of the mother and danger of fuffocation: in cafe alfo of immoderate and extraordinary drowfineffe, of exceffive hicquets and yexing without intermiffion, and of continual sneezing: moreover, when they were troubled with weakeneffe and feebleneffe of stomacke: in like manner in cafe of vomits, when they came either too faft or ouer-flow, either too little or too much: for this was a rule obferued among them, to giue with Ellebore fome other drugs, for to caufe it work the fooner, and to haften vomit more fpeedily: alfo they vfed means to fetch away the very Ellebore again if it lay ouer-long in the body, either by other purgatiue medicines, or by clyfters: oftentimes alfo by opening a veine or bloud-letting. And fay that Ellebore taken in manner aforefaid, wrought very well, yet they vfed to obferue euery vomit, the diuers colors of humors that came away, which many times were fearfull to behold: yea and when the Patient had done cafting, they confidered alfo the ordure and excrements that paffed away by the belly: they gaue order

* *Veratrum*, vnder *veratrum* & *veratrum*: and becaufe fuch prophets were counted mad & out of their wits, therefore it was fo called, for that it cured fuch. * *Scammonium*, *scammonium*, I doubt whether this be true: I fuppofe it fhould be read according to the old copy (*Scammonium*) (i.e.) they diftill or fhak off fleep, vfed to that purpose in lethargies & fuch drowfie difafes.

A be fides, for *bathing either before or after the taking of Ellebore, as occafion beft required, yea and they took great heed and regard of the whole body be fides; and yet, did what they could, the terrible name and report that went of this medicine, paffed all their care and circumfpection whatfoeuer: for it was an opinion generally held and receiued, That Ellebore doth eat away and confume the flefh feething in the pot, if it be boiled therewith. But herein were the ancient Phyficians much too blame and greatly in fault, in that they were ouer timorous, and for feare of fuch accidents infuing vpon this medicine, gaue it in too fmall a dofe: for inas much the greater quantity that one taketh of it, the more fpeedily it worketh, and the fooner paffeth out of the body, when it hath once done the errand. *Themifon* vfed to prefcribe two drams, and not aboue. The Phyficians who followed after, allowed the dofe of foure drammes; grounding vpon a notable and famous apothegme or fpeech of *Herophilus*, who was wont to fay, that Ellebore was like vnto a valiant and hardy captaine: for when (quoth he) it hath ftirred all the humors within the body, it felfe flieth forth firft and maketh way before them. Moreover, there is a ftrange and fingular deuife, To clip the root of Ellebore with fmall fizzers or fhears into little peeces, then, to lift them through a ferece, that the bark or rind may remain ftill, and when it is clenfed and purged from the pith or marrow within, the fame may fall thorow and paffe away: which is paffing good to stay vomits, in cafe the Ellebore doe worke too extremely: furthermore, if we looke for good fuccesse in our cure by miniftring of Ellebore, in any wife we muft take heed and be carefull, how we giue it in clofe weather, and vpon a darke and cloudie day; for certainly it patteth the Patient to a jumpe or great hazard, and caufeth mo^t grievous and intollerable pains and torments. For that it fhould be taken in fummer rather than in winter, no man doubteth thereof. Ouer and be fides, the bodie ought to be prepared a feuen-night before; during which time, the Patient is to eat tart and * sharp meats and poignant fauces, to abftaine from wine altogether, and the fourth and third day before, to affay by little and little to vomit gently: laft of all, to forbear fupper ouer-night, when hee is to take his Ellebore the morrow. As touching the manner of giuing Ellebore: the white may be drunke in fome fweet wine; but the beft and chiefeft way of taking it, is in milke, gwell, or portage. Of late daies there is come vp a pretty inuention, To flit or cut Radifh roots, and within thofe gashes to fteck or enterlace peeces of white Ellebore, which don, to bind them clofe vp again, that the ftrength and vertue thereof may be incorporat in the foresaid roots: and thus by the means of this kind temperature with the Radifh, to giue it vnto the Patient. Ordinarily this medicine of Ellebore continueth not aboue foure houres within the body, but it commeth vp againe, and within feuen it hath done working. And thus being vfed as is beforefaid, it is a moft foueraine remedie for the falling fickneffe, the fwimming or dizzineffe of the head: it cureth melancholicke perfons troubled in mind; fuch as be brain-fick, mad, lunaticke, phrantick, and furious: it is fingular good for the Elephantie, the foule and dangerous morphew called Leuce, the filthie leprofie, and the generall convulfion whereby the body continueth ftiffe and ftarke, as it were all one peece without any ioynt. It helpeth thofe that be troubled with trembling, fhuietings, and fhaking of their lims, with the gout, and the dropfie, and namely fuch as bee entering into a tympanie: fingular it is for thofe that haue weake and feeble stomackes and can keepe nothing that they take; for fuch as are giuen to fpaimes or crampes, lie * bed-rid of the dead palfie or fuch chronicke difeafes, encumbered with the Sciatica, haunted with the quartaine Ague, which will not be ridde away by any other meanes; troubled with an old cough, vexed with ventofities and griping wrings and torments which be periodically, and vfe to come and goe at certaine fet times howbeit, Phyficians forbid the giuing of Ellebore vnto old folk and yong children: Item, to fuch as be of a fœminine and delicate bodie; as alfo to thofe that be in minde effeminate: likewife to thofe who are thinne and flender, foft and tender: in which regards, wee may not be altogether fo bold to giue it vnto women as vnto men. In like manner, this is a medicine that would not bee miniftered inwardly to fearefull, timorous, and faint-hearted perfons; neither to thofe who haue any vlcir in the precordiall region about the midriffe, ne yet vnto fuch as vfuallly bee giuen to fwell in thofe parts; and laft of all vnto thofe that fpeit or reach vp bloud; no more than to fickely and crafe perfons who haue fome tedious and lingring maladie, as phthysicke, &c. hanging vpon them; and namely, if they be grieved and difeafed in their fides or throat. Neuertheleffe, applied without the bodie in manner of a liniment with falted hogs greafe, it cureth the breaking forth of flegmaticke wheals and pimples; as alfo healeth old

* *Elleborus* apointeth them to take before, who purge neceffarily with Ellebore: & in cafe of convulfions or other difeafes, therefore, I prefcribe both like wide the bain.

* As Radifh roots and oymell.

* *Elleborus* fowernead Cypris, &c. then it fignifieth thofe that haue their mouths downe aware to their earre the difeafes of the fides.

fores remaining after imposthumes suppurate and broken : mixed with parched or fried braley-groats, it is a very rats-bane, & killeth both them & mice. The Gauls or Frenchmen when they ride a hunting into the chafe, vse to dip their arrow heads in the juice of Ellebore, & they haue this opinion, that the venison which they take will eat the tenderer; but then they cut away the flesh round about the wound made by the foresaid arrows. Furthermore it is said, That if white Ellebore be beaten to powder and strewed vpon milk, all the flies that tast thereof will die. To conclude, the said milke is good to rid away lice, nits, and such like vermin out of the head and other parts of the body.

CHAP. VI.

¶ Of the herbe Mithridation. Of Scordotis or Scordium. Of Polemonia, and Philetaria, otherwise called Chiliodynama. Of Eupatorie or Agrimonia. Of great Centaury, otherwise named Chironia. Of the little Centaury, named also Libadion and Fel terra. Of Triorchies : and the medicinable vertues vpon these Simples depending.

C Raterus hath ascribed the inuention of one herb to K. Mithridates himselfe, called after his name Mithridation : this plant putteth forth no more than two leaues, and those directly and immediatly from the root, resembling the leaues of Branc. vñ: there riseth vp a stem between them both in the mids, carrying an incarnat floure in the head like a rose.

Pompeius Lenens (who by the commandement of Pompey the Great translated into Latine the Physick notes and receipts of K. Mithridates) saith moreover, that the said prince found out another herb named Scordotis or Scordium; and that among other his writings hee met with the description of the said herb, set down vnder the kings own hand in this manner; namely, That it grew a cubit high, with a main stem four-square, and the same full of branches garnished with downy or furred leaues, indented and cut like to those of the oke. This herb is found ordinarily growing within the region of Pontus, in battle and moist champian grounds, and in taste is very bitter. There is another kind of Scordium, with larger and broader leaues, and like it is vnto wild Minth or Calamint: both the one & the other be of great vse in Physicke, either by themselves alone, or els put into opiats and antidots among other ingredients.

Touching * Polemonia, which others call Philetaria, it tooke the name vpon occasion of the strife and controuersie between certaine princes which debated about the first inuention thereof. The Cappadocians know it by the name Chiliodynama, i. as one would say, endued with a thousand vertues. This plant hath a thicke and grosse root, but smal & slender branches, from the tops whereof there hang down certaine berries in tufts and clusters, inclosing within them black seed: in all other respects it resembles rue, & groweth commonly vpon mountains.

As for Agrimony, called otherwise Eupatoria, it hath gotten credit & reputation by a * king, as it may appeare by the name. The stalk or stem of this herb is of a woody substance, blackish in colour, hairy, and of a cubit in height, or rather more. The leaues grow disposed and distant by certaine spaces asunder, much like vnto those of cinquefoile or hempe, snipped & cut about the edges ordinarily in five parts, the same are of a blackish or dark green, and full of a kiade of plume or downe. The root is superfluous for any operation that it hath in Physick : the seed of this herb drunk in wine, is a singular remedy for the dysentery or bloody flux.

The greater * Centaury is that famous herbe wherewith Chiron the Centaure (as the report goeth) was cured, at what time as hauing entertained Hercules in his cabin, hee would needs be handling & tempering with the weapons of his said guest, so long vntill one of his arrows light vpon his foot and wounded him dangerously: wherupon some there be who name it Chironia. The leaues grow large, broad, and long, indented or cut rather, like a saw round about the edges: neare vnto the root they come vp very thick : the stems run vp three cubits high, full of knots and joints all the way: knotted in the top like vnto Poppie heads: the root is of a mighty bignesse, inclining to a red colour, howbeit tender and easie to break or knap in sunder : two cubits it beareth in length, full of a liquid juice : bitter in taste, and yet sweet withal: it loneth to grow vpon banks and pretty hills, where the ground is fat and battle. The best Centaury of this greater kinde, cometh out of Arcadie, Elis, Messenia, Pholoe, and mount Lycæus : and yet there is good found vpon the Alpes, and in many other places. Some there be, who out of this plant draw

* Of mshuas, which signifies, war, or debate.

* Eupator.

Rha poutick.

A draw a juice in manner of Lycium. Of such efficacy it is to incarnat wounds, that (by report) if it be put into the pot to seeth among many gobbets or pieces of flesh, it will cause them to grow together and vnite. The root only is to be giuen inwardly, and namely in drinke, to the weight of two drams, in such cases as I will shew hereafter: with this charge, That if the Patient haue an ague hanging vpon him, it be stamped and taken in water: others may drinke it well enough in wine. Also the juice drawn forth of it when it is boiled, is good for the diseases or rot of sheep.

Another Centaury there is, surnamed also in Greeke Lepton (i. Small) for that it hath little leaues in comparision of the other : some name it Libadion, for that it loneth to grow neere to springs or fountains : it is somewhat like to Origan, save that the leaues be narrower and longer : the stalk is cornered, rising vp to a smal height, to wit, a hand-breadth or a span at most: the same also putteth forth little branches : the floure hath some resemblance of the * red-Rose of singular operation. This herb would be gathered in Autumne, when it is fresh, full of leaues, and floures, for then it yeeldeth best juice. Some take the stalks and branches, shred them smal, let them lie infused in water 18 daies, and then presse forth the juice. This is that * Centaury, which we here in Italy call Fel Terra, i. the Gal of the earth, by reason of the exceeding bitterness which it hath: the Gauls terme it Exacos, because if it be drunk it sendeth downward by feege out of the body, any hurtfull poison whatsoever.

There is a third Centaury named Centauris, knowne by the addition Triorchies : who soeuer cometh to cut this herb, he quits himselfe well and escapeth faire, if he wound not himselfe. This plant yeeldeth forth a certaine red juice like vnto blood. Theophrastus hath deliuered in his history of Plants, that the hawkes * Triorchides protect and defend this herbe, & are ready to encounter and fight with them that come to gather it; wherupon it took the foresaid name Triorchis. But many ignorant and vnskillfull persons there be, who write confusedly of all these Centauries, and attribute this last property and name, to the first Centaury the great.

CHAP. VII.

¶ Of Clymenos, Gentian, Lyfimachia, Parthenis or Artemisia, Ambrosia, Nymphaea, Heraclum, and Euphorbium, with their operations in Physicke.

D The herb Clymenos beareth the name of K. Clymenus, the first inuenter and finder out thereof. Leased it is like vnto Ivie, full of branches : the stalkes or stems be hollow and empty within, diuided by joints and partitions: of a strong and vnpleasant smell : the seed resembleth the grains or berries of Ivie ; and it taketh pleasure to grow in wilde woods and among mountains. As touching the operations which it hath, & namely what diseases it cureth being taken in drinke, I will shew hereafter : mean while, I will not put off any longer, but aduertise the Reader, euen in this place, That this herb as it doth good one way, so it hurteth another ; for if they be men that drinke it, wel may it cure them of the maladies for which it is giuen, but surely it killeth their naturall seed and disableth them for getting children, so long as they vse it. The Grecian writers described it to be like in leaf vnto Plantain : in stem four square, bringeth forth certain little cods full of seed, infolded and interlaced one within another after the manner of the tufted and curled haire about the Pourcuttle fishes called Polypi. But be it what it will, the juice of the herb is refrigeratiue, and of great vse in Physicke.

As for the herb Gentian, we must acknowledge Gentium king of the Illyrians for the Authour and patron thereof, for he brought it first into name & credit: and howsoeuer it grow in all places, yet the best is that which is found in Illyricum or Sclauonia. The leaues come neare in fashion and forme to those of the Ash tree, but that they be small in manner of Lettuce : the stem is tender, of a thumb thickness, hollow as a kex and void within : leaved here and there with certain spaces betweene, growing vp other while 3 cubits high. The root is pliable and will winde euery way, somewhat blacke or dusky, without any smell at all : it groweth in great plenty vpon waterish hillocks that lie at the foot of great mountains, such as the Alps be. The juice of the herb is medicinable, like as the root it selfe also, which is very hot of nature and not to be giuen in drinke to women with childe.

Lyfimachia, the herbe so much commended by Erasistratus, beareth the name of king Lyfimachus,

* Ichnidis.

* Our Centaury.

Our Buzzards (as I say) thinketh)

machus, who first gaue light of the vertues that it hath: greene leaues it beareth like vnto those of the willow: the floures be purple: giuen much it is to branch from the root, and those stalkes grow vpright: a * sharp smell it carrieth with it, and delighteth to liue in watery places. Of so effectuell vertue it is, that if it be laid vpon the yoke of two beasts which will not draw gently together, it staith their strife and maketh them agree well enough.

Not men only and great kings, but women also and queens haue affected this kind of glory, To giue names vnto herbes. Thus queen *Artemisia* wife to *Mausolus* king of Caria, eternized her owne name by adopting (as it were) the herb Mugwort to her selfe, calling it *Artemisia*, where-as before, it was named *Parthemis*. Some there be who attribute this denomination vnto *Diana* (called in Greek *Artemis* Ilihya) because it is of speciall operation to cure the maladies incident to women. It brancheth and busheth thick much like to wormwood, but that the leaues be bigger, far and wel liking withal. Of this Mugwort there be two kinds: the one carrieth broad leaues, the other is tender and the leaues smaller: this grows nowhere but along the sea coasts. There be writers who call by this name *Artemisia*, another herb growing in the midland parts of the main and far from the sea, with one simple stem, bearing very small leaues and plentie of floures, which commonly break forth and blow when grapes begin to ripen, and those cast no vnpleasant smel, which herb some thereupon name * *Botrys*, others *Ambrosia*: and of this kind there is great store in *Cappadocia*.

* *Nenuphar* is called in Greeke *Nymphaea*, the originall of which herb and name also, arose by occasion of a certain maiden Nymph or yong lady, who died for ieiouise that she had conceived of prince *Hercules* whom she loued: and therefore by some it is named also *Hieraclion*, of others *Rhopalos*, for the resemblance that the root hath to a club or mace. But to come againe to our first name *Nymphaea*; this quality it hath alluding and respectiue thereunto, That whoeuer do take it in drink, shal for 12 daies after find no prick of the flesh, no disposition (I say) to the act of venery or company of women, as being depriued for that time of all naturall feed. The best *Nemphar* or *Nymphaea*, is found in the lake *Orchomenus*, and about the plain of *Marrathon*. The people of *Boeotia*, who also vse to eat the seed thereof, commonly call it *Madon*. It taketh great contentment to grow in waters: the leaues float vpon the face of the water, be broad and large, while others put forth from the root. The floure resembleth the *Lillie*, which when it is once shed, there be certain knobs remaining like vnto the bolls or heads of *Poppie*. The proper season to cut the stems and heads of this plant, is in Autumne. The root is blacke, which being gathered and dried in the Sunne, is counted a soveraigne remedy for those that be vexed with the flux or fretting of the belly. A second * *Nemphar* or *Nymphaea* there is, growing in *Theffaly*, within the riuer *Peneus*, with a white root, but a yellow floure in the head about the bignesse of a rose.

No longer ago than in our forefathers daies, *Iuba* king of *Mauritania*, found out the herb *Euphorbia*, which he so called after the name of his own Physitian *Euphorbus*, brother to that learned *Musa* Physitian to *Augustus Caesar*, who saued the life of the said Emperor, as heretofore I haue declared. These two brethren Physitians, ioined together in counsell, and gaue direction for to wash the body all ouer in much cold water, after the hot baine or stouue, thereby to knit and bind the pores of the skin: for before their time, the maner was to bathe in hot water only, as we may see plainly in the Poet *Homer*. But now to return vnto our herb *Euphorbia*, the foresaid *K. Iuba* wrote one entire booke (at this day extant) wherein he doth nothing els but expressly set forth the commendable vertues and properties of this one herb. He found the same first vpon the mountain *Atlas*, where it was to be seen (saith he) bearing leaues resembling *Brace-vrins*: so strong and forcible it is, that those who receiue the juice or liquor issuing from it, must stand a good way off; for the manner is to launce or wound it first, and then presently to retire backe, and so at the end of a long pole to put vnder it a pail or trey made of kids or goats leather for a receptory; into which there runneth forth out of the plant, a white liquor like vnto milke: which when it is dried and growne together, resembleth in shew a lump or masse of *Frankincense*. They that haue the gathering of this juice called *Euphorbium*, find this benefit thereby, M That they see more clearly than they did before: an excellent remedy this is against the venom of serpents, for what part soeuer is stung or wounded by them, make a light incision vpon the

* crown [of the head] and apply thereto this medicinable liquor, it will surely cure it. But in that country, the *Getulians* (who commonly do gather *Euphorbium*, for that they border vpon the

* Or the vpper part of the hurt place.

* *Odore acri*: Surely Willow or *Lyfmechia* hath a kind of sharp coole fen: not vnpleasant: al though *P. iay* vs the word (*acri*) for hot and biting in other places. Hereupon it might well bee called *donuaga*, (*i.*) I. nettles, and not of *K. Lyfmechia*.

* Or rather *Botrys* (i. oke of *K. of filem*) is of some called *Artemisia*, of others *Ambrosia*, as *Plin.* *Dioscorid.* * *Water-lilly*.

A mount *Atlas* sophisticate it with goats milke. Howbeit, fire will soon dete & this imposture of theirs, for that which is not right but corrupt, when it burneth, doth yeeld a lothsome fume and stinking sent. The juice or liquor which in France is drawn out the herb *Chamaelea* (the same that beareth the red grain, named by the Latines *Coccum*) commeth far short of this *Euphorbium*. The same being grown thick and hard, if a man break it, resembleth gum *Ammoniacke*. Taft it neuer so little at the tongues end, it setteth all the mouth on a fire, and so continueth it a long time hot, but more by fits, vntill in the end it parcheth and drieth the chawes and throat al-

CHAP. VIII.

B ¶ Of *Plantain*, *Buglosse*, and *Borrage*. Of *Cynoglossa* or *Hounds tongue*. Of *Buphthalmus*, *i.* *Oxe cie*, or *Many-weed*. Of *Scythica*, *Hippice*, and *Ischamon*. Of *Veronica* and *Cantabrica*. Of * *Confiligo* and *Hiberis*. Of *Celandine* the great, *Canaria* and *Elaphoboscos*. Of *Distannum*, *Aristolochie* or *Herrwort*: That fish are delighted so much therewith, that they will make hast vnto it, and be soon taken. Also the medicinable vertues of those herbes above named.

T *Hemison*, a famous Physitian, set forth a whole booke of the herbe *Way-bred* or *Plantaine*, wherein he highly praiseth it, and challengeth to himselfe the honor of first finding it out, notwithstanding it be a triuiall and common herb, trodden vnder euery mans foot. Two kinds of it be found: the one which is the lesser, hath also narrower leaues, and inclining more to a blackish green, resembling for all the world theepe * or lambs tongues, the stalke is cornered bending downward to the ground, & it growes ordinarily in medows. The other is greater, with leaues enclosed (as it were) within certain ribs resembling the sides of our body, which being in number seuen, gaue occasion to some herbarists for to call it *Heptapleuron*, as a man would say, the seuen ribbed herb. The stem of this *Plantain* riseth to a cubit in height, much like to that of the *Naphew*. That which groweth in moist and watery places, is of greater vertue than the other. Of wonderful power and efficacy it is by the attringent quality that it hath, for to dry and condensate any part of the body, and serueth many times in stead of a cautery or searing yron. And there is nothing in the world comparable vnto it, in staying of fluxes and distillations, which the *Creeks* call *Rheumatismes*.

To *Plantain* may be ioined the herb * *Buglossos*, so called, for that the leafe is like an *Oxe* tongue. This herb hath one speciall property about the rest, that if it be put into a cup of wine it cheareth the heart, and maketh them that drink it, pleasant and merry; whereupon it is called *Euphrosynon*.

Vnto this for affinity of name, it were good to annex *Cynoglossos*, *i.* *Hounds tongue*, for the resemblance that the leaues haue to a dogs tongue: a proper herb for vinet-works and knots in gardens. It is commonly said, That the root of that *Cynoglossos* which putteth forth 3 stems or stalks, and those bearing seed, if it be giuen to drink, cureth tertian agues: but the root of that which hath foure, is as good for the *Quartains*. Another * *Cynoglossos* there is like to it, which carrieth small burs: the root whereof being drunke in water, is a singular counterpoison against the venom of toads and serpents.

E An herb there is with flours like vnto *oxe cie*s, whereupon it took the name in Greek * *Buphthalmos*: the leaues resemble *Fennel*: & it groweth about town sides: it shutteth forth stalkes from the root plentifully, which being boiled, are good to be eaten. Some there be who call it *Cachla*. This herb made into a salve with wax, resolueth all * *schirrous* and hard swellings.

Other plants there be, which beare the names not of men but of whole nations, which first found them and their vertues out. And to begin withall, beholden we are to *Scythia* for that which is called *Scythica*. It groweth notwithstanding in *Boeotia*, and is exceeding sweet in taft. Also there is another of that name, singular good for the cramps, called by the *Greeks* *Spasmata*. An excellent property it hath besides, for that whoeuer holds it in their mouth, shall for the time be neither hungry nor thirsty. Of the same operation there is another herb among the *Scythians* or *Tartars*, called * *Hippice*, because it workes the like effect in horses, keeping them from hunger and thirst. And if it be true that is reported, the *Scythians* with these herbes will endure without meat or drink for twelue daies together.

Touching the herbe *Ischamon*, the *Thracians* first found out the rare vertue that it hath in staunching

Scotterwoort, or Boats foot, as some think.

Whereupon it seemeth to be called in Greeke *distannum*.

Our Borrage.

This is our common Hound-tongue with little burs.

Some call them Moons, *Schirromata*, otherwise *Stomata*, which be bunches or swellings in the flesh full of a greasie matter.

* *Theophrastus* writeth the like of the sweet root or *Liquorice* and *Hippice*, that is, cheefe made of mares milke, but not of any herb *Hippice*.

stanching blood, according as the very name implies. For (say they) it will stop the flux of blood running and gushing out of a veine not only opened, but also if it were cut through. It coucheth and creepeth low by the ground, and is like unto Millet, but that the leaues be rough and hairy. The manner is to stutte the nothrials therewith for to stay the bleeding at nose. And that which groweth in Italy stancheth blood, if it be but hanged about the neck, or tied to any part of the body.

The people in Spaine named Vetroneſe, were the firſt authors of that herb, which is called in France * Vetronica, in Italy Serratula, and by the Greeks Ceſtron or Psychotrophon: Surely an excellent herb this is, and above all other ſimples moſt worthy of praife. It commeth forth of the ground, and riſeth vp with a cornered ſtalke, to the height of two cubits, ſpreading from the very root leaues of the bigneſſe of Sorrell, cut in the edges, or toothed in manner of a ſaw, with floures of a purple color growing in a ſpike, & ſeed correſpondent thereto. The leaues dried and brought into powder, be good for very many uſes. There is a wine and vinegar made or condite rather with Betony, ſoueraign for to ſtrengthen the ſtomack, and clarify the ſieſight. This glorious prerogatiue hath Betony, that look about what houſe ſoener it is ſet or ſowed, the ſame is thought to be in the protection of the gods, and ſafe enough for committing any offence, which may deferue their vengeance and need any expiation or propitiatory ſacrifice.

In the same Spain groweth * Cantabrica, lately found by the people Cantabri, and no longer since than in the daies of *Augustus Caesar*. This herb is to be seen euery where, rising vp with a benty or rufhy stalk a foot high, vpon which you may behold small long floures, like to cups or beakers, wherein lie enclosed very small seeds. Certes, to speake the truth of Spain, it hath bin alwaies a nation curious in seeking after simples. And euen at this day in their great feasts where they meet to make merry Sans-nombre, they haue a certain wassell or Bragar, which goeth round about the table, made of honied wine or sweet mead, with a hundred distinct herbs in it: and they are persuaded that it is the most pleasant and wholesomest drinke that can be deuised: yet there is not one amongst them all who knoweth precisely what speciall herbs there be in all that number, in this only they be all perfect, that there go a hundred severall kinds thereto, according as the name doth import.

In our age we remember well, that therewas an herō discovered in the Marſians country: and yet it groweth alſo amongſt the people named *Æquiccol* e, neare vnto the borough *Nerueſia*, and they call it * *Conſiligo*: this is a ſoueraigne plant, as we ſhall ſhew hereafter in place conuenient, for thoſe that be ſo farre gone in a *Phthiſicke* or conſumption, as no man would hight their life and recovery.

Of late daies *Servilius Damocrates*, a famous practitioner in Physick, brought to light an herb which he termed *Hiberis*, a deuified and fained name for his own pleasure, and nothing significant, as may appeare by a certain * Poem that he made as touching the discovery of that herbe. It commeth vp most willingly about old tombes and sepulchres, decayed wals, and ruinaul buildings, in vntoiled and neglected places, and namely, common high waies. It beareth floures at all times, and is leaued like to Cresses: the maine italke is a cubit high, but the seed so fine and small, that hardly they can diserne it. The root also hath the very smell of Cresses: it serueth to many good purposes, but with most successe in Summer time, & neuer but when it is green and fresh gathered. Much ado and trouble there is about the punning and stamping of it. Being tempered and incorporate with a little hogs greafe, it is singular to be applied to the paine of the hucklebone called Sciatica, as also to the gout of any ioints whatsoeuer. If the patient be a man it must lie bound fast vnto the place four houres at the most: but women may abide it but half so long, provided alwaies, that presently vpon this medicine they go down into an hot bain, and after they haue bathed, annoint their bodies all ouer with wine and oile. Thus must the patient doe once every 20 daies, so long as there remaineth any grudging or minding of the forefaid pain. And surely in this sort it drieth vp and cureth all inward and secret rheums running neare vnto the bones. Howbeit, this caueat would be giuen, not to lay this plaster too in the very heart and fure of the pain or disease, but the time must be waited when the extremity is somewhat slackened and ouer past.

Moreover other living creatures also there be besides men, to which we are to attribute the
our Celendine: invention of herbs: as first and principally, the great * Celendine, called in Greek Chelidonia,
for that the old Swallows with the helpe of this hearb helpe their young ones to see again, yea
though

A though their eies were plucked out of their head, as some are of opinion. Of this herb there be two kinds: the greater, which putteth forth many stems, & those full of branches, beareth leaues like vnto the wild * Parsnep, but that they be larger. The herb it selfe groweth vp to the height of two cubits. The leaues be whitish or hoary, like as the whole plant is felical faue the floure, which is yellow. The whole herb yeeldeth a biting and fretting iuice, of the colour of Saffron: and it bringeth forth seed resembling that of Poppy. The lesse * Celendine is seen with leaues fashioned much after the Ivy, but that they be rounder. Both Celendines do floure in the spring about the time that the swallows come abroad and shew themselves vnto vs, and those floures begin to fade again vpon the departure of that bird from vs. The onely time to draw or presse their iuice from them, is whiles they be in the floure: which if it be put into a brazen pan, and seeth gently vpon hot embers or ashes only, together with the best Atticke honey, is a singular medicine to discusse and scatter the cloudy filus that dim the eie-sight. The said iuice alone without any other preparations, goeth to the making of many collyries or eyefalues, which be called Chelidonia, by reason of that ingredient.

Touching the Dogs gaffe Canaria, it took that name in Latin, because dogs use therewith to discharge their gorge & whet their stomackes when their appetite to meat is gone. A strange thing of these dogs we see them chew this herb in our sight ordinarily every day, yet so, as we neuer can tell which * herb it is that they have bitten: for we may perceiue it only when it is eaten down. But no maruel if this creature be so frightful as to concale from vs a purgatiue herb, considering a greater malice that he sheweth in another: for it is said, that if a dog be bitten by a serpent, he hath recourse by and by to a certaine herb that cureth him presently; but he will be sure that no man shall see him when he croppeth that herb.

Yet the poore hinds (simple and harmlesse creatures they) are not so coy and dainty of their knowledge, for they haue shewed vs the plant * Elaphoboscon, whereof I haue already written like as the herb * Sefelitalfo, which presently after they haue calued, they feed vpon in our sight, & make it not strange. Nay, they haue not thought much to impart to vs the vertue of the herb Diatamnus (as I haue partly declared heretofore) for we may euidently see them after they bee thor or wounded, to go forthwith vnto this hearb, and no sooner haue they eat of it, but immediately the arrows or darts wherewith they were hurt and sticking in them, fall out of their bodies. This plant is found growing no where but in the Island Candy. The branches be exceeding fine and slender: it resembbeth in some sort Penyrroial. At the tongues end hot it is and biting. And the leaues only are in vief: for * neither floure nor feed it hath, ne yet any stem or stalk. As for the root, as it is smal and little, so is it * needlesse for any good it doth in Physick: a rare plant this Diatamnus is, for euen in Candy, the naturall place therof, it grows not euery where, but within some small compasse of ground within that Isle, and there Goats haue a wonderful desire to be feeding vpon it. Mary in lieu of this true Diatamnus, there is a ballard kind found in many countries, called Pinguicula, which groweth in leafes like to those of the true Diatamnus, but

Henbane, stamped leaues and all, is singular to be taken in wine, especially against the sting G
of the Aspides.

But of all other herbs, there is none more honored among the Romans than * Hierobotane, called also otherwise in Greek Peristereon: which we in Latine name Verbenaca. This is that hearb, which (as I haue declared heretofore) our Embassadors vse to cary with them when they go to denounce war, and to giue defiance vnto our enemies. VVith this herbe the feastiuall table of * Iupiter is wont to be swept and clenfed with great solemnitie, our houses also be rubbed and hallowed, for to driue away ill spirits. And herof be two kinds. That which they take to be the female, is stored well with leaues, the male hath them growing but thin: yet both of them put forth many small and slender branches, commonly a cubit long, and cornered. The leaues be lesfer and narrower than those of the Oke, but deeper they be indented, and the partition wider: the floures be of a * gray colour, the root long and small. It groweth euery where vpon plains subiect vnto waters. Some writers make no distinction at all of male & female, but hold them all to be of one and the same kind, because they work the same effects. In France the Druides vse them both indifferently, in casting lots, telling fortunes, & foreshewing future events by way of prophesie. But the wise men or sages called Magi, ouerpasse themselves mightily in this herb, and shew their foolery and vanity without all fence and reason: They would beare vs in hand forsooth, that whosoever be rubbed all over the body therewith, shall obtaine whatsoeuer their heart desireth, be able to cure and driue away all manner of agues, reconcile them that be fallen out, make friendship between whom they list, and in one word, giue remedy to any disease whatsoeuer: they giue moreover expresse order, that it be gathered about the rising of the great dog- star, but so, as neither Sun nor Moon be at that time about the earth to see it; with this especial charge besides, that before they take vp the herbe, they bestow vpon the ground where it groweth, honey with the combs, in token of satisfaction and amends for the wrong and violence done in depriving her of so worthie an hearbe. They rest not so, but when these ceremonious circumstances be performed, they inioine them also who are to dig it vp, for to make a circle round about the place with some instrument of yron and then to draw and pluck it vp with the left hand in any wise & so to fling it aloft ouer their heads vp into the aire: which done, they appoint precisely that it be dried in the shade, leaues, stalkes, and roots, euery one apart by themselves. To conclude, they adde moreover and say, that if the hall or dining chamber be sprinkled with the water wherein Veruaine lay steeped, all that sit at the table shall be very pleasant, and make merrie more iocundly. VVell, to leaue these roies and fooleries, the truth is this, stamp and beat it, giue the juice or powder therof in wine, it is a good defenfatue against the poison of serpents.

An herb there is much resembling Mullen or Langwort, and indeed so like as oftentimes one is taken for the other, howbeit, the leaues be not altogether so white, and more little branches it putterth forth, bearing likewise a pale yellow floure: cast this herb or strew it in any place all the moths therabout will gather to it, whercupon at home they call it Blattaria.

The herbe Lemonium yeeldeth a white juice, much like vnto milke, which will harden and grow together in manner of a gum: and it groweth in moist places. The weight of one denarius giuen in wine, is a singular preseruatiue against the dangerous sting of serpents.

As for Cinque foile or five leaved grassie, there is not one but knoweth it: so common it is, and commendable besides for the * strawberries which it beareth. The Greeks call it Pentapetes, Chamæzelon, or Pentaphyllon: the Latines Quinquifolium. The root when it is new digged, looketh red: but as it beginneth to drie about ground, so it waxeth black, and becommeth also cornered. It tooke the common name both in Greeke and Latine, of the number of leaues which it beareth. This herb herein is of great affinitie with the vine, that they both bud, spring, leaue, and shed the same together. It is vsed also about purging & blessing of the house, against naughty spirits or enchantments.

As for Sparganium, an herb so called by the Greeks, the root thereof is good to be giuen in white wine against venomous serpents.

Of Carrots, Petronius Diodotus hath set downe 4 seueral kinds. But what need I to go through them all foure, seeing they may be reduced well enough into * twaine, and doe require no other distinctions. The best and most approued Carrots be those of Candy: the next to which in goodnesse come out of Achaia. But generally in what country soeuer they grow, the better be

A be such as come vp in the foundier and drier grounds. As touching the Candy Carot, it resembleth fennel, but that the leaues stand more vpon the white, they be smaller also and hairy with all. The stem groweth vpright a foot high, and hath a root odoriferous to smell vnto, and of a most pleasant tast: this ioieth in stony places exposed to the South quarter of the world. As for the other Carots of a wild nature, in what country grow they not? you shall finde them vpon earthie bankes and hils, you shall haue them about high waies, but neuer shall a man meet with them in a leane and hungry ground; they loue a battle and fat soile: their leaues come neare to the Coriander: their stem ariseth to a cubit heighth, bearing round heads, three ordinarily, and otherwhiles more: the root is of a woody substance, and being once dried, it serueth to no purpose. The seed of this kind is like vnto Cumin; but of the former, to Millet grain, white, quick, and sharp, and they be all odoriferous and hot in the mouth. The seed of the second is more agree and biting than the former, and therefore ought to be taken in lesse quantitie. As for the third kind (it we list to make so many) it is much like to the wild Parsnep, called in Greek Staphylinos, and in Latine Pastinaca Erratica: the same beareth a seed somewhat long in form, and a sweet root. All the sort of these Dauci or Carots, are safe enough from the bit of four-footed beasts both winter & summer, vnlesse it be after they haue cast their abortiue fruit before time [for then they seek therto to be clenfed of their gleane.] Of all Carots, the seeds be vsed only: but that of Candy affordeth the root also, which is sweet: but both the seed of the one sort and the root of the other, be most appropria remedies against serpents: a dram weight in wine is a sufficient dose at a time: which also may be giuen in a drench to foure-footed beasts that be stung by them.

C Touching the herb Therionarca (I mean not that which the Magitians vse) it groweth also in this part of the world here with vs in Italy: many branches it putteth forth, and springs thick with diuers shoots from the root: the leaues be of a light green, and the floure of a red-rose colour: it killeth serpents outright; besides, it hath this property, That if it be brought neere vnto any wild beast whatsoeuer, it benummeth their senses [whereupon it took that name.]

Perfolata, which the Greek writers call * Arcion, there is not one but knoweth: large leaues it hath, and bigger than the very Gourds, more hairy, blacker also and thicker; a white root and a great: this root taken in wine to the weight of two deniers Roman, is good likewise against the venom of serpents. In like manner, the root of Cyclaminus or Sow-bread is as effectual against them all: leaues it hath somewhat resembling those of Ivy, but that they be of a more duskyish and sad greene, smaller also and without corners, wherein a man may perceiue certaine whitish specks. The stem is little, and hollow within: the flours of a purple colour; the root broad (so as a man would take it to be a Turnep) and covered ouer with a black rind: it groweth in shadowy places. Our countrymen here in Italy call it in Latine Tuber terra, that is to say, The knur or bunch of the ground. Sowne and planted it would be in euery garden about an house, if so be it be true that is reported of it; namely, that whersoever it groweth, it is as good as a countercharm against all witchcraft and forceries: which kind of defenfatue is called properly A-muletum. Moreover, this root (they say) if it be put into a cup of wine, turneth the brain presently, and maketh as many drunk as drink therof. For the better keeping and preseruing of this root, it must be ordered after the manner of Squilla or Sea-onion roots, (i.) cut into thinne slices or roundles, then dried, and so laid vp: the same also is vsually sodden to the consistence or thicknesse of hony. As good as this root is in those former respects, yet it is not without some venomous quality, for it is commonly said, That if a woman with child chance to step ouer it, shee will fall presently to labour before her time, and lose the fruit of her wombe. A second kind of Cyclaminus or Swine-bread I finde, surnamed by the Greekes * Cissanthemos, growing with

D and sad greene, smaller also and without corners, wherein a man may perceiue certaine whitish specks. The stem is little, and hollow within: the flours of a purple colour; the root broad (so as a man would take it to be a Turnep) and covered ouer with a black rind: it groweth in shadowy places. Our countrymen here in Italy call it in Latine Tuber terra, that is to say, The knur or bunch of the ground. Sowne and planted it would be in euery garden about an house, if so be it be true that is reported of it; namely, that whersoever it groweth, it is as good as a countercharm against all witchcraft and forceries: which kind of defenfatue is called properly A-muletum. Moreover, this root (they say) if it be put into a cup of wine, turneth the brain presently, and maketh as many drunk as drink therof. For the better keeping and preseruing of this root, it must be ordered after the manner of Squilla or Sea-onion roots, (i.) cut into thinne slices or roundles, then dried, and so laid vp: the same also is vsually sodden to the consistence or thicknesse of hony. As good as this root is in those former respects, yet it is not without some venomous quality, for it is commonly said, That if a woman with child chance to step ouer it, shee will fall presently to labour before her time, and lose the fruit of her wombe. A second kind of Cyclaminus or Swine-bread I finde, surnamed by the Greekes * Cissanthemos, growing with stems full of knots or joints, hollow within and good for nothing; far different from the former, winding and clasping about trees; bearing berries much like to those of Ivy, but they are soft; a white floure faire and louely to see too, but a needlesse root for any goodnesse in it: the berries that it beareth be only in vse, and those are of a sharp and biting tast, & yet they be viscous and clammy to the tongue: these being dried in the shadow and stamped, are afterwards reduced into certain bals or trofches. My self haue seen a third kind also of Cyclaminus, carrying the name besides of Chamæcissos, which brought forth but one only leafe: the root was much forked & diuided into branches, wherewith folk vsed to kil fishes. But among al other herbs of name, Peucedanum is much talked of and commended: principally, that which groweth in Arcadie: next

* Some take it to be the Clotbury, or Bitter-bur.

* Cicuthemos, Distill. id est, i. caud like to ivy.

* Pliny herein er. th. glosely. Indica the leaues of Cinque foile are much like to the Strawberry: ate: but as the one hath no true or berry at all, so the other (to wit the Strawberry) puts forth but three leaues. * The same and the wilde.

to it, most account is made of that in Samothrace: a slender stalk it carrieth and a long, resembling the stem of Fennell: neere vnto the ground it is replenished well with leaues: the root is black, thick, full of sap, and of a strong and vnpleasant smell: it delighteth to come vp and grow among shady mountains. The proper time to dig it out of the ground, is in the later end of Autumne: the tenderest roots and those that run deepest downe into the earth, are most commendable. The manner is to cut these roots ouerthwart into certaine cantels or pieces of foure fingers in length, with kniues made of bone, whereout there issueth a iuice which ought to be dried & kept in the shade: but the party who hath the cutting of them, had need first to annoint his head all ouer and his nostrills with oile of rose, for feare of the gidd, and least he should fall into a dizzinesse or swimming of the braine. There is another iuice or liquor found in this plant lying fast within the stems thereof, which they yeeld forth after incision made in them. The best iuice is knowne by these marks, It carrieth the consistence of honey, the colour is red, the smell strong, and yet pleasant, and in the mouth it is very hot and stinging. Much vse there is of it in many medicines, as also of the root and decoction thereof: but the iuice is of most operation, which being dissolved with bitter almonds or rue, people vse to drink against the poison of serpents; & in case the body be annointed all ouer with oile, it preferueth them safe against their stings.

CHAP. X.

¶ Of ground Elder or Wallwort. Of Mullen or Taper wort. Of the Aconit called Thelyphonus. Of remedies against the pricke of Scorpions, the venome of Hedge-toads, the biting of mad Dogs: and generally against all poisons.

The smoke or perfume also of VVallwort (a common herb and knowne to euery man) cha-feth and putteth to flight any serpents. The iuice of * Polemonia, is a proper defensatiue especially against scorpions, if one haue it tied about him or hanging at his neck: likewise it resisteth the pricke of the spiders Phalangia, and any other of these venomous vermins of the smaller sort. Aristolochia hath a singular vertue contrary vnto serpents: so hath Agaricke, if foure oboli thereof be drunke in as many cyaths of some artificiall or compound aromatized wine. Vervaine is a soueraigne herb also against the venomous spider Phalangium, being taken in wine or oxycrat, i. vineger and water: so is Cinquefoile, and the yellow Carrot.

That herb which the Latines call Verbascum, i. Lungwort or Hightaper, is named in Greek Phlomos. Two special kinds there be of it: the one is whiter, which you must take for the male; the other black, & that may go for the female. There is a third sort also, but it is found nowhere but in the wild woods. The leaues of all the former, be broader than those of the Colewort, and hairy withal: they beare a main vpriight stem, a cubit in height with the vantage: the seed is black and of no vse in Physicke: a single root they haue, of a finger thicknes. These grow also vpon plains and champion grounds. The wild kinde beareth leaues resembling sauge: the branches be of a woody substance, & the same grow high. There be moreover of this kind two other herbs named * Phlomidis, both of them hairy, their leaues be round, and they grow but low. A third sort there is be sides, named by some Lychnitis, and by others Thryallis: it sheweth 3 leaues or foure at the most, and those be thick & fat, good to make wyks or matches for lights. It is said, that if figs be kept in the leaues of that which I named the female, they will not rot. To distinguish these herbs into feuerall kinds, is a needlesse peece of work, considering they agree all in the same effects: their root together with rue, is to be drunk in water against the poyson of scorpions: true it is, that the drinke is very bitter, but the effect that it worketh maketh amends.

There is an herb called by some * Thelyphoton, by others Scorpion, for the resemblance that the root hath to the Scorpion; and yet if Scorpions be but touched therewith, they will die thereupon: no maruell therefore if there be an ordinary drinke made of it against their poison: [and here commeth to my mind that which I haue heard, namely, that if a dead scorpion be rubbed with the white Ellebore root, it wil reuiue and quicken again.] The said Thelyphoton hath such a spightful nature against the four-footed beasts [of the female sex] that if the root be laid to their shap or naturall place, it killeth them: and if the leafe, which is like vnto the Cyclamin or Sowbread leafe about named, be applied in that manner, they will not liue one day to an end. This herb is parted and diuided into knots or joints, taking pleasure to grow in coole and shady places. To conclude and knit vp these remedies against scorpions, the iuice of Betonic, of

A of Plantaine likewise, is a singular remedie for their poison.

Moreover, Frogs (such especially as keep in bushes and hedges, and be called in Latine Rubetrix, i. toads) are not without their venom: I my self haue seen these vaunting Montebanks calling themselves Pfylli, as comming from the race of those people Pfylli who feared no kind of poison; I haue seen them (I say) in a brauery (because they would seem to surpass all others of that profession) to eat those toads baked red hot between 2 platters; but what became of them? they caught their bane by it, and died more suddenly than if they had bin stung by the Aspis: but what is the help for this rank poison? surely the herb * Phrynon drunk in wine. Some call it Neuras, others Poterion: pretty flours it beareth: the roots be many in number, full of strings like vnto sinews, and the same of a sweet & pleasant sent. Likewise Alifura is counted another remedy in this case: an herb it is, called by some Damoforium, by others Liron: the leaues might be taken for Planta in, but that they be narrower, more jagged and plaited, bending also toward the ground; for otherwise ribbed they be and full of veins, as like as may be to Plantain. As for the stalk, it is likewise one and no more, plain and slender, of a cubit in height, in the head whereof it hath knobs: roots growing many and thick together, and those but small, like vnto those of the blacke Ellebore, but they be hot and biting, of a sweet and odoriferous smell, and of a fatty substance withal: it groweth ordinarily in watery and moist places. And yet there is a second kind of it which commeth vp in woods, of a more dusky and blacker colour than the former, bearing bigger leaues: the root of both is of singular operation against the venomous frogs or toads about said: also against the sea-hare, if it be taken in wine to the weight of one dram. And

C since we haue mentioned the sea-hares, take this withall, That Cyclaminos also is soueraigne against their venom. Moreover, a mad dog letteth in a dangerous poison by the wound that his rooth maketh, against which there is not a better thing than dog-rose of the Eglantine called Cynorrhodon, as I haue before declared. Plantain is a singular herb against the biting of any venomous beast whatsoever, whether it be taken inwardly in drink, or outwardly applied. Betonic is likewise good therefore if it be drunk in old wine. Veruain, which the Greeks call Peristereos, is an herb bearing one main stalk of a good height, furnished well with leaues, spreading forth toward the head into other branches, much sought to by doves and pigeons, whereupon it took the foresaid name Peristereos. They say, whofoeuer carry this herb about them, there dare not a dog bark at them. Thus much as touching the dangers proceeding from venomous beasts.

D What remaineth now but in the next place, to treat as well of such forceries and maleficall poisons, as men haue deuised and practised to the mischief of their own kind, as of their remedies where in the first place there presenteth it self vnto vs that noble herb Moly, so much commended by the Poet Homer, as a soueraigne preferuatiue not only against all those wicked inventions, but also against the secret and diuinish practises; to wit, charmes and inchantments, wrought by Art magick and witchcraft. Next vnto which, the herbs * Mithridation, Scordotis, and Centaury: also the seed of Betony drunk in honied wine or sweet cuit: the powder also of the dried herb it selfe, to the weight of one dram taken in 4 cyaths of old wine, doth expell out of the body & euacuat by the seege any poison whatsoever; but the patient must be forced to vomit vp the first potion, and then to recharge again & take another draught of the foresaid medicine. And verily it is a common speech, That whofoeuer vse to tast euery day a little of Betony, shall neuer catch harm by any poisoned cup. If a man or woman chance to haue drunk down any poison, the root of Aristolochia is a present remedy, used in that order as I haue prescribed before in case of stinging by venomous serpents. The like effect hath the iuice of Cinquefoile. Semblably Agarick, if it be taken to the weight of one denier Roman in three cyaths of honied water or mead, is of the same operation; with this charge, That the party do lay vp his stomach or cast before. There is an herb called Calves-snout, in Greeke Antirrhinon or Anarrhinon, a kind of wild Lichnis like vnto Line or flax, with little or no root at all, carying a floure resembling the Hyacinth or Crowtoes, and the seed much like a calves snout or muzzle: the Magicians haue a great opinion of this herb, That whofoeuer be rubbed all ouer with it, or annointed

F thoroughly with the iuice thereof, shall looke more beautifull, louely, and amiable: and whofoeuer weareth it in a bracelet about the wrest or arme, shall take no harme by charme, forcerie, witchcraft, or poison. The like conceit they haue of another herb called * Euploea; and they affirme, That if any man or woman be annointed therewith, they shall grow in great credit and reputation with the people. Moreover, they say, that the herb Artemisia or Mugwort will pre-

* Some take it for Rata may a-lu, or Salvia vltia, a kind of Saxi-rag, or rather Maiden-haire.

* Whereof he writeth in the beginning of the sixt chapter of this booke.

* Euploea indeed signifieth in Homer, a bon-voiage, or prosperous nauigation: but what is that to this place? No doubt I shoud haue read in Theophrastus, which is no heauy, but the happinesse of a good name among men, whereof I haue speake here, & which Theophrastus attributeth to Antirrhinon, as of the effects of that herb. But I say the fault (I pray you) as well here as elsewhere, vnto Plinies Anguills or Rea-ders, who either read wrong, or pronounced not their words distinctly and precisely vnto

* Sauge de Bois.

* Some take these for the Cowslip and Primrose.

* Aconitum Pardalianchet, Libard-baine.

all those who haue it about them, from witch-craft, forcerie, and poison, from danger by ver-
mous beasts, yea and from the hurtfull and maligne aspect of the very Sun. The same, if it be ta-
ken in wine, helpeth and saueth those that are poisoned with Opium: being either drunke, or
worn about the neck, or but tied to any part of the body, it hath a peculiar vertue against the ve-
nom of todes. There is an herb of the bulbous or onion-root kind named * Pericarpum: where-
of the two sorts, the one hath a red bark or rind [about the roots,] the other a black, and is like vn-
to the Poppy; of greater operation this is than the former, but both of them be very hot: which
is the reason, they serue to good purpose for to be giuen vnto them that haue drunk Hemlock: a-
gainst which venomous herb, Frankincense, and Panaces (especially that which they call Chi-
ronium) be counted singular: and this Panaces also last named, is an excellent antidote for them
that are poisoned with venomous Mushrooms.

CHAP. XI.

¶ Proper receipts and remedies for the diseases of the head.

Since wee are waded so far into the deep secrets of Physick, it will not be amisse to proceed
forward and to set downe many good medicines for all the maladies incident either in ge-
nerall to the whole body, or particularly to euery speciall part and member thereof, begin-
ning first at the head.

There is an vnscemely accident happening otherwhiles to the head, and disgraceth it much,
called * Alopecia, when as the haire vnnaturally falleth off. The cure of this inconuenience, is
to make a liniment with the roots of Nymphaea and Hemlocke stamped together, and therewith
to annoint the bald and naked places, for it will cause the haire to come vp againe & grow thick.
Polytricha & Callitrica [both capillare herbs] differ one from another, for that Polytricha hath
white benty filaments or threds, the leaues be also more in number & greater with all: besides,
the very plant it selfe spreadeth and brancheth more than the other: this herb is singular to fa-
sten the haire of the head at the root, and to make it bush and grow thick, being otherwise ready
to shed. In like manner, there is an herb called in Latine * Lingulaca, which loneth to grow a-
bout springs or fountains, & is singular for the same imperfection of shedding haire, if the root
together with the leafe burnt and beaten to powder, be incorporate with the greafe of a blacke
swine (but in any wise she must be a yong gilt that neuer farrowed or had pigs) and so brought
into a liniment, and the head rubbed and annointed therewith: with this charge besides, That af-
ter the annointing, the Patient sit bare headed in the sun; for that helps forward the cure verie
much. And in the same case there is the likewise of the Cyclamine or Sowbread root.

Touching the scurfie or brannie scales called Dandruffe, the root of Veratrum or Ellebore,
sodden either in oile or water, maketh a most excellent medicine to rid it away, & to cleanse the
head thereof.

As for head-ache, the roots of all the kinds of Panaces, stamped and tempered with oile, doe
cure the same: so doth Aristolochia and Iberis, if they be applied in manner of a frontall and
bound to the forehead, the space of an houre or longer if the Patient can abide it, so that a bath
be vsed presently vpon it. The yellow carot also called in Latine Daucus, is a good remedy for
the pain in the head. Moreover, the foresaid herb or root Cyclaminos, if it be mixed with hony
and put vp as an erhin or nasal into the nostrills, purgeth the brain, & the same brought into an
ointment, beaeth the scalls and sores in the head. Of the like operation is Veruain, which they
call in Greek Peristeros. The wild Caraway, named Cacalia or Leontine, beareth certain grains
resembling smal seed pearls, which a man shal see hanging between the leaues, which be big &
large: and it groweth lightly vpon hills: take 15 of these grains or seeds, steep them well in oile,
and maketherof a liniment, it is passing good to rub and annoint the head withall, so it be done
vpward against the haire. Furthermore, the herb Callitriche, is singular good to prouoke snee-
zing; it beareth leaues much like vnto those of Lentils or Ducks meat: the stalks be very small
like fine bents, and the root is as little: it delighteth to grow in coole, shady, and moist grounds,
and is of a sharp and hot tast.

For the lowsie disease, wherein lice and such vermin cawle in exceeding abundance all ouer
the head, there is not a better medicine than an ointment made of hyssope and oyle stamped
and incorporat together: the same likewise killeth the itch in the head. Now the best hyssop is
that

* So called,
because the
fruit claspeth
round about
the stem or
is like of the
heabe.

* Because fox-
es are much
subiect vnto
it, who are il-
l in Greeke
Alopektes
* Capillus vne-
ris, or Maiden
haire.

* Adders
tongue.

H

I

K

L

M

A that of Cilicia, growing vpon the mountaine Taurus: and in a second degree, there is reckoning
made of that which commeth out of Pamphylia and Smyrna. An herb this is, nothing friend-
ly to the stomack: being taken with figs, it purgeth downward, with hony, by vomit: howbeit,
stamped with hony, salt, and cumin, and so reduced into a plaster, it is thought to be a proper re-
medy for the sting of serpents.

Lonchitis is not the same herb (as most men haue thought) that Xiphion or Phasganion, al-
though the seed be pointed like to a speare head; for it beareth leaues resembling lecke blades,
which toward the root be red, and more in number than about the stem it selfe: it carrieth little
heads in the top, made after the fashion of maskes or visors, such as players in Comedies are
wont to weare, lilling out pretty little tongues, and the roots be exceeding long, & yet it grow-
eth in drie grounds far from water. Contrariwise, * Xiphion or Phasganion delighteth in water. * Our Glades
or Flages.
B rich and moist places: at the first coming vp, it maketh a shew of a sword blade: the stem ri-
seth vp to the heigh of two cubits: the root hath beards or fringes as it were hanging about it,
and is in fashion shaped to a filbert nut: which ought to be digged out of the ground before
haruest, and to be dried in the shade: the vpper part of this root (for it groweth double) stamp-
ed with Frankincense and mixed with wine of equal weight, and so made into a salve, draweth
out the spills or broken scales in the brain-pan or scull: the same is good likewise to draw any
impostume that is broken, and to fetch out corruption in any part of the body: and it is singu-
lar for the bones that be broken and crushed * vnder cart or waggon wheels: lastly, the same is * Carpentils
an effectuall remedy against poisons.

C But to returne againe to the head-ache, the said Ellebore boiled either in common oile, or els
in oile rosat, and applied in manner of a liniment, doth assuage the same, so doth Peucedanum
[i. Hare-strange] being incorporat in oile of roses and vinegar. The same also being laied vnto
the head warm, doth mitigat the pain called the migrain, when as the one half of the head doth
ake; and it cureth beside, the dizziness of the braine. The root of Peucedanum made into an
ointment and vsed accordingly, prouoketh sweat, by reason of the hot nature that it hath, which
is burning and causticke. The herb Fleawort, which some call Psyllion, others Cynoides, Chry-
stallion, Sicelion, and Cynomyia, hath a small root, whereof there is little or no vse in Physick.
The branches that it bringeth forth, be slender and pliable in manner of vine shoots, bearing in
the top certain big berries or knobs like vnto beans; the leaues not vnlike to * dogs heads; the

D seed resembleth dogs fleas, whereupon it hath that name Cynomyia, and the same lieth within
the foresaid berries. The herb it selfe is ordinarily growing in vineyards: of great vertue it is to
refrigerat and to discusse or resolute withall: but the seed it is which yeeldeth most vse in Phy-
sicke; and the same is applied in a frontall to the forehead and temples, with vinegar and oile of
roses, or else with vinegar and water together, for to allay the paine of the head. For other acci-
dents, when it is applied in forme of a liniment, the manner is to take the measure of one acetab-
le, and to infuse it in a sextar of water vntill it gather together into a thicke and clammy
substance; then it would be stamped, and the mucilage or slime drawne out thereof serueth for
any paine, impostume, and inflammation.ouer and besides, Aristolochia is a singular herb for
the wounds of the head: it draweth forth broken bones and spills in any part of the head, and so
doth Pistolochia. To conclude, there is an herb called * Thysselum, not vnlike to garden Par-
sley: the root whereof if it be but chewed in the mouth, purgeth the head of phlegmaticke hu-
mours.

* Whereupon
it is called
Cynoides.

* Hydrostylis,
Dioscorides it
Water-parsley

CHAP. XII.

¶ Receipts for the diseases of the eyes, made of Centaurie, Celendine, Panaces, Hen-
bane, and Euphorbium.

IT is thought that the Rha-pontrick (which is the greater Centaurie) helpeth the cie-sight ve-
rie much, if a fomentation be made therewith and water together. The juice of the lesse Cen-
taurie tempered with hony and applied, helpeth the imperfections of the cies; namely, when
there seeme gnats to flie before them, or when they are ouer cast with a cloud; for it scattereth
the dimnesse and web which darkeneth the sight, and doth subtiliate the cataraet or cicatrices
that ouergrow the ball or apple. The herbe Sideritis is so appropriate vnto the cies, that it cu-
reth the verie haw that groweth in horses cies. But so excellent is the herbe Celendine, that it
passeth

passeth them all, and is a soueraigne medicine for all such imperfections. The root of Panaces mixed with parched or fried barley meale, maketh a good cataplasme for to repress the rheume of watery and weeping eyes. And there is a singular drink commended for the staying of such humors, made of Henbane seed one obulus, of Opium or the juice of Poppy and wine as much: Some put thereto the like quantity of the juice of Gentian, which also they vied to mingle with collyries and eye-salues (that require some sharpnesse and acrimony) * in stead of the foresaid Opium or Poppy juice. Moreover, Euphorbium clarifies the eye-sight, if there be an inunction made therewith. For bleered eyes, it is good to drop the juice of Plantain into them. As for the thick mists that hinder the eye-sight, Aristolochia doth dissolve and resolve them. The herb Iberis bound vnto the forehead, together with Cinquefoile, stoppeth the fall of humors into the eyes, and cureth all other maladies incident vnto them. Mullen or Lungwort is likewise a great defensarive against the foresaid rheums which haue taken a course to the eyes and cause them to water; so is Veruain, if it be applied with oile rosat or vineger: For the cataraft or suffusion of the eyes, for the pin and web which offend the eye-sight, the Trofches of Cyclamine being dissolved and so applied, are soueraigne. As for the juice of Peucedanum, (i. Hare-strange) it is (as I said before) a notable medicine for to cleare the sight, and rid away the muddy mists before the eyes, if it be laid to with Opium and oile rosat. Finally, Flea-wort staieeth and keepeth vp the flux of humors into the eyes, if the forehead be annointed with the mucilage thereof.

CHAP. XIII.

¶ Of Pimpernell, named Anagallis and Corchoros. Of Mandragoras or Circeium. Of Hemlocke, Cressmarine or Sampire, named in Greeke Crithmos Agria. Of the herbe Molybdana. Of Fumiterre. Of Acorus or Galangale. Of Floure-de-lys. Of Coryledon or Venus nauiell. Of Sengreen, and Parcellane. Of Groundswill. Of Ephemerion. Of the Tazell, and of Cromfoot: with the medicinal vertues of the said hearbes, appropriate to the diseases of the eyes, eares, nostrils, teeth and mouth.

The herbe Pimpernell, some call Anagallis, others Corchoros. Of it be found two kinds; the male with a red floure, the female with a blew: neither of them both be taller than the hand-bredth or a span at most: tender they be likewise in all parts: the leaues be very smal, round, and lying vpon the ground: they grow as well the one as the other in gardens and watery places: that with the blew floure bloweth first: the juice of them both tempered with hony, dissipeth the mist and dimnesse of the eyes, consumeth the rednesse occasioned by a stripe or bruise, and taketh away the red spots in the white of the eye; and so much the sooner, if the hony be of the best, and made about Athens, wherewith the eyes be annointed. The said medicine likewise is good for to extend and dilate the tunicles that make the ball or apple of the eye: and therefore it is an ordinary course that their eyes be annointed therewith beforehand, who are to be pricked with a needle for couching of a cataraft. These herbes be singular good likewise for the haw in horses or beasts eyes. The iuice of Pimpernell conueyed vp into the nostrils, cleanseth the braine by the munitory of the nose, so that afterwards the Patient do draw vp wine into the nostrils, for a collution to wash them. A dram of the said iuice drunk in wine, is a counterpoison against the venom of snakes. But this is strange, and I cannot chuse but maruell of it, that sheep should so much hate and abhor the female Pimpernell as they do: howbeit, in case they should mistake the one for the other because they are so like (for in floure only they differ) and tast the Pimpernell with the blew floure, presently they haue recourse (by a natural instinct) to an herbe for remedy called in Greeke Asyla, and by vs in Latine Ferus oculus (i. the wild and cruell eye, or Margellane.) Some there be, who set down certain ceremonies and circumstances to be obserued by them who are to dig or plucke vp this hearbe; namely, That they goe to this businesse before the Sun-rising, and salute or bid good morrow to it three times, before they speak any other word that morning; and then to take it vp and cast it on high: which don, to presse forth the iuice of it. Thus ordered forsooth, they say it is of better operation, and will do the deed surely.

Toucing Euphorbium, what it is I haue sufficiently spoken. The iuice thereof is singular for bleered eyes, especially if they be swelled withall: likewise wormwood stamped and incorporat with hony: as also the powder of Betony. There groweth many times a fistulous vicer betweene

A twene the corner of the eye and the nose, called Agilops; for to heale which sore, there is a soueraigne herbe of that * name growing among Barly: in blade or leafe it resembleth that of whear: the seed or graine whereof, beaten into powder and mixed with meale or floure, or the juice drawne out of the herbe, they vse for the said purpose to applie vnto the affected place in manner of a salve or liniment. Now the said iuice must be pressed out of the stalke and leaues thereof, whiles they be fresh and fullest of sap: but then the haw or care that it beareth, ought to be taken away, which being incorporat with the floure of three moneths corn, is made vp into bals or trofches. Some were wont in this cure to vse the juice also of Mandragoras, but they gaue it ouer afterwards. Howbeit, for certain, the root of Mandragoras bruised or stamped, and tempered with the oile of roses and wine, cureth weeping and watering eyes; yea, and assuageth their pain: & the said iuice, how soeuer it be rejected in the former case, goeth into many collyries or eye-salues.

This herbe Mandragoras, some writers call Circeium; and two kinds there be of it: the white which is supposed the male; and the black, which you must take for the female: the leaues of this female resemble those of the * Lectuce, but that they be narrower: hairy also they are, and all of an * equall bignesse. Two or three roots it hath, and those of a reddish or russet colour without; but white within: of a fleshy substance and tender, running downe into the earth almost a cubit in length. A certain fruit or apple they beare, of the bignesse of Filberds or Hazel-nuts, within which there be seeds like vnto the peppens or Peas. The white Mandrage some name Arsen, (i. the male; others * Morion: and there be again who call it Hypophlomos. The white leaues of this Mandrage be broader than the other, and indeed equall to the garden Docke or Patience:

In the digging vp of the root of Mandrage, there are some ceremonies obserued: first they that goe about this worke, looke especially to this, that the wind be not in their face, but blow vpon their backs: then with the point of a sword they draw three circles round about the plant, which don, they dig it vp afterwards with their face into the West. There is a iuice pressed forth both of the fruit, and also of the leaues shred and minced of the * item likewise being first headed or the top cut off, and also of the root, which sometime they do pounce and prick for to let out the liquor; otherwhiles they boile it: and the root so prepared, is as good as the iuice. The same also being cut into certain thin rundles they vse to * preserve in wine. Howbeit, Mandrage is not found alwaies and euery where full of iuice: but in what place soeuer such may be gotten, the right season to seek for it is about vintage time: the sent thereof is strong, but the root and fruit do smell the stronger. The apples of the white, when they be ripe, the manner is to dry in the shadow; but the juice drawn out of them, is permitted to stand in the Sun for to gather and harden.

In like sort, the juice of the root whether it be bruised and stamped, or sodden in grosse red wine to the consumption of a third part. The leaues moreover of Mandrage are commonly kept and condite in a kind of pickle or salt brine: for otherwise the juice of them whiles they be fresh and green, is pestiferous and a very poison. And yet order them so well as you can, hurtfull they be euery way: the only smell of them stuffeth the head, and breedeth the murre and the poise. Howbeit, in some countries they venture to eat the apples or fruit thereof; but those that know not how to dresse and order them aright, lo se the vse of their tongue thereby, and proue dumbe for the time, surprised and ouertaken with the exceeding strong sauer that they haue. And verily if they be so bold as to take a great quantity thereof in drinke, they are sure to die for it. Yet it may be vnder safely enough for to procure sleep, if there be a good regard had in the dose, that it be answerable in proportion to the strength and complexion of the patient; one cyath thereof is thought to be a moderat and sufficient draught. Also it is an ordinary thing to drink it against the poison of serpents: likewise before the cutting or cauterizing, pricking or launcing of any member, to take away the sence and feeling of such extreme cures. And sufficient it is in some bodies to cast them into a sleep with the smell of Mandrage, against the time of such Chirurgery. There be that drink it in lieu of Ellebore, for to purge the body of melancholick humors, taking two oboles thereof in honied wine. Howbeit, Ellebore is stronger in operation for to euacuat black cholour out of the body, and to prouoke vomit.

As touching Hemlock, it is also a ranke poison, witnesse the publicke ordinance and law of the Athenians, wherby malefactors, who haue deferred to die, were forced to drinke that odious potion of Hemlock. Howbeit, many good vertues hath this herbe, and would not be rejected and cast aside for the sundry vses thereof in Physicke. The seed is euery way hurtfull and venomous.

As for the stems and stalks, many there be that do eat it both green & also boiled or stewed between two platters. Light these stems be as kexes, and full of ioints like Reeds and Canes: of a darke gray or fullen colour, rising vp many times aboue two cubits high: and toward the top they spread and branch. The leaues in some sort resemble Coriander, but that they be more tender, and a strong stinking smell they haue with them. The feed is thicker and grosser than that of the Annise. The root likewise hollow, and of no use in Physicke. The leaues and seed are exceeding refrigeratiue: which if they haue gotten the mallery and vpper hand of any that hath taken them, so as there is no way but one without help, they shall feele themselves begin to wax cold in their extrem or outward parts, & so to die inward: howbeit there is a remedy euen then, before the cold haue taken to the vital parts: namely to take a good draught of wine, which may set the body in a heat, and chaufe it again: may if they drinke it with wine, there are no meanes in the world to saue their liues. There is a iuice pressed out of the leaues and floures both together, for that is the right reason, namely whiles it is in flour: the which is pressed out of that seed stamped, being afterwards dried in the Sun and made into bals or trofches, kills them that take it inwardly, by congealing & cluttring their blood; for this is a second venomous and deadly quality that it hath: which is the cause, that whosoever die by this means, there appear certain spots or specks in their bodies after they be dead. And yet there is a use of this iuice, to dissolue hot and biting medicines therein instead of water: moreover, there is made of it a very convenient cataplasme to be applied vnto the stomack, for to coole the extreame heat thereof. But the principal vertue that it hath, is to repress and slay the flux of hot humors into the eyes* in summer time, and to assuage their pains if they be annoiued therewith. It entreteth besides into collyries or medicines deuised to ease pain: and verily there is no rheumatick flux in any part of the body but it stoppeth it. The leaues also of Hemlocke doe keepe downe all tumors, appease paines, and cure watering eyes. *Anaxilans* mine Author saith, That if a pure maidendoe in her virginity annoiue her breasts with this iuice, her dugs will neuer grow afterwards, but continue still in the same state. True it is indeed, that being kept vnto the paps of women in child-bed, it drieth vp their milke: as also extinguieth naturall seed, if the cods and share be annoiued therewith. What remedies they should vse to saue themselves who are adjudged by law to drink it, I for my part purpose not to set down. The strongest Hemlocke and of speediest operation is that which growes about Susa in the confines of Parthia. Next to it for fearful working, is that which commeth out of Laconica, Candy, and Natolia. In Greece the Hemlocke of Megara is counted the quickest, and then that of Attica.

Crestmarine or Sampier, called the wild Crethmos, riddeth the eyes of the gummy & viscous water that sticketh in them, if it be applied thereto: and if it be made into a cataplasme with fried Barly meale, it assuageth also their swelling.

There groweth commonly an herbe named in Greeke Molybdæna, that is to say in Latine, Plumbago, euen vpon euery corne land; in lease resembling the Dock or Sorrell, with a thicke root, and the same rough and prickly. Let one chew this herb first in his mouth, & then eftsoons lick with his tongue the eye, it consumeth and taketh away the * Plumbum, which is a kinde of disease or infirmity incident to the eyes.

As touching the first * Capnos, which in Latine is commonly called Pedes Gallinæ, i. hens feet: it groweth about decayed wals and ruina buildings, among rubbish, & in hedges: the branches be very smal, & spread loosely or scattering, the floure of a purple colour, the leaues green, the iuice wherof dissoluth the dimness and thickeness about the eyes, and clarifieth the sight: and therefore it is usually put into eye-salues. There is another herb of the same * name, & like in effect, but different in form from it, which doth branch thicke, and is of a tender substance: the leaues for shape resembling Coriander, and those of a wan or ashie colour, but it beareth a purple floure: it groweth in Gardens, Hort-yards, and Barly-lands. If the eyes be therewith annoiued, it cleanseth and cleareth them: but it causeth them to weepe and water, like as smoke doth, whereupon it tooke the name Capnos in Greeke. If the haire of the eye-lids be once pulled forth, and then the edges or brims be annoiued therewith, it will keep them for euer coming M vp againe.

* Acorus hath leaues like to the Flour-de-lis, but that they be only narrower, & growing to a longer stele or taile: the roots be black & not so full of veins nor grained, otherwise they agree well with the Ireos root, hot & biting at the tongues end. To smel vnto they are not vnpleasant: and

A and being taken inwardly, they do gently moue rising, and cause the stomack to breake winde vpward. The best Acoros roots be those which come from Pontus: then they of Galatia: and in a third rank are they to be set which are brought out of Candy. Howbeit, the principall and the greatest plenty are those esteemed which grow in the region Colchis neere to the river Phasis: and generally in what country soeuer, they that come vp in watery grounds be chiefe: the fresher that the roots be and more newly drawn, the stronger sent and lesse pleasant taste they haue with them, than after they haue bin long kept aboue ground. Those of Candy be whiter than the other of Pontus. They vse to cut them into goobets as big as a mans finger, and then hang them within bags or pouches of leather a drying in the shade. I find in certain writers, that the root of Oxymyrine is called Acoros, and therefore some (alluding to the name of Acoros) chuse rather to call this plant Acoron the wild. Well, the root of Acorus is of great operation and effect to heat and extenuate: and therefore the iuice thereof taken in drinke, is singular against catarracts or any accidents of the eyes that cause dimness. Soueraigne likewise it is taken to be against the venome of serpents.

Cotyledon, named in Latine Vmbilicus Veneris, is a pretty little herb, hauing a tender and a smal stem, a leafe thicke & fatty, growing hollow, like to the concavity wherin the huckle-bone turneth, and therupon it took the foresaid name in Greeke. It groweth by the sea side and in rocky or stony grounds: of a liuely green colour, and the root round, much like to an Olive. The iuice is thought to cure the eyes. Another kind there is of Cotyledon, with grosse and * fattie leaues likewise, but broader than the former. Toward the root they grow thicker, which they seem to compass and inclose, as it were an eye. A most harsh & vnpleasant taste it hath: the stem is high, but very slender. This herb hath the same properties which the Flour-de-lis.

Of Sengreen or Houlleek, which the Greeks call Aizoon, there be two kinds. The greater is ordinarily planted in earthen pans or vessels set out before the windows of houses: which some name Buphthalmion, others Zoophthalmion, and Sregerethron, because it is thought so good in some drinks or amorous medicines: others againe giue it the name Hypogeson, for that it is seen to grow vnder the eaves of houses. There are also who loue to term it Ambrosia, or Amerimnos. Here in Italy they call it Sedum the greater, Oculus also, and Digitellus. For the second kinde is somewhat lesse, which the Grecians distinguish by the name * Erithales or Trithales (because it beareth floures thrice in the yeare;) others Chrysothales; and some againe, Isoetes. But both the one and the other they call Aizoon, because they be alwaies fresh and green: according to which name in Greeke, some giue it the Latine name Sempervivum. The greater kind beareth a stem a cubit high and more, and the same of the thickeness of a mans thumb, with the better. The leaues in the head or top whereof, be like vnto a tongue, fleshy and fat, full of iuice, a good inch broad, some bending downe and coping toward the earth, others standing vpright, but so, as if a man mark their round circle or compass where in they lie couched, he shall obserue the very proportion of an eye. The lesse Sengreen or Iubarb groweth vpon walls, and specially such as be ruinated and broken down: likewise vpon the tiles of house-roofs. This herb is tufted with leaues from the very root euen to the top of the branches. The leaues be narrow and sharp pointed, and full of iuice. The stalk groweth a good hand-breadth or span high. The root is not medicinable nor of any vse.

Much like to this is that herb which the Greeks call Andrachne Agria, i. wilde Purcellane; the Italians, Illecebra. The leaues be but small to speake of, howbeit broader than those of the herb before named, and shorter toward the top. It groweth vpon rocks and stony places: & folke vse to gather it for to eat. All these last rehearsed haue the same operation, for they be exceeding cold and astringent withall. Good they be to stay the rheum that falleth into the eyes and causeth them to water, whether the leaues be applied to them, or the iuice in manner of a liniment: moreover, they cleanse and mundifie the vlcers of the eyes, the do also incarnate, heale, and skin them vp: singular good besides to loose and open the eye-lids, when they are aglued and closed vp with viscous gum. The same do allay the head-ache, if either the temples be annoiued with the iuice thereof, or the leaues be applied to them. Moreover, they mortifie or kill the poison inflicted by the prick of the venomous spiders Phalangia: but the greater Sengreen hath this peculiar vertue, to resist the deadly poison of the herb Aconitum. Furthermore it is sayd, that whosoever carry it about them, shall not be stung by scorpions.

All the kinds of them are proper remedies for the pain in the ears. Like as the iuice of Henbane

* Epiphoras
affliction of
the eyes, as
hot rheum.

* Ambrosia, out
of Dioscor, not
iustly, as

bane also, if it be applied moderately, of Achillea and the best Centaury, of Plantaine and Harstrang, together with oile rofat and Opium: finally, the iuice of Acorns or Galangale vsed with Roses, is much commended in that case. But this would be noted, that the manner of preparing of all these iuices, is to heat them first, & then to conuey or infuse them into the ear by a * pipe for the purpose [called an Orenchyte.] Semblably, the herb Vmbilicus Veneris or Cotyledon is much commended for mundaying the ears, when they run with filthy matter especially, if it be tempered with deere sewer, and namely of a Stag or Hind, and so infilled hot. The iuice of the Walwort root clarified and strained through a fine linnen cloth, and soon after dried & hardened in the Sun, healeth the swelling impostumations vnder the ears, if as need requireth, it be dissolved in oile of Roses, and so applied hot. The like effect in that case hath Veruain & Plantain; Sideritis also being incorporat in old Hogs greafe.

After the same manner Aristolochia together with Cyperus, healeth the stinking and ilfaucored vicer of the nose, called Noli-me-tangere.

The root of Panaces, especially that which is called Chironia, if it be chewed in the mouth, assuageth the tooth-ache: so doth the iuice thereof, if there be a collution made therewith. The root of Henbane hath the like vertue, if one chew it with vineger, as also of Polemonia or sauge de bois: for which purpose it is passing good to chew the Plantain root, or to wash the mouth and teeth with the iuice or decoction thereof boiled in vineger. And the very leaues of Plantain be singular for the pain of the teeth; yea, though the gums were putrified with rank & corrupt blood, or in case there owled or issued out of them filthy bloody matter. And the seed of Plantain cureth the impostumations of the gums, albeit they gathered to suppuration and ran matter. Moreover, Aristolochia doth knit and consolidat the gums; yea, and fasteneth the teeth in the head. For these infirmities of gums and teeth, the root of Veruain is highly commended if it be chewed: or if it be boiled in wine or vineger, and the mouth washed with that decoction. The roots of Cinque-foile sodden likewise either in wine or vineger to the consumption of a third part, worke the same effect. But looke that before you boile them, they be wel rincd and washed either in sea water or salt water at the least: and when you vse this collution, see you hold the liquor or decoction in your mouth a long time. But some there be who thinke it better to rub the teeth with the ashes of Cinquefoile burnt, leaues, root, and all. Moreover, the root of Mullen or Taperwort sodden in wine, maketh a singular collution for the teeth. Likewise if the teeth be washed with the decoction of Hyssop or the iuice of Harstrang, together with Opium or Poppie iuice, much good and ease will insue thereupon. As also by the iuice of a Pimpernell root: and the rather of that which is counted the female, if the same be conueighed vp into the nostril of the contrary side to the tooth that aketh. There is an herb called Groundswel, which the Greekes name Erigeron, and we the Latines Senecio: they say if a man make a circle round about it with some instrument of yron, and then dig it out of the ground, and therewith touch the tooth that is pained, three seuerall times, and between euery touching spit vpon the ground, and then bestow the said herb, root and all, in the very same place where he drew it, so as it may liue and grow again, the said tooth shall neuer ake afterwards.

This Groundswel is an hearbe much like in shape vnto Germander, as soft also and tender as it, the small stalkes or braunches whereof incline to a reddish colour: and it loueth to grow vpon tiled houses or VValles. The Greekes imposed that name Erigeron, because in the Spring it looketh hoarie, like an old gray beard: in the top it diuideth it selfe into a number of heads, betweene which there cometh forth a light plume, much like vnto Thistle-downe: VVhich is the reason that *Callimachus* calleth it *Acanthus*; and others, *Pappos*. But in the farther Description of this Hearbe, it seemeth that the Greekes agreed not: for some haue sayd that it is alsow like to Rocket; others to an Oke, but that they bee much lesse. There bee VVriters also who hold the root to bee good for nothing in Physicke: and there bee againe that commend it to bee singular for the sinewes: besides, some others are of opinion, That it strangeth and choaketh as many as drinke it. Contrariwise, certaine Physitians prescribe it for the laundise to bee taken in VVine: for all the diseases likewise of the bladder, and against the infirmities of the Heart and Liuer. And they assure vs, That it scoureth the Reines or Kidneies of all grauell. In case of the Scitica they haue ordaind it to bee drunke to the weight of a dramme with Oxymell, presently after some exercise by walking: giuing out, that there is not a better thing in the VVorld for the gripes and torments

A ments of the guts, if it be taken in sweet wine cuit: esteeming it a singular herbe for the griefe of the midriffe and precordiall parts about the heart, if it be eaten with meat in a sallad with vineger: and in regard of these manifold commodities, they low and nourish it in their gardens for to be alwaies ready at hand. And some authours I find who haue made a second kind thereof: but they haue not described what manner of herbe it is, only they appoint it to be giuen in water against the sting of serpents, and to be eaten for the falling sicknesse. For mine own part, I will set downe the vse thereof in some cases, according as I haue found it by experience to work in the praefise here at Rome. The plume or downe which it beareth, if it be stamped and reduced into a liniment with Saffron and a few drops of cold water, and so applied, cureth the inordinat flux of waterish humors into the eyes. The same dried and parched against the fire, or otherwise fried with some cornes of salt, and laid to the swelling wens called the Kings euil, healeth them.

The May-Lillie (called in Greeke Ephemeron) is leasd like vnto the Lillie, but that the leaues be lesse: the stem is semblable and equall vnto it, vpon which it beareth a * blew floure. The seed which it carrieth is nothing medicinable. One single root it hath of a finger thickenesse, which is soueraigne for the teeth, if it be cut and minced small, and afterwards sodden in vineger for a collution to wash the teeth with it warme. The very substance also of the root is singular good to confirme the teeth standing loose in the head: and to be put into those that be hollow and worne eaten. Moreover, the root of Celendine is good for the teeth, if it be bruised or stamped, and so with vineger held in the mouth. If teeth be rotten and corrupt, the black

C Ellebore is singular to be put into their concauities. And both of them (as well the blacke as the white) serue in a collution to strengthen and keep them fast in their sockets, if they be boyled in vineger. As touching the Tazill (which is called in Latine Labrum Veneris) it grows in riuers and * waters: within the heads or burs which it beareth, there is found a little worne or grub, which for the tooth-ache they vse to binde about the teeth, or to put it in their holes and close them vp with wax. But when that herbe is pulled out of the ground, great heed must be taken that it touch not the earth. The herbe Crowfoot is called in Latine Ranunculus, in Greeke Batrachion; whereof be foure kinds: The first beareth leaues like vnto Coriander, but that they be fatter, and as broad as those of the Mallow, of a swert colour: the stalke is whirish, or griled and slender, the root also white: it groweth ordinarily along great rode waies, especially in cold, shadowie, & moist places. The second is better furnished with leaues, and those more

D ly in cold, shadowie, & moist places. The second is better furnished with leaues, and those more cut and indented than the former, and riseth vp with greater and higher stalks. The third is the least, hauing a strong sent, and bearing a yellow floure like vnto gold. The fourth is like to this, and hath likewise a yellow floure. They be all of them of a causticke and burning qualitie. For lay but the leaues raw and greene (as they grow) vpon any place, they will raise blisters in the skinne, as well as a light coale of fire: which is the reason, that they bee much vsed for leprogies and foule scabs; also to take out any markes imprinted in the skinne, or vnseemely scarre. In summe, it is one of the ingredients that go to the making of all potentiall cauterics or causticke medicines. VVhere the haire is gone, and the place bare and naked, they vse commonly to applie these hearbes for to recouer the haire againe: but they must be soone remooued. For E tooth-ache also it is an ordinary thing to chew of their roots, but if one continue so long, it will burst their teeth in pieces. The same beeing cut into roundles, and dried, and so beaten into pouder, serueth to prouoke sneezing. Our Herbarists here in Italy call this hearbe *Strumea*: because it helpeth and cureth the wens named *Strumæ* or the Kings euil, and the flat biles or pufes called *Pani*, if the same be hanged vp afterwards in the chimney to take smoke. For this opinion they haue, and be verily perswaded, that if it be set againe into the ground, the wens and biles afore said which were healed, wil returne and be sore again. The like forcery and witchcraft they vse with Plantaine: but in truth, the iuice of Plantaine is singular good for the cankers or vicers within the mouth: so are the leaues and roots, if they be only chewed, yea though the patient or diseased person were troubled with the spitting rheume; for they intercept all F those defluations, which take a course into the mouth. Cinque-foile is a very soueraigne herb for the sores of the mouth, and for stinking breath. Pysyllium, i. Fleawort, is good for the vicers thereof.

But since I haue named a stinking breath, which is a foule and nastie disease, putting man or woman to shame, as no infirmite more; I will set downe one or two compound receits for that

* *Discorides*
saith white.* It contains
water indeed
within the
concauities or
ar-me-pis (as
it were) of the
leaues where
they join to
the stem, but
surely in riuers
it grows not.Latter *Disco-*
i. white.

that imperfection. Take Myrtle & Lentisk leaues, of each a like weight, of the Gal-nuts grow-
ing in Syria, halfe as much in quantity; stamp them all together, and in the stamping, sprinkle
them with good old wine: giue the patient this composition in bole to chew and eat in the
morning, there is not the like medicine vnto it for a sweet breath. Also take Ivy berries, Casia or
Canell, and Myrrhe, of each an equall weight, incorporat them with wine in manner aforesaid,
and vse this confection accordingly. For the sores that be incident to the nose, the seed of dra-
gons made into powder, and tempered with hony, is singular to be applied therunto, yea though
they were very cankers, and had eaten deep. Where the skin looketh blacke and blew, whether
it be vnder the eies, or otherwise in any part of the visage, a salue made of Hyssope applied ther-
to, restoreth it to the fresh and natieue colour. To conclude, a liniment of Mandragoras taketh
out the markes or prints that be branded or seared in the face [if it be applied presently while
they be fresh.]

THE TWENTY SIXTH BOOKE OF THE HISTORIE OF NATVRE, WRITTEN BY C. PLINIVS SECVNDVS.

The Proeme.

CHAP. I.

¶ Of medicines appropriate and respectiue to all other parts and members of the body. Of
certaine new maladies: and namely, of the ill-fauored tetter called Lichenes:
what kinde of infection it is, and when it first entred into Italy.
Of the blain or sore called the Carbuncle. Of the filthy
leprosie or wild scab named Elephantia-
sis. And of the Collicke.

Long is it not since the face and visage of men began to be annoied with certaine
new and strange diseases, vnkowne in our forefathers daies, and neuer heard of
before in Italy, nor almost in any part of Europe. And euen of late daies when
these maladies first set foot in these parts, they were not seene so to spread
throughout all Italy, ne yet to range greatly in Illyricum, France, or Spain, al-
though some little sprinkling there was in those countries: but about Rome
only and those quarters adioining, as they rained first, so they raged most. These new come
diseases verily were nothing painfull to the Patients, nor dangerous any waies and deadly; but
so foule and filthy, so loathsome and ougly, that a man would haue chosen rather to die any
death, than to be so disfigured. But of them all, the worst and most detestable was that, which
by a Greeke name they called Lichenes, and in Latine (because ordinarily it began about the
chin) * Mentagra. A terme giuen vnto it (I assure you) at the first by way of jeast and in a meri-
ment (as commonly we see many are disposed to play and make good game at other mens mi-
series) but afterwards it went currant in euery mans mouth: and by no other name than Ment-
agra was it known, notwithstanding the disease possessed not the chin alon, but in many that had
it, took vp the whole visage, all faue the eies, yea, and ran downward to the neck & breast, pre-
ading also to the armes and the very hands: and in such sort was the skin of the poore wretches
be painted

* For Mentum
in Latine is a
chin.

A be painted and beraied with foule scurfe and filthy scales, as it would haue pittied one at the
heart to see them. This contagious disease, our fathers and ancestors in times past neuer heard
of, nor knew what it meant: for the first time that it crept into Italy, was in the daies of *Tiberius*
Claudius late Emperor of Rome, euen about the middle of his raigne; and that was by the means
of a certain knight or gentleman of Rome borne at Perusum, who being secretary or clerke vn-
to the Treaferer vnder the Romans in Asia, and giuing attendance according to his place, chan-
ced there to be infected, and so hee brought the disease ouer with him to Rome. But will you
heare the strange nature of this foule euil? women were not subiect vnto it; no more were slaues,
base and poore commoners, no nor citizens of mean state and condition: the greatest gentlemen
and those of the nobility, it made choise of, and picked them from among the rest: very car-
ching it was, and soone passed from one to another, especially by the mouth, and * by the means
of a kisse were it neuer so short: foule and ill-fauored enough was the disease it selfe, but the
B fear, remaining after it was healed (for many there were who came vnder the Chirurgians hand
and indured the cure) looked a hundred times worse: and why? no way there was to rid it, but
by caustick medicines or potentiall cauteries; and vnlesse the flesh were eaten away to the very
bones, it was not possible to kill and root it out clean, but it would reuiue and spring again: and
verily there came Physitians and Chirurgions out of Egypt (a countrey apt to breed the like
diseases and where they be common) such as professed only the skill in this kind of cure, who
filled their purses well, and mightily enriched themselves by their practise at Rome: for well
known it is, that *Marius Cornutus* (late L. Pretor, and lieutenant general for the state in the pro-
C uince of Guienne or Aquitaine in France) dealt with one of these Egyptian leeches for to be cured
of this disease, and agreed to pay him 200000 Sesterces for his paine. And thus much of
Mentagra.

Moreover, what a wonderfull thing is this obserued in these new kind of maladies, that many
times (contrary to the course of other sicknesses) they come together in troupes; that some of
them should all on a sudden light vpon a particular country; that they should take to one cer-
taine member of mans body; assaile those of such an age and no other, haue a spight to persons
of this or that quality, and spare the rest; as if they made choise, some to plague young chil-
dren, others elder folk; some to punish none but the rich and mighty, others to be doing with
the poore and needy? In our Annals or Chronicles we find vpon record, That while *Lucius Rati-*
lus and *Q. Marcius* were Censors of Rome, the pestilent carbuncle (a disease appropriat to Pro-
D uance and Languedoc in France) came first into Italy. Of which maladie, there died within the
compassse of one year (about that very time when I compiled this worke and history of mine)
two noble men of Rome and late Consuls; to wit, *Iulius Rufus* and *Q. Licanus Bassus*: of which
two, the former was cut for it by the counsell of vnskillfull Physitians, and * by that means lost
his life. As for the other, hauing it vpon the thumb of his left hand, he chanced * to pricke it
himselfe with a needle; and although the wound was so small, that hardly it could be seene and
discerned, * yet it cost him his life. This carbuncle riseth ordinarily in the most hidden and se-
cret parts of the body, and for the most part vnder the tongue: it is hard and red in manner of the
swelling veines called in Latine Varices: and yet in the head it looketh blackish; the skin also
E about it seemeth swert and dead: it stretcheth the skinne and the flesh in some sort stiffe, but
without any great swelling; no paine at all, no itching no other symptome but sleepe, where-
with it so possesseth the Patients, that in three daies it will make an end of them. Otherwhiles
it causeth the party to fall into a quietering and shaking as it were for cold, and raiseth certaine
blisters or angry pimples round about it; and verie seldome causeth an Ague: but looke in
whom soeuer it taketh to the stomacke or throat, it quickly dispatcheth and maketh an end of
them.

As touching the white leprosie, called Elephantiasis (according as I haue before shewed) it
was not seen in Italie before the time of *Pompey* the Great. This disease also began for the most
part in the face, and namely it tooke the nose first, where it put forth a little specke or pimple
F no bigger than a small Lentill; but soone after, as it spread farther and ran ouer the whole body,
a man should perceiue the skin to be painted and spotted with diuers and sundry colors, & the
same vneuen, bearing out higher in one place than another, thicke here, but thin there, and hard
every where, rough also like as if a scurfe or scab ouerran it, vntill in the end it would grow to be
blackish, bearing downe the flesh flat to the bones, whiles the fingers of the hands, and toes of

the feet were puffed vp and swelled againe. A peculiar malady is this, and naturall to the Egyptians; but look when any of their kings fell into it, wo worth the subjects and poore people: for then were the tubs and bathing vessels wherein they sat in the bain, filled with mens blood for their cure. But surely this disease continued not long in Italy, before it was quite extinguished: like as another before it, and in old time * *Gemurfa*, which began between the toes: and so long agoe it is since any haue bin troubled therewith, that the very name also is forgotten and grown out of vse. Where by the way, this is to be noted as a strange and wonderfull thing, That some of our diseases should haue an end and lose their course for euer; and others againe continue still: as for example, the cholique passion, which came among vs no longer agoe than in the daies of *Tiberius Caesar* the Emperour: and the first that euer felt it, was the prince himselfe; whereupon arose no small question throughout the whole city of Rome: for when as the said Emperour published a certain proclamation, wherein he excused himself for not comming abroad to manage the affaires of the State, because he was sick of the cholique; the Senat and people reading this strange name of an vknowne maladie, entred into a deep discourse with themselves, what to thinke and make of it? But what should we say of all these kinde of diseases? and what an anger and displeasure of the gods is this, thus to plague and punish vs? Was it not enough to haue sent amongst men into the world a certaine number of maladies otherwise, and those not so few as three hundred, but we must be in feare and danger still every day of new? and yet feel as many as there be of them comming by the hand of God, yet men throw their owne excessse and disorders, bring as many more vpon themselves, and be causes still of farther troubles & miseries. Well, thus you see by that which I haue written in the former bookes, what was the old Physicke in times past; namely, consisting of the simples onely found in dame Natures garden, and how she alone at the first and for a long time, was our Physitian and furnished vs with remedies for all diseases.

CHAP. II.

¶ *The praise of Hippocrates, and other Physitians meere Simples.*

Hippocrates verily had this honor aboue all men, That he was the first who wrote with most perspicuity of Physicke, and reduced the precepts and rules thereof into the bodie of an art: howbeit, in all his bookes wee find no other receipts, but herbes. Semblably, the writings of *Diocles* the Carystian, were no lesse stored with the like medicines, and yet a famous Physitian he was, and both in time and reputation next and second to *Hippocrates*. *Praxagoras* also, and *Chrysippus*, yea and after them *Erasistratus* held on the same course. As for *Herophylus*, although he was the first that went more exquisitely to work and brought in a more subtil and fine method of Physick, yet none esteemed better of simples than hee. But surely, practise and experience (which as in all things else is found to be most effectuell, so in the profession of Physick especially) began in his daies by little and little to flake, vntil in the end all their Physicke proued nothing but words and bibble babbles; for beleue me, his schollers and disciples thought it more for their ease and pleasure to sit close in the schooles and heare their discourses out of the chaire discourse of the points of Physicke, than to go a simpling into the deserts and Forrests to seeke and gather herbes at all seasons of the yere, some at one time, and some at another.

CHAP. III.

¶ *Of the new practise in Physicke of Asclepiades the Physitian: and what course he tooke to alter and abolish the old Physicke for to bring in the new.*

What cunning means foeuer these new Physitians could deuise to ouerthrow the ancient manner of working by simples, yet it maintained still the remnants of the former credit, built surely vpon the vndoubted grounds of long experience; and so it continued till the daies of *Pompey* the Great, at what time *Asclepiades* a great Oratour and professor of Rhetoricke went in hand to peruert and reiect the same: for seeing that he gained not by the said Art sufficiently, & was not like to arise by pleading causes at the bar, to that wealth which

A he desired (as he was a man otherwise of a prompt wit and quick spirit) he resolved to giue ouer the law, and suddenly applied himselfe to a new course of Physick. This man hauing no skill at all, and as little practise, considering he neither was well studied in the Theoricke part of this science, nor furnished with knowledge of remedies which required continuall inspection & vse of simples, wrought so with his smooth and flowing tongue, and by his daily premeditated orations gained so much, that he withdrew mens mindes from the opinion they had of former practise, and ouerthrew all. In which discourses of his, reducing all Physick to the first and primitive causes, he made it a meere coniecturall Art; bearing men in hand, that there were but five principall remedies which serued indifferently for all diseases; to wit, in Diet, Abstinence in meat, Forbearing wine otherwhiles, Rubbing of the body, Walking, and the * Exercise of gestations. In sum, so far he preuailed with his eloquent speech, that euery man was willing to giue care & applause to his words: for being ready enough to beleue those things for true, which were most easie; and seeing withall, that whatsoeuer he commended to them, was in each mans power to perform, he had the general voice of them: so as by this new doctrine of his, he drew all the world into a singular admiration of him, as of a man sent & descended from heauen aboue, to cure their griefs and maladies. Moreouer, a wonderfull dexterity and artificiall grace he had to follow mens humors, and content their appetites, in promising and allowing the sick to drink wine, in giuing them effsoons cold water when he saw his time, and all to gratifie his patients. Now for that *Herophylus* before him had the honor of being the first Physitian who leached into the causes of maladies; and because *Cleophantus* had the name among the Antients, for bringing wine into request and setting out the vertues thereof: this man for his part also, desirous to grow into credit & reputation by some new inuention of his own, brought vp first the allowing of cold water before said, to sick persons; & (as *M. Varro* doth report) took pleasure to be called the Cold-water Physitian. He had besides other pretty deuises to flatter & please his patients, one while causing them to haue hanging litters or beds like cradles, by the mouing & rocking whereof too and fro, he might either bring them asleep, or ease the pains of their sickness; otherwhiles ordaining the vse of bains, a thing that he knew folk were most desirous of: besides many other fine conceits very plausible in hearing, and agreeable to mans nature. And to the end that no man might think this so great alteration and change in the practise of Physick, to haue bin a blind course and a matter of smal consequence, one thing aboue the rest that wooed himselfe a great fame, and gaue no lesse credit and authority to his profession, was this, that meeting vpon a time by chance with one he knew not, carried forth as a dead corse in a bier for to be burned, he caused the body to be carried home from the funerall fire, and restored the man to health again. Certes, this one thing, wee that are Romanes may be well ashamed of and take in great indignation, That such an old fellow as he, comming out of Greece (the vaine nation vnder the sun) & beginning as he did of nothing, should only (for to enrich himself) lead the whole world in a string, and on a sudden set down rules and orders for the health of mankind, notwithstanding many that came after him, repealed as it were, and annulled those lawes of his. And verily, many helps had *Asclepiades*, which much fauored his opinion and new Physick; namely, the manner of curing diseases in those daies, which was exceeding rude, troublesome, & painful; such adoe there was in lapping and covering the sick with a deale of cloaths, and causing them to sweat by all meanes possible: such a worke they made sometime in chafing and frying their bodies against a good fire, but euery foot in bringing them abroad into the hot Sunne, which hardly could be found within a shade and close citie as Rome was. In lieu whereof, not onely there, but throughout all Italy (which now commanded the whole World, and might haue what it list) hee followed mens humours in approouing the artificiall baines and vaulted stoues and hot houses, which then were newly come vp and vsed exceedingly in euery place by his approbation. Moreouer, he found means to alter the painefull curing of some maladies, and namely of the Squinancie; in the healing whereof other Physitians before him went to worke with a certain instrument which they thrust down into the throat. He condemned also (& worthily) that dog-physick which was in those daies so ordinar, that if one ailed neuer so little, by and by he must cast and vomit. He blamed also the vse of purgatiue potions, as contrary and offensive to the stomack, wherein he had great reason and truth on his side: for to speake truly, such drinks are by most Physitians forbidden, considering our chiefe care and drift is in all the course of our physick, to vse those means which be comfortable and wholsom for the stomack.

* Some thinke it was an inflammation resembling our Carbuncle or Anthrax.

* Riding on ho sebacks, carrying in a coach, litter, barge, &c.

CHAP. III.

¶ The foolish superstition of Art-Magicke, which here is derided. Of the tetter called Lichen : remedies proper for it, and the diseases of the throat.

ABoue all other things, the superstitious vanities of Magitians made much to the establishing of *Aclepiades* his new Phyticke; for they in the heighth of their vanity, attributed so strange and incredible operations to some simples, that it was enough to discredit the virtues of them all. First, they vaunted much of *Aethyopus*, an hearbe which (by their saying) if it were but cast into any great riuer or poole, it would draw the same dry; and was of power (by touching onely) to open lockes, or vnbolt any dore whatsoeuer. Of *Achoemenis* also another herb, they made this boast. That beeing throwne against an armie of enemies ranged in battell array, it would driue the troupes and squadrons into feare, disorder their ranks, and put them to flight. Semblably, they gaue out and said, that when the king of Persia dispatched his Embassadors to any forein states and Princes, he was wont to giue them an herb called *Latace*, which so long as they had about them (come where they would) they should want nothing, but haue plenty of all that they desired: besides a number of such fooleries wherewith their bookes be pestered. But where, I beseech you, were these herbs when the *Cimbrians* and *Teutons* were defeated in a most cruell and terrible battell, so as they cried and yelled again? What became of these Magitians and their powerfull herbs, when *Lucullus* with a small army consisting of some few legions, ouerthrew and vanquished their owne kings? If herbs were so mighty, what is the reason (I pray you) that our *Romane* capitaines provided euermore aboue all things how to be furnished with victuals for their camp, and to haue al the waies and passages open for their puruerours? In the expedition of *Pharfalia*, how came it to passe that the souldiers were at the point to be famished for want of victuals, if *Cesar* by the happy hauing of one hearbe in his campe, might haue inioined the abundance of all things? Had it not bin better think ye, for *Scipio Aemilianus* to haue caused the gates of Carthage to flie open with the help of one herbe, than to lie so many yerres as he did in leaguer before the city, & with his engins & ordirance to shake their wals, & batter their gates. Were there such vertue in *Ethiopi*us aforesaid, why dowe not at this day dry vp the *Pontine* lakes, and recouer so much good ground vnto the territory about *Rome*? Moreover, if that composition which *Democritus* hath set downe and his bookes maketh prayse of, to be so effectual, as to procure men to haue faire, vertuous, and fortunat children, how happeneth it that the kings of Persia themselves could neuer attaine to that felicity? And verily wee might maruell well enough at the credulity of our Ancestors in doting so much vpon these inuentions (how soeuer at the first they were deuised and brought in, to right good purpose) in case the mind and wit of man knew how to stay and keepe a meane in any thing els besides: or if I could not proue (as I suppose to doe in due place) that euen this new leech-craft brought in by *Aclepiades* which checketh those vanities, is growne to farther abuses and absurdities than are broched by the very Magitians themselves. But this hath beene alwaies and euer will bee, the nature of mans mind, To exceed in the end and go beyond all measure in euery thing which at the beginning arose vpon good respects and necessary occasions.

But to leaue this discourse: let vs proceed to the effects and properties remaining behind of those herbs which were described in the former booke; with a supplement also and addition of some others, as by occasion shall be offered and presented vnto vs. Howbeit, to begin first with the remedies of the said Tettars (so foule and vnseemly diseases) I mean to gather a heape of as many medicines as I know appropriat for that malady, notwithstanding I haue shewed already of that kind not a few. Well then, in this case, *Plantaine* stamped is very commendable: so is *Cinquefoile* and the root of the white *Daffodill*, punned and applied with vineger. The young shoots or tender branches of the fig-tree boiled in vineger: likewise the root of the * *Marsh-Mallow* sodden with glow in a strong and sharpe vineger to the consumption of a fourth part. Moreover, it is singular good to rub tettars thoroughly with a pumish stone first, to the end that the root of *Sorrell* stamped and reduced into a liniment with vineger, might be applied afterwards therupon with better successe; as also the floure of * *Miseto* tempred & incorporat with quick-lime: the decoction likewise of *Tithymale* together with rosin, is much praised for this cure: but the herb *Liuertwort* excelleth all the rest, which therupon tooke the name *Lichen*: it groweth

* *Hibiscus*, some take it for the Hollyhock.

* *Hibiscus*, some read *Hibiscus*.

A groweth vpon stony grounds, with broad leaues beneath about the root, hauing one stalke and the same small, at which there hang downe long leaues: and surely this is a proper herb also to wipe away all marks and cicatrices in the skin, if it be bruised and laid vpon them with hony. Another kind of * *Lichen* or *Liuertwort* there is, cleauing wholly fast vpon rockes and stones in manner of mosses, which also is singular for those tettars, being reduced into a liniment. This herb likewise stancheth the flux of blood in green wounds, if the juice be dropped into them: and in a liniment, it serueth well to be applied vnto apostumat places: the jaundise it healeth, in case the mouth and tongue be rubbed and annointed with it and hony together: but in this cure the Patients must haue in charge, To bathe in salt water, to anoint themselves with oile of almonds, and in any case to abstain from all salads and rothearbs of the garden. For to heale tettars, the root of *Thapsia* stamped with hony is much vsed.

B As for the *Squintie*, * *Argemonia* is a soueraigne remedy if it be drunk in wine: *Hyssop* also boiled in wine and so gargarized: likewise *Harstrang* with the rennet of a Seale or Sea-calf, taken both of them in equall portion: moreover, Knot-grasse stamped with the pickle made of Cackrebs and oile, and so gargled, or els but held only vnder the tongue: Semblaoy, the juice of *Cinquefoile*, being taken in drink to the quantity of three cyaths: this juice besides, in a gargarine, cureth all other infirmities of the throat. And to conclude with *Mullen*; if it be drunk in water, it hath a speciall vertue to cure the inflammation of the amygdals or almond kernels of the throat.

* *Onocoma*, some call it *Onocoma*.

* *White* some take to be wild Poppy, call it *Rouelle*.

CHAP. V.

¶ Receipts for the scrophulous ar wens called the Kings euill: for the paines and griefes of the fingers: for the diseases of the breast, and namely for the Cough.

Plantaine is a soueraigne herb to cure the Kings euill: also *Celendine* applied with hony and hogs lard: so is *Cinquefoile*. The root of the great *Clor-bur* serueth for the same purpose, if it be incorporat with hogs greafe, so that the place after it is annointed therewith, be couered with a leafe of the said bur laid fast vpon it: in like manner *Artemisia* or *Mugwort*: also a *Mandrage* root applied with water, is good for that purpose. The broad leaved *Sideritis* or *Stone-sauge*, being digged round about with a spike of yron and taken vp with the left hand, and so applied vnto the place, cureth the kings euill; provided alwaies, that the Patients when they be healed, keepe the same herbe still by them, for feare least it being replanted againe by these Herbarists (such is the malicious force of some of them as I haue already shewed) the malady returne and be as bad as it was before: the like caueat I find giuen vnto them, who are cured of this disease either by *Mugwort* or *Plantaine*. The herb *Damaconium*, called likewise * *Alisma*, if it be gathered about the Summer solstead, applied vnto the foresaid wens with rain water, is singular good for them; for which purpose, the leaues are to be stamped, or the root bruised and incorporat with hogs greafe, and so applied in a liniment; with charge, That the place be couered with a leafe of the same: in which manner prepared and vsed, it serueth to allay all pains in the nape of the neck, and to keepe downe or dissipat the swelling in any part of the body. There is an herb growing commonly in meadows, called the *Quise*, with a white floure. & partly inclining to a red, which if it be ioined with *Mugwort* in an ointment, is thought to make the medicine far more effectual for the kings euill. *Condurdum* is an herb of smal continuance, for about the Summer solstice it sheweth a red floure and soon sheddeth the same: which (as they say) if it be hanged about the neck, represseth and keepeth vnder the foresaid disease: the like doth *Vertuaine* together with *Plantaine*, vsed and worne in the same manner.

Touching all the accidents happening to the fingers, and namely the excrescences & risings of the skin about the roots of the nailes, called in Greeke *Prerygia*, *Cinquefoile* is a singular good herb for them.

F Amongst all the infirmities of the breast, the cough is most troublesome and grievous, for which, the root of *Panaces* in sweet wine is a soueraigne remedie. The juice of *Henbane* is excellent for them also that reach vp blood out of the breast: and the very smoke thereof as it burneth, is as proper for them that cough. In like manner, *Scordotis* beeing dried and made into powder, afterwards mingled with cresses and rosin, and so reduced into a liquid confection or

* *Alisma* in some readings.

lochoch, cureth the cough. The said herb taken simply by it self alone, raiseth tough flegme out of the brest, and causeth it to break from the Patient with ease. The like effect hath Centaury the greater, yea though a man did bring vp blood: for which infirmity, the juice of Plantain also is thought to be singular. Betony taken in water to the weight of three oboli, is of great force against the spitting of blood, and raising vp of filthy matter out of the chest. The root of the great bur hath the like vertue, if it be eaten to the weight of one dram with 11 Pine-nuts. The juice of Harstrang, as also Galangale, is good for the pain in the brest, and therefore they go both of them into preseruatues and antidotes which serue for counterpoisons. The Carot likewise helpeth those that cough, like as the herb Scythica (which is the wild Caraway;) for beeing drunk to the weight of 3 cyaths in sweet wine cuit, it is generally good for all diseases of the brest, for the cough, and helpeth such as fetch vp filthy and rotten matter.

CHAP. VI.

¶ Of Mullen or Lungwort: of Calalia: of Folefoot called Tussilago or Bechium, and of Sange: herbs all appropriate for the cough.

Mullen or Lungwort with the yellow golden floure, being in like maner taken to the same quantity, eases the foresaid infirmities. Certes this herb is of that efficacy in these cases, that if a drench thereof be giuen to horses, which not onely haue the cough, but also be broken winded, it wil help them: the same effects I find attributed to Gentian. The root of Calalia foked in wine and chewed, is good not onely for the cough but also for the infirmities in the throat. Take 5 branches or slips of hyssop, and two sprigs of rue, with 3 figs, seeth these together, it is an excellent drink for to discharge the brest of flegme that stuffeth it. Folefoot, called in Greek Bechion, that is to say in Latin *Tussilago, doth appease the violence of the cough. Two kinds there be of this herb: the wild, which wherefoeuer it is seene to grow, sheweth that there is water vnder it: a thing that they know well enough who seek for springs, for they take it to be an assured sign and direction to water: it beareth leaues like to Iuy, but somewhat bigger, either 5 or 7 in number, which vnderneath or toward the ground be somewhat whitish, but aboue in the vpper side, of a pale colour, without floure, stem, or seed, and the root is but small. Some would haue it and Chamfeuce both, to be one and the same herb called by diuers names: take this herb, leafe and root together, when they be dried, set all on fire and receiue the smoke by a pipe, as if you would suck or drinke it downe, it is (they say) a notable medicine to cure an old cough, but between every pipe you must sip a pretty draught of sweet wine. The second Bechion some would haue to be called Saluia, an herb like vnto Mullen: stampe the same, and let the juice run through a streiner, which being made hot, drinke it for the cough and pain in the sides. This herb likewise is very effectual against scorpions & sea dragons. Also an inunction made therewith and oile together, is commended much for the sting of serpents. A bunch of hyssop sodden with three ounces of hony, is a fine medicine for the cough.

CHAP. VII.

¶ For the paine of the sides and breast: for those that cannot draw their wind but sitting vpright: for the paine of the liver: the heart ach: for the lights: difficulty of vrine: the cough: the breast: vlcers: for the eyes: for the flux of the belly, occasioned by a feeble liver: against immoderat vomits: for the yex, the pleurisie, and all griefes of the side.

Lungwort or Mullen drunke in water with Rue, is very good for the pain of the sides and the brest: for which purpose also, they say, that powder of Betony is as good, if it be taken in water wel warmed. The juice of Scordotis is holden to be a great corroboratiue of the stomack: so is Centaury also & Gentian, drunk in a draught of water. Plantain either eaten alone by it selfe, or with a gruell & broth of Lentils, or els with a frumenty potage made with wheat, is comfortable to the stomack. Betony, although otherwife it lie heauy in the stomack; yet if one either chew the leaues, or drinke them in some broth, it helpeth much the defects & infirmities thereof. In like case Aristolochia if it be taken in drinke. Also Agaricke chewed drie, so as betwixt whiles the patient sup a little of pure wine of the grape, hath like vertue: as for Nympha

A phrea or Nemphar synnamed Heraclia, it strengtheneth the stomacke, applied outwardly in a liniment: euen so doth the juice of Harstrang. For the hot distemper of the stomacke, it is good to lay vnto it the herbe Flea-wort or Coryledon, otherwise called Vmbilicus veneris, stamped with fried Barly meale into a cataplasme: or els to take Iubarb, *i. Sengreen*, to the same effect. The herbe Molon hath a stem * chamfered or channelled along: soft leaues, & those small: a root foure fingers long, in the * end whereof it beareth an head like vnto Garlick. Some call it Syron. Taken in wine, it helpeth the stomack and difficulty of drawing breath: In which cases the greater Centaury is singular, if it be reduced into a lochoch or liquid electuary. Plantain also eaten any way, either in a green-sauce or sallad. This composition is reputed a soueraign medicine, Take of Betony stamped the weight of one pound, of Atticke hony as much, incorporate them together, and hereof drinke euery day the quantity of halfe an ounce in some conuenient liquor, or in water warm. Aristolochia or Agarick are soueraigne meanes to be vsed in these infirmities, if one drinke the weight of three oboli thereof, either in warme water or asses milke. The herb Cissanthemos is good to be drunk for those that be streight winded, and must sit vpright when they draw their breath. In the like case Hyssop is commended: as also for pursuenesse and shortnesse of wind. The juice of Harstrang is an ordinary medicine for the griefe of the liuer, the pains also of brests and sides, in case the Patient be cleare of the ague. As for Agarick, it helpeth all such as spit blood, if the powder thereof, to the weight of one Victoriat, be giuen in five cyaths of honied wine. Of the same operation is Amomum. But particularly for the liuer, the herb Teueria is thought to be soueraign, if it be taken fresh & green to the weight of foure drams in one hemine of water and vinegar mixed together. One dram of Betony giuen in three cyaths of warm water, or in twain of cold, is thought to be a singular cordiall. The iuice of Cinquefoile helpeth all the imperfections of the liuer and lights, it cureth them that voyd or reach vp blood, and generally it serueth for al inward corruptions and distemperatures of the whole masse of blood. Both Pimpernels be wonderfull medicinable for the liuer. Fumiterre the herb whosoever do eat, shal purge choler by vrine. Galangale is helpfull likewise to the liuer, to the chest also, and the midriffe or precordial parts. The herb Caucon, named also * Ephedra, and by some Anabasis, groweth ordinarily in open tracts exposed to the wind: it wil clime vpon trees, and hang down from their boughs and branches. Lease it hath none, but is garnished with a number of haire which are no other but rushes indeed full of ioints and knots: the root is of a pale colour. Let this herb be beaten to poudre, and giuen in red wine that is greene and hard, it is good for the cough, for the shortnesse of wind, and the wrings of the belly: it may be taken also in some other supping, whereto it were conuenient to put wine. In like sort the infusion of one dram of Gentian which hath lien steeped the day before, may be very wel taken in three cyaths of wine for those purposes. Herb Benet or Auens hath a small root of a blackish colour, which hath a good sent: this herb not onely cureth the pains of the brest and side, but also discusserth all crudities proceeding of vnperfect digestion, by reason of the pleasant saour that it hath. As for Veruaine, it is medicinable vnto all the principall and noble parts within the body: good for the sides, the lungs, the liuer, and the breast: but most properly it respecteth the lungs; and namely, when the patient is in a phthisick or consumption, by the means of their vicer. The root of Bearfoot, an herb which I said was but lately found out, is a present remedie for swine, sheep, goats, & all such cattel, in case they be diseased in the lights, if it be but drawn crosse through any of their eares. The same ought to be drunke in water, and a peece thereof continually held vnder the tongue. As for any other part of this hearbe aboue ground, be it leafe, stalke, floure or seed, it is not yet certainly knowne, whether it be good or no for any purpose in Physicke. As for the kidneies, the hearbe Plantaine is good to be eaten; Betonie to be drunke; Agaricke also to be taken in drinke, like as for the cough. * Tripolium groweth vpon the rocks by the sea side, on which the sea-water beateth: so as a man cannot say, that it is either in the sea or the drie land: in lease it resembleth woad, but that it is thicker: the stemme is a span or hand-breadth high, forked, and diuided at the point: the root white, odoriferous, grosse, and hot in taste: when it is sodden in a frumenty pottage of wheat, they giue it with good successe to those that be diseased in the liuer: this is thought of some to be all one with Polium, whereof I haue spoken in due place. Symphonia or Gromphena, an herbe hauing leaues, some red, others greene, growing to the stem in order, one red and another greene, is a soueraigne medicine for such as reach and void vp blood, if it be taken in oxycrat, or vinegar & water mingled together.

* Striato haply for stristo, i. slender, as Orissus describes it. * Discorides describes his Moly with such a head vpon the top of the stem.

* B: these names hecal-leth also Horst-tale.

* A kind of Turbit.

* i. Cough-wort.

ouer, the herb Lauer, which loueth to grow in brooks and riuers, being either condite and preserved, or els sodden, allaieth the wrings of the belly. Water-specke or Pondweed, called in Greek Potamogeton, is singular good for the dysentery or bloody flux; for the flux also which proceedeth from a weak stomach. This herb beareth leaues like to Beets, but that they be lesse only and more hairy, or furred with a downe. A little it beareth about the water, and hath a peculiar property, which is refrigeratiue and astringent: the leaues alone be medicinable, & those that are good for the morralls in the legs: for cankerous and corroding vlcers, if they be applied in a cataplasme with hony or vineger. *As for the Phytician describeth this herb* * Potamogeton after another fort, namely with a small slender long leafe like vnto horse-haires, putting forth a long stem likewise, and the same smooth, growing also in waters. He vsed with the root of this herb to cure the Kings euill, and heale all hard tumors. This Potamogeton hath an aduerfatiue nature to Crocodiles also, and therefore they who hunt after them, carry this herbe ordinarily about them. In like maner Achillea stoppeth a lask. And the same effects worketh Statice, an herb running vp commonly in feuen stems, in the top bearing buttons or heads resembling Roses. * Ceratia beareth but one leafe, and hath a knotty and great root, which is good to be eaten for to cure the lask, occasioned by the feeble stomacke, and the bloody flux, proceeding from the vlcer of the guts. Lions-paw, commonly called * Leontopodium, by some Leucocoron, by others Dorypetron, and Thorybetron, hath a root which bindeth the belly, and yet notwithstanding purgeth choler: if it be taken to the weight of two denarij Roman, in mead or honied water. This herbe groweth in light and lean champion grounds. It is said, that if the seed thereof be taken in drinke, it causeth strange visions and fantasticall dreames. Harefoot, which the Greekes name Lagopus, drunke in wine, bindeth the belly: but if the Patient be in an ague, it would be taken with water: being applied and bound vnto the shere, it representeth the tumors and risings in those parts: an herbe this is growing vsually among corne. Many there be, who for the dangerous bloudie fluxe that is thought incurable, commend highly aboue all other herbes, Cinquefoile, in case the Patient drinke the roots thereof boiled in milke: and the like opinion they haue of Aristolochia, in case there be taken of the root to the weight of one vnguldr in three cyaths of wine. Now this would be noted by the way, that in these cases of a toriat in three cyaths of wine. Now this would be noted by the way, that in these cases of a toriat in three cyaths of wine. Now this would be noted by the way, that in these cases of a toriat in three cyaths of wine.

* Which some take for ground Iuic.

* Here Pliny is deceived: for it is a kind of lace winding about Thyme, as Dodon. about Flax.

A Nempur taken in some hard astringent or wine, * gently purgeth the belly. Also, Pycnocomon is laxatiue: an herb this is like vnto Rocket, but that the leaues be thicker in substance, and * grow more thin: it hath a round root, and the same yellowish, and sending much of the earth: the stem is foure cornered, of a mean height, small and slender, and the floure much like to that of Basill. Found it is ordinarily in stony grounds. The root of this herbe drunke in mead, to the weight of 2 deniers, doth euacuat downward by the belly, both cholericke and also flegmatick humors. The seed causeth troublesome and vnquiet dreams, if one drinke a dram thereof in wine. Fumiterre also * consumeth and dispatcheth the kings euill. Polypodium (which we call in Latine Filicula) because it is like vnto Fearn, purgeth choler. The root, which is only medicinable and in vse, is full of hairs, of a greenish colour within, as big commonly as a mans little finger: full of hollow concavities it is, representing those holes that the fishes called Polyopi haue about their feet or clees: sweetish it is in tast, and groweth either vpon rocks, or * else at the foot of old trees. After that this root hath bin wel soaked in water, they vse to presse the iuice forth of it; or the same may be shred & minced smal, strewed among porbeards either of Beets or Mallows; yea, and put into the pot with them: or els tempered in some salt sauce, or sodden in broth: a fine medicine and a safe, gently loosing the belly, though the patient were in an ague: it doth euacuat choler and flegme both: but somewhat offensive it is to the stomach. The powder of it dried, conueighed vp into the nostrils, consumeth the ill-fauoured sore within, called Polypus or Noli-me-tangere. It * floureth, but seedeth not. Moreover, Scammonie also ouerturns and hurtheth the stomach, vnlesse two drams of Aloe be put vnto as many oboli of it: for then it purgeth choler, and sendeth it down by the belly. Now this Scammonie is the iuice of a certain herb (called likewise Scammonea) which brancheth and tufteth immediatly from the root: the leaues be fat, white, and made triangle wise: the root thick, moist, and in handling wil make ones stomach to rise, and be ready to heaue. It loueth to grow in battle grounds, and those of a white leere. About the rising of the great Dog-star they vse to make an hollow trough in the root as it groweth; to the end, that all the moisture thereof may fall and gather into it: which liquor being dried in the Sun, is wrought and made into bals or trochisks. The root it selfe also is commonly dried, or at leastwise the rind thereof. In regard of the country where it groweth, that is commended most which cometh from Colophon, Mysia, and Priene: but if you respect the form, and look of it, chuse that which is neat and clean, resembling as neare as possibly may be, strong Oxe glue, spongeous or fitulous, full of holes or passing small pipes. If you go by other qualities, take that which wil soon dissolve or melt: which also hath a strong and stinking smel, clammy and gummy, turning into a whitish liquor like milk, if you taste it at the tongues end, exceeding light in the hand, and when it is resolved, growing to a whitish colour. And yet this property you shall see in that Scammonie which is sophisticated: and that yv is may soone be done, for do but take the meale or floure of Eruille and the iuice of the sea Tithymal (& such is that commonly which cometh from Iudaea) it wil counterfeit the right Scammony: but such stuffe as this offendeth the throat, and is ready to choke or strangle as many as vse it. Howbeit this may be soon found by the very tast only: for the Tithymal setteth the tongue in a heat as if it were a bulb root: and is not good to purge, whether a man take it fasting or full. As for the true and sincere Scammony, they were wont to exhibit it for a purgation euen simply by it self alone in a draught of mead with some salt, and the dose was four oboli. But it was found to do the deed best, and most effectually taken with Aloe: so that the patient, when it began once to worke, took a pretie draught of sweet honied wine. Furthermore, the root if it be boiled in vineger to the consistence of hony, maketh a singular liniment for to annoint the leprosie; yea, and in case of head-ach it is found good to annoint the head with it & oile together. As for the Tithymal aforesaid, our countrymen here in Italy, some call it Laetaria, as one would say, the Milke herb; other Lactu caprina, i. Goats Lactuce. It is commonly said, that with the milke or iuice of these Tithymals, a man may write vpon the skinn of the body: for draw any letters therewith and strew ashes or dust thereupon, when they be drie, they will appeare very legible.

* Crinis contra-rium vultu. r. s. for it is a binder. * how is it then called Pycnocomon?

* I see not how this should stand here.

* Yea & in the head of old dodder Oke.

* I beareth neither floure nor seed.

* or Spurred. * Ramia, rather esulibus, stems, out of Dio. cor. * Ruge. Dis. f. hath succ. f. atly. i. full of sap.

Nem.

atly from the root, which hang downward inclining to the earth: but in the top it hath an hairy **G** tuft or head in manner of ruines. This groweth in rough places and rocks by the seas side. The seed together with the hairy bush that it hath, they vse commonly to gather in Autumn: which after it be dried in the Sun, they stamp and then lay vp against their need. As for the iuice, men draw it about the time that Quinces begin to ripen and gather a downe about them: for then they breake the sprigges and tender crops of the plant, out of which there issueth the iuice or milk, which they receiue either in Erule floure, or els vpon figs, that it may dry with them together. Now it is sufficient to let fise drops fall vpon euery such fig: for this opinion they haue, that looke how many drops light vpon a fig, so many stools shall hee haue who taketh that fig in a droppe, to purge waterish humors. But in the gathering of this iuice or liquor, great heed must be taken, that no drop of it touch the eyes. There is a iuice also pressed out of the leaues being bruised and stamped, but not so effectuall as the former. The decoction of the branches also is vsed to the same purpose. And the seed being sodden, serueth to the making of certaine pills confectioned with hony, which are highly commended for purgatiues: the same seed * enclosed within wax, is good to be put into hollow teeth when they ake: in which case also, a collutium made of the root boiled in wine or oile, is singular good, if they be washed therewith: With the iuice of this herb there is a liniment made for tetter and ringworms: and some there be who drink the same for to purge both vpward and downward, for otherwise an enemy it is to the stomach: in which portion if there be put some salt, it doth euacuat fleagme, but with salt perre it voideth cholerick humors. If the patient haue a mind to purge by seage, he shal do wel to drink the iuice of Tithymall in water and vineger mingled together: but if he be disposed to vomit, it is better to drink it in cuit or mead. The ordinarie dose is three oboles thereof in a portion. But the better way is to take the figs prepared as is before said, after meat: and euen so taken, in some sort the iuice doth sting the throat and set it on fire. For to say a truth, of so hot a nature it is, that alone of it selfe, being applied outwardly vnto any part of the body, it raiseth pimples and blisters no lesse than fire, in which regard, it is vsed for a caustick or potentiall cauterie: the second kind of the Tithymall, is knowne by the name Myrsinites, which others call Caryites: The reason of the one name is this, for that it beareth sharp pointed and prickie leaues in manner of the Myrtle, but that they be somewhat more tender: and the same groweth in rough places like as the former. The bushy heads or tufts of this Tithymall, would be gathered when Barly beginneth to swell in the eare: & so they be let to take their drying in the shade 9 daies **K** together: for in the Sun they wil be withered in that space. The fruit which this plant beareth doth not ripen all together in one season, but some part thereof remaineth against the next yere: and the said fruit is called the Tithymal nut, which is the cause, that the Greeks haue imposed vpon it that second name Caryites. The proper time to gather and cut down this herb, is when corn is ripe in the field, and ready to be reaped or mowed. Which beeing washed, must afterwards be laied forth a drying: & so they vse to giue it with two parts or twice as much of black Poppie, yet so as the whole dose may not exceed one acetable. This Tithymall is nothing so strong a vomitory as the former, no more be the rest, whereof I will speak anone. Some there be who giue the leaues also with black poppy after the foresaid proportion: & the very nut or fruit it selfe alone in mead or cuit, or els if they put any thing thereto, it must be Sefama: and truly in this manner it fendeth flegmatick & cholerick humors away by seage. This Tithymal is singular for the sores in the mouth. But for cankerous and corrosiue vlcers indeed which corrode deep into the mouth, it is good to chew and eat the same with honey. The third kind of Tithymall is called Paraluis or Tithymalis. This herb puts forth round leaues: riseth vp with a stalk a span or handfull high: the branches be red and the seed white, which ought to be gathered when the grape beginneth to shew [black] vpon the vine. And being dried and made into powder, is a sufficient purgation, so it be taken inwardly to the measure of one acetable: the fourth, kind is named Helioscopium: the leaues whereof resemble Purcellane, and from the root it puts forth 4 or 5 small vpright branches, which be likewise red and half a foot high: the same also be full of iuice or milk. This herb delighteth to grow about town sides, bearing a white seed, where in Doues & Pigeons take exceeding great pleasure: which also is ordinarily gathered when the grape maketh some shew of ripening. It took this name Helioscopium, for that it turns the heads which it beareth, round about with the Sun. Halfe an acetable thereof taken in Oxymel, purgeth cholier downward. And in other cases vsed it is, like as the former Tithymall named **L** Characias.

* or rather the seed or milk is to be put into the tūty and hollow teeth: and the rest which be found are to be defended with wax, according to Discoideus.

So Theophrast.

A Characias. The fifth, men call Cyparissias, for the resemblance that the leaues haue to those of the Cypresse tree: it riseth vp with a double or threefold stem, and loweth to grow in champion places: of the same operation and vertue it is, that Helioscopium and Characias before named. The sixth Tithymal, is commonly called Platyphyllos, although some name it Corymbites, others Amygdalites, for the resemblance that it hath to the almond tree: there is not a Tithymal hath broader leaues than it, which is the reason of the first and vsuall name Platyphyllos: it is good to * kil fish: it purges the belly, if either the root, leaues, or iuice, be taken in honied wine or in mead, to the weight of foure drams: a speciall vertue it hath to draw water downward from all other humors. The seuenth is called commonly Dendroides, and yet some giue it the name Cobion, others Leptophyllon: ordinarily it is found growing vpon rocks, and of all others carrieth the fairest head: likewise the stems be reddest, and the seed sheweth in most plenty: the effects be all one with those of Characias: as touching the plant called Apios Ischas or Rhabphanos-agria, i. the wild Radish: it putteth forth two or three stalkes like bents or rushes, spreading along the ground, and thoe be red, and the leaues resemble rue: the root is like an onion head, but that it is larger, which is the reason that some haue called it the wild Radish: this root hath a white fleshie substance within, but the skin or rind thereof is blacke: it groweth vsuall vpon rough mountains, and otherwise in faire greens * full of grasse. The right season to dig vp this root, is in the Spring, which being stamped and strained, they vse to put in an earthen pot, where it is permitted to stand, & look what it casteth vp and swimmeth aloft, they scum off and throw away: the rest of the iuice thus clarified, purgeth both waies, if it be taken to the weight of one obolus & a half in mead or honied water: and in that maner prepared, it is giuen to those that be in a droppe, the full measure of one acetable: the powder also of the root dried, is good to spice a cup for a purgation: and (as they say) the vpper part of the root purgeth * cholier vpward by vomit, whereas the nether part doth it by seage downward.

Now for the pains and wrings which oftentimes torment the poore belly: all the kinds of Panaces and Betony are singular to assuage and allay them plain, vnlesse they be such as are occasioned by crudity and indigestion. As for the iuice of Harstrang, it dissolueth ventosities, for it breaketh wind vpward and causeth one to rise: so doth the roots of * Acorus, also carors, if they be eaten in a salad after the maner of * Lettuce. For the infirmities proper to the guts, & namely the worms there breeding, Ladanium of Cypresse is soueraigne to be taken in drinke: in like **D** maner the powder of Gentian drunk in warm water, to the quantity of a bean: Plantain likewise hath the same effect, if there be taken of it first in a morning to the quantity of 2 spoonfulls, and of Poppy one spoonfull, in 4 cyaths of wine not very old: the same medicine may be giuen also last at a night to bedward, with some addition of sal-nitre or fried barley meale, if it be long after meat: and one hemine of the iuice thereof is singular for the cholique, if it be ministred in a clyste, though the patient were in an ague. In cases of the spleene, it is good to drink 3 oboles weight of Agarick in one cyath of old wine, for it cureth the spleen: and of the same operation is the root of all sorts of Panaces, taken in honied wine: but for the accidents of the spleen, Teucrion hath no fellow, if it be taken either dry in powder, or boiled, to the quantity of one handfull in 3 hemines of vineger: and the same herb maketh a soueraigne salue for green wounds to **E** be applied with vineger; or if the patient cannot indure it, with a fig or water in stead of vineger. Polermonia likewise is a good herb for the spleen, to be drunk in wine: so is Betony, taken to the poise of one dram in 3 cyaths of oxymell: and Aristolochia is likewise respectiue to this part, in case it be giuen vnto the patient as against the poison of serpents. If the Patient continue the eating of Argemonia seuen daies together with his meat, it will (as they say) in that time consume and wast the swelling spleen: & Agarick taken to the weight of 2 oboli in oxymell, is effectuall that way. The root of Nymphaea Heraclia or Nenuphar drunk in wine, is able of it selfe to consume the same. Cissanthemos is an excellent herb for the spleene or milt: if a man take a dram of it twice a day in two cyaths of white wine, and hold on that course for fortie daies together, it wil (by report) rid away the diseased spleen by vrine, to which purpose, the decoction of hyssop with figs serueth very well: euen so doth the decoction of Lonchitis, if it be taken before it spindles and run vp to seed: also the root of Harstrang boiled, is good for spleene and kidneys. Acorum, if it be taken in drinke, consumeth the milt.

For the Midriffe and Hypochondriall parts, or the small guts liuing in the flanke vnder the short ribs, * Radish roots be singular. The seed of water Betony, if it be drunke thirty daies together, **Z**

* If it be pūned into powder & shewed on the water, as saith Discoideus.

* Herbas: Theophrastus hath many names: this is to say, cragg coral: it is the same that Plinius called Teucrium: it is called also, Acorus, and is the same, as saith Discoideus.

* Which some take for Galangal, or for our Calamur. * With vinegre and oile.

Radices.

gether, the weight of one denarius at once in white wine, is singular in that case: the powder of Betsy taken in drink with hony and vinegar of Squilla, is commended for that purpose: as also the root of Lonchitis drunk in water; and Iucium applied as a liniment.

Scordum incorporat with wax, and Agarick with the powder or floure of Fenigreek, help the infirmities of the bladder, and namely, the intollerable pains of the stone and grauell, as I haue before said. Polemonia drunk in wine; and in like manner Agaricke, is good for that purpose: the root or leaues of Plantaine taken in sweet wine cuit; also Betonie, prepared in that manner as it was appointed for the disease of the liuer, be remedies for the infirmities of that part. Betonie also giuen in drink and applied in a liniment, healeth a rupture; and the same is most effectually in curing the strangury: some prescribe and giue counsell to drink Betsy, Veruaine, Yarrow, or Millefoile, of each a like portion in water, as an excellent remedy for the stone and grauel. And well knowne it is, that for to ease the strangury and remove the cause thereof, Dictamnus is an approued medicine: so is the decoction of Cinquefoile, if it be boiled in wine to the consumption of a third part, found by experience to be an vndoubted remedy in that infirmity: the same also is singular good to be applied in that rupture where the guts be false downe. The vpper root of Glader or Flagg, causeth young infants to make water, if it be laid to the bottom of the belly: the same giuen inwardly with water, cureth those that are burst and haue their guts slipped downe; and helpeth the infirmities of the bladder in an outward liniment. The iuice of Harstrang healeth little children who are bursten; and of Fleawort there is made a good ointment to annoynt their Nauell, when it beareth out ouermuch. Both the Pimpernels do prouoke vrine: so doth the decoction of Acorus root: the very root it selfe also beaten into powder, and taken in drink, worketh the like effect; and besides, healeth all the accidents of the bladder. Cotedon or Vmbellicus Veneris, both herb and root, breaketh the stone, and expelleth it by grauell; being otherwise singular good for all inflammations of the genitall parts or members of generation, if the stalks and seed be taken with Myrrhe, of each a like quantity: Walwort stamped together with the tender leaues thereof, and so drunk in wine, driueth out the stone: the same applied outwardly cureth the * accidents befalling to the cods. Groundswell, with the powder of Frankincense and sweet wine reduced into an ointment cureth the inflammation of the sayd cods. The root of Camfrey brought into a liniment, staierh the rupture whereby the guts come downe: and white Hypocistis, representh the cancerous sores in those parts. Semblably Mugwort is singular to be giuen in sweet wine, for the stone and strangury. The root of Nenuphar or Nymphaea Heraclia taken in wine, assuageth the paine and grieue of the bladder: of the same power is * Sampier, so highly commended by H. pprocates: now is this one of the wild woorts which are vsually eaten in salads: and certes, this is that very herbe which the good country wife Hecale forgot not to set vpon her boord in a feast that she * made (as we may read in Callimachus the Poet:) And what is it but a kind of garden Baris? It groweth vpon with one stem halfe a foot high, or a span at most: the seed is exceeding hot, round, and odoriferous like vnto Rosemary: if it be dried, it bursteth, and hath within a white kernell, which some call Cachrys. The leaues be fatty, and of a grayish white in manner of the oliue leafe, but that they be thicker, and saltish in tast: roots it hath three or foure, of a finger thickness: it groweth vpon the sea coast among rocks and cliffs. This herbe may be eaten, raw or boiled, it skilleth not how, with Beets, Coles, and other such woorts; and in tast likewise it is aromaticall and pleasant: it is vsually preferred and kept condite in a kinde of pickle: and the principall vse that it hath, is to cure the strangury, if either leafe, stalk, or root, be drunk in wine: also, being thus taken, it maketh folke look with a more lovely, & cheerful colour: but if ore be too bold with it, & vse it not with moderation, it breedeth ventosities. The decoction of Sampier maketh the body soluble, and is diureticall, for it mightily draweth water from the kidneys. In like manner, the powder of dried Althaea or Marsh-Mallow, drunk in wine, cureth the strangury, and casteth them that pisse drop-male, which it wil do more effectually, if the Carot be ioined withall: the same is wholesome for the spleen; and a counterpoison against serpents, if it be taken in drink. If the powder thereof be strewed and mingled among the barley which is giuen in Prouander vnto cart horses and such like, it helpeth them when they run at nose with the glanders, and stale drop by drop. Touching the herb Anthyllion, it is as like as may be to Lentils, which if it be drunk in wine, cureth all the infirmities of the bladder; and namely, when there issueth forth bloud with vrine: there is another hearbe comming neare to it in name; to wit, Anthyllis, like vnto Iva Muscata, or Chamapitys,

* To wit, when they be hard or swollen.

* Or Crestmarine.

* To prince Thibet.

A mæpitys, carrying purple flours, senting strong, and hath a root like to Cichory, which is good in these cases. But it seemeth that * Brooklime, called otherwise Cepæa (an herbe resembling Purcellane, but that the root is blacker, and good for nothing in Physick, growing vpon the sandy shore, and hauing a bitter taste) is better for the said infirmities than the former named Anthyllis; for if it be taken in wine with the root of Sperage, it is excellent for the diseases of the bladder: of the same operation is * Hypericon, which some call Chamapitys, others Corion. This herb * shooteth forth many branches, which be small and slender, of a cubit in length, and red withall: in leafe it resembleth rue; the smel is quick, hot, and piercing: the seed which it beareth within certain cods, is black, and the same ripeneth together with barley. The nature of the seed is astringent: it doth increaseth and thicken humors, and stoppeth a lask: vrin it prouoketh; and being drunk in wine, scoureth away the stone and grauell in the bladder. A second Hypericon there is, which some call Coris, in leafe it resembleth * Tamarix, vnder which it gladly groweth, but that the leaues be more fat, and not so red: it groweth not about a * span high: odoriferous to smell vnto, and of a mild sweet tast, and yet * sharp withall. The seed is hot, and therefore causeth ventosities, and * inflation in ruptures: howbeit, vnto the stomack it is not hurtful: and singular good for the strangury, in case the bladder be not exulcerat: drunk in wine, it cureth the pleurisie. Moreover, for the bladder and the diseases thereof, Maiden-haire made into powder together with Cumin, and giuen in white wine, is a soueraigne remedy; also Veruaine, sodden leaues and all, vntill the third part of the liquor be consumed, or the very root only thereof taken in honied wine hot, expelleth the stones and grauel in the bladder. In like maner the herb C Perpressa, which groweth at Aretium and in Sclauonia, being boiled in water from 3 hemines to one, and so taken inwardly as a drink, is an appropriate medicine for the bladder. Clauer or three leaved grassie taken in wine; Camomile likewise * drunk, is good for the same. Moreover, Anthemum expelleth the stone; an herb this is, which putteth forth immediatly from the root five small leaues, and two long stems, with a red rose colour floure: the roots stamped alone, are as effectual in this case as green * Lauer. As for Silaus, it groweth along those riuers which run continually and be neuer dry, especially such as glide vpon sand & grauel: it riseth to the height of a cubit, and resembleth garden Parsley: they vse to seeth it after the maner of * Soure-docke, and so prepared, it doth much good to the bladder, which, if it be excoriat and scabbed, the root of Panaces will heale it; for otherwise it is hurtful to that part. The herb called * Malum Erraticum [i. as one would say, the wandring poison, or apple] it expelleth the stone, if one pound of the root be thoroughly sodden in a congius or gallon of wine, vnto the consumption of the half, so that the patient take thereof for three daies together one hemine at a time; and that which remaineth of the decoction, in wine, with Lauer & sea-nettles. Also Carots and Plantaine feed taken in wine, driueth down stone and grauell. The nettle called Fulviana (an herb well knowne to them especially that handle it, and which took that name of him who first found out the vertue thereof) if it be stamped and drunk in wine, prouoketh vrine.

Scordium is singular for the swelling of the genetours or cods. Henbane is good for the diseases of the members seruing to generation. The iuice of Peucedanum [i. Harstrang] incorporate with hony, like as the seed also taken inwardly, helpeth those who are pained with the strangurie; likewise Agaricke, if three oboli thereof be drunk in one cyath of old wine: the root of Trifoile or Clauer giuen to the poise of two drams in sweet wine: and one dram of Daucum, id est, Carot [either the herb, root, or seed, haue the like effect].

Such as be troubled with the Sciatica or gout in the huckle-bone, finde remedy by a plaster or cataplasm, made with the seed and leaues both, of Madder; also with a drink of Panaces: likewise if the place be well rubbed with Polemonia, and bathed with the decoction of the leaues of Aristolochia, it finds much ease thereby. The broad sinew or cord at the end of the muscles which is called in Greek Platys, likewise the shoulders if they be pained, feeble sensible alleviation, by Agaricke, if the weight of three oboli be drunk in one cyath of old wine. Cinquefoile both taken in drinke, and also applied as a plaster, allaieth the paine of the Sciatica: so doth the herb Scammony boiled with barley meale. The seed of both the Hypericons drunk in wine, is proper for that malady.

The accidents of the seat or fundament, especially when that part is fretted or galled, a salue of Plantaine healeth most speedily.

The swellings or blind piles appearing like bigs or knuckles within the fundament, are cured with

* Becabungo.

with five-leave grasse: & if the said part be turned the insight outward, or displaced, there is not a better thing to settle and reduce it to the former state, than a fomentation with the Cyclamin or Sowbread root and vineger together. Pimpernell with the blew floure, restoreth the tiwill or fundament into the right place, if it be false downe and hang out of the body: and contrariwise, that with the red floure drieth it downe. Vmbilicus Veneris is of wonderful operation in the cure both of the blind piles, and the running hæmorrhoids. The root of *Acorus*, [*i. Galengale*] foddin in wine, stamped and brought into a liniment, assuageth the tumors or swellings of the cods. And *Cato* affirmeth. That whosoever haue the Ponticke wormwood about them, shall not be galled betweene their legs.

CHAP. IX.

¶ Of Penyrroiall and Argemone.

Others adde moreouer Penyroiall to the foresaid wormwood, & say, that if a man gather Peniroyall fasting and bind it fast to the reins and smal of the back, he shal feel no griefe in the share, or if he were pained already in that part, shall find ease thereby. * Inguinaria, which some name Argemony, is an herb growing euery where amongst bushes, briars, and brambles, which if it be but held in the hand, is thought to be excellent good for the accidents that befall the groin. Panaces made into a cataplasme with hony, healeth the flat biles and botches that arise in the emunctories of the share : and the like effect hath Plantaine, applied with salt, sue, leafe, & the root of the great clor-bur, like as in case of the kings euill : euen so is * Damasonium to be vsed. As for Taperwort or Mullen, if leafe root and all be stamped, with some sprinkling of wine among, and be afterwards lapped within a leafe of the own, and so heat vnder the embers & laid to the grieved place hot, it is very good for the same purpose : & some asfirm vpon their own knowledge, by the experience that they haue seen, that this cataplasme wil work much more effectually, if a yong maiden all naked haue the applying of it to the said bile ; prouided alwaies, that both she and he the patient be fasting; also that she touch the sore or impostume with the back-side of her hand, & in so doing say these words following, *Necat Apollo pestem posse crescere quam nuda virgo refingnat : (i.)* Apollo wil neuer suffer, that a botch which a naked virgin thus cureth shall possibly grow farther : which charm she must pronounce thrice, after the bath withdrawn her hand backe, and withall, both he and she are to spit as often vpon the floore, that is to say, euery time that she repeateth the foresaid spell. Furthermore, the root of Mandragoras being applied with water, healeth these botches : so doth the decoction of the Scanmionium root, reduced into a pulstiffe with hony. Also the herb Sideritis laid too, with old hoggs grease : last of all, Chryssipea, incorporat with fat sigs : where, by the way note, that this herb retaineth the name of him who first brought it to light.

CHAP. X.

¶ *Of the water-Rose, otherwise called Nenuphar. Of such herbs as either heat or coole the ap-
petite to lust and venery. Of Satyrion or Ragwort, * with the red
roots of Crategis and Sideritis.*

Nymphæa, which also is named *Heraclea*, if it be but once taken in drinke, disableth a man altogether for the act of generation (as I haue said before) 40 daies after: the same if a man drink fasting, or eat with his meat, freeth him from the dreams of imaginary *Venus*, which cause pollution. The root applied in a liniment to the genitals, doth not onely coole lust, but also keep down and repress the abundance of natural seed: in which regard, it is thought good to nourish the body and maintain a cleare voice. On the contrary side, the vpper root of *Glader* giuen to drink in wine, kindleth the heat of lust: like as the herbe which they call *Sampier* *Sauage*: as also wild *Clarie*, being stamped and incorporat with parched barley meale. But in this case wonderfull is the herb *Orchis* both male and female, and few be like vnto it, for two kinds there be of it: the one beareth leaues like vnto the oliue, but that they are longer, riseth vp with a stem foure fingers high, carrying purple floures, a double bulbous root formed like to a mans genitals, whereof the one swelleth and the other falleth by turns ech other yeare; and ordinarily it groweth neere the Sea side. The other is knowne by the name of *Orchis Scirapias*, and

* Some call it

L

M

A is taken to be the female: the leaves resemble lecke blades, the stalk is a span or hand-breadth high, and the flours be purple; the root likewise is bulbous & twofold, fashioned like to a mans stones or cullions; of which, the bigger, or (as some say) the harder, drunk in water, prouoketh the desire to venery: the lesser or the softer taken in goats milk, represseth the foresaid appetite. Some say it is leafed after the manner of Squilla or lea-onion, saue that the leaues be smother and smaller, and it putteth vp a stalk full of prickles or thorns: the roots wherof, do heale the fores in the mouth, and discharge the chest of fleame; but drunk in wine, do stop a laske. A power it hath also to stir vp fleshly lust, like as Satyrion; but this herb differeth from the other, in that it is diuided by joints or knots, and besides burtheth more, and is fuller of branches: the root is thought to be good for forcery and witchcraft: the same also, either by it selfe alone reduced into powder, or els stamped & incorporat with fried barley groats into a liniment, is singular good for the tumors and other risings and impostumes in the said priuie parts or members of generation. The root of the former Orchis giuen to drinke in the milke of an ewe bred vp at home of a cade lambe, causeth a mans member to rise and stand; but the same taken in water, maketh it to go down againe and lie. As for the Greekes, they describe Satyrion with leaues like vnto the red Lilly, but that they be smaller, & no more in number than three, which spring directly from the root: the stem smooth, a cubit high, naked and bare without leaues, and it hath withall two bulbous roots; of which the nethermore, which also is the bigger, serueth to get boies; the vpper (and that is the lesse) is as good to engender girles. They haue likewise another kinde of Satyrion, which they name Erythraicon, and it beareth certain grains or seeds resembling that of C * Chast-tree, or Agnus Castus, but that they be bigger and smooth: the root is hard and white within, the rind wherof is red, and in tast is somewhat sweetish: an herb ordinarily found (as they say) vpon mountains: and by their saying, the root is of that vertue, that if it be held onely in a mans hand, it wil cause the flesh to rise & incite him to the company of women; but much more will it set him in a heat if he drinke it in some hard and green wine: in regard of which propertie, the manner is to giue it in drinke to goats and rams, if they be vn lusty and nothing forward to leape the females. The Sarmatians likewise ministred a drench made with this herb vnto their stone-horses or stallions, when by reason that they are ouertrauelled and tired out of heart by continuall labour, they perceiue them to be slow and vnapt to couer mares, which defect the Greekes call by a proper and fit term Prosedamon. But say that one by taking of this root is ouer lusty and too much prouoked that way, the means to abate and quench the heat & strenght thereof, is to drinke mead or the iuice of lettuce. In sum, the Greeks generally when they would signifie any extraordinary wanton lust or appetite to venery, haue a pretty name for it and call it Satyrion. And euen so they haue giuen a denomination to Cratægonon, which is an herbe diuided by knots or joints, burtheth and spreadeth with a number of branches, the seed wherof is hot, and the root of no validity or vse in Physick: likewise they imposed vpon other the names of Arrhenogonum and Thelygonum; the seeds or graines of which resemble cods or cullions. Moreover, it is said, That whosoever haue about them the marow or pith of the Tithymal branches, shall be very prone and forward to the sports of Venus. *Theophrastus*, a renowned author, and otherwise a graue and modest writer, exceedeth in this point, and telleth vs of strange and incredible wonders; and namely, of a man who was able to company with women seuentie times together, by touching or handling one only herb; but he hath not put downe either the name or portraiture of that herb.

Sideritis the herb, if it be bound to the swelling and painfull veins called Varices in Latine, doth not only diminish their tumor, but also appease and take away their colour.

Touching the gout, the time hath bin when it was not so common a disease as now it is; and not only in our fathers and grandfathers daies, but euen in our age and within my remembrance it was no ordinary sicknesse here in Italy, as being a forraign malady and come out of strange countries hither to vs: for certainly if it had bin known to the Italians in old time, I doubt not but it would haue found a Latine name to be called by. Neither is the gout a disease incurable, as some haue beleued, for known it hath bin in some to haue worne away of it selfe without any medicines; but in many more, to haue been cured by the meanes of Physicke. Among the appropriate remedies for this malady, are to be ranged the roots of Panaces, applied in a cataplasme with raisins; the juice of Henbane or the seed, with the floure or powder of Selsama; Scordium laid too in a pulstesse with vineger; and the hearbe Iberis, as hath bene said before.

Veruaine stamped and incorporat with hogs greafe, is good for the gout: so is the root of Sow-bread, the decoction wherof healeth kided heels, if they be bathed therein: the root of * Xiphion cooleth the hot gout; the seed of * Psyllium doth the same: Hemlock also, incorporat with Licharge or hogs greafe: but about all other, Housleek or Sengreen is right fouveraigne to be applied at the first assault or fit of the red gout (i. when it is occasioned by a flux of hot humors: and whether it be hot or cold gout, Groundswell tempered into a liniment with swines greafe, and so applied, is a very fit and convenient medicine: as also Plantain leaues stamped, with a little salt mixed among: and Argemontia punned in a mortar & applied with hony: moreover, Veruaine reduced into an vnguent, is singular in that case; yea and if the goutie feet be well foked in the decoction therof, much ease wil infue thereupon: also Lappago, an herb resembling * Pimpernell, but that it is fuller of branches, and tufted more with leaues, which also be rough, rugged, and wrinkled, yeelding a juice in taste more harsh, and in smell strong and vnpleasant: as for that of this kind which is * soft, they call Mollugo: like vnto which (but for the leaues that be more rough in handling) is Asperugo, wherupon it took the name. Now for the gout, let the Patient take every day 11 deniers weight of the juice pressed forth of the former Lappago in two cyaths of wine: but for this disease the most excellent remedy and that which rids it quite, is the sea-weed, which in Greeke they call Phycos Thalassion, and in Latine Fucus Marinus; an herb like vnto Lettuce, & commonly Murets & other shel-fishes lye bedded vpon these weeds, which being applied before they are dried, do cure not the gout of the feet onely, but also any disease of all other joints. Now of this Sea-grasse so named, there be found three kinds: the first is broad and large; the second longer, and somewhat red; the third hath curled and frizled leaues, which in Candy they do vse in dying of their clothes; but all are of one and the same operation in Physick. *Nicander* was wont to giue them in wine, as a counterpoison against the venome of serpents. Moreover, the seed of that herb which I named Psyllium, is singular good for the gout, if the same be well steeped in water; so that in every hemine of the seed there be mingled the quantity of two spoonfulls of Colophonian rosin, and one of frankincense. Finally, the leaues of Mandragoras be highly commended in this case, if they be stamped and incorporat with fried Barly groats into a cataplasme.

CHAP. XI.

¶ *Generall medicines and receipts for all the infirmities incident to the Feet, the Ankles, Joints, and Sinews: Item, the remedies for those diseases which possesse and trouble the whole body. Of the herbe Mirtbrida. Medicines for those that cannot sleep: and for the Palsie. Of cold fevers: and the ague that is incident to horses: of the Phrensie. Of the herbe Walwort and Housleek. Last of all of the Shingles or S. Anthonies fire.*

IF the feet be swoln about the ankles, the mud that is found in the bottom of waters, wrought and conccorporat together with oile, is of wonderful operation to allay the same. For the pain in the joints, or griefe of sinews, the juice drawn out of Centaury is passing good: in like manner, the herb Centaury. As for Betony, it is comfortable vnto the nerues, which run and spread behind ouer the shoulder-blades, the shoulders, the back-bone, the loins and hanches, if it be taken in * drink, after the manner as it was ordained for the liuer. Cinquefoile, is fouveraigne for the pain of the joints, if it be applied outwardly: likewise the leaues of Mandragoras made into a pulstesse with parched barley meale, or the root it selfe newly drawn out of the ground & stamped with the wild Cucumber, or els boiled in water, for the chaps that appeare in the feet or vpon the elbows, the root of Polypodie is singular good; for the griefe of the joints, the juice of Henbane reduced into an ointment with swines greafe, is a proper remedy: likewise the iuice of the herb * Amomum, together with the decoction: also Cotton-weed or Cudwort, boiled in water: or fresh gathered mosse foked in water and bound to the grieced place, and there kept salt without remouing, vntill it be drie: as also the root of the Bur called Lappa Boaria, drunke in wine. Sow-bread sodden in water, cureth the cluishi & angry kibes beginning to rise vpon the heels, and all other chilblanes and bloody fols occasioned by cold. Semblably, Vmbilicus Veneris applied with hogs greafe, healeth the foresaid kided heels: so do Crowfoot leaues; and the juice of Epithymum. Ladanum made into a salve with Castoreum, and so applied, fetcheth out the core of agnells or corns by the roots: the like effect hath Vervaine, if it be laied too with wine.

A wine. And now that I haue run through those maladies which are offensive to euery particular member, I purpose to write in the next place of such as occupy the whole body; and of the remedies common to them all, which I find to be these ensuing.

And first there presenteth it selfe vnto me the noble herb * Dodecatheos, wherof I haue spoken before as a fouveraigne remedy for those vniuersal diseases, if it be taken in drink. Next to it are the roots of all kinds of the Panaces, which are thought to be excellent, and principally for long and languishing maladies: like as their seed for the obstructions of the bowels and the inward accidents of the guts: for the pains generally of the whole body, the iuice of Scordium is right commendable, and so is that of Betony: which herb taken in drink, hath a peculiar property to mend the wan and leaden hew of body, reducing it to a more fresh and pleasant color. The herb * Geranium, which some call Myrrhis, others Merthrays, is like vnto Hemlocke, save that it hath smaller leaues, and a shorter stem, which also is round, of a sweet sent to the nose, and good fauor in the mouth, for so we Latines doe describe it: but according to the description of the Greeks, the leaues rather resemble the Mallow, but that they are whiter somewhat, the stalks of leaues between: * it brancheth out big at the distance of euery two handbreadths, howbeit, full little buttons or heads like vnto Crane-bills. Another kind there is of them leaved after the manner of passe-floures, or wind-floures, but that they be intailed or indented deeper: and a round root it hath fashioned like an apple, which is sweet in taste, and is an excellent restorative for all such as haue bin weakened and decayed in nature by long sickness, and this I take to be the true Geranium, which is a rare herb. A dram weight thereof drunke twice a day [first and last] in three cyaths of wine, is a singular medicine for the phthisicke. And in that order it is good for ventosities: and hath the same effect though it be taken raw. The iuice of the root is fouveraigne for the infirmities of the ears. The seed giuen in drink to the quantitie of 4 drams with pepper and Myrrh, cureth the cramp which pulleth the head and body all backward. The iuice of Plantain if it be drunke, or the herb it selfe boiled and so eaten, is wholesome for those that be in a Phthisicke. Plantain eaten with salt and oile in a morning, so soon as a man is awakened, is a great cooler. The same is an ordinary medicine for those that mislike, and whose meat is not scene vpon them, if they take it each other day. Of Betony and hony there is a liquid confection or lohoch made, which being licked and let down leisurely, to the quantity at a time of a good big beane, helpeth those that are in a Phthisicke or consumption of the lungs. Also Agarick, if it be drunke to the weight of 2 oboli in wine cuit, is good in the like case: so is Daucum also taken in wine with Rhapontick. For the hungry worms Phagedenae (a name in this place signifying an inordinat * disposition, to be alwaies eating and neuer satisfied, although otherwise I vse it for cankerous and corroding vlcers) the Tithymalls or Spurges taken inwardly with Sefama seed, is counted fouveraigne. Among the maladies which affect & infect the whole body, want of sleep, or an indisposition thereto, is by most Physitians counted one: for which defect, they shew vs these herbs following; to wit, Panaces, water Betony, and Aristolochia, which they prescribe to the patient both for to smel too, and also to annoint his head al ouer withal. Likewise Housleek called Acizoon & also Sedum, giuing direction to wrap it within a blacke cloth, and so to lay it vnder the pillow or bolster of the sick person, but in no wise to let him or her know so much. Likewise Oenothera, otherwise named Onuris, is effectually for this purpose: an herb good also in wine to make the heart merry. It groweth with leaues resembling those of the Almond tree, and beareth floures like vnto Roses. Store of branches it putteth forth, and hath a long root, which being dried, senteth much of wine. Of such vertue is this herb, that if it be giuen in drink to the wildest beast that is, it will tame the same and make it gentle. As for the crudities or raw humors lying in the stomack, which cause loathing and abhorring of meat, Betony is singular to digest them: the same drunke immediately after supper, helps concoction, namely, if one dram weight of the herb be taken in 3 cyaths of oxymel: and so it resolueth and scattereth the fumes arising vp into the head, occasioned by strong wine. Of the same operation is Agaricke, drunke at the end of a meale in hot water. The foresaid Betony hath the name of a speciall remedie for the palsie: so is Iberis also reputed, as I haue shewed once before; the same heareberueth the limbs which are benumbed and in manner dead. And verily, Argemon is of that vertue, that it disfluxeth all those cold humors which mortifie any member, and put them in danger to be cut off or launced. The root of that Panaces which I named Heraclia, drunke with the ren-

So called, for that it receiveth the name of the twelve principal gods and goddesses called *Majorum Gentium Consentes*, whom the Poets imagined to sit in counsell together with Jupiter their President: and these had *Entus* comprised in this Distichon. *Iuno, Venus, Minerva, Ceres, Diana, Venus, Mars, Mercurius, Iovis, Nephtus, Neptunus, Neptunus, Apollo.* *Hercules* Robust, as some thinke, or the first kind by *Dionysus*. *Donesticet* or *Monardica*.

The Carot.
* *Antiquus*.

net of a Seal, so as there be in proportion 3 parts of the said root to one of the rennet, cureth the falling sicknesse. And of the same effect is Plantaine, taken in drink. The said disease is healed by Betony, if a dram thereof be taken in oxymell: by Agarick also, to the quantity of 3 oboli: and by a drinke made with Cinquefoile. Moreover, Brionium called likewise Archezoitis, wariseth this infirmity, but it must be giuen in Ammian wine. Furthermore, the root of Baccharis dried and beaten into powder, taken with Coriander in 3 cyaths of hot water, is a souveraigne mean to help that malady. * Cudweed made into powder, and taken with vineger, hony, or hot water: Vervaine drunk in wine: three beries of Hyssop stamped and drunk in water for 16 daies together: Harstrang, and the rennet in the maw of a Seale, of each a like quantity taken in drink: the leaues of Cinquefoile, if they be stamped and drunk in wine for 31 daies: the powder of Betony to the weight of 3 deniers, incorporat with one cyath of Squillitick vineger, & an ounce of Atticke hony: lastly, two oboles of Scammonie, with foure drams of Castor, be all appropriate medicines for the falling sicknesse.

In all * cold agues, if the Patient drink Agarick in hot water, the fits will be the lighter. And more particularly, the herb Sideritis drunk with oile, thortnerth the cold fit in a tertian: so doth that * Ladanum which groweth among cornes, if it be stamped and so giuen. Likewise, Plantain, if the patient drink the weight of two drams in mead two hours before the fit; or the verie juice of the root either after it hath lien a time infused, or simply stamped without any such preparation; yea, and the substance of the root reduced into powder, and giuen in a draught of water, made hot with a gad of steel quenched in it. Some haue appointed in this kind of ague 3 of those roots, and 3 cyaths of water precisely: and the same Physitians for a Quartaine haue prescribed foure of either: and by their saying, if when Borage beginneth to fade vpon the ground, one take out the pith or marow within the stem, and whiles he is so doing, name withal the sick party, and say hee doth it for to rid him or her from the ague; and withall bestow it in 7 leaues neither more nor lesse of the said herbe, and hang all tied fast about the patient before the time that the fit should come, the feuer wil neuer returne again. Also a dram of Betony or Agaricke taken in three cyaths of mead, drieth away any intermitten ague, especially those that begin with * quiuering and quaking. Some are wont to giue of Cinquefoile three leaues in a tertian, and foure in a quartan, and so rise to more according to the period or type of the * rest: others ordain indifferently for all agues the weight of 3 oboli, with some pepper, in mead or honied water. Vervaine verily giuen in wine as a drench to horses, cureth them of their feauers: but in Tertians it must be cut just about the third joint where it brancheth: but for Quartanes at the fourth. The seed of both kinds of Hypericon is good to be drunk in Quartanes. And the powder of Betony dried, is singular for the quaking fits: and in very deed the herb it selfe represseth all shiuering and whatsoeuer proceeding of cold. In like maner, Panaces is of so hot a nature, that Physitians giue direction to them who are to trauell ouer high mountains couered with snow, for to drink it, & annoint their bodies all ouer with it. Semblably, Aristolochia doth withstand all chilling and through colds. The best cure of those who be in a frensie, is by sleepe: and that may be procured easily by the juice of Peucedanum & vineger together infused vpon the head by way of imbrocation, or by rubbing the same with it: likewise with the juice of both the Pimpernels. Contrariwise, there is more adoe with those that are in a lethargy, to awaken them and keep them from drowiness: and yet may that be affected some say by rubbing their nostrils with the juice of the said * Harstrang in vineger. For those that be out of their right wits or be fraught, Betony is singular good to be giuen in drink. Panaces breaks the Carbuncle: also the powder of Betony in water, healeth it: or the Colewort with Frankincense, if the patient drinke often thereof hot. Some take a burning cole of fire, and when it is extinguished or gon out in the presence of the patient, with their finger gather vp the cindres or light ashes which settle thereupon, and apply them vnder the carbuncle: others stamp Plantain and lay it to the fore: the Tithymall called Characites, cureth the dropsie. Also Panaces and Plantaine taken as a meat in bole, with this regard, That the patient haue eaten some dry bread before, without any drinke at all. In which case Betony likewise is singular, if two drams thereof be giuen in as many cyaths of wine simply, or wine honied. Moreover, Agaricke, or the seed of Lonchitis, drunke to the quantitie of two Ligula or spoones full, in water. Fleawort being vied with wine: the juice of Pimpernels, both the red and the blew: the root of Vmbilicus Veneris in honied wine: the root of Walwoort newly drawne out of the ground, so that the earth bee onely shaken off

* Centunculus.
* Bacca. Some read fusces, i. bunches: but in mine opinion, cymes, tops or spikes, agree best to the sense.

without

A without any washing at all in case as much thereof as two fingers will comprehend, be taken in one hemine of old wine hot: the root of Clauer or Trefoile drunke in wine to the weight of two drams: Tithymall, named Platyphillon: the seed of Hypericon, and namely that which otherwise is called Coris: Chamæactæ, which some think to be Wall-wort, if either the root be beaten to powder and ministred in three cyaths of wine, so the patient haue no feuer hanging vpon him, or the seed giuen in thick red wine, be appropriate remedies euery one, for a dropsie. In like maner Vervaine, if a good handfull thereof be boiled in water vnto the consumption of the one halfe. But principally the juice of Wall-wort is thought to be the meetest medicine for to fit this malady.

B For the bleach or breaking out in wheales, for small pocks, swine pocks, and such like eruptions of flegmatick humors, Plantain is a proper remedy to rid them away: so is the root of fowbread applied with hony. The leaues of Walwort or ground Elder stamped, incorporat in old wine and so laid too, doe heale the meazels, purples, or red blisters, which some call Boa. The juice of Nightshade or pety Morell, vied as a liniment, killeth the itch. The shingles and such hot pimples called S. Antonies fire, are cured by nothing better than by Housleek, by the leaues of Hemlock stamped into an vnquent, or the root of Mandragoras. Now the manner of preparing and ordering it thus: take the said root, drie it abroad in the open aire, like as they do Cucumbers, but principally let it hang first ouer new wine; afterwards in the smoke: this don, stamp it and temper it with wine or vineger. Good it is also in this case to make a fomentation with

C wine of Myrtles, and therewith to bathe the grieved place. Also take of Mints two ounces, of sulphur, vif one ounce, powder them both, and mingle them together with vineger, vfe this mixture for the said S. Antonies fire. And some take soot & vineger tempered together for the same purpose. Now of this disease which we terme * S. Antonies fire, there be many kindes, whereof there is one more dangerous than the rest, which is called * Zoster, for that it couereth to goe round about the middle of a man or woman in manner of a girdle; and in case both ends meet together indeed, it is deadly and incurable. To meet with it therefore by the way & to prevent this extremity, Plantaine is thought to be a souveraigne remedy, if it be incorporat with Fullers earth. Also Vervaine alone by it selfe, and the root of the great Bur. Now for other corrosiue vlcers and tectars, it is very good to vfe the root of Vmbilicus veneris with honied wine: Send green: the juice of Mercurie also with vineger.

i. Bread lested

Erysipelas

i. A girdle, and it is our shingles.

Terra cimolia.

CHAP. XII.

¶ For dislocations or members out of ioint. Against the Jaundise, Felons, hollow sores called Fistula's. Tumors, Burnes, and Scaldings. Against other diseases. For to comfort the sinewes, and stanch blood.

THE root of Polypodium brought into a liniment, is a proper remedy for any dislocation: The seed of Fleawort: the leaues of Plantaine punned with some few cornes of salt put thereto: the seed of Mullen boiled in wine, stamped and reduced into a cataplasme: Hemlocke, incorporat with hogs greafe. All these applied accordingly, do assuage paine and bring down any swelling, occasioned by dislocation. The leaues of Ephemerum brought into a liniment, are good for any bunches or tumors caused by those accidents, if they be taken betimes whiles they may be dissolved and resolved.

As touching the Jaundise, I cannot but wonder at it, especially appearing as it doth in the eies; namely, how the gall should get vnder those fine membranes and tunicles, lying so close couched as they do. Hippocrates hath taught vs a rule, That if the jaundise shew in a feuer * after the seventh day from the beginning thereof, it is a deadly signe. Howbeit, I my self haue known some to haue escaped and liued still, notwithstanding that desperat signe. But this is not alwaies a symptome incident to an ague, but happeneth otherwhiles without a feuer: and then a drinke made of the greater Centaurie, as I haue before shewed, doth withstand & stay the course thereof. Also Betony riddeth away the jaundise, if the patient do drink three oboli therof in one cyath of old wine. The leaues of Vervaine likewise haue the like effect, if the same quantitie be drunke foure daies together in one hemine of wine hot. But the speediest cure of this disease, is by Cinque-foile or five leaved grasse, if three cyaths of the juice be taken with salt and hony in drink. The root of Sowbread is a souveraigne medicine for this infirmity, if the Patient drinke

Some take it for the May billic or billic convally.

* Nay rather before the 7 day for then it is Symptomaticall, and signifies irregular humours: whereas vpon the 7th, 11th, and such Decrees it is as it is criticall, and giveth hope of recovery. As Hippocrates binde fevers. ch. 2. 4. 7. 8. 9. 10. 11. 12. 13. 14. 15. 16. 17. 18. 19. 20. 21. 22. 23. 24. 25. 26. 27. 28. 29. 30. 31. 32. 33. 34. 35. 36. 37. 38. 39. 40. 41. 42. 43. 44. 45. 46. 47. 48. 49. 50. 51. 52. 53. 54. 55. 56. 57. 58. 59. 60. 61. 62. 63. 64.

the weight of three drams: but this care ought to be had, that the room be hot, and so close that no winde may come in, for feare of catching cold: and then it will drie out the jaundise by sweat, lustily. The leaues of Fole-foot taken in water: the seed of Mercurius, both the male & female, if a cup of drinke be spiced therewith, or if it be sodden with Wormewood or cich pease: the * berries of hyssop drunk with water: the herb Liuerwort, so that the patient abstain from all worts or potherbes, so long as he taketh it: Capillus veneris giuen in wine: and the Fullers herb in wine honied, be all of them good medicines for the jaundise.

As for the fores called Fellons or Cats-hairs, they will breed euery where in any part of the body, and put folk to great anguish and trouble who haue them, yea, and otherwhiles indanger their life, especially if they meet with lean and worn bodies. But what remedy? Take the leaues of the herb Pynocomos, let them be stamped and incorporate with fried Barley meale, and so applied, in case the said fellows are not drawne to a pointed or sharpe head. The leaues also of * Ephedros brought into a liniment and laid too, do discusse & dissolue them, if they be taken in the beginning.

Moreouer, you shall not see a part of the body but it is subiect to the Fistulae, which creepe inwardly and hollow as they go: but especially, when by the vnskillfull direction of Physitians, or the lewd hand of chyrurgions there be an incision vtowardly made in the body. The help is to make tents of Centaurie the lesse, with honey boyled, and put them into the concauity. Also to vse an injection of Plantain juice. To apply Cinquefoile with salt and hony. Ladanum also with Castoreum: to lay vnto the fore, Vmbilicus veneris, with deere Marow, especially of Stag or Hind, hor. The string or pith of a Mullen root fashioned slender to the form of a tent put into the vicer, or the root of Aristolochia in that manner vsed, or the juice of Tithymall conueied into it, serue all to cure the Fistula.

All inflammations, biles, & impostumes, are healed by a liniment made of Argemoney leaues. So be all hard and scirrous tumors, occasioned by the gathering of humors, with Venuaine or Cinquefoile sodden in vineger: with the leaues and roots of Mullen: with hyssope applied in wine: with the root of Acorus, so that there be a fomentation withall made of the decoction of the said herb: and finally with Housleek. In like manner, these herbs before rehearsed do heale bruises, hard tumors, or bunches and hollow sores. The leaues of * Illecebra draw forth any arrow heads and whatsoever sticketh within the body: so do the leaues of Folefoot: the Carot also, and the leaues of * Lions paw, stamped and incorporat with fried Barly meale in water. The leaues of Pynocomos punned, or the seed beaten to pouder, & with Barly meale parched, and so reduced into a cataplasim, are good to be applied to biles and impostumes broken & running matter. In like manner the Ragworts are to be vsed.

As touching the accidents that happen in the bones, the root of Satyrion if it be laid outwardly vpon them, are thought to work a most effectual & speedy cure. Al cankerous & eating sores, likewise impostumes growing to suppuration, are healed with the seaweeds, if they be applied before they be dried & withered. Also the root of marsh Mallow, doth dissipate and scatter all gatherings of humors to an impostume, before it be come to an head and to suppuration.

Plantain and the Clot Bur are singular for burns or scalds, healing them vp so clean without a skar, that a man shall not perceiue the place: the maner is to take the leaues, seeth them in water, stamp them into a liniment, and so to apply them. Likewise the roots of Sowbread, together with Housleek: the herb it selfe Hypericon, which I called before * Corion, haue the like effect.

For the infirmities incident to sinews and joints, Plantain is a soueraigne herb, if it be stamped with salt: so is Argemonia punned and incorporat with hony. The juice of Harstrang is singular to annoint those that be sprained, such also as be stretched with an vniuersall cramp as if they were all of a peece. For to mollifie the hardnesse of sinews that be shrunk vp, there is not a better thing than the juice of Agilops: and to assuage their pain, a liniment made with groundswell and vineger, is excellent. For those that be sprained and troubled with that crampe which draweth their necke backward, it is good to rub and annoint them well with Epithymum: with the seed of S. Johns wort, which also is called Coris, and to drinke the same. As for the hearbe Phrynyon, they say it hath vertue to conglutinat and vnite sinews again, if they were cut in sunder, if it be laied too presently, either stamped or chewed in the mouth. For such likewise as be spasmatick, pricked backward with the crampe, or troubled with trembling and shaking of the limbs, it is good to giue them the root of the marsh Mallow to drink in mead: and in that maner taken

A taken, it healeth those that be stiffe and stark for cold. Finally, the red seed of the herbe Pæony stancheth any flux of blood, the root thereof hath the like operation. As for Cyclaminos, that is to say Sowbread, it staies any bleeding, whether it be at the mouth raught vp from out of the body, or at the nostrils, whether it run by the fundament, or gush from the matrice of women. Likewise Lyfimachia stancheth blood either in drink, liniment, or Errhin put vp into the nose. The like effect hath Plantain seed. Cinquefoile also both taken inwardly and applied outwardly. Moreouer, if the nose bleed, take the seed of Hemlocke, beat it into pouder, mixe it with water, and so put it vp handfomly into the nostrils. Also Sengreene and the root of Astragalus. To conclude, wild Hirse called in Greek * Ischæmon and Achillæa, do stay any issue of blood.

* S anch-
blood, a kind
of Yarrow.

CHAP. XIII.

¶ Of the herbe Equisetum: of Nenuphar, Harstrang, Sideritis, and many more effectuell to stanch blood. Of Stephanomelis and Erisibale. Also remedies against wormes and vermine.

Horse-taile, named in Latine Equisetum, and by the Greeks Hippuris, an herb which heretofore I disallowed to grow in any medows (and it is esteemed the very haire, proceeding out of the earth, like for all the world to the haire of an Horse-taile) if it bee boyled in a new earthen pot neuer occupied before, so as the pot be brim full when it is set on the fire and so to continue seething, untill a third part be consumed, doth wast the spleen of lackies & footmen, it for 3 daies together they drinke one hemine of the decoction at a time: and besides, this charge they ought to haue in any wise, to forbear all fat and oily meats for 24 houres before they begin this diet drinke. In describing of this herb, the Greeks do not agree, but are of diuers opinions: some giue that name to a certain herb with blackish leaues resembling those of the Pine tree: and they report a wonderfull vertue thereof; and namely, that if it doe but touch a man, it wil stanch any issue of blood. And as some name it Hippuris, so others called it * Ephedros, and there be again who giue it the name Anabasis: because forsooth, as they say, it climes vpon trees, and hangerth down from thence, with many blackish slender haire in manner of rushes, resembling horse tailes. Small branches it hath full of joints, and few leaues, which be also fine and small. The * seed that it beareth is round, like vnto Coriander; and the root of a woody substance: this kind, say they, groweth principally in thickets and groues. An astringent and binding power it hath. The juice if it be conueighed vp into the nostrils, stenteth bleeding at nose, though it gusheth out from thence: it knitteth also the belly, and stoppeth a lask. Taken in * sweet wine to the quantity of 3 evaths, it helpeth the bloody flux. Urine it prouoketh, the cough it staith, and cureth straintesse of winde when the patient is forced to sit vpright for to draw his breath. It healeth ruptures, and represseth those sores that loue to spread and run ouer the body. The leaues are good to be drunk for the infirmities that offend guts & bladder: a speciall vertue it hath to cure those that be bursten belied and haue their guts slipping downe in the bag of their cods. The said Greek writers describe also another Horse-taile, by the name of Hippuris, with shorter, softer, and whiter haire than the former, and they commend it as a soueraigne herb for the sciatica and for wounds, to be applied vnto the place with vineger, & namely for to stanch blood: in which case the root of Nenuphar serueth very well, if it be stamped and laid vpon a green wound. If a man or woman void blood at the mouth, which doth rise from the parts below, there is not a better thing than Harstrang taken in drinke with the seed or berries of the Cypress tree. And as for Sideritis the herb, it is so powerfull that way, that it stancheth blood out of hand, if it be applied & kept fast to the wounds of these sword-fencers that fight at sharp, bleed they neuer so fresh: the which effect we may see in the ashes and coles of Fennell-geant: but the toad stoles or Mushrooms growing about the root of the said plant, doth the feat more surely: in case the nose gush out with blood, Hemlock seed also beaten to pouder, tempered with water and so put vp, is counted very effectuell to stay the bleeding: in like maner * Stephanomelis, if it be applied with water. The powder of Betonic dried and drunk in Goats milk, stancheth blood issuing out of womens breasts by the nepples. The same doth Plantaine bruised and laid too in a pulsette. The juice of Plantaine is good to be giuen them that vomite blood. For a blood that runneth vp and downe, breaking out one while here and another while there, a liniment made of a Burre root and a little swines greafe, is commended to be excellent.

For

Which some

or green wine.

For such as be bursten or haue any rupture within, be plucked with convulsions, or haue faim from on high; Centaury the greater, the root of Gentian being stamped into pouder or boiled, the iuice of Betonie, be counted singular means to recouer: and more than that, if a vein be broken by ouermuch straining the voice, or the sides. Likewise, Panaces, Scordium, and Aristolochia taken in drinke, serue well for the same purpose. Moreouer, if any be bruised within the body, or haue bin ouerturned backward and throwne downe, it is good for them to drinke the weight of two oboli of Agarick in three cyaths of honied wine, or in case an ague follow them withall, in honied water: for which purpose serueth also that kind of Verbascum or Mullen, the floure whereof resembleth gold: the root also of Acorus. All the kindes of Housleeke, to wit, Prick-madam, Horfe-taile, or Stone-crop: but indeede the iuice of the biggest is most effectual. In like manner the decoction of Comfrey root and Carot taken raw. There is an herbe called Eristhales, with a yellow floure, and leaues much after the manner of Brankvrsine: the same ought to be drunk in wine, as also Chamerops in the same case. As for Irio, it would be giuen in some supping: and Plantain may be vsed any way, it matters not how: which herb hath this good property ouer and besides, to cure the lowfie disease, whereof Scylla the Dictatour died, who was eaten with lice. A wonderfull thing, that in the very masse of blood there should be ingendered such creatures to consume mans body. But the iuice of the wild vine called * Vva Taminia, as also of Ellebore, is soueraigne against this foule and filthy maladie, in case the body be annoi- nted all ouer with a liniment made of it and oile together. As for the said Taminia, if it boyled in vineger, it killeth such vermine breeding in clothes or apparell, so they be washed or rubbed therewith.

tribute vnto it
this wrong
name.

CHAP. XIII.

¶ For vlcers and wounds. To take away werts. Of the herbe Polycnemom.

Vlcers as they be of many sorts, so they are cured after diuers manners. If they be such as run and yeeld filthy matter, a liniment or salue made of the root of all kinds of Panaces, & wine together, are thought to be a soueraigne means to heale them. But that Panaces, which they call Chironia, hath a singular property aboue the rest to drie vp such sores: the same root beaten to pouder and incorporat with honey, breaketh and openeth any swelling impostumes. This herb tempered with wine, it makes no matter whither you take floure, seed, or root so it be applied with Verdegrease or the rust of brasse, healeth any sores, be they neuer so desperat, and principally such vlcers as be corrosiue and eat as they go. The same if it be mingled with fried Barly meal, is good for old festered vlcers. Also Heraction, Siderion, Henbane, Fleawort, Tragacanth, and Scordotis, incorporat accordingly with hony, cleanse the said sores. As for this last named, the very pouder of it alone strewed vpon vlcers, eateth away the excrescence of proud flesh. * Polemonia healeth those malignant sores which be called morimals, and are hard to be cured. Centaury the greater reduced either into a pouder, and so cast vpon the sore, or brought into a liniment and applied accordingly: the tops also of the lesse Centaury either sodden or beaten to pouder, do mundifie and heale vp all inueterate and cankered vlcers. The * tender crops or husks of * Clymenos, are good to be laid vnto fresh & green wounds. Moreouer, the root of Gentian either stamped or boiled in water to the consistence of hony, or the very iuice thereof, serueth very well to be applied vnto corrosiue and eating vlcers: like as a kind of Lycium made of it is as appropriat for wounds. Lysimachia is an excellent wound herb, and healeth wounds speedily, if they be taken whiles they be new. Plantain is a great healer of any fore whatsoeuer, but principally of such vlcers as be in the bodies of women, children, and old folk. If it be * made soft & tender at the fire first, it doth the cure so much the better: and being incorporat in some ordinary cerot, it mundifieth and cleanseth the thicke edges and swollen brims of any sore, and staith the canker of corroding vlcers. But when Plantaine is thus reduced into a pouder & strewed vpon the sore, you must not forget to couer the same with the oile of leaues. Moreouer, Celendine is singular for all impostumes and botches, whether they be broken or no, yea, it mundifieth and drieth vp hollow vlcers called Fistulae: and for wounds is such a singular defecatiue, that Chirurgions vse it in stead of Spodium. The same being incorporat with hogs grease, is excellent to be applied vnto them when they be in manner past cure, and giuen ouer by the Chirurgion. The herbe Dictamnus taken in drinke, thrusteth out arrow- heads:

* Saue de bois.

* Coliculi.
Some take it
for water Be-
tony.

* Mollia, Why
not Mollia,
(the ground to
pouder against
the fire) since
that the vlcers
saris so com-
monly for the
pouder of drie
herbs?

A heads: and in a liniment outwardly, draweth forth the ends of darts, and any spils whatsoeuer sticking within the body: for which effect, the leafe would be taken to the weight of one obolus in one cyath of water. Next to this in operation, is the other bastard kind thereof, called Pseudodictamnus: and there is neither of them both, but is good for to draw all biles & impostumes that are broken & do run matter. Moreouer, Aristolochia is an excellent herb to eat and confume putrified vlcers full of dead flesh: it mundifieth also those that be foule and filthy, if it be applied with honey, yea and draweth out the vermin bred of the corruption within them: the callosities likewise and hard excrescences arising in sores, it fetcheth away: also it drawes forth any thing sticking in the flesh, especially arrows and the spils of broken and scaled bones, if it be laid too with rosin. Of it selfe alone without any thing els, it is a good incarnatiue and filleth vp hollow vlcers with good flesh: but mixed with the pouder of the Flour-de-lis root, and so incorporat with vineger, it is singular for to heale vp green wounds. Moreouer, for old sores, Veruaine and Cinquefoile medled together with salt and hony, do make a soueraign salue. The roots of the great Clot bur are good to be laid vnto fresh wounds, made by the sword or any edged tooles: but the leaues are better for old wounds, if the same be tempered with hogs grease: howbeit this charge ought to be giuen, That as well the one as the other, haue a leafe of the oile prepared in that manner as it is ordained for the Kings euill. And the leaues of Mullen serueth wel for the same purpose, if they be applied with vineger or wine. Veruaine is a good herbe for all sorts of wounds and sores, were they ouergrowne with callosities and full of putrefaction: the root of Nymphaea Heraclea, healeth perfectly all running and filthy vlcers. In like manner, the root of Cyclamin [i. Sowbread] either alone of it selfe, or incorporat with vineger or hony: The same is singular good for those wens or impostumes that ingender within them a certaine matter like vnto * fat or tallow. Like as Hyssop is an appropriat herb for running vlcers. Semblably * Peucedanum, which is of that efficacy for the healing of green wounds, that it will draw corruption from the very bone. The same effects haue both the Pimpernels: and besides, they doe repress those cancerous sores that eat deepe: they stay also the flux of a rheume to any sore, which hindereth the healing thereof: they be good also for green wounds, but especially in old bodies. The fresh leaues of Mandragoras newly gathered, incorporate with the masse of some cerot, are singular for impostumes and maligne vlcers: like as the root healeth wounds beeing made into a plaster with honey or oile. Likewise Hemlocke tempered with the floure of fine white wheat, and wrought into a paste with wine. Housleeke cureth shingles, ringwormes, and such like wild-fires, yea if they grow to be woules, and begin to putrifie: like as Groudwel healeth those vlcers which be giuen to ingender vermin: but the roots of the mountaine Cich, or pease earth-nut, are soueraign for green wounds: and both kinds of Hypocisthis, do mundifie inueterat vlcers. The seed of Pied-de-Iron, stamped with water, and reduced into a liniment with parched Barley groats congregate all together, draweth forth arrow heads: so doth the seed of Pycnocomon, in the same sort vsed and applied. The iuice of the Spurge called Tithymalus Characias, healeth gangrens, cankers, and putrified sores tending to mortification. The decoction also of the branches sodden in oyle, with fried barley meale. As for * Ragworts, they cure morimals also, either drie or greene, so they be applied with vineger and honey: and Oenothera by it selfe, healeth those vntoward and fretting vlcers, which are the worse and more angry for the handling. The Scythians are wont to heale wounds with their hearbe Scythica. And for cancerous sores, the herb Argemone incorporat with honey, is knowne to be most effectual. When any wound or sore is * ouer healed, an Asphodill root boiled, as I said before, then stamped together with parched barley, and so applied, is singular good to rectifie that default: but for any sore or wound whatsoeuer, Henbane leaues be singular. The root of Astragalus beaten into pouder, are soueraigne for such vlcers as do water much, and be alwaies moist: likewise the common * Maidenhaire boiled in water: but more particularly, if the skin be newly fretted off by wearing some vnease shoes, there is not a better thing to heale and skin the place, than a salue made with Veruain also with herb willow stamped, or Nenuphardried, made into pouder, and so strewed vpon the gall. As for the other Maidenhaire, it is counted better to heale the same raw excoriations, if they haue continued some time, and are growne to be exulcerat. There is as an herb named Polycnemom, like vnto wild Origan, howsoeuer the seed resemble that of Peniroyall: it shooteth forth many branches, and those knotted and jointed in di-

is.

uers places: it beareth in the head certain berries as it were in bunches and clusters, odoriferous, and as they sent somewhat strong and hot, so the smell is not vnpleasant: take this herbe, chew it with your teeth, and then lay it to any wounds made by the edge of the sword or such like weapon, and so let it lie and remoue it not vntill the fifth day, you shall see it to heale excellent well. Camfrey applied vnto a green wound, skinneth it most speedily: so doth Sideritis; as for this herb, it should be applied with honey. The seed and leaues of Mullen, sodden in wine, & stamped to the form of a cataplasme, draweth forth all thorns, spils, and arrow heads, which sticke within the body. The like effect work the leaues of Mandragoras, incorporat with parched barley meale, and Sowbread roots stamped and mixed with honey. The leaues of Germander punned with oile, are excellent to be applied vnto those vlcers which doe corrode the flesh vnder them and eat forward, like as the Reiks or sea-weeds. Betonie is a soueraigne herbe for cancerous vlcers: also for the blacke sploches that haue continued a long time vpon the skin, if there be salt put thereto. Argemonia tempered with vineger, taketh away warts: so doth the root of Crowfoot, which also is singular good to fetch off with ease, the ragged and fretted nailes that be offensive. The leaues of Mercurie, the male and female both, or the iuice thereof brought into a liniment, haue the like operation. All the sorts of the Tithymals take away any warts whatsoever: so do they rid the troublesome risings and impostumations like whiffawes about the naile roots, and all flecks, spots, wheelks, and specks whatsoever. Ladanum reduceth any scars to look faire and fresh coloured againe.

CHAP. XV.

¶ Many experiments and approved receipts, for the prouoking or staying of womens monethly tearmes: for curing the diseases of their matrice: for sending out the birth, or retaining the same within the bodie the full time. Also sundry deuises for to amend the faults that blemish the skin of the face: to colour the haire of the head, or to fetch it off. Last of all, diuers medicines for the farcines or scabs in foure-footed beasts.

It is said, That if a trauelier or wayfaring man weare fast tied about him, Mugwort or Sauge, he shall neuer be weary nor thinke his journey long. But to come now vnto the infirmities of women: the black feed of the herb Pæony, is generally good for all their *maladies, if it bee taken in mead: the root also is of the same operation, and besides prouoketh the ordinary course of their months. The seed of Panaces drunk with wormwood, moues their fleurs, & prouoketh them to sweat: the like effect hath Scordotis either in drink or liniment. A dram of Betony giuen to women in 3 cyaths of wine, helps all the maladies incident to their natural parts, *but especially those that insue vpon their deliury of childbirth. Achillea being applied accordingly, staeth the excessiue flux of their monthly termes: for which purpose also, it is good for them to sit in a bath made with the decoction of the said herb: & in this case, to their breasts or paps, *there would be laid a plaster of Henbane seed tempered with wine: the root also applied in manner of a cataplasme to their secret parts, is counted soueraigne for that infirmity: like as Celendine the greater laid vnto the foresaid breasts. If the after birth, when the childe is borne, be loth to come away, or if the infant be dead within the mothers womb, the roots of Panaces applied accordingly to the priuy parts, fetch forth both the one and the other. The very herb it self Panaces drunk in wine, or outwardly vsed to the region of the matrice, *clenseth the same. Sauge de bois taken with wine, expelleth the after-birth, and by a suffumigation, mundefieth the matrice. The iuice of Centaury the lesse, bringeth women to their desired sicknesse, if they drink it, or foment the parts beneath, therewith. Likewise the root of the bigger Centaury vsed after the same manner, appeaseth the pains of the mother. If the same be scraped smooth, & put vpon into the right place as a pessary, it draweth away the dead child within her body: for the griefe and anguish which women fee in their womb, there is no better thing than to apply the iuice of Plantaine in a locke of wooll: and in danger of suffocation by rising of the mother, to giue it in drinke. But Dictamnus is soueraigne and hath no peere: it prouoketh monthly fleurs: it sendeth out the dead childe, yea though it lay ouerthwart and stucke crosse in the birth: for which purpose, the woman must drink to the weight of one obolus, in water: and verily of such power is this herb in such cases, that so long as women go with child, it must not come within the chamber where they are, for feare it put them to trauell before their time. And not onely in

* In their matrice, as namely, the rising of the mother, &c.

* To wit, the stay of the after burden, after throwes, suppression of their purgation, or immoderate shifts, &c. * Swelled and hard.

* Turgat, some read better (in mine opinon) corrigis, i. rediect it into the right place being vnswelled and peruerced.

A drink is it thus effectual, but also in a liniment; yea and the very perfume and smoke thereof received in the body, will do the deed. Next to it, there is not a more soueraigne herb than the bastard Dictamnus, called Pseudodictamnus: but it must be boiled to the weight of one denier, with pure wine and strong of the grape, and then taken in drinke, it prouoketh womens desired sicknesse. And yet Aristolochia is many waies good for the infirmities of women: for if there be myrrh and pepper put thereto, and then either taken in drinke or put in a pessary, it draws downe their fleurs, bringeth forth the after-birth, and fetcheth away the dead infant: it keepeth vpon and staeth the matrice ready to fall and slip out of the body, either in fomentation, perfume, or pessary, especially the *small kind thereof. But in case a woman be in danger of suffocation by the ascent of the mother, or otherwise diseased for want of her monethly purgation, let her drinke Agaricke to the weight of three oboli in one cyath of old wine: make a pessary of Veruain incorporat with fresh hogs lard, and apply Calues snout, otherwise called Snap-dragon with oile of rose and hony, she shall haue ease, and be cured speedily. Semblably the root of Nenuphar, especially that which groweth in *Fhesalie, applied vnto the naturall parts of women, ease the paines thereof: and if it be drunke in grosse red wine, it staeth their shifts or immoderate flux of the months. Contrariwise, the Sow-bread root, both taken in drinke and also outwardly vsed, prouoketh the same, if they do stay vpon a woman. Also a decoction thereof, if a woman do sit therein, helpeth the accidents of the bladder. Cissanthemos taken in drinke, sendeth out the after-birth, and healeth the maladies of the matrice. The vpper root of the Flag or Glaier, drunke in vineger to the weight of one dramme, bringeth women to the ordinary course of their fleures. The fume of Harthtrag burnt, fetcheth women againe when they lie as it were strangled and dead in a fit of the mother. Flea-wort taken to the weight of a dram in three cyaths of honied water, prouoketh their monthly termes, but especially it maketh them soluble if they were costiuie. The seed of Mandragoras cleanseth the matrice, if a woman take it in her drinke: the iuice whereof applied to the naturall parts, prouoketh her months and fetcheth away the dead child within her body. Again, the seed taken with wine and brimstone, staeth the immoderate flux of the monthly termes. Crowfoot either drunk or eaten with meat, knitteth the belly and stoppeth a lask: an herb otherwise (as I haue said) of a causticke and burning nature, if it be vsed raw, but certainly, being boyled with salt, oyle, and cumine, a commendable meat. Yellow Carrots taken in drinke, doe exclude the after birth, and prouoke womens fleurs with exceeding great facilitie. A perfume of Ladanum, setteth streight the matrice when it is out of the right place, and turned to a side: and for the paine and exulceration thereof, it is of great force either applied outwardly or injected inwardly. Scammonie, either in drink or cataplasme, sendeth forth of the body the dead fruit of the wombe. Both kinds of S. Johns wort, stirreth the issue of womens fleurs, onely by an outward application. But aboue all (in the iudgement of Hippocrates) *Crithmos passeth for that, if either the seed or the root be taken in wine. As for the pill or rind thereof, it fetcheth away the after birth also: and drunk in water, it helpeth the suffocation occasioned by the rising of the mother. The root of *Geranium likewise more particularly, is a very conuenient remedy for to bring away the after-birth, and to cure the inflammation of the matrice. Horsetaile hath a secret vertue to mundefie the naturall parts of women, either drunke, or applied outwardly. Knot-grasse giuen in drinke, *staeth the inordinate and excessiue voidance of the fleurs: so doth the root of Marsh Mallow. The leaues of Plantaine, *drunke downe the same: so likewise Agaricke in honied water. Mugwort stamped and incorporat with oile of Ireos, Figges, and Myrhe, hath the same effect, if it be applied accordingly: The root of which hearbe, if a woman take in drinke, is so purgatiue and will bring her to such a lask, that shee shall withall exclude the dead infant within her bodie. A decoction made with the branches of Mugwort, bringeth downe womens monethly sicknesse, and fetcheth away the after-birth, if they fit therein: a dramme weight of the leaues taken in drinke, is of the like vertue and operation: if they be but laied vnto the belly in manner of a cataplasme, especially with barley meale, they will doe as much. Moreover, Acoron, both the kindes of Conyza, as also *Sampier, are singular good for all the inward griefes and maladies whatsoever of women. Also both kinds of Anthyllis drunke in wine, are soueraigne for the accidents of the matrice, namely to assuage the throws and wrings thereof, and to bring away the after-birth when it staeth behind. A fomentation made with Maidenhaire, is comfortable to the naturall parts of women: like as it hath vertue to cleanse the scurfe and dandruffe, to rid away the white patches appearing

in the skin or haire, and to color the same black, if it be brought into pouder, & with oile made into a liniment. Herb Robert drunk in white wine, and Hyocisthis in red, do stay the flux of reds or whites. Hyssop is a soueraign herb to open and relax the obstructions of the matrice causing suffocation. The root of Veruaine taken inwardly with water, is the best thing in the world for all the maladies incident to women, either in their trauell or after their deliuerance. To which effect, some there be, who together with Harstrang mix the grains of the Cypresse tree beaten to pouder, and giue it to drink in grosse red wine. For the seed of Fleawort, boiled in water, and laid too warme, doth moderate and qualifie all the violent fluxes of the matrice. Camfrey stamped and giuen in grosse wine or allegant, bringeth down the sicknesse of women when it staith vpon them. The iuice of Scordotis taken to the quantity of one dram in foure cyaths of honied water, giueth women speedy deliuerance in childbirth: and for that purpose, the leaues of Dictamnus are excellent, if they be taken in water: and knowe it is for certain, that the weight of one obolus of those leaues giuen to a woman in hard trauell, wil presently cause her to be deliuered with ease, yea though the infant were dead in the belly. The like operation hath the bastard Dictamnus, but that it worketh more slowly: and in this case, they vse to tie the root of Cyclamin about the woman in labour; to cause her also to drinke Cissanthemos; yea and the powder of Betony in honied water. As for Arsenogonon and Thelygonon, they be two herbes, bearing certain grapes or berries like to oliue blossomes, but that they be more pale; and white seeds or kernels within, resembling those of white Poppy. If a woman drink Thelygonum, some say, she will therupon conceiue a maid child. Arsenogonon differeth from the other in nothing but in the seed, which commeth nere vnto that of the oliue: and (forsooth) if she take this herb in drink, she shall haue a man-child; beleue it who that list. Others there be, who say, that both the one and the other be like vnto Basil; and that Arsenogonon carrieth a double seed knit together like as they were two genitors.

That kind of Housleek which I called Digitellus, is singular for the diseases incident to womens Breests. Groundswell bringeth abundance of milke into womens paps, if they drinke it in wine cuit: so doth Sowthistle sodden in frumenty. The grape called Bumastos, taketh away the haire about the nipples of nourses breasts, which spring sometime after they haue once borne children: which also otherwise is very good to cleanse the skales and scurfe in the face, and to scoure away other spots and pimples arising vpon the skin. Gentian, and Nymphaea called Heraclaea, the root also of Cyclamin, riddeth all such cutaneous specks and blemishes. The graines of wild Carawaies, called Cacalia, incorporate in wax melted and made liquid, lay the skin of the face plain and even, and smoothe all wrinkles. The root of Acorum, serueth likewise to purifie the skin from all outward deformities. Herb Willow giueth the hair of the head a yellow colour. Hypericon, which also is named Corion, dieth it black: likewise doth Ophrys, an herbe growing with two leaues and no more, like vnto jagged Beers or Colewoorts. Also Polemonia setteth a black colour vpon haire, if it be boiled in oile. As for depilatorie medicines, which are to take away the haire from any part, the proper place to treat of them is indeed among those that pertain especially to women: but now adaies men also are come to it, and vse such deuises as well as women. The most effectfull of all others be they accepted, that are made of the herbe Archezotis. The iuice of Tithymall is likewise very good to fetch off haire: and yet there be some, who pluck them out first with pinfers, and then with the said iuice incorporat with oile, rub the place often in the hot sun. Finally, Hyssop tempered with oile into a liniment, is excellent to heale the mange or scab in four-footed beasts: and Sideritis hath a peculiar vertue for to cure swine of their squinies or strangles. Now is it time to pursue all other kindes of hearbes which remaine behind.

* Some think this is meant of hairs which in the paps, which should be swallowed down by a cup of dinke, and so ranke in the paps, & a diuise called by Aristotle Trichia. And Rhetorica is an opinion, that one u h thing of m bling an hanc may be ed within the breast, spatri- fied humours or corrupt like B r it scemeth by that whi h fol loweth, hat Plu e meant no such nar- re, out rather to countward eye fore.

A

THE TWENTY SEVENTH BOOK OF THE HISTORIE OF NATURE, WRITTEN BY C. PLINIUS SECVNDVS.

The Proeme.

CHAP. I.

C

Ertes, the farther that I proceed in this discourse & history of mine, the more am I forced to admire our forefathers and men of old time: for, considering as I do, what a number of simples there yet remain behind to be written of, I cannot sufficiently adore either their carefull industry, in searching and finding them out; or their liberal bounty, in imparting them so friendly to posterity. And verily, if this knowledge of Herbes had proceeded from mans inuention, doubtlesse I must needs haue thought, that the munificence of those our ancestors had surpassed the goodnesse of Nature her selfe. But now apparent and well knowne it is, That the gods were authors of that skil and cunning, or at leastwise there was some diuinitie and heavenly instinct therein, euen when it seemed to come from the braine and head of man: and to say a truth, confesse we must, That Nature (the mother and nource of all things) both in bringing forth those simples, and also in reuealing them with their vertues to mankind, hath shewed her admirable power as much as in any other work of hers whatsoeuer. The herbe Scythica is brought hither at this day out of the great fens & meers of Mæotis, where it groweth. Euphorbia commeth from the mountain Atlas, far beyond Hercules pillars & the straits of Gibraltar, and those are the very vtmost bounds of the earth: from another coast also, the herbe Britannica we haue, transported vnto vs out of Britaine, and the Islands lying without the continent, and diuided from the rest of the world; like as Æthiopia out as far as Æthiopia, a climat directly vnder the Sun, and burnt with continuall heat thereof: besides other plants and drugs necessary for the life and health of man, for which merchants passe from all parts too and fro, and by reciprocall commerce, impart them to the whole world; and all by the meanes of that happy peace which (through the infinite maiesty of the Roman Empire) the earth inioieth: in such sort, as not only people of sundry lands and nations haue recourse one vnto another in their traffick & mutual trade, but high mountains also & the cliffes surpassing the very clouds, meet as it were together, & haue means to communicat the commodities, euen the very herbes which they yeeld, one to the benefit of another: long may this blessing hold, I pray the gods, yea and continue world without end: for surely it is their heavenly gifts, that the Romans as a second Sun should giue light and shine to the whole world.

CHAP. II.

F

¶ Of the poison Aconite, and the Panther which is killed thereby.

Aconite alone, if there were nothing els, is sufficient to induce any man to an endlesse admiration and reuerence of that infinit care and diligence which our antients employed in searching out the secrets of Nature; considering how by their means we know there is no poison in the world so quicke in operation as it, in so much as if the shap or nature of any living creature

Aa 3

creature

creature of female sex be but touched therewith, it will not liue after it one day to an end. This was that poison wherewith *Calphurnius Bestia* killed two of his wiues lying asleep by his side, as appeareth by that challenge and declaration which *M. Caelius* his accuser framed against him. And hereupon it was, that in the end of his accusatory inuētiue, he concluded with this bitter speech, That his wiues died vpon his finger. The Poets haue feined a tale, That this herb should be ingendered first, of the fume that the dog *Cerberus* let fall vpon the ground, frothing so as he did at the mouth for anger when *Hercules* pluckt him out of hell: and therefore it is sorlooth, that about *Heraclea* in *Pontus* (where is to be seen that hole which leadeth into hel) there groweth *Aconit* in great plenty: howbeit, as deadly a bane as it is, our forefathers haue deuised means to vse it for good, and euen to saue the life of man: found they haue by experience, that being giuen in hot wine, it is a counterpoison against the sting of scorpions: for of this nature it is, that if it meet not with some poison or other in mens bodies for to kill, it presently sets vpon them and soon brings them to their end: but if it incounter any such, it wrestleth with it alone, as hauing found within, a fit match: to deale with: neither entrench it into this fight, vnlesse it find this enemy possessed already of some noble and principall part of the body, and then beginneth the combat: a wonderfull thing to obserue, that two poisons, both of them deadly of themselves and their own nature, should die one vpon another within the body, and the man by that mean only escape with life. Our ancestors in times past staid not thus, but found out and deliuered vnto vs proper remedies also for wilde beasts; and not so contented, haue shewed meanes how those creatures should be healed which are venomous to other: for who knoweth not, that scorpions if they be but touched with *Aconite*, presently become pale, benumbed, astoned, and bound, confessing (as it were) themselves to be vanquished and prisoners: contrariwise, let them but touch the white *Elleboe*, they are vnbound and at liberty again; they recouer (I say) their former vigor and vertue: whereby we may see, that the *Aconite* also giueth the bucklers to enemies twaine, pernicious poisons both, the one to it selfe, and the other to all the world. Now if happily any man should say, That the wit and head alone of man could possibly compasse the knowledge of these things; surely he should shew therein his ingratitude and impiety vnto the gods, in not acknowledging their beneficence. The people about *Heraclea*, to kill the Panthers which breed in those parts, vse to rub with *Aconite* certain gobbets of flesh, which they doe lay about the mountains as a bait and bane for them: and vnlesse by this meanes they did destroy them, no doubt they would fill the whole countrie; which is the cause that some call it *Pardalanches*, / *Libard-bane*: but they again on the other side, presently haue recourse to the excrements of a man, as I haue before declared, the only counterpoison whereby they saue themselves: who doubteth now, but the knowledge of this secret came first to them by meere chance? and considering that it is not possible to render a reason of the nature and vsage of such wild beasts (and whensoever we see the like to fall out, we count it still a new & strange accident) we must needs attribute the finding thereof to Fortune.

CHAPTER: III.

¶ *That of all Creatures and Inventions in this life, the author is a god.*

THis Chance and Fortune then, by means wherof we attaine to so many inuentions that we haue, is a diuine power, and no lesse indeed than a God: by which name also we vnderstand and call that great mother and mistresse of all things, dame Nature: and surely considering that conjecturall it is and doubtfull, Whether these wild beasts come by this knowledge day by day at adventure, or were indued naturally at the first with that perceiuaunce? we haue as great reason to attribute a diuinity and godhead to the one, as the other. Well, be it Chance, or be it Nature, that hath thus ordered the matter, certes a great shame it had bin, that all other creatures should haue knowne thus (as they do) what is good and profitable for them, and man only remain ignorant. But such was the industrie and goodnesse of those ancestours of ours in times past, that they not only deuised means, but also deliuered to posterity, how this venomous herbe Aconitum might be most safely and commodiously mingled in those collyries and medicines which be ordained for the eies: an euident argument and plaine prooffe, I assure you, that there is nothing so bad but it hath some goodnesse in it, and may be vsed wel. And therefore dispensed withall I looke to be, if I who hitherto haue written of no poisons, put downe the description

A scription thereof; to the end that a man may know it, and by knowing, take heed and beware. This herb hath leaues, resembling Cyclamin or the Cucumber, in number no more than foure, and those toward the root in some sort rough and hairy. The root but small, and the same like vnto a sea crabfish: and therefore some haue named it Cammaron, whereas others, for the reason before shewed, call it * Theliphonon. And for that the root doth turn and crook inward in manner of a scorpions taile, there be that giue it the name Scorpion. There wanted not others who chose rather to call it * Myo. Tonon, because with the very fent it is able to kill mice and rats a great way off. It groweth naturally vpon bare and naked rocks, which the Greeks call * Aconas: which is the reason (as some haue said) why it was named Aconitum. And for that in the place
B where it groweth or neare vnto it, there is no mould, nor so much as any dust found for to giue it nourishment, some haue thought it took the name therupon. Yet there be others who assigne another cause of that denomination, to wit, for that it is as forcible and as speedy in working the death of those whom it toucheth, as the hard stone or rag in turning or wearing the edge of any yron tooke; for no sooner cometh it neere vnto the body and is applied vnto it, but the quick operation is sensibly found.

С H A P. III.

¶ Of *Ethiopsis, Ageraton, Aloe, Alcca, Alypon, Alsina, Androsace, Androsamon, Ambrosia, Anonis, Anagryon, and Anonymon.*

C The leanes of Æthiopis are great and many in number, hairy also neere vnto the root, and otherwise correspondent to those of Mullen. It riseth vp with a four cornered stem, rough in handling, and after the maner of the main item of the Clot-bur, hauing many concauities or holes like arm-pits in the grafting of the branches to the said stem. It beareth seeds like vnto Eruille, which ordinarily grow double two by two, and are white. The roots be many, and those long, full and well nourished, soft, and clammy in tast: being dried, they wax black & grow hard withal; in such sort, as a man would take them for horns. They grow ordinarily in Æthiopia, also vpon the mountain Ida in the region of Troas, and in Messenia. The right season to gather these roots, is in Autumne; and then they ought to be laid a drying in the Sun for certain daies together, to keep them from moulding. Being taken in white wine, they help the infirmities of the matrice; and the decoction thereof drunk, is good for the Sciatica, the pleurisie, & the hoarseness in the throat. But that which commeth out of Æthiopia is counted best and hath no fellow, for it worketh presently.

As for Ageraton, it is an herb of the Ferula kind, growing vp to the height of 2 spans like to Origanum, but that the floures refemble buttons or brooches of gold. The tume of this herbe when it burneth, prouoketh vrin and mundefieth the matrice, especially if a woman sit in a bath thereof, and do foment the natural parts therewith. The reason of the name Ageraton, is this, because the floures continue very long before they seem to fade and wither.

Aloe is an herbe which hath the resemblance of the sea-onion, but that it is bigger and the leaues be more grosse and fat, chamfered or channelled bials all along: the stem that it beareth, is tender, red in the midst, not vnlike to Anthericon: one root it hath and no more, which runneth directly deep into the ground in manner of a big stake: strong it is to smell vnto, and bitter in tast. The best Aloe is brought out of India: but there groweth good store thereof in Asia, howbeit of no vse, but that they lay the leaues fresh vnto green wounds; for they do incarnate and heale wonderfully, like as their iuice also. And for that it is such an excellent wound-herbe, folk vse to set and sow it in barrels or pipes pointed beneath, and broad aboue, like as they do the greater Housleek. Some there be who for to draw a iuice or liquor out of it, stay not vntill the seed be ripe, but cut the stem for that purpose: others make incision also in the leaues: moreover there is other while found in Aloe a certain liquid gum issuing out of it self, and sticking fast to the stem thereof: and therefore they hold it good to paue or ram the ground hard all about the place where Aloe groweth, that the earth should not drink vp the liquor which distilleth from it. * Some haue written that in Iury aboue Ierusalem, higher into the country, there is a certain minnerall Aloe to be found, growing in manner of a merral within the ground: but there is none worse than it, neither is there any blacker or moister. If you would know the * best, chuse that which is fat and cleare, of a red colour, brittle and apt to crumble, close compa& in manner of a liuer,

fant is born: or if a woman desire to see her monthly sicknes, it is good to drink a dram weight of the leaues in wine cuit. And in that maner they are giuen to those who be short winded: but in old wine against the sting of the venomous spiders Phalangia. The root is singular to be put to those plasters which either do resoleue or maturat any impositumed place. The seed chewed, staeth immoderat vomits.

* Anonymos, finding no name to be called by, got therupon the name * Anonymos. a Plant this is brought out of Scythia to vs; highly commended by *Hiesius* a Physitian of great name and authority, also by *Aristogiton*, for an excellent vulnerary, if it be bruised or stamped in water, and so applied; but taken inwardly in drinke, it is good for womens breasts and the precordiall parts about the heart, if they haue gotten a stripe, or be bruised: also for such as reach vp blood. Some haue ordained a vulnerary drinke to be made therof for those that be wounded. But what is said moreover as touching this herb, I hold meere fabulous: and namely, that if two pieces of yron or brasse be put into the fire and burn together with this herbe, fresh and new gathered, they will foudre and joine againe.

CHAP. V.

¶ Of *Erith* or *Goose grasse*. Of the *Clot-bur*. Of * *Ceterach*: of *Asclepias* and *Aster* or *Bubonium*. Of *Ascyron* or *Ascyroides*. Of *Aphace*, *Alcibium*, and *Alectorolophus*.

ERith is by some called in Greeke *Aparine*, by others *Omphalocarpus* and *Philanthropus*. An herb giuen to be full of branches, rough and prickly, carrying fise or six leaues growing round together about the said branches in order like a star, and a pretty distance there is between euery of these roundles. The seed is round, hard, hollow, and sweetish. It groweth in corn fields, in gardens and meadows: rough it is, that it is ready to * catch hold of folkes clothes as they passe by, and to stick vnto them. An effectuell herb against serpents, if a dram of the seed be drunk in wine: also for them who are pricked with the spiders Phalangia. The leaues haue a singular vertue to repress the abundant flux of blood out of wounds, if they be outwardly applied: like as the iuice hath a speciall property to help the infirmities of the ears, being dropped or poured into them.

Arction, which some rather name *Arcturus*, is like in lease to the great Mullen or Taperwort, but that it is more rough: the stem tall and soft, and the seed resembling Cumin. It grows ordinarily in stony grounds, with a root tender, soft, & sweet. Being sodden in wine, it easeth the tooth-ach, so that the patient hold the decoction in his mouth. For the *Sciatica* and stranguerie it is good to be taken at the mouth in wine; and outwardly applied, it healeth burns and cureth kibed heeles: in which cases the root is much commended, if together with the seed it be stamped with wine, and a fomentation madewith the decoction thereof.

As touching *Asplenium*, some there be who call it *Hemionion*: an herbe putting forth many leaues * foure inches long: the root is giuen to haue cranks and holes, and those full of mud or durt: much what do the leaues grow like to Fearn: the root is white and rough. It beareth neither stalk, stem, nor seed. It delighteth to grow among rocks and stones, vpon walls standing in the shade, and in moist grounds. The best is that which we haue out of Candy. It is commonly said, that if the decoction of the leaues boiled in vineger be drunke forty daies together, it wasteth the swelled spleen. The same may be applied in a liniment for that purpose, & so also they do stay the exceffive yex or hocket. This herb would not be giuen to women, for it causeth them to be barren.

Asclepias beareth leaues resembling *Iuic*, long branches, many small roots, and those odoriferous; howbeit the flours haue a strong and rank stinking smell with them, the seed much like to the *Axvitch*. It loveth to grow vpon mountains. The roots of this herbe not only taken inwardly in drinke, but also applied outwardly in a liniment, do ease the wrings of the belly, and resist the sting of serpents. After, is by some named *Bubonium*, for that it is a present remedy for the tumours arising in the thare. This herbe putteth vp a small stemme, with two or three leaues so newhat long. In the top thereof it beareth certaine little heads inuironed with spokie leaues, and those disposed round in manner of a starre. Taken in drinke, it is thought to be a preseruatiue against the venom of serpents. But to make a medicine for the share before named, it

A it must (they say) be gathered with the left hand: and then kept fast bound neere vnto the middle or girding place of the patient. And surely it helpeth the *Sciatica*, in case it be tied sure to the affected place.

Ascyron and *Ascyroides*, be herbes resembling one another, and both like vnto *Hypericon*: howbeit that which is named *Ascyroides*, hath the bigger branches, and those streight and direct, much after the manner of *Fenell* and such like, red throughout: and in the top thereof appeare little heads or knobs, of a yellow color. The seed contained in certain pretty cups, is smal, black, and gummie: bruise the said tops or knobs between your fingers, they seem to stain them with blood, which is the cause that some call this herb * *Androsæmon*. The seed is singular for the *Sciatica*, namely if the patient drinke two drams weight thereof in a sextar of *Hydromel*, that is to say, mead or honied water: for it looseth the belly and purgeth choler. A liniment made therewith, is much commended for a burne.

Apæce is an herb which hath very fine and small leaues: and a little taller it is than the *Lentill*; but larger cods it beareth, wherein lie three or foure seeds, blacker, moister, and smaller than the grains of the said *Lentill*. It groweth vpon corn lands. More astringent it is by nature than the *Lentill*, and bindeth stronger; for all other matters it worketh the same effects. The seed boiled, staeth vomits and lasks.

Touching * *Alcibion*, what manner of herb it should be, I neuer could yet finde in any writer. But they giue direction to stamp the roots and leaues thereof, and so in a cataplasme to apply them vnto any place stung with serpents, and to drinke them also. Now they prescribe for the drink, to take of the leaues one good handfull, and to stamp them, and so to giue them in three cyaths of meere wine full of the grape: or of the root three drams weight, with the like measure of wine.

Alectorolophus in Greek, called by vs in Latine *Crista Galli*, i. Cocks-comb, hath leaues for all the world resembling the crest or comb of a cock and those in number many: a slender stem and black seed, inclosed within certain cods. A soueraign herb it is for them that cough, if it be boiled with bruised beans, and taken in maner of an electuary with hony. It scattereth the cloudy films that trouble the eie-sight; & the maner is to take the seed whole and sound as it is, and to put it into the eie: it is nothing offensive nor troubleth that part one whit, but gathereth to it selfe all those grosse humors which impeached the sight. And in very truth, this seed whiles it is within the eie changeth colour, and being black before, beginneth to wax white, it swelleth withall, and in the end commeth out of the eie by the owne accord.

CHAP. VI.

¶ Of *Alum*.

The herb which we name in Latine *Alum*, the Greeks call *Symphytum Petraeum*, as if one would say, *Comfrey* of the rock: and verily like it is to wild *Origan*. The leaues be small, and three or foure branches spring immediatly from the root: the tops whereof resemble those of *Thyme*. Much branched it is otherwise, odoriferous in smel, and sweet in tast: it draws down water into the mouth and causeth spitting. The root which it putteth forth is long & red. This herb taketh pleasure to grow in stony places among rocks: in which regard it took the addition of the name *Petraeum*. Singular good it is for the sides and flanks, the spleen, reines, and wrings of the belly: for the breast, the lights, for such as reject or cast vp blood, and are troubled with the asperity and hoarseness in the throat: for which infirmities, the root is to be stamped, boiled in wine, and so drunke; yea, and otherwhiles to be reduced into a liniment, and so applied. Moreover, the chewing of it only, quencheth thirst, and hath a principal vertue to coole the lungs. Being applied outwardly in the form of a cataplasme, it knitteth dislocations, helpeth convulsions, is comfortable to the spleen, & the bowels or guts, if they be fallen by any rupture. The same root roasted or baked vnder the ashes, staeth a lask, in case it be first shrugged from the hairy strings thereof and pilled; and then after it is beaten into powder, be drunke in water with nine Pepper corns. And for healing of wounds, so soueraigne it is, that if it be put into the pot and sodden with pieces of flesh, it will foudre and reioine them, whereupon the Greeks imposed vpon it the name *Symphytum*, i. Confound: finally, it serueth to vnite again broken bones.

CHAP.

* Pliny hath forgotten himselfe, considering that in the 22 booke, & 21 chapter, he describes it (according to *Diocorides*) to be like in root and lease to *Orchaner*, &c. and there hee nameth it *Arcibion*.

* Some take it for Bugle or Scilicet heale. * Namelesse.

* or *Scolopendrium*.

* Whereupon they call it *Philanthropus*, i. a louer of man.

* *Trientalibus*.

CHAP. VII.

¶ Of Reits or sea-grasse, and Wallwort, Of the wild vine, and Wormewood.

THe sea-weed that looketh red, named in Latine *Alga*, is very proper for the prick and sting of Scorpions.

Touching Wallwort, it hath leaues carrying a strong and stinking smell with them: the stems be rough and parted into ioints: the seed black like to that of the luy, saue that the berries containing the same be soft. This herb delighteth in shady, cool, rough, and watery places. Beeing giuen to the full quantity of one Accetabulum, it is singular for the inward maladies which be proper to women.

The wild Vine, called by the Greeks *Ampelos-Agria*, is an herbe (as I haue sufficiently described already in my Treatise of Vines planted and wel ordered by mans hand) which putterth forth hard leaues of Ash-colour, long branches and winding rods clad with a thicke skin, and the same be red, resembling the floure *Phlox*, which in the chapter and discourse of Violets, I called *Iouis Flamma*; and a seed it beareth much like vnto the graines within a *Pomegranate*. The root boiled in three cyaths of water and two cyaths of the wine comming out of the Island *Coos*, is a gentle emollitiue of the belly, and maketh the body soluble, in which regard it is giuen with good successe to such as be in a drop sicke. A very good herb for women, as well to rectifie the infirmities of the matrice, as also to scoure and beautifie the skin of their face. Moreover, for the sciatica it is good to stamp it leafe and all, and to annoint the grieved place with the iuice thereof.

As for Wormewood, there be many kindes thereof. One is named *Santonicum* of a city in France called *Saints*: another, to wit *Ponticum*, taketh that name of the kingdome *Pontus*; where the sheep feed fat with it, which is the cause that they be found without gall: neither is there a better Wormewood than it: much bitterer than that of Italy, and yet the marow or pith within of that *Ponticke* Wormewood, is sweet to ours. Meet and requisite it is that I should set down the vertues and properties thereof, an herb (I must needs say) as common as any, and most ready at hand, howbeit, few or none so good and wholesome: to say nothing of the especiall account which the people of Rome make of it about their holy sacrifices and solemnities: for in those festiuall holydaies named *Latina*, at what time as there is held a great running with chariots for the best game, he that first attaineth to the goale and winneth the prize, hath a draught of VVormewood presented vnto him. And I beleue verily, that our forefathers and ancestors deuised this honourable reward, for the good health of that victorious chariotier, as judging him worthy to liue still. And in truth, a right comfortable herb it is for the stomach, and doth mightily strengthen it: In which regard, there is an artificiall wine that carrieth the strength and tast thereof, named *Abinthites*, according as I haue shewed heretofore: moreover, there is an ordinary drinke made of the decoction of VVormewood boiled in water: for the liquor ought to stand a day and a night afterwards to coole in the open aire, and then is it to be vsed: Certes, there is not a decoction of any herbe of * so great antiquitie as it, and knowne to haue bene vsed so long. Moreover, the infusion of VVormewood is in great request, and a common drinke: for so we vse to call the liquor wherein it lay steeped a certain time. Now this would be considered, that be the proportion of water what it will, the said infusion ought to stand close couered for three daies together. Seldome or neuer is there any vse of wormewood beaten to powder, ne yet of the iuice drawn by way of expression. And yet those that presse forth a iuice, take the VVormewood when the seed vpon it beginneth to swell and wax full, and being newly gathered, let it lie foking in water three daies together: but if it were drie before, to steep it a whole feuen night: which done, they set it ouer the fire in a brassen pan, with this proportion, namely, ten hemines of the herbe, to five and fortie sextars of water, and suffer it to boyle vntill a third part of the liquor be consumed: after this the decoction must run through a strainer, with hearbe and all well pressed: then ought it to be set vpon the fire againe, and suffered to seeth gently and leisurely to the height or consistence of honey, much after the order of the syrup made of *Centaurie* the lesse. But when all is done, this iuleb or syrup of VVormewood

* *Vetustissime in usu est.* Some read *Vetus sine usu est*, that is, It this drinke be stale, and not vsed presently, it is good for nothing.

A wood, is offensive to the stomach and head both; whereas that decoction first aboue-named, is most wholesome: for astringent though it be, and binding the mouth of the stomach aloft, yet it doth euacuat choler downward, it prouoketh vrine, keepeth the body soluble, and the belly in good temper, yea and if it be pained, giueth great ease: the worms ingendered therein, it expelleth: and being taken with *Seseli*, and *Celticke nard*, so there be a little vinegar put thereto, it dispatcheth all ventosities in the stomacke, and cureth women with child of that inordinat desire and strange longing of theirs: it clenseth the stomach of those humors which cause loathing of meat, bringeth the appetite againe and helpeth concoction: if it be drunke with Rue, Pepper, and salt, it purgeth it of raw humors & crudities occasioned by want of digestion. In old time, Physicians gaue wormwood for a purgatiue; but then they tooke a sextar of sea water that had bin kept long, six drams of the seed, with three drams of salt, and one cyath of hony: and the better will this purgation worke, in case the poise of salt be doubled; but it would be puluerized as fine as possibly may be, to the end that it might passe away the sooner, and worke more easily. Some vse to giue the weight before said in a gruell of Barley groats, with an addition of *Peniroyall*: others against the *Palsie*; and others againe had a deuise to put the leaues of wormwood in figs, and make little children to eat them so, that they might not tast their bitternes. Wormwood being taken with the root of *Floure-de-lis*, dischargeth the brest of rough fleagme, and clenseth the pipes. For the iauundise, it would be giuen in drinke raw, with * *Parley* or *Maidenhair*. Supped hot by little and little in water, it breaketh wind and resolueth ventosities: and together with *French Spikenard*, it cureth the infirmities of the liuer: and taken with vinegar, or some gruel, or els in figs, it helpeth the spleen: giuen in vinegar, it helpeth those that haue eaten venomous Mushrooms, or be poisoned with the gum of *Chamaelon* called *Ixia*. In wine if it be taken, it saueh those who haue drunk *Hemlock*: it resisteth the poison inflicted by the sting of the hardishrow, the sea dragon, and scorpions. It is holden to be singular for the clarifying of the sight: if the eies be giuen to watering, it represseth the rheum or flux of humors thither, so it be applied with wine cut: and laid vnto contusions, and the skin blacke and blew vnder the eies, with hony, it reduceth the place to the natie colour againe. The vapour or fume of the decoction of wormwood receiued into the eares, assuageth their paine: or if they run with corrupt matter, it is good to apply the same, reduced into powder and incorporat in hony. Take three or foure sprigs of wormwood, one root of *Nardus Gallicus*, boile them in six cyaths of water, it is a soueraigne medicine to drinke for to prouoke vrine, and bring downe the desired sicknesse of women: or being taken simply alone with hony, and withall put vp in a pessarie made with a locke of wooll, it is of speciall operation to procure their monthly terms: with honey and salnitre, it is singular for the *Squinancie*: it healeth chill-blanes, if they be bathed with the decoction thereof in water: applied vnto fresh or green wounds in a cataplasme, before any cold water come vnto them, it healeth them: and besides, in that manner, it cureth the scabs in the head: being incorporat with * *Cyprian wax* or figges, and so applied to the flanks or hypochondriall parts, it hath a particular vertue by it selfe to helpe their griefes. Moreover, it killeth any itch. Howbeit, this would be noted, that wormewood in no case must be giuen to those that haue an ague. Let a man or woman vse to drinke wormewood, they shall not be sea-sicke nor giuen to heauing, as commonly they be that are at sea. If wormewood be worne in a trusse to the bottom of the bellie, it allayeth the swelling in the sharc. The smell of wormewood procureth sleepe; or if it be laid vnder the pillow or bolster, provided alwaies that the patient be not ware of it. Either basted within cloaths, or strewed vpon them, it keepeth away the moth. If one rub his body therewith and oile together, it driueth gnats away so doth the smoke thereof also when it burneth. If writing inke be tempered with the infusion of wormewood, it preferueth letters and bookes written therewith, from being gnawne by mice. The ashes of wormewood burnt, and incorporate with oile *Rosat* to an ointment, coloureth the haire of the head black. There is yet another kinde of Sea-wormewood, which some call *Seriphium*: and excellent good is that which groweth about the city * *Taphositis* in *Aegypt*. Of this wormewood it is, that the priests of *Isis* in their solemn marches and processions, vse to beare branches before them. The leaves be somewhat narrower than those of the former, and the bitternesse not altogether so much. An enemy it is to the stomache: howbeit, the belly it loosneth, and chafeth worms out of the gurs; for which purpose, it is good to drinke it with oile and salt: or else the infusion thereof in a * *supping* or gruell made with the floure of the three moneth corne. To make the decoction

* *Cum apio, not opio.*

* *Or the ceros; Cyprie, arice Dioscurides.*

* *So called, because Oxyris was entred and his sepulchre renewed there.*

* *Or rather, a kind of sweet cut called *Hyppoma*, by *Diof.* which signifies also a wa-*

coction of wormwood well, there would be taken a good handfull of wormwood, and foddren in G
a sextar of water to the consumption of the one halfe.

CHAP. VIII.

¶ Of stinking Horehound: of *Mille-graine*, or *Oke of Ierusalem*: of *Brabyla*, *Bryon*, *Bupleuros*, *Caranance*: of *Calla*, *Circaea*, and *Cerium*: of *Crataegonon* and *Thelygonum*: of *Crocodilium* and *Cynoforchis*: of *Chrysolachanon*, *Cucubalon*, and *Conserua*.

Stinking Horehound, which some Greeks call *Ballote*, others *Melampyrion*, *i. Black Horehound*, is an herbe tufted full of branches: the stems be black and cornered; the leaues wherewith they be clad and garnished, are somewhat hairy, resembling those of sweet or white Horehound, but that they be bigger, blacker, and of a stinking sauer: but the leaues stamped and applied with salt, be very effectually against the biting of a mad dog: also, if they be wrapped in a Colewort or Beet leafe, and so roasted vnder the embers, they are commended for the swelling piles in the fundament. This Horehound made into a salve with honey, clenseth filthie vlcers.

* *Perri*: but it should be *Marrubij*, according to the Greeke word *megri*: not *megre*.

Bortrys is an herb full of branches, and those of a yellowish colour, and beset round with seed: the leaues resemble *Cichorie*. Found it is commonly growing about the banks of brookes and riuers. Good it is for them that be streight-winded and cannot draw their breath but sitting vpright. The Cappadocians call it *Ambrosia*, others *Artemisia*.

As for * *Brabyla*, they be astringent in manner of *Quinees*. More than so, I find not any Author to write thereof.

* Some take them for *Dama-scen plums*, or rather for *Bullois*, *Skogs*, or such like wilde *Plums*.

Bryon no doubt is a Sea-herbe, like in leaues to *Lettuce*, but that they be riuelled and wrinkled as if they were drawne together in a purse: no stem it hath, and the leaues come forth at the bottom from the root: it groweth ordinarily vpon rockes bearing out of the sea: and ye shall find it also sticking to the shells of certaine fishes, especially such as haue gathered any mud or earth about them. The herbe is exceeding astringent and desiccative, by vertue whereof it is a singular repercussive in all impostumes and inflammations of the gout especially, & such as require to be repressed or cooled.

Touching *Bupleuros*, I read that the seed thereof is given against the sting of serpents: and that the wounds inflicted by them, are to be washed or fomented with the decoction of the herb, putting thereto the leaues of the *Mulberrie tree*, or *Origan*.

Caranance is a meere *Theffalian* herb, and growing nowhere els but in *Theffalie*; and forasmuch as it is vsed only in amorous matters, and for to spice loue drinks withall, I meane not to busie my selfe in the description thereof: howbeit, thus much it would not be amisse to note, for to detect and lay open the folly and vanities of *Magitians*; namely, that they went by this conjecture onely, that it should be of power to win the loue of women, because forsooth when it is withered, it draweth it selfe inward * like a dead *Kites foot*. For the same reason also, I will hold my tongue and say neuer a word of the herb * *Cemos*.

* As if it would catch women and hold them fast perforce.

* *magis* or *magis* in Greeke signifieth a bridle or bit: and it is thought to be *Leontopodium*, *Disfor*, though others take it for *Doder*. * Or rather *Calix*. * Rather *Orocleia*, out of *Dioscorides*.

* *Cala* is of two sorts: the one like to *Aron*, which loueth to grow in toiled and ploughed grounds: the time to gather this herb is before it begin to wither: the same operation it hath that *Aron*, and is vsed to the like purposes: the root thereof is commended to be giuen in drink for a purgation of the belly, and to prouoke the monethly termes of women: the stalkes boyled leafe and all together with some pulse or other into a pottage, and so taken, cure the inordinate prouocations to the stoole, and streinings therupon without doing any thing. The second kind some call *Anchusa*, others, * *Rhinochisia*: the leaues resemble *Lettuce*, but that they be longer, full of plume or down; the root red, which being applied with the floure of barley groats, healeth shingles, or any other kind of *S. Anthonies fire*: but drunke in white wine, cureth the infirmities of the liuer.

Circaea is an herb like to winter *Cherry* or *Alkakengi*, but for the flours which are black: the seed small, as the graine of *Millet*, and the same groweth in huskes or bladders resembling little hornes: the root is halfe a foot long, forked for the most part into three or foure grains or branches: the same is white, odoriferous and hot in the mouth: it loueth to grow vpon rockes and stonie grounds lying pleasantly vpon the Sun. The infusion of this root in wine, is good to be

A be drunke for the paine and other diseases of the matrice: but of the said root there ought to be taken three ounces stamped, and the same to steepe a day and night in 3 sextars of wine, for to make the infusion aboue-named. This portion also serueth to fend down the after-birth, if it stay behind. The seed of this herbe drieth vp milke, if it be drunke in wine or mead.

Cirion cometh vp with a slender stalke two cubits high, and seemeth to be made 3 cornered triangle-wise: the same is beset round about with prickie leaues: howbeit, the said prickies are but tender and soft. The leaues in forme resemble an oxe tongue or the herb * *Langue-de-boeuf*, but that they be smaller and somewhat white; in the top whereof there put forth purple buttons or little heads, which in the end turne to a plume like thistle down. Some writers hold, that this herb or the root onely, bound vnto the swelling veins called *Varices*, doth allay the paine thereof.

* Or *Borage*, called in Greeke *Buglosson*.

Crataegonos spindlet in the head like vnto the eare of wheat, and out of one single root ye shall haue many shoots to spring and rise vp into blade and straw, and those also full of ioints. It gladly groweth in coole and shadowie places: the seed resembleth the grain of the *Millet*, which is very sharp and biting at the tongues end if a man & his wife before they company together carnally, drink before supper for 40 daies together the weight of three oboli of this seed, either in wine, or as many cyaths of water, they shall haue a man childe betwene them, as some say. There is another * *Crataegonos*, called also *Thelygonos*; & the difference from the other may soon be known by the mildnesse in taste. Some authors affirme, that if women vse to drinke the floures of *Crataegonos*, they shall within 40 daies conceiue with child. But as well the one as

* Some take this for our *Perficaria*, or *Art-emet*.

C the other applied with honey, do heale old vlcers: they incarnate and fill vp the hollow concavities of fistulous fores: and such parts as do mislike and want nourishment, they cause to gather flesh and fill the skin again: foule and filthy vlcers they mundifie, the flat biles and risings called *Pani* they rarifie and disscusse: gouts of the feet they mitigate; & generally all impostumations, in womens breasts specially, they resolute and assuage. *Theophrastus* would haue a kind of tree to be called *Crataegonos* or *Crataegon*, which here in Italy they call * *Aquifolia*.

* *i. Holly* or *Huluer*: nay rather, *Aquifolia* is *Agria* in Greeke; and the *Crataegus* of *Theophrastus*, which he meaneth here, is a kinde of *Ceanoth* tree now called *Terminalis*.

Crocodilion doth in shape resemble the thistle herbe or *Artichoke* called the blacke *Chamaeleon*: the root is long and thicke in all parts alike, of an hard and vnpleasant smell: it groweth ordinarily in sandy or grauelly grounds. If one drinke of it (they say) it will set the nose a bleeding, and send out a deale of thicke and grosse blood, that the spleene will diminish and weare away by that means.

As touching *Testiculus Canis* or *Dogs-stones*, which the Greeks call *Cynoforchis*, & others simply *Orchis*, it hath leaues like vnto those of the oliue; soft & tender they are, and about halfe a foot long, and therefore no maruell if they lie spread vpon the ground: the root is bulbous and growing long-wise, in a double ranke, or two together: the one aboue, which is the harder, the other vnder it, and that is the softer: when they be foddren, folke vse to eat them after the manner of other bulbs: and lightly a man shall find them growing in vineyards. Of these two roots, if a man eat the bigger, it is said, that he shall beget boies; and if the woman eat the smaller, she shall conceiue a maiden childe. In *Theffalie*, men vse for to drinke in goats milke, the softer of these roots, to make themselves lustie for the act of generation; but the harder, when they would coole the heat of lust: whereby we may see, that they be contrarie, and one hindereth the operation of the other.

Chrysolachanon cometh vp like a *Lettuce*, and commonly groweth in plots of ground set with *Pines*: the vertue of this herbe is to heale wounds of the sinewes though they were cut quite asunder, if it be presently laied too. There is another kinde of * *Chrysolachanon*, bearing floures of a golden colour, and leaved like vnto the *Beet*: when it is boiled, folke vse to eat it instead of meat, and it loosneth the belly as well as *Beets*, *Coleworts*, and such like: and if it be true that is reported, whosoever beare this hearbe tied fast about any place of their bodies which is euil in their eie, so as they may see the same continually, it wil cure them of the jaundise. Touching this hearbe *Chrysolachanon*, well I wot that I haue not written sufficiently, that men might know it by this description, and yet could I neuer meet with any author who hath said more, or described it better. This verily hath been the fault and oversight euen of our moderne *Herbarists* of late daies, To write sleightly of those herbes and simples which they themselves knew and were acquainted with, as if forsooth they had been knowne to euery man; setting downe onely their names and no more: which is euens much as to tell vs a tale and say,

* I thinke he meaneth *O-rach*.

* *Coccullo terra*

that with the * rennet or rundles of the earth, one might stay a laske, or giue free passage to the vrine in the strangury, so it be drunke in wine or water.

As for Cucubalum, they write of it, That if the leaues bee stamped with vineger, they heale the stings of serpents and scorpions. Some of them call this herb by another name, Strumus, and others giue it the Greeke name Strychnos: and black berries (they say) it hath. The iuice thereof taken to the quantity of one cyath, with twice as much honied wine, is soueraigne for the loins or small of the back: likewise it caeth the head-ache, if together with oile of roses it bee distilled vpon the head by way of embrochation. The herb it selfe in substance made into a liniment, healeth the wens called the kings cuill.

Concerning the fresh water Sponge (for so I may more truly terme it, than either mosse or herbe, so thicke of slag haire it is and fistulous withal) it groweth ordinarily within the riuers that issue from the root of the Alpes, and is named in Latine * *Conserua*, for that it is good to conglutinat, in manner of a soulder. Certes, I my selfe know a poore labourer, who as he was lopping a tall tree, fell from the top down to the ground, and was so pitiously bruised thereby, that vnneth he had any found bone in all his body that was vnbroken: and in very truth, lapped he was all ouer with this mosse or sponge (call it whether you will) and the same was kept euermore moist and wet with sprinkling his owne water vpon it, whensoever it began to drie vpon him with the heat of his body: seldome was it vndone or remooued, and neuer but when of necessity for verie change fresh was laied too for default of the other: and by this manner of cure and no other, the poore wretch recovered perfectly, in so smal a time, that it was wonderful and almost incredible.

CHAP. IX.

¶ Of the berrie called *Coccullo Gnidium*. Of the *Tazill*, and *Oke ferne*. Of *Dryophanon*, and *Ela-tine*. Of *Empetrum*, otherwise named *Calcifraga*. Of *Epipactis*, or *Elleborine*. Of *Epimedium*, *Enneaphyllon*, and *Ferne*. Of the herbe named *Oxe-thigh*. Of *Galeops*, otherwise *Calcobdolon*. Of *Glaux*, or *Engalatum*.

The berrie *Coccullo Gnidium*, in colour resembleth the Scarlet graine; in quantity a pepper corne, but that it is bigger: of an ardent and caustick quality it is, and therefore they vse to lap it in the soft crum or pith of a loaf of bread, and to swallow it, for feare it should burn the throat as it passeth down. A present remedy this is for those who are impoisoned with Hemlocke; and it hath a good propertie to stop a laske.

The *Tazill*, called in Greeke * *Dipfacos*, hath leaues much resembling Lettuce, sauing that in the mids of the back-part, there are to be seen certain bubbles as it were, or ridings, and those be prickly: the main stem which it beareth, is two cubits high, and the same armed with prickles: at euery ioint and knot whereof, it putteth forth two leaues which do compasse and inclose the same round about in maner of wings, making thereby a certaine * concauitie or hollow receptacle, wherein alwaies there standeth a * saltish dew or water. In the top of this maine stem and other branches proceeding from it, it beareth certaine burry heads, beset all ouer with sharpe prickles, like those of an *Vrchin*: and it loneth to grow in waterie places. This herb closeth vp and skinneth the fissures or chaps in the fundament: also the root boiled in wine, healeth fistuloes; but the same ought to be so tender sodden, as it may be wrought like wax, that a colyric or tent made of it may be put into the concauitie of the sore. Moreover, it cureth werts of all sorts: and some there be, who to rake away werts, wash them with the liquor found in the hollow pith of the foresaid wings. The *Oke fern* named in Greeke *Dryopteris*, is like to other fern, & groweth vpon trees, hauing leaues finely slit, and those somewhat sweet in tast: the root is rough and hairy: of a caustick and fiery nature is this herb; and therefore the root being punned, is a depilatory and fetcheth off haire: for which purpose, the manner is to apply it in manner of a liniment, vntill it procure sweat: which course would be re-iterated twice or thrice, during which time the sweat must not be wiped away.

Dryophanon is an herb much like to *Dryopteris*: the stems whereof be small, yet growing to the length of a cubit, & those be inuironed on both sides with leaues an inch broad: in shape much like to *Bruscus* or butchers-broom, called in Greeke *Oxymyr sine*, but they be whiter and softer,

A softer, bearing a white floure likewise in manner of the Elder. The young crops and tendrils of this herb, may be eaten when they are sodden: and the seed is commonly vsed in stead of pepper.

Running Buckwheat or Bindweed, named in Greeke *Elatine*, putteth forth smal leaues, round and hairy, much like to those of *Parietary* of the wal; and immediatly from the root there spring fine or six pretty branches halfe a foot long, furnished well with leaues. This herb grows among corn: sower it is and harsh in tast, whereupon it is taken to be very effectuall to repress the fluxe of humors which cause watering eyes, if the leaues be stamped with barley groats, and applied with a fine linnen cloath vnderneath. The same boiled together with *Linefeed*, cureth the bloudy flux, in case the patient drinke the broth or decoction thereof.

B As for *Empetron*, which our countrymen in Latine name *Calcifraga*, it groweth vpon mountains regarding the sea, and commonly vpon rocks and stony cliffes: the nearer it is to the sea, the saltier tast it hath, by which means if it be taken in drinke, it purgeth choler & fleam: the farther off that it groweth from the sea, and the more terrene and earthly substance that it hath, the bitterer it is found to be, and this doth euacuat waterish humors: but the manner of taking it, is in some potage, or els in mead. Being long kept, it loseth the force: if it be fresh and new gathered, and then either sodden or stamped, it is diureticall and breaketh the stone. And verily they that promise thus much in the behalfe of *Empetron*, and would seem to iustifie and make good their word, do affirme for the better credit thereof, That if stones doe boile with it in the same pan, they will burst in pieces.

Epipactis, named by some *Elleborine*, is a little herb bearing small leaues: soueraign for the diseases of the liuer, and against all poisons, if it be taken in drinke.

Epimenidion putteth forth no great stem, bearing ten or twelue leaues resembling the *Iuie*, but it neuer sheweth floure: the root is smal, black, and of a strong and stinking smell: it groweth vpon moist grounds: of an astringent nature it is, and cooleth mightily: an hearbe that women * must beware of. The leaues stamped and applied to the paps of maides, keep them down that that they shall not grow.

Enneaphyllon hath long leaues, in number nine, neither fewer nor more, and those be of a burning or causticke nature: a singular hearbe for the paines of loines, and the *Sciatica*, but it ought to be applied enwrapped well in wooil, for feare least it burne the flanks, for presently it raiseth blisters.

D Of *Ferne* be two kinds, and they beare neither floure nor seed. Some of the Greekes call the one *Pteris*, others *Blechnon*: from one root whereof there spring many branches representing wings, and those exceed two cubits in length, yeelding * no vnpleasant sauor; and this they suppose to be the male. The second kind, the said Greekes some call *Thelypteris*, others *Nymphæa* *Pteris*: this groweth single, and brancheth not into many stems; shorter it is than the former, softer also, and thicker of leaues, and those toward the root guttered and somewhat hollow: there is neither of them both, but their roots will feed swine fat: and the leaues of the one as well as the other, are disposed on both sides so, as they do represent birds wings, whereupon the Greeks gaue them the name * *Pteris*. The roots of both *Fernes* be long, and those growing bias: in colour blacke, especially when they be drie: and dried they ought to be in the Sunne. Fern groweth euery where, but their most delight is in a cold soile. The due time of digging them vp, is about the setting of the star *Virgilia*. There is no vse in Physicke of their roots, but when they be iust two yeres old; for both before & after the time, they serue for no purpose. Taken in this their season, they do expell all kind of vermin out of the guts, with honey, if they be broad and flat wormes, but in some sweet wine, for all the rest, whether they be round or small, so that the Patient continue this drinke three daies together. Neither of them both, but are very contrarie and offensiu to the stomack: howbeit, they purge the belly, and first euacuat choler, then soon after, waterish humors: but the better do they chase the foresaid flat wormes out of the body in case they be quickened with the like quantitie of *Scammonie*. The root of *Ferne* taken to the weight of two oboli in water, cureth all rheums; but the Patient ought to fast one whole day before, and likewise eat a little bony somewhat before that he take the said drinke. As for women, neither the male nor the female Fern would be giuen vnto them, for if they be with child, it will driue them to trauell before their time, and slip an vntimely birth; and if they be cleare, it hindereth conception and causeth them to be barren. The powder of *Ferne* roots, is singular to be strewed or cast vpon maligne vlcers, yea, and the farcins and sores in horse necks. The leaues of

* This *Empetron* is thought to be our *Saxifraga*.

* For it hindereth conception.

* Non grani odore: *Dioscorid* saith, *Sub graues odore*, somewhat vnpleasant in smell.

* And in *Columella*, *Felix* is called *Ania*.

* *Virga pastoris*

* Thereupon it is called *Labrum Veneris*, *Venus lauer*.
* This water is not saltish: but because the name *Dipfacos* in Greeke alludeth to thirst, & salt things cause thirst: it is called *Urine* in this humour to be saltish.

Ferne kill punaises or wallice, and a serpent they will not harlor; and therefore it is good for those who are to lie in suspected places, to make them pallets of Ferne leaues, or at leastwise to lay them vnder their beds: the very smoke also of them when they be burned, do chafe away ferpents. Moreover, Physitians haue made some difference and choise euen in this herbe also; for the best is counted that of Macedony: and the next to it in goodnesse, cometh from Cassiope.

As touching the herb called in Latine Femurbubulum (i.e.) Ox-thigh, it is very good for the sinews, if being new gathered, it be stamped and incorporat in vineger and salt.

* Many take it for Archangel.

* Galeopsis, otherwise called by some Galeobdolon or Galion, hath a stem and leaues like to the nettle, but that they are more smooth and mild in hand; which being bruised or stamped, yeeld a stinking smell; and it beareth a purple floure, it groweth euery where about hedges and path-waies. The leaues and stalks both, stamped and applied with vineger, heal all hard tumors and cancerous sores: likewise the wens called the kings euill: they resolute flat impostumes, and the swellings behind the ears: now the manner is to foment the said infirmities with their decoction. Being laid too with salt, they heale vlcers tending to putrifaction, and gangrens.

As touching Glaux, in old time called Euglauston, it is an herb in leafe resembling Treetri-folie, and the Lentill, but that the back part of the leafe in Glaux is whiter. The branches, that be in number five or six, and those springing directly from the root, very small, doe creepe along the ground: the flours which it putteth forth be of a purple colour: and this herb is found growing ordinarily neare the sea-side. Being boiled in a gruell made of fine wheat floure, it cauterh nourses that drinke it, to haue plenty of milke in their breasts; but then they must presently goe to a baine or hot house.

CHAP. X.

¶ Of Glaucion. Of Paconie, and Cudweed or Cottonwort, called also Chamaæleon. Of Galedragon, Holcus, Hyofris, Helosteon, and Hippophaeton.

Glaucion grows naturally in Syria and Parthia: a low herb, tufted thick with leaues, much like vnto Poppie, but that they be smaller and looke more foule and greasie; of an vnpleasant and stinking smell; bitter also in tast, styptick, and astrigent: graines it beareth of a Safron colour, wherout is drawne the juice Memithra, called by the Greeks Glaucium also, as well as the herb. Now for to get this juice, they vse to couer the graines in mud or clay, and put them in an earthen pot which they set in an ouen; where, after they are well heat, they vse to presse out of it the foresaid juice. And not onely it, but the leaues also if they be stamped, are much vsed for the flux of humors to the eies, especially such as fall together all at once in great violence. And of this herb or juice there is a certaine collyrie compounded, which the Physitians call Diaglaucion: a good medicine also for nourses to drinke in water, if they haue lost their milke and would recouer it againe.

Paconie, which some in Greeke call Glycyfide, others Paconia, or Pentorobos, hath one main stem two cubits high, & the same accompanied with two or three more lesse stalks of a reddish colour, and the rind resembleth that of a Bay tree: the leaues be very like vnto Wood, were they not fatter, rounder, and smaller: seed it beareth in certaine husks like grains, and those be partly red and partly blacke. Of Paconie there be two kinds; the female it is thought to be, to the root whereof there sticketh eight long bulbies commonly, or six at least: the male hath more of them hanging to it, by reason it standeth not vpon one single and entire root onely, but of many, and those run downe a span deep, and be white withall. These roots are found to be astrigent and stypticke at the tongues end. As for the female, the leaues thereof do sent of Myrrhe, and grow somewhat thicker than those of the male. They loue both to grow in woods. It is commonly said, That the roots must be digged vp in the night season, for feare that the Wood-speight or Hickway should see them: for in the day time the said bird would flie in their faces that carry it away, and be readie to job out their eies. In the very drawing also of those roots out of the ground, there is some danger, lest their fundament or tiwill fall out of their bodies who are imployed about that businesse. But I suppose all this to be but a fabulous and vaine inuention, deuyed onely to make folke beleue it is an herbe of wonderful operation. Moreover, the grains are diuersly vsed: for the red, beeing taken to the number of fiftene or thereabout, in some grosse or hard VVine, doe stay the monethly fluxe of the reds in women: whereas the blacke

dranke

A dranke to the same number in sweet wine cuit or simple wine, cure the passions of the matrice, [and namely the rising of the mother.] The root giuen in wine, appeaseth all the paines of the belly, cleneth the gurs, cureth the convulsion or cramp which plucketh the neck & body backward, and the jaundise: it pacifieth also the griefes of the reins and bladder. As for the wrings of the matrice and stomack, the same boiled in wine, doth assuage them; the lask it staeth: and being eaten with meat, it is good for those that be troubled in their braines, or otherwise giuen to melancholy. But in these cases foure drams is counted a sufficient dose. The black grains taken to the number aboute said in wine, help those that be ridden with the night-mare, and in danger thereby to haue their breath stopped. For the gnawing in the stomack, the same being either eaten or applied in a liniment, are singular good: impostumations likewise growing to suppuration, if they be taken betimes, may be resolute with a plaster made of the black berries, and say they were of long continuance, the red will do the deed. But as well the black as the red, are soueraigne for those who be stung with serpents: as also for young children who haue the stone, and be entering into the strangury, and pisse drop-meale.

Cudwort or Cottonweed, some there be who call Gnaphalion, others, Chamaæleon. The white, soft, and delicate down of the leaues, many vse in stead of flocks, and surely it is not much vnlike. This herb is good to be giuen in some austere and styptick wine, for the bloody fluxe. It staeth lasks, and restraineth the immoderat flux of womens fleurs. Being clysterized, it is singular for the Time-me, that is to say, the continual prouocations to the sege without any voidance of excrements. Last of all, in a liniment it serueth well to be applied in vlcers tending to putrifaction.

C As touching Galedragon (an herb so called by *Xenocrates*) it resembleth the Thistle named Leucacanthus [*S. Mary thistle*] and groweth full of sharp pricks in moory grounds. The stem riseth vp tall, in manner of Ferula or Fennell geant, in the very head and top whereof it beareth a thing resembling an egge, in which there breed (they say) in proesse of time certain grubs or little worms, which are excellent for to ease the tooth-ach, if they be kept in a box with bread, and as need requireth, tied fast vnto the arm of the patient on that side where they ake; for it is wonderfull how soon the paine wil by this means cease. Mary they ought to be changed euery yere, for after one yere they be of no vertue in this case: and in any wise they must at no time touch the ground.

D As for Holcus, it groweth vpon stony grounds and those that be dry. It riseth vp with a stem like vnto the straw of that Barly which springeth euery yere without sowing: in the top whereof it beareth slender spikes or cares. This herb bound about the head, or the arme, draweth forth of the body any spils whatsoeuer: whereupon some name it *Aristida*.

* *Hyofris* resembleth Cichory or Endive, but that it is lesse, and in handling more rough: a soueraigne vulnerary herb, so it be stamped and laid to a wound.

Helosteon, which the Greeks so call by the * contrary, is an herbe without any hardnesse at all, as if we should terme * [Gall] by the name of [Sweet.] So small and slender it groweth, that a man would take it to be all hairs; foure fingers long, in manner of quich-grasse or stitchwort. The leaues be narrow, and haue an astrigent tast. It cometh vp ordinarily vpon banks & hillocks, which be all earth and nothing stony. Being drinke in wine, there is great vse thereof for convulsions, spreins, and ruptures. It is a great healer besides, and skinneth greene wounds: and experience hereof may be soone seene: for if it be put among pieces of flesh in the pot whilest they boile, it will cause them to grow together and vnite.

Hippophaeton is a certain prickly bush growing by the sea-side, wherewith * Fullers and Diers fill their leads & coppers, without stem, without floure: it bringeth forth certain little knobs or buttons only, & those hollow: leaues also it hath smal, and many in number, of a grasse green colour: the roots be white and tender; out of which there is a juice drawne by way of expression in Summer time, which is singular good for to purge the belly, if it be taken to the weight of three oboli; and principally helpeth those that be subject to the falling sicknesse, trembling of the members, and the dropsie: it cureth also those that be giuen to the swimming and dizziness of the braine, to straitnesse of winde, and who cannot breath but vpright; and last of all, to such as be entering into a palse.

CHAP.

CHAP. XI.

¶ Of Hypoglossa and Hypecoon, Idea, Ispopyron, Lathyrus, Leontopetalon, Lycopsis, Lithospermon. The vulgar stone. Of Limeum, Leuce, and Leucographis.

Bistlingua.
Horse-tongue,
or Double-
tongue.

Hypoglossa hath leaues fashioned like vnto Butchers broome, and those turning hollow, and pricky: within which concauities there come forth certaine little leaues resembling tongues. A garland or chaplet made of these leaues, and set vpon the head, easeth the pain thereof.

Hypecoon groweth amongst corne, and is leaef like vnto Rue. It hath the same nature and properties that Opium or the juice of Poppie.

As for the herb Idea, the leaues therof resemble those of ground-Myrtle or Butchers broom: vnto which there grow close certaine tendrils, and those carry floures. It stopperth a lask, staierth the immoderat flux of womens moneths, and stancheth all vnmeasurable bleeding: for by nature astringent it is and repercussive.

Ispopyron, some there be who call it Phasiolum, because the leaf (otherwise like vnto Annise) doth turne and writh like vnto the tendrils of Phasils. In the top of the stemme it beareth small heads or buttons full of seed, resembling Nigella Romana. A soueraigne hearbe, taken either in honny or mead, against the cough and other infirmities of the breast: likewise for the accidents of the liuer.

* Lathyrus.
* For the mil-
ky juice chaply.
For Dioscor.
saith amygdala,
is of the Al-
mond tree.
* Purgata faci-
lia. Some
thinke gentle
purgatiues.

* Spurge hath many leaues resembling * Lettuce: besides which, it putteth forth as many other slender and small branches, containing in little tunicles or husks certain seeds in manner of capers: which being dried and taken forth, resemble for bignesse corne of Pepper, white in colour, sweet in tast, & easie * to be clenfed from their husk. Twenty of these seeds drunk either in cleare water or mead, do cure the dropfie: besides waterish humors, they euacuat choler. They that desire to be thoroughly purged & would haue them to work strongly, vse to take them husk and all, but certainly so taken, they hurt the stomack: and therefore there is a deuise of late found out to giue them either with fish, or els in some broth of a cock or capon.

Leontopetalon, which some call Rhaeion, carseth leaues like to Coleworts, and a stalk halfe a foot high, garnished with many branches resembling wings: and seed it beareth in the head contained within cods, after the maner of ciches. The root is made much after the fashion of a rape or turnep, big and black withall. This herb groweth in corne grounds. The root is a singular counterpoison to be giuen in wine against the sting or venome of any serpents; and verily there is nor in the world a more speedy remedy. Very good it is for the Sciatica.

* Some take it
for a kind of
Orchanet,
others for
Hounds-
tongue.

* Lycopsis hath leaues like to Lettuce, but that they be longer and thicker: it riseth vp with a long stem, and the same hairy, with many branches growing thereto of a cubit in length: and beareth little Purple floures. It loueth to grow vpon champion plaines. A liniment made with it and barly meale, is good for the shingles and S. Anthonies fire. In agues it procureth sweat, so that the patient drink the juice thereof mingled with hot water.

But of all herbes that be, there is none more wonderful then Greimile: some call it in Greeke Lithospermon, others Agonychon, some Diospyron, and other Heracleos. It groweth ordinarily * five inches high: and the leaues be twice as big as those of Rue. The foresaid stalks or stems be no thicker than bents or rushes, and the same garnished with small and slender branches. It bringeth forth close ioining to the leaues, certain little beards one by one, & in the top of them little stones white and round in manner of pearls, as big as cich pease, but as hard as very stones. Toward that side where they hang to their steles or tailes, they haue certain holes or * concauities containing seed within. This herb groweth in Italy, but the best in the Island Candy. And verily of all the plants that euer I saw, I neuer wondred at any more: so sightly it groweth, as if some artificiall goldsmith had set in an alternatiue course and order, these prety beads like orient pearls among the leaues: & so rare a thing it is & difficult to be conceiued, that a very hard stone should grow out of an herb. The Herbarists who haue written thereof, do say that it lieth along and creepeth by the ground: for mine owne part, I neuer saw it growing in the plant: but shewed it was vnto me plucked out of the ground. This is for certaine knowne, that these little stones called Greimile seed, drunke to the weight of one dram in white wine, breake the stone, expell

A expell the same by grauell, and dispatch those causes that be occasions of strangurie. Certes, a man no sooner seth this hearb, but he may presently know the vertues thereof, and for what it serueth in Physicke; a thing that he shall not obserue again in any other whatsoeuer: for at the very first sight of these little stones, his eie will tell him what it is good for, without information from any person at all. There be common stones found about riuers, bearing a certain drie hoary mosse vpon them. Rub one of these stones against another, hauing spit first therupon, and then therewith touch the tetter or ringworme in any part of the body, it will kill the same: but the party must as he toucheth it, vtter this charme following:

* *Quod est Ruridideris, non est deus tuus dicitur.*

That is to say,

Cantharides flie apace: for a wilde Wolfe followeth in chase.

The French-men haue a certaine herbe which they call Limeum, out of which they draw a venomous iuice, named by them Stags-poison, wherewith they vse to envenome their Arrow heads when they go to hunt their red Deere: Take of this as much as goeth to the poysoning of one arrow, and put it in three measures or Modij of a mase wherewith they vse to drench cattel: and make sops thereof, and conuey them down the throat of sick oxen or kine, it will recouer them. But presently after the receipt of this medicine, they must be tied vp sure vnto their boufies vntill the medicine haue done purging: for the beasts commonly fare all the while that it is in working, as if they were wood. In case they fall a sweating vpon it, they must be washed all ouer with cold water.

* Leuce is an herbe like vnto Mercury; but it tooke that name by reason of a certaine white strake or line that runneth crosse through the mids of the leafe, for which cause some call it Me-soleucas. The iuice of this herbe healeth fistuloes: and the substance of the herbe it selfe stamped, cureth cancerous sores. It may be peraduenture the same herb which is named Leucas, that is so effectually against all venomous things proceeding from any sea-fishes. The herbarists haue not described this herb otherwise than thus, That the wild kind thereof with the broader leafe, is more effectual in the leaues; and that the seed of the garden kind, hath more acrimony than the other.

* Menib Sa-
vacencia.

D Touching Leucographis, what manner of herbe it should be, I haue not found in any writer: and I wonder thereat the rather, because it is reported to be so good for them that void & reach blood vpwad, namely, if it be taken to the weight of three oboli with Saffron: likewise stamped with water and so applied, it is singular good against those fluxes that proceed from the impetility of the stomacke: soueraigne also for to stay the immoderat flux of womens termes. And it entereth into those medicines which are appropriate for the eies, yea and into incarnatiues, such especially as be fit to incarnat those vlcers which are in the most tender and delicate parts of the body.

CHAP. XII.

¶ Of Medion, Myosota, Myagros, Nigina, Natix, Odontitis, Ottonne, Onosma, Onopordos, Oxyris, Oxy, Batrachion, Polygonon, Pancration, Peplos, Periclymenos, Laucanthemon, Phytocoma, Phyllon, Phellandron, Phalaris, Polyrrhizon, and Prosepinaca: of Rhacomia, Ruscida, and Staechas.

Medion hath leaues like vnto * garden Floure-de-lis. A stem three foot * high, garnished with faire large floures, of purple colour, and round in forme: the seed is small, and the root halfe a foot long: it groweth willingly vpon stony grounds lying in the shade. The root taken in a liquid electuary or lohoch made with honny to the quantity of 2 drams, for cerdaies together, staierth the immoderat flux of womens monethly termes. The seed also reduced into powder and drunke in wine, representh their extraordinary shifts.

* Indisfatue:
others read Se-
ridis & Endime.
* striped stem.
But Dioscor.
saith Tricubi-
stem, a three
cubit high.
* Mouse eate.

* Myosota, otherwise called Myosotis, is a smooth herbe, shooting forth many stems from one single root, and those in some sort of a reddish colour and hollow: garnished with leaues, which toward the root be narrow, long, and blackish, hauing their backe part sharpe and edged: which leaues grow along the stems two by two together: and out of the concauities or armpits be-

between the stalk and them, there put forth other small branches with a blew floure. The root is of the thicknesse of a mans finger, bearded with many small strings resembling hairs. This root is of a corrosiue nature, fretting and exulcerating any place wherunto it is applied: in which regard it healeth vp the fistulous vlcers called *Ægilops*, growing between the nose and angles of the eies. The *Ægyptians* are of opinion, that if vpon the 27 day of that moneth which they call *Thiatis* (and which answereth very neare to our moneth August) a man or woman do annoint themselves with the juice of this herb in a morning before they haue spoken one word, he or she shall not be troubled with bleared eies all that yeare long.

Myagros is an herb growing vp with stems in manner of *Fenell* geant, in leaues resembling *Madder*, and riseth to the height of 3 foot. The seed which it beareth is oleous, & out of it there is an oile drawne, which is good for the sores in the mouth, if they be annointed therewith.

The herbe called *Nigina*, hath three long leaues like vnto those of *Succorie*; wherewith if scars (remaining after vlcers and wounds) be rubbed, it will reduce them to the natural color of the other skin.

There is an herb, which in Latine is named *Natrix*, the root whereof being pulled out of the ground, hath a rank smell like vnto a Goat; with this herbe they vse in the *Picene* country to driue away those hob-goblins which they haue a maruellous opinion to be spirits, called *Fatui*: but for mine own part, I am verily perswaded they be nothing else but fantastickall illusions of such as be troubled in mind and bestraught, the which may be chased and rid away by the vse of this medicinable herbe.

Odontitis may be reckoned among the kinds of hey-grasse, putting forth many small stems growing thicke together from one root, and those knotted and full of ioints, triangled and blackish withall: in euery ioint small leaues it hath, resembling those of knot-grasse, howbeit somewhat longer: in the concavities between the said leaues and the stem there is contained a seed like vnto *Barly* corns: the floure is of a purple colour, and very small. It groweth ordinarily in meadow grounds. The decoction of the branches and tender stalks of this herb, to the quantitie of one handfull, boiled in some astringent wine, cureth the toothach, if the patient hold the same in the mouth.

Othonne groweth plenteously in *Scythia*, like vnto *Rocket*: the leaues be full of holes, and the floure resembleth *Safron*: which is the cause that some haue called it *Anemone*. The juice of this herbe entreteth very well into those medicines which are appropriate to the eies; for it is somewhat mordicatiue, and heateth gently: besides exiccatiue it is, and by that meanes astringent. It cleneth the eies of those films and clouds which darken the sight, and remoueth whatsoever hindereth the same. Some ordain for this purpose that it should be washed first, and after it is dried againe made into certain balls or trofchisks.

Onosma beareth leaues well-neare three fingers long, and those lying flat vpon the ground: three in number, and indented or cut after the manner of *Orchanet*, without stem, without floure, without seed. If a woman with child eat thereof, or do but step ouer it, she shall cast her vntimely birth out of her wombe.

As for *Onopordon*, they say if a fesse eat thereof, they will fall a fizling and farting. Howbeit of vertue it is to prouoke vrine, and the monethly sicknesse of women: to stop a laske, to discusse and resoluë impostumes, and to heale them when they be broken and do run.

* *Osyris* putteth forth small branches of a browne colour, slender, pliable, and easie to wind; the same be garnished with leaues * resembling those of *Line* or *flax*, of a dark & dusky green at first, but afterwards changing colour, and inclining to a red colour, and the seed is contained in those branches. Of these leaues are made certain washing balls, to scoure womens skin, and make them look faire. The decoction of the root being drunk, cureth those that haue the jaundise. The same roots, gathered before the seed be ripe, cut into roundles, and dried in the Sun, do stop the laske: but drawn after that the seed is ripe, they repress all catarrhes and fluxes of the belly, if the patient drink the supping wherein they are boiled. Also stamped simply, and so giuen in rain water, they haue the same effect.

* *Oxys* beareth three leaues and no more. This herb is singular to be giuen for a feeble stomach which hath lost all appetite to meat. They also who haue a rupture, and whose guts be fallen down, eat thereof to very good successe.

Polyanthemum, which some call *Batrachion*, hath a causticke quality, whereby it doth blis-

* *Linaria* or
Toads' flax.
* According
to *Dioscorides*.

* Cuckowes
meat, or
Wood-Sorell.

A fter any vnseemly scars, by means whereof, reduceth them to their fresh and former colour: the same also applied, scoureth away the morpew, and bringeth the skin to the natieue hue, answerable to the rest of the body.

Knot grasse is that herb, which the Greeks name *Polygonon*, and we in Latine, *Sanguinaria*: in leaf it resembleth *Rue*, in seed common quick grasse, & riseth not from the ground but creepeth along: the juice of this herb conueied vp into the nostrils, stancheth bleeding at the nose. They who set down many kinds of *Polygonon*, do hold that this is to be taken for the male, and by reason of the multitude of seed which it beareth is called * *Polygonon*: or for that it groweth so thick in tufts, *Calligonon*. Others name it * *Polygonaton*, for the number of * knots or knees which it carrieth. There be again, who giue it the name *Theuthalis*: some call it *Carcinotron*, others *Clema*, & many *Myrtopetalon*: and yet I meet with some writers, who say this is the female knot-grasse: and that the male is the greater, and not altogether so dark of colour, growing also thicker with knots, & swelling with seed vnder euery leaf: well, how soeuer it is, the property of them both, the one as well as the other, is to bind and coole: and yet their * seed doth loosen the belly, which if taken in any great quantity, is diuretical and represseth any rheums, provided alwaies that the patient be troubled therewith, otherwise it doth no good. The leaues are singular good to be applied vnto the stomach, for to assuage the heat thereof: in a liniment they mitigate the grieve of the bladder, and stop the course of hingles and such like wilde-fires. The juice is soueraine to be dropped alone by it selfe into the eares that run, and into the eyes to abate their pain. It is vsually giuen to the quantity of 2 cyaths in tertian Agues, and Quartans especially, before the fit commeth: likewise for the feeblenesse of the stomach when it will keep nothing: for the bloody flux, and the rage of cholerick humors both vward and downward.

A third kind there is, which they call * *Oreon*, growing vpon the mountains, resembling a tender reed: rising vp in one single stem, but full of little knees or knots, and those * couched & thrust together. Leased it is like the *Pitch* tree: the root needlesse, and of no vse: and generally the whole herb of lesse strength and operation than the former. Howbeit, this singular propertie hath it, to help the sciatica. A fourth *Polygonum* there is, called the wild, and this busheth like a shrub or a prey tree rather: the root is of a woody substance, & the stock or plant of a reddish colour, resembling the *Cedar*: it beareth branches much like to *Spart* or *Spanish* broome, two spans long, iointed into three or four knots, and those of a blackish colour. This also hath an astringent nature, and tasteth in the mouth like to a Quince. The decoction thereof in water, till the third part be consumed, or the powder of it dried, is commended for the sores in the mouth, and for any part that is fretted and galled. And the very substance thereof is good to be chewed in case the gums be sore. It represseth the malignity of eating corrosiue vlcers and cankers: and in one word, staith the malice of all sores that run on end, and be vntoward for to be healed: but a peculiar property it hath by it selfe to cure any vlcere occasioned by the snow. Our Herbarists vse this kind much for the squinancy; and to ease the head-ach, make a garland thereof, appointing it to be set vpon the head: but to repress any violent catarrhs, they prescribe to wear it about the neck. In Tertian agues, some giue direction to pluck it out of the ground with the left hand, and then to tie it to the arm or other part of the patient. And there is not an herb or plant

E that they be more careful to keep dry and to haue alwaies ready at hand, than *Polygonon*, for to stanch any issue or flux of blood whatsoeuer.

Pancration, which some chuse rather to call the little *Squilla* or sea-onion, beareth leaues resembling the white Lilly, but that they be longer and thicker, with a great bulbous root; & the same in color red. The juice of it taken with the floure of *Eruile*, maketh the belly laxatiue: and outwardly applied, mundifieth vlcers. For the dropie and hardnesse of the spleene, it is giuen with hony in manner of a syrrop. Some take the root and boile it in water vntill the liquor be sweet, which they poure forth; and then stamp the said root, and reduce it into bals or trofches, which they lay to dry in the Sun: and vse them afterwards as occasion serueth for the skals or vlcers of the head, and all other sores that require mundification. Semblably, they giue thereof as much as one may take vp with three fingers in wine, for the cough, and in a liquid eleuarie or lohoch for the pleurisie and peripneumonie. They prescribe it likewise to be drunke in wine for the Sciatica: to allay also the gripes and wrings of the belly, and to procure the monethly

into many branches; the leaues be like vnto Rue, but that they be somew hat broader: the seed appeareth vnder the leaues round, & (but that they be smaller) not vnlike to the white Poppie. Ordinarily it is found among Vines, and they gather it in haruest time. They hang it forth seed and all together a drying, setting water vnderneath, that the said seed or fruit may fall down in- to it. If it be taken in drinke, it purgeth the belly, and doth euacuat both choler and fleagme. The measure of one acetable is counted an ordinary and indifferent potion to be drunk in three hemines of mead or honied water. With this seed they vse to powder meats and viands, thereby to keep the body soluble.

* Periclymenos is also a bushie plant, and loueth to branch much: it beareth whitish & soft leaues, disposed two by two at certain spaces & distances very orderly. In the top of the branches it beareth hard seeds between the leaues, which hardly may be plucked off. It groweth in tilled corn fields & hedges, winding about euery thing that it can catch hold of, for to support and beare it vp. The seed after it is dried in the shade, folk vse to pun in a mortar, and so to make and it vp into trochisks. In case that the spleen be swollen or hard, they take of these trochisks, and after they be dissolved, giue thereof a sufficient quantity in 3 cyaths of white wine for 30 daies together: which drink is of such operation, that it will waite and spend the spleen, partly by vrine which wil appeare bloudy, and partly also by tege: and this will be perceiued sensibly by the tenth day of the cure. The leaues also be diureticall, and a decoction made with them, prouokes vrine. The same likewise are good for those that cannot draw their wind but sitting with their body vp right. Being drunk in like manner, they help women who are in fore trauell, to speedie deliuerance, and fetch away the after-birth.

As touching * Pelecium, it groweth as I said before among corn, branching thick, and garnished with leaues like vnto the cich pease. It beareth seed in certain cods, which crook in manner of little horns, and those be four or five in number together. The said seed resembleth Gith, so far as euer I could see, and is bitter, but good for the stomach: one of the ingredients that goe into antidotes and preseruatiues against poison.

Polygala reacheth vp with a stem a span high, in the top wherof it beareth leaues resembling the Lentils, of an astringent tast, which being drunk, causeth nources to haue plenty of milk in their breasts.

Poterion, or as some call it, Phrynon or Neurada, brancheth and spreadeth much: armed it is with sharp pricks, and besides, full of a kind of thick down: the leaues be small and round: the branches slender, long, soft, and pliable: the floure in form long, of a grasse green color. The seed is of no vse in Physick, but of a quick and sharp tast, odoriferous also, and pleasant to the smell. It is found growing as well in watery places, as also vpon little hills. Two or three roots it hath, which run down two cubits deep into the ground full of cords or sinews, white, and of a firm and hard substance. About Autumne they vse to dig round about it, hauing before cut the plant it selfe aboue ground, which yeeldeth thereby a iuice like vnto a gum. The root is (by report) of wonderfull operation in healing wounds, and especially of sinews cut in sunder, if it be applied thereto in a liniment. Also the decoction thereof drunke with honey in manner of a syrre, helpeth the feeblenesse and dissolution of the sinewes; and namely, when they bee wounded and cut.

Phalangites by some is called Phalangion, by others Leucanthemon, or, as I find in some copies, Leucacantha. Little branches it putteth forth, neuer fewer than twaine, and those tending directly a contrary way. The floures white, fashioned like the red Lilly: the seed blacke, broad, and flat, shaped after the manner of halfe a Lentill, but much lesse: and the root is of a greenish colour. The leafe, floure, and seed of this herbe is a singular remedie against the venomous sting of scorpions, the spiders Phalangia, and serpents; also for the wringing torments of the belly.

As for Phyteuma, somewhat els I haue to do rather than to describe it, considering there is no vse of it but in amatorious medicines to procure womens loue.

There is an herbe called by the Greekes Phyllon, growing vpon stony mountaines standing much vpon a rocke. The female of this kinde is of a deepe greene colour, the stem is slender, the root small, the seed round, and like vnto that of Poppie. This hearbe serueth for the getting and conceiuing either of boyes or girles, according as the male or the female is vsed: which differ only in seed or fruit, which in the male resembleth an oliue that is new come forth and

A and biginneth only to shew. But both of them are for the said purpose to be drunke in wine.

Phellandrian groweth in moory grounds, and in leafe commeth neere vnto garden Parsley: the seed thereof is good to be drunke for the stone, and the infirmities incident to the bladder.

As for Phalaris, it hath a long slender stem like vnto a reed, in the top wherof it beareth a floure bending downward; and the seed resembleth that of Scfama: and this also breaketh the stone, if it be drunke in wine or vinegar, or otherwise with milk and honey. The same cureth the accidents of the bladder.

Polyrrhizon is leaied like vnto the Myrtle, and hath many roots, which being bruised, are giuen in wine against the poison of serpents, not only if men but also if fourfooted beasts be stung by them.

* Proserpinaca likewise, being otherwise a common herb, is counted a foueraigne remedie against scorpions: the same stamped and incorporat with fish-pickle and oile, is (by report) a singular medicine against the prick of scorpions.ouer and besides, it is said, that if it be but held vnder the tongue, it refresheth those who be ouertruelled or any waies wearied, so as they haue lost their speech with very faintnesse: but in case it be swallowed downe the throat, it procureth vomit, which alwaies is good and wholesome for the Patient.

As touching Rhacoma, it is brought vnto vs out of those countries which are beyond the kingdome of Pontus: a root it is much resembling the black Costus, but that it is smaller and somewhat redder, also without any smell, hot at the tongues end and astringent: being punned, it is of a wine colour inclining to saffron: a liniment made of this root, doth mitigate all impostumes and inflammations; healeth wounds, and appeaseth the violence of any rheums taking a course to the eies, especially if it be applied with cuiral marks remaining after stripes, & other places of the skin black and blew, it taketh away, if they be annointed with it and vinegar together: the powder thereof is good to be cast vpon old morimalls and vlcers vntoward to be healed: & being to the weight of one dran taken in water, it is singular for them that cast vp blood: moreover, in case of the dysentery and the flux proceeding from imbecility of the stomacke, it is an excellent medicine to be taken in wine, if the Patient bee free of the ague; otherwise, it would be giuen in water. For to pun or stamp this root more easily, it had need to lie and soke in water ouernight: the decoction thereof is giuen to drinke in double measure or quantity for those that be plucked with the cramp, bursten, & bruised, or to such as haue tumbled down from some high loft. In pains of the breast, there had need some Pepper and myrrh to be put thereto: in case the stomack be feeble and clean done, it ought to be taken in cold water: and whether it be giuen inwardly or applied outwardly, it helps all those that void vp filthy matter from the parts beneath: likewise it cureth such as haue weak liuers, hard or swelled spleens, and the Sciatica: it healeth the infirmities of the kidnies, shortnesse of wind, & straitnesse of breath, namely, when a man is driuen to sit vp right for it. The hoarsnesse and roughnesse of the throat it cureth, if either the powder be taken to the quantity of 3 oboli in cuir, or the decoction drunk. The filthy tertars called Lichenes it scoureth away, applied vnto them in a liniment with vinegar. In drink, it dissolueth ventosities, riddeth away through-colds, and namely the shiuering and shakings in cold agues: it represseth the yex or hicquet, appeaseth the wrings of the belly, clearereth the windpipes, dispatcheth the pose, the murre, and heauinesse of the head, stilleth the dizzines of the head and turning of the brain occasioned by melancholy humors: and finally assuageth all painfull lassitudes, and is singular good for cramps or convulsions.

About the towne Ariminum there groweth an herb commonly knowne by the name of Reseda: it resolueth and discusseth all impostumes: it reduceth also into temperature any inflammation. But they that vse to cure with this herb, must when they lay it to the place, say with all these words following; *Reseda, morbos Reseda, scisne scisne, quis hic pullos egeris? Radices nec caput nec pedes habeam.* That is to say, *Reseda, cause these maladies to cease: knowest thou, who hath driuen these pullets here? Let the roots haue neither head nor foot.* This charm (I say) they must pronounce three times ouer, and spit vpon the ground as often.

To conclude, Stoechas groweth in those Islands onely which carry that name and be called Stoechades: an odoriferous herb it is, bearing leaues like vnto hyssop, and is bitter in tast: taken in drink, it procureth womens moneths, and doth mitigat the pains of the breast. Also it is one of the species or ingredients entring into the preseruatiue compositions called Antidotes.

CHAP.

* Thought to be the same that Polygon or Knot grass abouenamed.

* Wood-bind.

* Some take it for Securidaca, i. Aitch.

that their seeds be nothing so effectuall, if incision were made in the roots for to draw juice out of them, before the said seed is fully ripe.

Furthermore, this is known & found by experience, that the ordinary vse of all simples doth alter their properties and diminish their strength, in so much, as whoeuer is daily accustomed vnto them, shall not find when need requires, their vertue powerfull at all, either to do good or to work harme, as others shall who seldome or neuer were acquainted with them.

Ouer and besides, all herbs be more forcible in their operations, which grow in cold parts, exposed to the Northeast winds, likewise in dry places, than in the contrary.

Also there is no small difference to be considered betwene nation and nation: for, as I haue heard them say who are of good credit, as touching worms and such like vermin, the people of Egypt, Arabia, Syria, and Cilicia, be troubled & infested with them: whereas contrariwise, some Græcians & Phrygians haue none at all breeding among them. But lesse maruel there is of that considering how among the Thebans and Bœotians (who confine vpon Attica) such vermine is rife and common; and yet the Athenians are not giuen at all to ingender and breed them: the speculation whereof, carrieth me away again vnto a new discourse of liuing creatures, and their natures; and namely, to fetch from thence the medicins which Nature hath imprinted in them, of greater prooffe and certainty than any other for the remedy of all diseases. Certes, this great Mother of all things, entended not that any liuing creature should serue either to feed it selfe only, or to be food for to satisfie others; but her will was and she thought it good, to insert and ingraffe in their inward bowels, whole some medicines for mans health, to counterpoise those medicinable vertues which she had ingrauen and bestowed vpon those furd and sencelesse herbes: may her prouidence was such, that the foueraigne and excellent means for maintenance of our life, should be had from those creatures which are indued with life; the contemplation of which diuine mysterie, surpasseth all others, and is most admirable.

THE TWENTY EIGHTH BOOK OF THE HISTORIE OF NATURE, WRITTEN BY C. PLINIVS SECVNDVS.

CHAP. I.

¶ The medicinable vertues of liuing creatures.

Having discovered as well all those things which are ingendred between Heauen and Earth, as also their natures; there remained nothing for me to discourse of, saue only the Minerals digged out of the ground, but that this late Treatise of mine, as touching the medicinable properties of Herbs, Trees, and other plants draweth me quite aside from my purpose, and haleth me back againe, to consider the foresaid liuing creatures themselves (euen the subiect matter of Physicke) in regard of greater meanes found out euen in them, to aduance Physicke and cure diseases. For, to say a truth, since I haue described and pourtraied both Herbes and Floures, since I haue discovered many other things, rare and difficult to be found out; should I conceale such meanes for the health of man, as are to be found in man himselfe? or should I suppress other kind of remedies which are to be had from creatures liuing amongst vs, as wee doe, if they may benefit vs? especially seeing that our very life is no better than torment and miserie, vnlesse we

A we be free from paine and sicknesse: No verily; and far be it from me that I should so do. But on the contrary side, I will do my best indeuor to performe and finish this task also, how long and tedious soeuer it may seem to be: for my full intent and resolution is, so I may benefit posteritie and doe good to the common life of man, the lesse to respect the pleasing of fine eares, or to expect thanks from any person. And to bring this my purpose about, I mean to search into the customes of forreine countries, yea and to lay abroad the rites and fashions of barbarous nations, referring the readers who shall make scruple to beleue my words, vnto those Authors whom I alledge for my warrant. And yet herein, this care I haue euer had, To make choice in my reports of such things as haue bin held and in manner ad iudged true, by a generall consent & approbation of all writers; as coueting to stand more vpon the choice of substance, than the variety and plenty of matter. But before I enter into this argument, I thinke it very necessary to aduertise the Reader thus much, That whatsoeuer I haue heretofore written of liuing creatures, concerneth the instinct of Nature wherewith they be indued, and certain simples whereof they haue giuen vs the knowledge (for surely, as much good haue they done vnto vs by the medicinable herbes by them found out, as possibly they can by the remedies which themselves do afford from their own bodies:) But now it remaineth to shew simply the medicinable & helpful properties in themselves, which notwithstanding in the former treatise were not altogether left out and passed ouer. And therefore this my present discourse of those creatures, howsoeuer it is in nature different, yet it dependeth of the other. Begin then I will at Man himselfe, to see what Physick there may be found in him to help his neighbor. In which first entrance of mine, C there presenteth it selfe vnto mine eie, one object that troubleth and offendeth my mind exceeding much: for now adaeies you shall see them that are subiect to the falling euil, for to drink the very blood of fences and sword-plaies as out of liuing cups: a thing, that when we behold within the same shew-place, euen the tygres, lyons, and other wild beasts to do, we haue it in horreur as a most fearfull and odious spectacle. And these monstrous minded persons are of opinion, That the said blood forsooth is most effectuall for the cure of that disease, if they may sucke it breathing warme out of the man himselfe; if they may set their mouth (I say close to the veine, to draw thereby the very heart blood, life and all: how vnaturall soeuer otherwise it be holden for a man to put his lips so much as to the wounds of wild beasts, for to drinke their blood: nay, there be others that lay for the marrow bones, the very braine also of young infants, and neuer D make strange to find some good meat and medicine therein. Ye shall find moreouer among the Greeke writers not a few, who haue deciphered distinctly the seuerall tastes as well of euery inward part, as outward member of mans body; and so neare they haue gone, that they left not out the paring of the very nailes, but they could pick out of them some fine Physicke: as if health consisted in this, That a man should become as bloudie as a sauage beast; or that be counted a remedy, which indeed is cause of a mischief and malady. And wel deserue such blood-suckers and cruell leeches to be frustrat of their cure, and thereby to worke their owne bane and destruction; for if it be held vnlawfull and abhominable to pricke and look into the entrails and bowels of a mans body, what is it then to chew and eat them? But what monster was hee, who first broched this geare, and deuised such accursed drugs! Ah wicked wretch, the inuenter and artificer E of those monstrosities; thou that hast ouerthrowne all law of humanity; for with thee wil I haue to do, against thee wil I whet my tongue and turne the edge of my stile, who first didst bring vp this brutish leech-craft, for no other purpose but to be spoken of another day, and that the world might neuer forget thy wicked inventions. What direction had he who thus began to deuoure mans body lim by lim: nay, what conjecture or guesse moued him so to do? what might the originall and foundation be, whereupon this diuelish Physicke was grounded? what should he be that bare men in hand, and would persuade the world, That the thing which is vsed as a poison in witchcraft and forcerie, should auaille more to the health of man, than other knowne and approued remedies? Set case that some barbarous people vsed so to do: say that strange nations and far removed from all ciuility, had these manners among them, must the Greekes take vp those fashions also, yea and credit them so much as to reduce them into a method, amongst other their goodly Arts? And yet see what Democritus one of them haue done? there be extant at this day books of his inditing and penning, wherein you shall read, That the scul of a wicked malefactor, is in some cases better than that of an honest person; and in other, That of a friend and guest, preferred before a stranger. As for Apollonius, another of that brood, hee hath written,

ten, That if the gums be scarried with the tooth of a man violently slain, it is a most effectuall and present remedy for the tooth-ach. *Artemon* had no better receipt for the falling sicknesse, than to draw vp water out of a fountaine in the night season, and to giue the same vnto the Patient to drink it in the brain-pan of a man who died some violent death, so he were not burnt. And *Anthous* took the skull of one that had bin hanged, and made pills thereof, which he ministred vnto those who were bitten by a mad dog, for a soueraigne remedy. Moreover, these writers not to those who were bitten by a mad dog, for a soueraigne remedy. Moreover, these writers not to the content to vse these sorceries about men, imploied the medicines also of the parts of man to the cure of foure footed beasts; and namely, if kine or oxen were dew-blowne or otherwise puffed vp, they were wont to bore holes through their horns, & so to inlay or interlard them (as it were) with mens bones: finally, when swine were diseased, they took the fine white wheat Siligo, being permitted to lie one whole night in the very place where some men were killed or burnt, and gaue it them to eat. As for me, and all vs that are Latine writers, God forbid we should defile our papers with such filthinesse: our intention is to put downe in writing, those good and wholesome medicines which man may afford vnto man, and not to set abroad any such detestable and hainous forceries: as for example, to shew what medicinable vertue there may be in breest-milke of women newly deliuered, what healthfull operation there is in our [fasting] spiritle; or what the touching of a man or womans body may auail in the cure of any malady; and of many other semblable things arising from naturall causes. For mine owne part verily, I am of this mind, That we ought not so much to make of our health or life, as to maintain and preserue the same by any indirect course and vnlawful meanes: And thou, whosoeuer thou be, that doest addi& thy selfe to such villanies whiles thou liuest, shalt die in the end a death answerable to thy beastly and execrable life. To conclude therefore, let euery man for to comfort his heart, and to cure the maladies of his mind, set this principle before his eies, That of all those good gifts which Nature hath bestowed vpon man, there is none better than to die in a fit and seasonable time: and in so doing, this is simply the best, * That in his power it is, and the meanes hee hath, to chuse what death he list.

* Look for no better diuinitie in *Plinie* a more Pagan, Epicurean, and professed Atheist.

CHAP. II.

¶ Whether Words, Spels, or Charms, are auailable in Physicke. Also whether wonders and strange prodiges may be either wrought and procured, or put by and auoided by them, or no.

THE first point, concerning the remedies medicinable drawn from out of man, which moueth the greatest question, and the same as yet not decided and resolved, is this, Whether bare Words, Charms and Inchantments, be of any power or no? If it be granted Yea, then no doubt ought we to ascribe that vertue vnto man. But the wisest Philosophers and greatest Doctors, take them one by one, doubt thereof, and giue no credit at all thereto. And yet go by the common voice of the whole world, you shall find it a generall beleefe, and a blinde opinion alwaies receiued, whereof there is no reason or certain experience to ground vpon. For first and formost we see, that if any beast be killed for sacrifice without a sett forme of praier, it is to no purpose, and held vnlawfull: semblably, if these inuocations be omitted, when as men seeke to any Oracles, and would be directed in the wil of gods by beasts bowels or otherwise, all booteth any nor, but the gods seem displeased thereby. Moreover, the words vsed in crauing, to obtaine any thing at their hands, run in one form; and the exorcismes in diuerting their ire, & turning away some imminent plagues, are framed after another sort: also there be proper termes seruing for meditation only and contemplation. Nay, we haue scene and obserued, how men haue come to make suit and tender petitions to the soueraigne and highest magistrats, with a preamble of certain set prayers. Certes, so strict and precise men are in this point about diuine seruice, that for fear least some words should be either left out, or pronounced out of order, there is one appointed of purpose as a prompter to read the same before the priest, out of a written booke, that hee misse not in a tittle; another also set neare at his elbow, as a keeper to obserue and mark, that he faile not in any ceremony or circumstance; and a third ordained to goe before and make silence, saying thus to the whole assembly & congregation, *Favete linguis*, [i. spare your tongues and be silent:] and then the fluits and haut-boies begin to sound and play, to the end that no other thing be heard for to trouble his mind or interrupt him the while. And verily, there haue been

A been memorable examples knowne of strange accidents insuing both waies, namely, as often as either the vnlucky foules by their vntoward noise * haue disturbed and done hurt, or if at any time there haue bin error committed in the prescript prayer & exorcisme: for by this means it falleth out oftentimes, that all on a sudden as the beast standeth there in place to be sacrificed, the master veine in the liuer, named the head thereof, is found missing among other entrails, and the heart likewise wanting: or contrariwise, both these to be double, and appeare twain for one. And even at this day there remaineth a most notable precedent and example to all posterity, in that prescript forme of exorcisme, whereby the two *Decij*, both the father and sonne, betooke themselves to all the hellish furies and fiends infernall: moreover, the imprecation of the vestall Nun *Tuccia*, when shee was put to proue her virginity, continueth extant vpon record; by vertue of which charme the carried water in a sieve without shedding one drop: which happened in the yeare after the foundation of Rome city 609. And verily, no longer ago than of late time in our owne age, we saw two Gracians, to wit, a man and a woman; yea, and some of other nations, with whom in those daies wee maintained warres, buried quicke within the beast-market in Rome: in which maner of sacrifice, whosoeuer readeth the prayer or exorcisme that is vied, and which the V Varden or Principall of the colledge of the Quindecemvirs is wont to reade and pronounce to the exorcist; he would no doubt confesse, that such charmes and execrations be of great importance: and namely, seeing they haue bin all approved and found effectuall by the experience and euents obserued for the space of * eight hundred and thirtie yeares: As for our vestall virgins in these our daies, we are certainly perswaded and beleue, that by the vertue of certaine spels and charmes which they haue, they be able to arrest and stay any fugitiue slaue for running one foot farther; provided alwaies that they be not gone already without the pourprise and precinct of the city walls. Now if this be receiued once as an vndoubted and confessed truth, and if we admit that the gods do heare some praiers, or be moued by any words; then surely we may resolute at once of these coniectures; and conclude affirmatiuely of the maine question. Certes, our ancestors from time to time haue euermore beleueed and deliuered such principle, yea, and that which of all other seemeth most incredible, they haue affirmed constantly, That by the power of such charmes and conjurations, Thunder and Lightning might be fetched downe from aboue (as I haue formerly shewed.) *L. Piso* reporteth in the first booke of his Annals or yearely Chronicles, That *Tullius Hostilius* king of Rome, was stricken dead with Lightning, for that when hee went in hand to call *Iupiter* downe out of heauen, by vertue of a sacrifice which king *Numa* was wont to vse in that case, hee had not obserued exactly all the exorcismes and ceremoniall words contained in those bookes of king *Numa*, but swarued somewhat from them. And many other writers do testifie, that by the power of words and oses, the destinies and prodiges of great importance prefiged to one place, haue bin cleane altered and transferred to another: as it was like to haue happened to the Romanes, at what time as they laied the foundation of *Iupiters* Temple vpon the mount or rocke *Tarpeius*. For when they digged there for the foundation of the said Temple, and chanced to finde within the ground a mans head: the Senate of Rome sent certaine Embassadors of purpose to the Sages and V Vifards of *Tuscane*, to know the signification of this strange sight and miraculous occurrent. V Whereof *Olenus Calenus* (who was reputed the most famous diuinor and prophet of all the *Tuscans*) hauing some intelligence, and foreseeing the great felicity and happinesse that it imported and prefiged, intended by subtil interrogatiue to translate the benefit thereof to his owne native countrey of *Tuscane*. Hauing therefore first with a staffe set out and described (as it were) the modell and forme of a Temple, vpon the ground which lay before him; hee came about the Roman Embassadors before said, and questioned with them in this wilie manner: Is it so, Romanes, as you say? and are these your words indeed? There must be a Temple here of *Iupiter* that most gracions and mighty god: we haue light here vpon a mans head. Vnto which interrogation of his, the said Roman Embassadors according to the instructions which they had receiued beforehand from the V Vifard or Diuinors sonne, answered in this manner: No, not here in this very place, but at Rome (we say) the head was found. And verily, our antient Chronicles doe all of them most constantly affirm, that had they not been thus forewarned and taught what to say, but had simply answered Yea, here we haue found a head, &c. The fortune of the Roman State and Empire had gone quite away to the *Tuscans*, and been established among them. The same had like to haue happened a second time, as we may see in the Records and Monuments of old date,

* Which is called *Ombutario* dicarum, as we may read in *M. Tull. de Divinatione*, l.

* In which yeare it seemeth *Piso* wrote this worke.

date, when as a certain chariot with foure horses, made of clay, and prepared for to be set vpon the louver or lantern of the said temple, chanced as it lay baking in the furnace, to grow into an extraordinary bignesse. For the foresaid Wise men of Tuscan being asked what the said prodigy should betoken, practised the like, as *Olenus* did: but the Romans being wise & wary in their words, saved and retained the same fortune still for the behoofe of Rome, which was presaged vnto them by that happy foretoken. These examples may suffice to shew & prouoe evidently, that the vertues and significations of these signes and presages do lie in our own power: and are no otherwise of force and effect, but according as euery one of them is so taken * and accepted. True it is, and held for an vndoubted principle in the Augures discipline & learning, That neither cursed execrations, ominous and vnlucky birds, nor any other presage by their flight singing and feeding, can touch those persons who take no heed of them, and do protest plainly, that they regard them not, what business soeuer they go about and be entering into: a greater gift than which, and testimony of the diuine indulgence and fauor of the gods to vs, we cannot haue, thus to subiect their secrets to our puissance. Moreover, in the laws and ordinances of the 12 tables here at Rome, are not in one place these very words to be found, *Qui fruges occentassit*, [i. who soeuer shall enchant or fore-speak any corne or fruits of the earth:] and in another place, *Qui malum carmen incantassit*, [i. What person soeuer vseth pernicious charmes to the hurt or mischiefe of any creature?] Ouer and besides, *Verrinus Flaccus* doth affirm vpon the credit of certain Authors which he alleadgeth and beleueeth, That the first thing which the ancient Romans were wont to doe at the siege and assault of any towne or city, was by their priests to conjure and call forth that god or goddesse which was the patron or patronesse therof, and withal to promise vnto the said god or goddesse, either the same place againe, or else a greater and more spacious seat; yea, and the like diuine worship, or better, among the Romanes: and euen at this day our Pontifices or Bishops haue the charge of this sacred ceremony amongst other functions belonging to their ministry. And herupon well known it is, that for this cause and nothing else, it was neuer divulged abroad, what god was the protector and patron of Rome city, for feare least some of our enemies should assay to coniure him forth, and deale by vs as we do by them. Furthermore, who is there that is not afraid of all maledictions and cursed execrations; and especially when the * names of the infernall fiends or vnluckie foules are vsed in such bannings? For feare likewise of some harme, see we not that it is an vsuall thing to * crush and break both egge and fish shels, so soon as euer the meat is supped and eaten out of them; or els to bore the same through with a spoone stele or bodkin? From hence came those amatorious eides and eclogues of *Theocritus* among Greek Poets, of *Catullus* and *Virgil* among vs, full of amorous charmes, in imitation of such exorcismes and coniurations indeed. I assure you many folke there be of this beleefe, That by certaine spells and words, in manner of charmes, all the pots and vessels of earth baking in a furnace, may be cracked and broken, without touching them at all. And there are not a few who are persuaded for certaine, that euen the very serpents as they may be burst by incantment, so they can vnwitch themselves: and that as brutish otherwise and earthly as they be, yet in this one thing they haue a quicke sence and vnderstanding, in so much, as at the charmes of the Marfians they will shrink from them and draw in their bodies round into a knot, though it were in the night season when they lie asleepe. Some there be also that when a skare-fire hath taken an house, write certaine * words vpon the walls, and thereby limit and confine the fire, that it shall go no farther. Certes, I am not able to say, whether strange, forraigne, and ineffable words hard to be pronounced, are more available to the effecting of these incredible things, or our Latin words, coming out at a venture vnlooked for and spoken at random: which must needs seem ridiculous in our judgement, seeing that the spir it and mind of man, expecteth alwaies some great and mighty matter in these coniurations and exorcismes, which may carry a majesty therewith to incline and moue the gods to mercy and fauour, or rather indeed to command their heauenly power perforce. But to proceed, *Homer* the Poet hath written, that prince * *Pylxes* being wounded in the thigh, stanchd the bloud with a charme. And *Theophrastus* testifieth, that there be proper spels to cure the Sciatica. *Cato* hath left in writing, that there is a special charme for dislocations, wherby any bone put out of ioint may be set again. And *M. Varro* reporteth the like vertue of certain good words for the gout. As for *Cesar* the Dictatour, it is commonly said of him, that hauing beene once endangered with the fall or overthrow of his coach wherein he rode, would neuer afterwards ride in coach againe, vnlesse so soone as euer hee

* Whereupon it was thought materiall to speake in this manner. *Accipio omen*. For otherwise it auailed not.

* As in saying thus, The Deuill take thee, or the Rauens peck out thine eyes, or I had rather see thee pie pect: and such like. * Because afterwards no witches might prick them with a needle in the name and behalfe of those whom they would hurt and mischiefe, according to the practise of pricking the images of any person in wax; vsed in the witchcraft of these daies. * That is to say, *Arse vesce*, out of *Afranius* Festus noeth, which in the old Tuscan language signifieth *Auerie ignem*, i. Put backe the fire: or rather the sonnes of *Auolentius* in his *dyffera*.

A had taken his place, and before that he set forward vpon his way, he had pronounced a certaine charm that he had in store: and persuaded he was, that if he laid it ouer three times together, he should come by no mischance in his journey, but trauel in security. A thing that I know many now adades to practise ordinarily as well as he. But for farther prooue and confirmation of this one but knoweth: What is the cause I pray you, that the * first day of euery yeare we salute one another for luck sake, with wishing a good new yere? What is the reason, tel me, that in all our publick processions and generall solemnities euery fifth yeare for the health and good estate of the city, they * made choice of such persons for to lead the beasts appointed to sacrifice, whose * names were good and fortunat: or how cometh it about, that for to preuent or diuert witchcraft and forcery, we obserue a peculiar adoration, and inuocat vpon the Greekeish [goddesse of vengeance] *Nemesis*; in which regard onely, we haue her statue or image set vp in the Capitoll, notwithstanding we know not yet what name in Latine to giue her? How is it, that in making mention of those that be dead, we speake with reuerence and protest that we haue no meaning to disquiet their ghosts thereby, or to say ought preiudiciall to their good name and memorion of odd numbers, beleueing that they be more effectuall in all things than the euen? a matter I may tell you of great consequence, if we do but obserue the critically daies in feuers. Also in the gathering of our first fruits, be they Pears, Apples, Figs, &c. wherfore vse we to say, These be old, God send vs new? What moueth vs to wish health and say, God helpe, or blesse, when one sneezeth? for euen *Tiberius Caesar*, who otherwise was known for a grim sir, and the most vsociale and melancholick man in the world, required in that manner to be saluted and wished well vnto, when soeuer he sneezed, though he were mounted in his chariot. And some there be who in this case do ceremoniously salute the party by name, and thinke there is a great point of religion lies in that. Moreover, is not this an opinion generally receiued, That when our ears do glow and tingle, some there be that in our absence doe talke of vs! *Attalus* auoucheth for a certainty, that if a man chance to espie a scorpion, and do no more but say this one word * *Duo* [i. two] the serpent wil be stil & quiet, and neuer shoot forth his sting. And now seeing by occasion of mentioning a scorpion, I am put in mind of A frick, you shall vnderstand thus much, that throughout all that country there is not one goeth about to do any thing, but before he begins he saith this word * *Africa*. A frick. As for other nations, in euery enterprise that men take in hand, they vse the name of their gods, & pray ordinarily, that it would please them to giue a grace and blessing to their attempts. As for this ceremony, namely, when the table is spread and furnished with viands, to lay a ring from the finger vpon it, we see it commonly & orderly practised; and that it is of force to put by many scruples and religious doubts it is very euident. You shall see some men to take the spittle out of their mouths, and conuey it with their fingers end behind the ear, for to reioice the heart & driue away all pensiuess and melancholick fancies that trouble the mind. And to bend or bow down the thumbs when we giue assent vnto a thing, or do fauor any person, is so vsuall, that it is growne into a prouerbiall speech, to bid a man put down his thumb in token of approbation. In adoring the gods and doing reuerence to their images, wee vse to * kisse our right hand and turne about with our whole body: in which gesture * the French do serue to turne toward the left hand; and they beleue that they shew more deuotion in so doing. As touching the maner of worshipping and adoring, flashes of lightening, all nations with one accord and conformity do it with a kind of * whistling or chirping with the lips. If there be mention made of seare fires at the table as we sit at meat, we hold it ominous, but we turn away the perillous presage thereof, by spilling and casting water vnder the board. When one riseth from his meat and is ready to depart, if they of the house go in hand presently for to sweep the floore and make all cleane: as also to take away dishes, trenchers, &c. vpon the board; or to remoue the cupboard of plate, & liuery table, whiles one of the guests is a drinking, are thought to be most vnfortunat tokens, and to presage much harm. *Servius Sulpitius* a principal person of our city, hath written a treatise of this argument, wherein he giueth a reason why we should not leaue or shift our trenchers at euery course or change of dishes, for in those daies there were no more allowed than there sat guests at the tables, and those were serued but once for all. If one chance to sneeze after repast, the order is to call for a dish of meat and a trencher againe to be set vpon the board: and in case he taste not of somewhat afterward, it is thought a most fearefull and

* i. The first o Ma ch.

* Which answer to our Rand A.

and cursed preface on this behalf: like as to sit at the table and eat nothing at all. * See how ce-
 remonious those men were, and what precise ordinances they instituted, who were of beleeft, that
 in all our affaires and actions, and at all times, the diuine power of God was present: and that by
 these means they left them pacified for all our sins and vices. Neither is there an end here: for
 ouer and besides it hath been marked, that many times all the table is hushed, and there is not a
 word heard from one end to the other: but this is noted neuer to happen but when the guests
 make a iust euen number. But what doth this silence preface? Surely, euery one of them * shall
 be in danger to lose or impaire his credit, good name, and reputation. Moreouer, if a peece of
 meat chanced to fall out of the hand down to the floore, it was taken vp and deliuered vpon the
 boord again, where it passed from one to another, and went through the table: but in any wise
 they were forbidden to blow therupon, for to cleanse it from the dust or filth that it caught. Fur-
 thermore, they haue proceeded thus far, as to gather prefaces from such things as happen iust at
 the time whiles one either speaketh or thinketh of the same. But of all others, this was counted
 a most execrable token, in case it chanced that the Pontifice or high Priest sitting at the table
pro forma, and for order sake, at any solemne feast or sacrifice, let fall a morcel of meat: but if the
 same were laid vpon the boord again, and afterwards burnt and sacrificed to the familiar gods
 of the house *Lares*, it was thought a sufficient expiatory satisfaction. Semblably, men are of opi-
 nion, That if any medicines purgatiue or others, fortune to be set vpon a table before they bee
 giuen to the patient for to drink, they wil do no good at all, but lose their operation. Also there
 is a superstitious ceremony in paring the nailes of the fingers, during the market daies held at
 Rome, with this charge, that the party hold his tongue and be silent all the while, & begin at the
 fore-finger, and this forsooth concernes the mony of many a man. Likewise, as great a matter as
 that, lieth in stroking or handling the haire of the head, either on the 17 day after the change of
 the Moon, or the 29: for a special means this is to keep the haire on, which is giuen to fall, as also
 to ease the head-ach. Moreouer, the peasants in the country obserue this custome in many man-
 ners and farmes of Italy, to forbid their wiues and women to spin as they walke vp and downe
 abroad in the street or any common way of passage, or to carry their rockes and distaues vndi-
 zened or bare, for this opinion they haue, that in so doing they preiudice the hope of al fruits, and
 the corne especially growing in the field for that yeare. Not long since, *M. Sernilius Nonianus*,
 (who in his time was a principal citizen of Rome) to preuent the blearednesse of his eies which
 he feared, before that either any man else foretold him of that disease, or himselfe once named
 it, took a little peece of paper, and wrote therein these two capital Greek letters P and A, which
 he lapped round & fast tied with a linnen thred, and so wore it hanging at a lace about his neck
 vnder his throat. *Mutianus* (who had bin thrice Consull of Rome) obserued the same effect by
 wearing a flie aliue within a little rag of white fine linnen cloth: and both of them did highly
 commend these medicines of theirs, reporting, that by those meanes they were free from blea-
 red eies. Finally, we read of certain charms and spels against storms of hail: against sundry sorts
 of diseases, and namely for any part that is burnt or scalded, and verily some of them haue been
 proued by experience to be effectual. But for mine own part abashed I am and ashamed to put
 them downe in writing, considering how diuersly men are affected in minde. And therefore to
 conclude this matter, I leaue euery man to himselfe to giue credit or otherwise vnto them at
 his owne pleasure and discretion.

CHAP. III.

¶ Remedies proceeding from man, for the cure of diseases.

IN my former Treatise as touching strange and wonderfull nations, I spake of certaine races
 of men which were of a monstrous nature, and carried a venomous regard and looke in their
 very eies: besides many other properties of beasts, which here to repeat were needlesse. How-
 beit, in this place I thinke it not amisse to note, that some people there be whose bodies be from
 top to toe all medicinable and wholesome to others. As for example, the men of those families
 which do terrifie serpents, and driue them away with their very presence: who also are of this na-
 ture, that they be able to cure and ease such as are stung already either by touching only, or else
 by a medicinable sucking of the place: of which kind are the *Psylli* and *Marfi*: those also in the
 Island * *Cyprus*, whom they call *Ophugenes*: and of this race and house there came an Embas-
 sadour

* Or *Paros*.

* *Euegon*.

A fador out of the said Island, whose name was * *Exagon*, who by the commandement of the Con-
 sul was put into a great tun or pipe wherein were many serpents, for to make an experiment and
 trial of the truth: and in very deed the said serpents licked his body in all parts gently with their
 tongues, as if they had bin little dogs, to the great wonder of them who beheld the manner of
 it. A man shall know those of this family (if any of them remain at this day) by this signe, that
 they breath a strong and stinking sent from them, especially in the Spring season. Now, these
 people beforenamed had not only a gift to cure folk with their spittle, but their very sweat also
 had a medicinable vertue against the sting of serpents. For as touching those men who are born
 and bred in *Tentyrus* (an Island lying within the riuer *Nilus*) so terrible they be vnto the *Cro-*
codiles, that they wil not abide so much as their voice, but flie from them so soon as they heare
 it. Moreouer, it is knowne for certaine, that all the sort of these people, who haue their bodies
 thus priuiledged by that secret antipathic in nature between them & serpents, are able to ease
 those who are stung, if they do but come in place where they be: like as a wound will be more
 angry and fore, if they come neare who at any time before haue been hurt by sting of serpent or
 rooth of mad dog: such also carry about with them in their bodies so venomous a quality, that
 their onely presence is enough to marre the eggs that a brood-hen sits vpon, and make them all
 adde, yea, and to driue ewes and other cattell to cast their yong before the time: such a virulent
 property remaineth still behind in their bodies who haue bin once stung and bitten, that not-
 withstanding they be cured thereof, yet venomous they are now and hurtfull to others, who be-
 foretime were poisoned themselves. But the only way to remedy this inconuenience, is to cause
 them to wash their hands before they enter into the roome where the patients lie, and with the
 same water to besprinkle and wash them who are to be cured. Again, this is to be obserued,
 that whosoever at any time haue bin pricked with a scorpion, shal neuer afterwards be stung by
 hornets, waspes, or bees. A strange thing this is no doubt, howbeit, no great wonder vnto them
 who know, that a garment or cloth which had bin vsed at funerals, wil neuer be afterwards morsh
 eaten: and how that serpents hardly can be plucked out of their holes, vnlesse it be by the left
 hand.

CHAP. III.

¶ Of certaine Sorceries: and the properties of a mans spittle. Also
 against Magicians.

THE inuentions of *Pithagoras* as touching numbers, beare a great stroke in these matters,
 and lightly misse not: but principally in this, That the said Philosopher would giue judg-
 ment by the vowels contained in the proper name of any person, concerning their fortunes,
 for in case the vowels were in a number odde, he pronounced, that if the party euer proued lame
 of a lim, lost an eie, or met with any such like accidents, the same should happen vpon the right
 side of the body: but contrariwise, if the number of vowels were euen, then these infirmities
 should befall the left side. Furthermore, it is commonly said, that if one take a stone, dart, or in-
 strument of shot, wherewith a man hath killed these three liuing creatures, a man, a wilde Bore,
 and a Bear, one after another, & that with one single stroke to euery one of them, and sling the
 same clean ouer an house where there is a woman in hard trauell of child-birth, so as it light on
 the other side without touching any part thereof, the woman shal presently be deliueed. More
 reason there is that a * light iauelin or *Pertuisan* should do this feat, which had bin drawn forth
 of a mans body, so as it neuer touched the ground after, for do but bring this murdering iauelin
 into the place where a woman is in labor, it wil forthwith procure her deliuerance. *Orpheus* and
Archelaus do write much after the same maner of arrows pulled out of men bodies, namely, that
 if care be had that they touch not the earth, & then be laid vnder the bed where man or woman
 lieth, they wil cause the parties to be enamored vpon them that bestowed the said arrows there:
 and these authors report moreouer, that the venison of any wilde beast killed with the same wea-
 pon which was the death of a man before, is singular to cure the falling sicknesse.

As some men there be whose bodies all throughout be medicinable, so there be others who
 haue certain parts onely of the same vertue, according as I haue written already concerning the
 thumbe of king *Pyrrhus*. In the citie *Elis* also the inhabitants were wont to shew as a wonder-
 full monument the rib of *Pelops*, which they auouched to be all of luory. And euen at this day,
 many

* *Uentris he-
 B*, which also
 was called *ce-
 libatus*.

effect, so that the dead party & the Patient be both of one sex. As for the tooth-ach, it is a common speech, That if one bite off a peece of some tree that hath been blasted, or smitten with lightning, provided alwaies that he hold his hands behind him at his back in so doing, the said morfell or peece of wood will take away the toothach if it be laid vnto the tooth. Some there be who giue direction to take the perfume of a mans tooth burning in the fire, for to ease the too h ach of a man; and semblably of a womans tooth to help women in the same case. Others you shall haue, that prescribe to draw one of the eie-teeth, called in Latine Canini, out of the head of man or woman lying dead and not yet entered, and to wear the same against the tooth-ach. It is a common speech, That the earth found in or about a man or womans skull, is a singular depilatory, and fetcheth away the haire of the eiebrows. As for the grasse or weed that grows therein (if any such may be found) it causeth the teeth to fall out of the head with chewing only. As also that no vicer wil spread farther but keep at a stay, if there be a circle drawne about it with the bone of a man or womans body. As touching the cure of a tertian ague, some there be who lade vp water out of 3 pits, as much out of one as another, and mingle all together; which done, they put the said water into a new earthen pot that neuer was occupied before, & begin to the Patient out of it, giuing the rest vnto him or her for to drink, when the fit commeth. But for the quartan ague, they get me a broken fragment of a wooden pin which held the sides & crosse peece of a paire of gallows together, wrap it within a lock of wool, and so hang it about the Patient: or els they take a peece of the halter or rope from the gallows, and vie it in like maner for the foresaid purpose: but wot ye what? when the patient is by this meanes rid of the feuer, the said parcel of wood or cord they vse to bury or bestow close in some hole within the ground, where the Sun may neuer shine on it, & then the access will neuer return more. See the toies & vanities of these Magitians! and yet these be not all; for they run on stil and say, that if one take a whetstone which hath serued a long time to whet knives & other edge tooles on, and lay the same vnder the bolster or pillow where one lieth that is ready to faint and giue vp the ghost vpon some indirect means, by forcery, witchcraft, or poisoning (but this must be done without the knowledge of the said party) you shall from the very mouth of the patient hear, what poison was giuen, in what place, & at what time; but who it was that gaue it, he or she shall not be able to name. Moreover, this is known for a truth, that if one be stricken speechlesse with lightning, and then the body be bent and turned toward the wounded place, the party shall recouer presently and speak again. Some there be, who to driue back and keep down the biles and botches that rise in the share, take the thred or yarn out of the weauers loome which serue for the selvedge or list, making feuen or nine knots, and in the knitting of euery one of them name some widow or other, and then tie it fast about the grieved place. Also for to assuage the paine of any wound, they giue order, that the wounded party take a naile or some other thing that one hath troden vnder foot, and to wear the same tied about the neck, arme, or other part of the body. For to be rid of warts, some chuse a time to pluck them vp by the roots, when the Moone is twenty daies old at least, and then lay themselves along vpon their backs in some ordinary high way, looking fully vpon the Moone, and stretching their armes backward as farre as they can beyond their heads, and looke what they can catch hold of with their hands, therewith they rub the place. If one cut and pare an agnell or corn in any part of the body, obseruing a time when a star seemeth to shoot or fall, they say, it will quickly weare away and be healed for euer. They would beare vs in hand, That if a man poure vinegar vpon the hooks and hindges of doors, and make a liniment with the durt that commeth of the rust thereof, and therewith annoint the forehead, it will assuage the head-ach. They promise also to do as much with a wyth or halter that a man is hanged withall vpon a gibbet, in case it be done about the temples of the head in manner of a frontal. Moreover, if any fish-bone stick in the throat and will not remooue, it shall incontinently goe downe, if the party ready thus to bee choked withall, put his feet into cold water: but if some peece of any other bones be ready to choke one, make no more adoe, but take some other little spils of the said bone and lay them vpon the head, you shall see it passe away and do no harm. If a peece of bread haue gone wrong or lie in the way readie to stop the breath, take the crums of the same loafe and put them into both the eares, you shall see it will soon be gon and do no further harme. Furthermore, the Grecks (who were giuen much to make money of euery thing, and namely of their publicke places of bodily exercise) made great account of certaine excrements that came from mens bodies, as singular remedies for many diseases: for the filth

that

A that was scraped & rubbed from the bodies of wrestlers, &c. serued to mollifie, to heal, resolute, and incarnate; a medicin consisting of sweat & oile tempered together with it they vsed to cure the inflammations, contractions, distortions, and risings of the matrice, by application outwardly: therewith they would draw down the monthly fleurs of women; lenifie the intemperat heat, and dissolve piles and swelling bigs in the seat or fundament: they vse the same also to assuage the griefe of the sinews, to rectifie dislocations & set the bones in ioint, and to discusse the nodosities of the ioints. Howbeit, the scrapings that come of sweating in banes and hot-houses, be counted of greater validitie in all these infirmities, and therefore no maruell if they enter into the composition of maturatiue emplasters, and which bring an impostume to suppuration: as for the foresaid medicines which stood vpon sweat, oile wherewith wrestlers were anointed, and some vrine mingled among, they be good onely to mollifie the nodosities of the ioints: for as they heat and resolute more effectually, so in the other respects nothing so forcible they are as those that be gathered out of stoues & baines. Verily a man would not beleeue to what shamelesse and impudent curiosity some authors are grown vnto (and euen those of all others who be most renowned) who bash not with open mouth to commend vnto vs that, for a singular remedy against the prick of scorpions, which I am not willing to name, euen the filthy sperme that passeth from a man by his priuities. Neither could they stay there, but to cause barren women for to teeme and beare children, they haue found out a proper pessarie to be put vp into their secret parts, made forsooth of the ordure that commeth away from infants so soone as they be out of their mothers womb: and this medicine they haue a pretty name for, & call it Meconion. Moreover, the Grecks haue gone so neare, that they haue scraped the very filth from the wals of their publicke halls and places of wrestling, and such like exercises; and the same (say they) hath a speciall excafcatory vertue, whereby it discusseth and resolueth the biles and impostumes called Pani; and serueth as a soueraigne liniment to heale the vlcers in the bodies of children and old folk, yea & to skin any place that is galled, raw, & blistred with burning. Lo what remedies haue bin found in the body of man? And surely since I haue taken the pains to put them down, I may not omit those voluntary medicines which depend vpon his minde, & proceed from his will and vnderstanding. In the first place, you shall haue some that wil fast and forbear all kinds of meat; others drink not at all; one while they abstaine from wine onely, another while from all flesh meats; and you shall see diuers men neuer come vnto bathe or baine, euery one according as their sicknes doth require. And this kind of abstinence or regiment of themselves, they hold to be the readiest and surest means to recouer their health. In the rank of these remedies, are reckoned bodily exercise, straining of the voice, vnction, scratching, and rubbing, as need and occasion requirerh; for hard and vehement friction doth constipat and bind the body: contrariwise, gentle and soft frictions do mollifie and open the pores; and, as much rubbing taketh down the body and causeth leanness, so that which is moderat setteth it vp and encreaseth fatnesse: but nothing is there more wholesome than walking and gestation; which is an exercise performed many waies. If the stomacke be weake, and the legs feeble, riding on horseback is an excellent exercise: for the phthisicke or consumption, nothing so good as to saile or be rowed vpon the * water: but in case there be a long disease hanging vpon a man, what better thing in the world E than to change the aire, and remoue from place to place? In like manner to procure sleep, by lying in some pretty bed that may be rocked too and fro, is oftentimes good for a mans health: as also to vomit now and then, but in no wise to vse it ordinarily. Lying in bed vpon the backe, is commended for the infirmities of the eies; but vpon the belly, for the cough. To lie vpon the sides shifting from one to the other, is held to be singular against rheums and catarrhs. Aristotle and Fabianus do say, That we be giuen to dreame at the Spring and Fall, more than in the other seasons of the yere; also, most when we lie with our face vpward, but neuer groueling. And Theophrastus affirmeth, That sleeping vpon the right side, helpeth forward the concoction of meat in the stomacke; whereas they that lie vpon their backe shall not haue so quicke digestion. The manner of bathing also and vsing the baine and hot house, (which is one of the chiefe and principal means of our health) is in a mans power to order as he list himselfe: like as he may chuse what kind of friction he will in the stoue or hot-house; either to be rubbed with linnen cloths, or well curried and scraped with kombes. Item, it is knowne to bee verie good and wholesome, to wash ones head with hot-water, before hee enter into the baine or hot-house; and after that he is out of it, to doe the like with cold water: as also to take a draught of cold water

Dd 2

immedi.

* Specially vpon the sea.

immediatly before meat, and to do as much between meals: likewise to drink the same to bedward, ea, and otherwhiles in the very night, so as we sleep both before and after; where, by the way this would be noted, That no liuing creature else but man alone, delighteth to drinke any drink hot, know then hereby, that such kind of drinks be not natural. Finally, to wash the mouth with wine before one goeth to bed, for a sweet breath: likewise so soon as he is vp betimes, with cold water against the tooth-ach, so as he do it three or fure times together, or at least wile obferuing such an odde number, as also to bath the eies in a morning with Oxycrat (i) with vineger and water mingled together, to preferue them for being bleared, are singular and approued experiments.

CHAP. V.

¶ *Obferuations as touching Diet, and the manner of our feeding, for the regiment of Health.*

Like to the former rules is this also, as touching our Diet, That it be not too precise, but so as we may feed indifferently of all viands, and acquaint our bodies with variety of meats; which is obserued to be the best way to maintain our health; and in very truth, Hippocrates faith, That to eat but one meale a day (i) to forbear dinners, is a diet that will drie vp a mans body within, and bring them soon to age and decay. But this aphorism of his he pronounced as a Physitian to reclaim vs from that hungry and sparing diet, and nor as a patron and maintainer of full feeding and gourmandise: for I assure you, a temperat and moderate vse of our meats, is the wholsomest thing that is for our bodily health. But *L. Lucullus* was so strict herein, that hee suffered himselfe to be ordered and ouer-ruled by his owne seruant, who would not let him eat but as he thought good: in such sort, that it was no small disgrace vnto him in his later daies thus to make his man his master, and to be gouerned by him rather than by his * own selfe: for was it not (think you) an approbrious and shamefull sight, to see a * slave and no better, to put his lords hands from a dith of meat, being an aged gentleman as he was, and who in times past had rode in triumph; to gage him thus (I say) and keep him short, though hee were set amongst great states at a roiall feast within the capitoll of Rome?

CHAP. VI.

¶ *Of sweezing: the vse of Venerie: and other means which concerne mans health.*

Sweezing dischargeth the heauinesse of the head, and easeth the pole or rheum that stuffeth the nose: and it is commonly said, That if one lay his mouth to the nothrils of a mouse or rat and touch the same, it wil do as much. To sneeze also, is a ready way to be rid of the yex or hicquet. And *Varro* giueth counsell, to scrape a branch of a * Date tree with one hand after another by turnes, for to stay the said hicquet. But most Physitians giue direction in this case, to shift a ring from the left hand to the longest finger of the right, or to plunge both hands into very hot water. *Theophrastus* faith, that old men doe sneeze with more paine and difficulty than others.

As touching carnall knowledge of man and woman, *Democritus* vtterly condemned it: and why so? Because (quoth he) in that act, one man goeth * out of another. And to say a truth, the lesse one vseth it, the better it is for body and mind both: and yet our professed wrestlers, runners and such gamsters at seats of a ciuility, when they feele themselves heauy or dull, reuiue and recouer their liuely spirits again by keeping company with women. Also this exercise clenferth the brest and helpeth the voice, which being sometime before cleare and neat, was now become hoarse and rusty. Moreover, the temperat sports of *Venus*, easeth the pain of the reins and loins, mundifie and quicken the eiesight, and be singular good for such as be troubled in mind and giuen ouermuch to melancholy.

Moreover, it is held for witchcraft, to sit by women in trauell, or neare vnto a Patient who hath a medicine either giuen inwardly or applied vnto him, * with hand in hand, crosse-fingered one between another: the experience whereof was well seene (by report) when lady * *Alcmena* was in labour to be deliuered of *Hercules*. And the worse is this peece of sorcery, in case the party hold the hands thus joined a-crosse one finger within another about one or both knees. Also

A to sit crosse-legged, with the ham of one leg riding aloft vpon the knee of the other, and that by turns shifting from knee to knee. And in very truth, our ancestors time out of mind, haue expressly forbidden in all counsels of State, held by princes, potentats, and Generals of the field, to sit hand in hand or crosse-legged; for an opinion they haue, That this manner of gesture hindereth the proceeding and issue of any act in hand or consulted vpon. They gaue out likewise a strait prohibition, That no person present at any solemnity of sacrifices or vows making should sit or stand crosse-legged or hand in hand in manner aforesaid.

As for veiling bonnet before great rulers and magistrats, or within their sight, *Varro* saith, it was a fashion at first not commanded for any reuerence or honour thereby to be done vnto gouernors, but for healths sake; and namely, that mens heads might be more firm & hardy, by that ordinary vse and custome of being bare.

When a mote or any thing els is false into one eie, it is good to shut the other hard. If there be water gotten into the right eare, the maner is to jump and hop with the left leg, bending and inclining the head toward the right shoulder; semblably, if the like happen to the left eare; to do the contrary. If one be false into a fit of coughing, the way to stay it is to let the next fel low spit vpon his forehead. If the uvula be false, it will vp again, if the Patient suffer another to bite the haire in the crown of his head, and so to pull him vp plumb from the ground. Hath the neck a crick or a pain lying behind, what better remedy than to rub the hams? Be the hams pained? do the like by the nape of the neck: lay the cramp take either feet or legs, plucking & stretching the sinewes when one is in bed, the next way to be vsed, is to set the feet vpon the floore or the ground where the bed standeth: or put case the crampe take the left side, then be sure with the right hand to catch hold of the great toe of the left foot: and contrariwise, if the cramp come to the right leg, do the like by the right foot. If the body fall a shaking and quivering for cold, or if one bleed excessively at the nothrils, it is passing good to bind strait and hard the extreame parts; to wit, hands and legs, yea and to plucke the eares also. It falleth out oftentimes, that one cannot lie dry nor hold his water, but it cometh from him euer and anone; what is then to be done? mary tie the foreskin of his yard with a linnen thred or a papyr rush, & withall, binde his thighs about in the middle. If the mouth of the stomacke be ready to turne, and will neither receiue nor hold any thing, it is good to presse hard and straine the feet together, or els to thrust both hands into hot water.

D To come now vnto our speech and exercise of the tongue: in many cases and for diuers causes it is wholsom to speak but little. I haue head say, that *Mecenas Messius* inioined himselfe three yeres silence, and during that time neuer spake word, for that in a fit of a conuulsion or crampe, he had beforetime cast vp bloud. In case any thing be ready to fall or rush violently against vs, and that we be in danger of some stroke, say that we be climbing vp hill, or turned downe backward, or lying along, there is not the like meanes againe to preferue our bodies, as to hold our winde: and this inuention we had from a bruit and dumbe beast, according as I haue shewed before.

Moreover it is said, that to stick down a spike or yron naile in that very place where a man or womans head lay during the fit of the falling sicknesse, at the very first time that hee or she fell, E secureth the party that so doth, for euer being troubled with that disease. Also it is holden for a singular thing to mitigat the intollerable torments of the reins, loins, and bladder, to pisse with the body bending forward and groueling in the bathing tubs within the baines. As for greene wounds, it is wonderfull how soon they will be healed, in case they be bound vp and tied with a * *Hercules* knot: and verily it is thought, that to knit our girdles which we wear about vs euery day with such a knot, hath a great vertue in it, by reason that *Hercules* first deuised the same.

Demetrius, in a treatise that he compiled as touching the number of foure, affirmeth that it is of great efficacy; and he alledgeth reasons why it is not good to prescribe in any medicine to be drunke, the quantitie of foure sextars or foure cyaths. To rub the ears behind, is supposed to be very good for them that are giuen to be bleare-eyed: like as to rub the forehead, for weeping or watering eies.

Concerning the signs of life & death which may be found in man, this is one, That so long as the Patientes eie is so cleare that a man may see himselfe in the apple of it, wee are not to despair of life.

As for the Vrine of mankind, diuers authors haue treated of it; who as I find, haue not onely

* For euery man is to be his owne Physitian: where-upon might rise this proverbe, *A sole or a Physitian*. * Thought to be *Calpurnius* his Physitian: for in those days Physitians were reckoned but seruants to such persons as *Lucullus* was.

* *Palmis alterna manu scilicet: vnde hec* meaneth [to scate] the palm or inside of the hand, &c.] which answereth somewhat to the remedies next following.

* *Homo alius ex illo ex homine: vnde* hec meaneth thus, For that a man in that action, goeth beside himselfe. * For it holdeth women in pain still, &c. hindreth the operation of Physicke. * There was an old witch that by this meanes kept her in a long and tedious trauail.

* Wherein no ends are to be seene, they are so close enclosed, & therefore hardly to be vnloosed.

set downe their reasons in nature as touching the vertue thereof, but also haue bin very ceremonious and superstitious in handling that argument; yea, and they haue written distinctly of the feuerall kinds of vrine digested into certain principal heads. And among other things, I remember, that they set downe the vrine of * men that are vnable for generation, to be singular good by way of injection, to make women fruitfull. But to speake of such remedies as we may be bold to name with honesty: the vrine of yong children who be not yet vndergrowne nor 14 yerres of age, is good against the venomous humor of the Apides or Adders which the Greeks name * Ptyades, for that they spit their poison vpon the eies and faces of men and women. Also the same is held to be singular for the pearle, the catara, the filmes, the pin and web in the eies; like as for the eie-lids also, and the accidents happening vnto them. Being incorporate with the floure of Erulle, it is good for sun-burnings: soddan also with bolled leeks to the consumption of the one halfe in a new earthen pot which was neuer occupied, it is excellent to mundifie the eares that run with matter, or that haue any worms or vermin within them: and verily a stouph made with the vapour of this decoction, bringeth downe the desired sicknesse of women. Dame Salpe ordaineth to foment the eies with the said decoction, for to fortifie the sight, and to strengthen them that they fall not out of the head: she appointeth to make a liniment with it and the white of an egge, but principally if it be of an ostrich, and therewith to annoint the skin that hath bin tanned and burnt in the Sun, for the space of two houres together: with it a man may wash away any blots or blurs of ink. Mans vrine is much commended for the gout in the feet, as wee may see by Fullers, who neuer be goutie, because ordinarily their feet are in mens vrine. Stale chamber-lie or vrin long kept and incorporat together with the ashes of oister shels, cureth the red-gomb in yong infants, and generally in all running vlcers: the same so prepared, serueth in a liniment for eating cankers, burns and scalds, the swelling piles, the chaps and rifts in the feet and feet, also for the sting of serpents. The most expert and skilfull midwiues haue pronounced all with one resolution, that for to kill an itch in any part of the body, to heale a scald head, to scoure away dandriffe and scurfe in the head or beard, and to cure the corroding vlcers in any place, but in the priuy members especially, there is not a liquor more effectuell than vrine, with a litle sal-nitre put thereto. But surely, euery mans own water (if I may for reuerence of manhood so say) is simply best; and namely, if the Patient that is bitten with a dog, do straightways bath the place therewith; or in case there be any prick of vchyn, hedghog, or such like spill sticking in the flesh, to apply the same thereto in sponges or wooll, and so let it lie on. But say it was a mad dog that bit the Patient, or that he be stung with a serpent, it is good to temper it with a shes and lay it vnto the sore. For as touching the vertue thereof against Scolopendres, it is wonderfull what is reported, namely, That whosoever be hurt by them, if they doe wet the crown of their heads but with one drop of their own vrine, it will presently cure the same, so as they shall feele no more pain nor harm thereby.ouer and besides, by the speculation of our vrine, we are able to giue iudgement and pronounce of health and sicknesse; for if the first water made in a morning be white and cleare, and the next after it higher coloured and inclining to a deep yellow, the former sheweth that concoction was then begun, and the second is a signe that digestion is now perfect. A red vrine is naught, but the black is worst of all: likewise if it be full of bubbles and froth aloft, and be withal of a grosse and thick subsistence, the same is but a bad water. If the Hypostasis or Sediment which ferleth heavy to the botom, be white, it signifieth that there is some pain and grievance like to insue about the joints or principall parts within the body. Dorth an vrine look greenish; it betokeneth some obstruction or disease already in the noble bowels and inwards: is it of a pale hew: it saith that choler aboundeth in that body: If it look red, the blood be sure is predominant and distempered. The vrin is not to be liked but pre-fageth danger, wherein there appeare certain contents like brans & blackish clouds: also, a white thin, and waterish vrine is neuer good: but in case it be thick and of a stinking smell withall, it is a deadly signe, and there is noway but one with the Patient. As for children, if their water be thin and waterish, it is but ordinary and naturall.

The Magicians expressly forbid in making water, to lay bare the nakednesse of that part against Sun and Moon, or to pisse vpon the shadow of any person. And therefore Hesiodus giueth a precept, to make water against a wall, or something standing full before vs, for feare least our nakednesse being discouered, might offend some god or Angell. To conclude, *Hesiodus* doth vpon his warrant assure vs, That whosoever droppeth some of his owne vrine euerie morning

A morning vpon his feet, he shall be secured against all charms, forceries, and deadly poisons whatsoever.

CHAP. VII.

¶ The remedies that womens bodies do minister.

The medicines which are said to proceed from the bodies of women be such, and the operations so miraculous, that they come nearer to the nature of monstrous wonders than true reports of naturall works: to say nothing of much mischief and many wicked parts committed by the means of their vntimely births and infants still born, which haue bin dismembred and cut in pieces for some abominable practises: to let passe the strange expiations wrought by their monthly terms, and a thousand more deuises which haue bin deliuered and set abroad not only by midwiues, but also by secret harlots that haue slippt their conceptions, and bin deliuered in corners. But to speake of the foresaid remedies which are in vre, and commonly known. The perfume that the hairs of a womans head make whiles they burn, chafeth away Serpents. The smell thereof also raiseth and reuiueth women, who in a fit of the mother lie speechlesse and breathlesse. The ashes verily of the said hairs burnt in some earthen pan or fish-shell, being applied alone or with litharge of siluer, is a singular medicine for the asperity of the eies, & the itch. Item, It taketh warts away, and cureth the red gum and sores that infants be subiect vnto, if it be vsed with hony. The same ashes mingled with Hony and Frankincense, healeth wounds in the head, and doth incarnate or fill vp with good flesh hollow vlcers whatsoeuer they be. And incorporates with swines lard, it is good for the broad bites called Pani, for the gout, and *S. Antho-* such like.

Toucing womens milke, it is holden by a generall accord, of all other to be sweetest & most delicat: whereupon it is prescribed by Phyticians vnto those that haue lien of a long & languishing feuer; as also to such as be troubled with a fluxe occasioned by a feeble stomack: but in these cases, that milk is reputed most wholsom which a nourse giueth that hath newly weaned her child: besides, when the appetite of women is giuen to an inordinate longing after strange things, in agues also, in gnawings and frettings of the stomacke, it is found by experience to be most effectuell. Likewise, being incorporat with Frankincense, it is singular good for the impostumes breeding in womens breasts. If the eies be bloudshoten vpon any stripe, if they be in pain or troubled with a violent rheum falling into them, let a nourse milk it in them, they shall find very much ease thereby: howbeit for the accidents abouenamed, it is held to be more soveraign, in case it be applied to the place together with hony & the juice of the daffodil, or els with the powder of frankincense: where by the way this would be obserued, that for what vse soeuer milk is imploied, that is ordinarily of more force which a woman giueth that bare a man child but if she was brought to bed of two twins, both boies, then it is best and most effectuell; provided alwaies, that the mother her selfe do forbear drinking of wine, & eat no meat or sauces that be sharp. Moreouer, this is knowne for certaine, that if womans milk be incorporat with the liquid white of an egge, and so applied to the forehead with wooll wet in the said liquor, it staieth the flux of humors into the eies. Moreouer, a soveraign remedy is milk against the venomous slime or spittle of roads, in case they pisse or spurt into our eies. Also if they haue bitten one, there is not a better thing either to be drunk or dropped vpon the sore, than breast milk. It is a common saying, That whosoever can meet at one time together with the milk of mother and daughter both, shall neuer need to feare all their life long any infirmities of the eies, so they be annointed or bathed therewith. Semblably, womens milk is singular for to cure the accidents befalling to the eares, if it be dropped in with a litle * Opium put thereto: but if so be the eares are pained by reason of some stripe that they haue receiued, the said milke would haue some Goose grease mixed with it, and so be instilled warme. And say that they haue a strong and stinking smell with them, as commonly it falleth out in all long diseases, there is nothing better than to put wooll into them, which is soaked in breast milk and hony together. If it happen that the eies look still yellow after the jaundise, it is good to drop milk into them with the juice of the wild Cucumber. This peculiar vertue it hath ouer and besides those abouenamed, if it be taken in drink, to help those that haue bin poisoned with the sea-Hare, the worrne Buprestis, and as *Ar. stotie* saith

* Madice ad-
miso opio.

saith, with the deadly Dwale called Dorycnion. In this maner also it cureth those whose brains be troubled and intoxicated with drinking Henbane. Physicians likewise haue prescribed to make a liniment with milke and Hemlock for to be applied vnto the gout. And some there be who vse it in that case, together with Osetype (v) the sweat or fattinesse of vnwasht wooll, and Goosegrease: in which manner it serueth in a pessary to be put vp in the naturall parts of women, to assuage the pain of the marrice. To drinke breast milke is a good meane to stop a laske, as *Rabirius* writeth, & yet the same doth prouoke the monthly course of womens fleurs: what is to be sayd now of a womans milke who hath borne a maid child? surely it is better than the other in these cases only; to wit, in scouring the skin of the face, and taking away the pimples, spots, and freckles, which be therein. But I must not forget, that any breast milke whatsoeuer, cureth the maladies incident to the lightes: and if there be tempered therewith the vrine of a yong lad not full fourteen yeares old, and Attick honey, so there be of each one spoonfull, I find it to be an excellent remedy for to rid away the ringing and thumping within the ears. And to conclude, it is a general speech, That if dogs do lap and tast the milke of a woman which hath borne a maid child, they will neuer run mad.

As touching the fasting spittle of a woman, it is judged to be a proper medicine for blood-shotten eies, also for the rheum that hath taken a course thither, if to be the corners of the eyes be euer and anone bathed and wet therewith when they be hot and inflamed; but more effectually will this remedy work, in case the woman forbear all meat and wine the day before. I read moreover in some Authors, That if the head be bound vp with a womans haire lace or fillet, it easeth the pain thereof. And thus much in some good sort as touching the medicines proceeding from women. As for the rest that are written and reported, they exceed all reason, and there is no end of them.

For first and formost it is said, that if a woman whiles her monthly sicknesse is vpon her, bee set into the wind abroad with her belly naked, she will scar away haile storms, whirlewindes, and lightnings, yea, and avert any violence of the weather whatsoeuer. And at sea verily, any woman standing openly against the weather bare, although she haue not her fleurs, is enough to secure the failers and passengers from all tempests. As for the very monthly flux it self of women, (a thing in other respects and at all times, as I haue shewed before, of a monstrous nature) there be writers who tell and presage wonders thereof, such as be horrible, abominable, and indeed not to be spoken: and yet some of these things I hold it no shame to deliuer in writing; namely, If it fall out just in the eclipse of Sun or Moon, that a woman hath her sicknesse come down, the same is a pestilent quality, and apt to breed diseases incurable. Likewise, if haply the time of the change, when the Moon is in coniunction with the Sun, and those things concur together, the man who medleth with her during that time, shall not auoid his bane but it will bring vpon him some pestilent malady remediless. Moreover, the venome thereof is so strong at that time especially more than at any other, that the presence or breath only of a woman then, will infect and staine any purple cloth. And yet bad enough it is at all times: for whensoever they are in their fleurs, it skills not in what quarter of the Moone, if they goe about any field of corn with their nakednesse vncovered, yee shall see the canker wormes, caterpillers, beetles, and all such wormes and hurtfull vermine, to fall from the corn as they passe along. This inuention by the saying of *Scepsius* and *Meiodorus*, came from the Cappadocians, who being infected with a number of those green flies called *Cantharides*, deuiled this means to be rid of them; for they caused their women at the time of their monthly terms (sauing the reuerence of womanhood be it spoken) to go through the standing come, with their cloths tuckt vp round about their waist, and all bare beneath. In other countries yet they are more mannerly, and in a better respect to the honor of women, put them only to go barefoot for this purpose, with their haire hanging loose about their eares, vngrirt, vnclaced, and vnbraced. Howbeit, great heed must be taken, that they walke not thus at the Sunne rising, for then surely all the crop vpon the ground will wither and dry away to nothing. Also if a woman during her natural courses doe but touch any yong vines, it is enough to marre them for euer. As for Rue and Luie, Plants otherwise of themselves most medicinable, and indued with singular vertues against poison, they will presently die with their touch. Much I haue already said of this strong and pestiferous venome, and yet I haue not written all. For ouer and besides, certaine it is that if a menstruous woman doe no more but touch a Bee-hiuc, all the Bees will be gone and neuer come to it againe. Also if at such a time she handle

A die any skains or slips of linnen yearn and set them ouer the fire, to seeth, they will in the boiling turn black. Let her but take a barbers rasor in her hand, the edge wil turn and become blunt: nay if she do no more but touch any brassen vessel, it is wonderfull what a strong sauer it wil cast, and how it wil rust and canker therupon; and the rather, if this fall out to be in the decrease or wane of the moon. Doth a woman at such a time touch a mare that is in foale, it is enough to make her cast the same before due time. And not onely so, but the very sight of women in that case, although they be a great way off, is able to do much harm; but principally the first time that they haue the said fleurs after the losse of their maidenhead; or otherwise during their virginity, when they first come down by course of nature of the owne accord. The malignitie of this venomous humor is so great, that the slime ingendred within the lake of Sodome in Iury, as viscus as it is otherwise, will forgoe all that tenacity, and diuide in sunder by nothing els but a thred infected with the said menstrual blood, according as I haue declared heretofore. So forcible it is besides that the very fire, which is of power to ouercome all things and change their nature, is not able to conquer and alter this: for burne or calcine it to ashes, and strew neuer so little thereof vpon any cloths that are to be washed or scoured in the Fullers mill, it wil change their color, though they were of purple, and cause any die whatsoeuer to lose the fresh lustre. And more than that, so pernicious is the quality of this venome, that as naturall otherwise as it is to women, it is no better than a poison to those of their own sex: for in case one woman with child be annointed about her naturall parts, with the foresaid blood of another, or do but step ouer the place where it is, she will immediatly fall to labour, and slip an abortiue birth. As for the famous curtizans, C *Lais* and *Elephantis*, who haue written so contrary one to the other of this argument, and namely, as touching abortions, and of what efficacy the cole of Colewort, Myrtle, or Tamariske root is, after it hath bin quenched in the said blood; as also, how shee Asles will not conceiue for so many yeres as they chance to eat Barly corns infected therewith; besides other strange deuises vnto their writings, considering the monstruosities & contrarieties which they haue put down; whiles the one prescribeth medicines for to make fruitful, & the other ordaineth the very same, to hinder conception and cause them to be barren. Moreover, *Bythm* of *Dyrrbachium* saith, that for to make a mirror or looking glasse cleare againe, which was dusked and dimmed by the aspect of a menstruous woman, the next way is to cause her to cast her eies backward and to look ouer her shoulders vpon it againe; he saith moreover, that if women in that case haue about them the fish called a Barbill, they shall not by that means infect or do hurt at all, but the same menstrual blood shall lose all the foresaid strength.

Well, as hurtfull and mischievous as it is otherwise, yet many there be who affirm it to be in many diseases medicinable; and namely, for the gout, if the place be annointed therewith: as also if women while their monethly sicknesse is vpon them, doe handle the wens named the Kings euil, the swelling kernels behind the ears, the broad tumors or biles called Pani, shingles, *S. Anthones* fire, felons, or violent flux of humors to the eies or other parts, there wil insue much ease therupon. *Lais* and *Salpe*, two notable strumpets, haue left in writing, That if the foresaid menstrual blood bestowed within a little Locke of wooll that came from a blacke Ram, be worne inclosed within a siluer bracelet, it is a soueraigne remedy against the biting of mad dogs, and for Tertian and Quartan agues. *Diostimus* of Thebes reporteth, That any little peece or rag of cloth, yea, though it were but a thred stained therein, and so set handfomly into a bracelet, is sufficient to do as much. *Sotira* the renowned midwife affirmed, That there was not in the world so good a thing against the Tertian & Quartan, as to rub & anoint therewith the soles of the patients feet: but much more effectually would it do the deed, in case the woman her self had the doing of it with her own hand, so as the sick party know not thereof in any hand. And this (quoth she) is a soueraigne medicine to raise them out of a fit of the Epilepsie, who are surprisid and fallen therewith. *Ictidas* a worthy Physician among the Greeks, assureth vs vpon his word, That Quartane agues will make an end and go away by the act of generation, at what time onely as a woman beginneth to enter into her fleurs. But this is agreed vpon by all authors professed and seen in this theam, that if one be bitten with a mad dog, and so far gone, that he is afraid of water, so as he dare not see it or drink at all, do but put a clout or shred of cloth dipped in the said menstrual blood vnder the cup whereout hee is to drinke, hee shall immediatly be deliuered from that feare: And this commeth by that powerfull and predominant Sympathie, whereof the

the Greeks write so much, between mad dogs and the said blood, considering, as I haue before-
said, that they begin first to run mad by tasting thereof. This is known for certain, that the ashes
of a burnt cloth infected therewith, or of the blood it self calcined, is a singular powder to heale
the farcins or sores of horses and all such laboring beasts, so it be mixed with the soot of chim-
ney or furnace, and al incorporat together with wax. Now say there be any garment or cloth pol-
luted therewith, there is not any thing will take out the stain, but the urine onely of the same
woman. The ashes before said tempered alone with oile of Roses into a liniment, and so applied
in maner of a frontal to the forehead, allaieth the headach of women specially. This also would
be noted, That for the first yeare after a woman hath known a man, and so parted from her vir-
ginity, her fleurs are most sharp, mordant, and fretting. Furthermore, this also is resolved clearly
among all writers, That there is no charme or enchantment whatsoeuer, of any validity to doe
harm to that house where the side posts or dore cheeks are striked lightly ouer with mensruous
blood: an argument I assure you, that convinceth notably the folly of these Magitians, the vai-
nest people vnder heauen, and ouerthroweth all their art: and a point that pleaseth me very wel,
& which for mine own part I am right willing to beleue: and since I am light thus vpon them,
I care not much, if to detect their vanities, I set downe one of the most modest receipts that they
haue giuen their word for, and which may seem to carry some shew of truth or probability. For
thus they prescribe with great warrantize, To take al the nail-parings of toes and fingers of man
or woman lying sick of an intermittent feuer, and to mix or incorporat them with wax, so as the
party in the doing herof do say these words, *I am about a remedy for the Tertian, Quotidian, or Quar-*
tan ague (according as the patient is troubled with the one or other of these feuers) which done
and said, to stick vp the said wax vpon the dore of another man or womans house that is not sick
at all, and that before the Sun be risen, which no doubt (as they say) wil cure the sick person, and
set the ague vpon another that was well before. Now would I gladly know what greater vanitie
and folly there can be, if this medicine misse and do not the feat? or what more villany and mis-
chiefe, than thus to transfer and remoue diseases from those that be sick already, vnto such as be
sound and think no harme? To conclude, some of these Magitians are so far gone, that after all
the foresaid nailes of fingers and toes be pared, they ordaine them to be thrown into Ant-holes,
and to obserue that Emmet that first begins to draw one of them into her nest, to catch her vp
quickly, and hang her about the necke of any one that is sick of an ague, and so the patient *pro*
certo, shall shake off the disease and be quite rid of it.

CHAP. VIII.

¶ The medicines that are found in diuers strange and forraign beasts, as namely, the Ele-
phant, Lion, Cammell, Hyena, Crocodile, Chamaleon, Skinke, Water-
horses, and Onnces.

These be the remedies which the bodies of men and women do affoord: as many I meane as
I may with some honesty relate: and yet ywis many of them be such as are not to be read
out and vttered, but with leaue and patience first craued, for the reuerence that we owe to
chaste eares. I know ful wel there is a great deale more behind that I haue not touched, but such
stufte I assure you as is detestable and not fit to bee spoken or committed to writing, which
makes me rather to make hast and leaue the discourse of Man and Woman, and so to proceed
to the singular vertues and operations of bruit beasts.

And to begin with the Elephant, The blood of that beast, especially the male, staieth all flux-
es of humors, which the Greeks cal Rheumatismes. The shavings of yvory (which is the Ele-
phants tooth) incorporat with Attick hony, scatter (as folk say) the dusky spots that appeare
in the visage: like as the dust thereof, which the file or saw doth make, cureth the whitflawes or
impostumations breeding at the naile roots. The trunk or muffle of an elephant if it be but touch-
ed only, allaieth the head-ach; & the more effectually it is, in case sneezing come withall. It is
said moreover, if one take a piece of the right side of the same trunk, & carry it fast about him
with the red ocre of Lemnos (called Terra Sigillata) it will incite him mightily to carnal lust.
The blood of an elephant is singular good for those that be in a consumption & wast away: like
as the liuer helpeth such as be giuen to the falling sicknesse.

The greafe or fat of a Lion tempered with oile of Roses into an vnguent, preferueth the skin
of

A of the face from all ill fauor spots, and keeps it white and smooth. The same ointment healeth
the skin that is scorched and pilled with cold, by travelling ouer mountains charged with snow;
yea, and abateth the tumors & nodosities vpon the ioints. Now, if we list to beleue the foolle-
ries of Magitians, they would bear vs in hand, that whosoever be anointed all ouer with the said
greafe, shall be gracious with princes and kings, yea, and win much fauor among the people, and
any state or nation where they shall conuerse; but principally it must be the fat in the forehead
between the eie-brows (where indeed it is vnpossible to find any at all.) The like effects they do
promise of the Lions teeth, and those especially of the right side; like as of the shag haire (for-
sooth) that should hang vnder their nether jaw. Indeed the gal of a Lion mixed with water, cla-
rifieth the eiesight, in case the eies be bathed therewith: the same tempered with the own greafe,
B dispatcheth as they say the falling sicknes, in case the patient tast neuer so little of it, & so soon
as he hath taken it, run a while for to digest the same. A Lions heart cureth a Quartane ague, if
the sick person do eat thereof, and their fat is a soueraigne remedy for the feuer Quotidian, if it
be vsed with oile rosat. There is not a beast so fel and sauage, but it wil run away from them that
be anointed with Lions greafe: and it is thought to be a singular preferuative for to preuent any
secret ambushes or practises intended against one.

As touching the Cammell, his braine (by report) is excellent good against the epilepsie or
falling sic knesse, if it be dried and drunk with vinegar, so doth the gall likewise taken in drinke
with hony: which also is a good medicine for the Squinancy. It is said that a Cammels tail dri-
ed causeth loosnesse of the belly: like as the dung reduced into ashes and incorporate with oile,
C doth curle and frizle the haire of the head. The said ashes made into a liniment and so applied,
yea, and taken in drinke as much as a man may comprehend with three fingers, cureth the dysen-
tery: so doth it also the falling sicknesse. Cammels pisse (they say) is passing good for Fullers
to scour their cloth withal: and the same healeth any running sores which be bathed therein. It
is well known that the barbarous nations keep this stale of theirs vntil it be 5 yeres old, and then
a draught thereof to the quantity of one hemine, is a good laxatiue potion: likewise that the
heire of their tails, twisted into a wreath or cord, and so worn about the left arme in manner of a
bracelet, cureth the Quartane ague.

As for the Hyena, there is not a wild beast of the field that the Magitians haue so much in
D admiration as it: for they hold that in the Hyena it selfe there is a certaine magicall vertue, at-
tributing a wonderfull power thereto, in transporting the mind of man or woman, and rauishing
their senses so, as that it will allure them vnto her very strangely. Concerning the rare property
of these beasts to chaunge the sex each other yeare (i. to be male this yeare, and female next;
as also touching other monstrous qualities obserued in their nature, because I haue discoursed
already of them, it remaineth now that I proceed to shew the medicinable vertues that are re-
ported to be found in them: wherof this may be counted for one of the chiefe, that considering
they be so terrible * to Panthers, that they dare not quetch nor make head against them: who-
fouer hath about him but a piece of the Hyenes skin may be sure that a Panther will not set
vpon him, nor once come neere. And that which is a wonderfull thing to be spoken, in case the
E hides of them both be hung vp one against another, the haire of the Panther will fall off. When
the Hyenaes flie before the hunter and would not be taken, they wind with a carriere out of the
way toward the right hand, and wheele about vntil the man be gotten before them; & this they
do, because they would meet with his traicts and footing, which if they happen vpon, and get be-
hind him, you shall see the hunter incontinently to be so intoxicat in his brain, that he is not a-
ble to beare his head nor sit his horse, but to fall from his back. But in case that they turn on the
left hand, it is an euident signe that they be ready to faint, and then will they quickly be taken.
The sooner also and with more ease be they caught (if we may beleue art Magick) if the hun-
ter tie his girdle about his middle with 7 knots, and the cord of his whip likewise wherewith he
ruleth and jerketh his horse, with as many. But see how subtil and cunning these Magitians bee
F to cloke and colour their vanities and deceits, with superstitious circumstances! This chase for-
sooth after the Hyene, must be iust at the very point when the moon is passing through the sign
Gemini: and then if they be taken, the huntsman must be sure to saue euery haire of their skins,
and misse not one, so medicinable they are. By their saying also the skin that grows to the head
of the Hyene, if it be applied in manner of a frontal, is singular good for the headach: the gall
of the Hyene cureth bleared eies, if the forehead be anointed therewith: but if the same bee fod-
den

den with three cyaths of Attick hony and one ounce of Saffron, to a liniment, it is an excellent G
preseruatiue to keep one from euer being blear-eyed, if so be the eyes be annointed with it. The
said composition likewise is singular for to rid away the cloudy films and catarracts that breed
in the eies. But for to clear the sight & quicken it, the older this medicine is, the better they hold
it to be. And kept it must be in a brazen or copper box, which eie-falut they say, serues also for
the mailles or spots, for the asperities, excrescences, cicatrices, dents, & excoriations remaining
in the eies. The graue or dripping likewise of the Hyænes liuer, newly taken out of the body
and roasted, being incorporat with clarified hony into an vnguent, riddeth away the red film that
ouercasteth the apple of the eie and darkneth the sight thereof. They will make vs beleue, that
the Hyænes teeth are good for the tooth-ach, if the pained teeth be but touched therewith, or if
the said teeth be arranged in order, and so applied fast vnto the patients teeth, as they may fit e-
uery tooth in his head. The shoulders also of the Hyæne are proper to ease the paines that lie
in our shoulders and arms both, so they be set likewise orderly and hanged close to the grieved
parts. The teeth of the said Hyæne plucked out of the left side of the chaw, and bound vp sure
within a piece of a sheep or goats skin, is right soueraigne to be worn in manner of a scutcheon
or stomacher for to ease the intolerable paines of the stomacke. A dish of meat made of their
lungs and eaten, is soueraigne for the flux proceeding from a feeble stomack. But if the same be
burnt and reduced into ashes, and so brought into the form of a liniment with oile, and applied
accordingly, it comforteth the stomack mightily. The pith or marrow taken out of the backe-
bone along, and incorporat with old oile and * gall, is passing good for the nerues. The liuer of
the Hyæne drieth away Quartan agues, in case the patient take three bits thereof one after a-
nother before the access. Take the ashes of the Hyænes ridge bone, the tongue and right foot
of a Seale, put thereto a Buls gall, seeth them all together and make a cataplasme therof, prea-
ding the same vpon a piece of a Hyænes skin, and apply it accordingly, you shall see how it will
ease the pain of the gout. The very gal likewise of this beast mixed with the powder of the stone
Asius, is commended by them for to cure the said malady. They that are subiect to trembling
and to the cramp, such also as be giuen to leap out of their beds, or are troubled with the bea-
ting and panting of the heart, ought to take and boile the heart of the Hyæne, and eat one part
therof, and with the other being burnt to ashes and with the brains of the said Hyæne together
reduced into a liniment, to annoint the grieved part. This composition likewise serueth to take
away the hairs of any place, if it be annointed either with it alone, or els with the gall, & in case
one would not haue them euer to come vp againe, they ought to be plucked vp before, and then
the place to be annointed. Thus they vse to rid away the haire of the eie-lids that be trouble-
some. In like manner for the paines of the loins, the flesh about the Hyænes loines is prescribed
to be eaten, and therewith oile together, and the place also is to be rubbed well and besmeared.
They say moreover, that if a woman which is barren, eat the eie of a Hyæne with Liquorice and
Dill, she shall proue fruitful: and so neare they go, as to promise she shall conceiue within three
daies after. And (by their report) whosoever are haunted with sprites in the night season, and be
affrighted with such bugbears, let them but take one of the master teeth of the Hyæne, & weare
it about them tied by a linnen thred, they shall be freed from all such fantastical illusions: these
Magitians also giue direction to those that be out of their wits and gon besides themselves, to
haue a perfume made with the smoke of those teeth, and to weare one of them hanging before
the brest, with the fat growing about the kidneys, or els with the liuer or the skin. If a woman be
with child, and would gladly go out her full time, let her take a peece of the white flesh of this
beast, and 7 haire, neither more nor lesse, together with a stags pizzle, bind them all fast within
the skin of a Buck or Doe, and so weare them hanging about her necke just against her brest,
she shall not slip an vntimely fruit. Furthermore they promise in the behalfe of this beast, that
if a man or woman do eat the genital member of a Hyæne, according to their sex, they shall be
prouoked to fleshly lust, how cold soeuer the man were before, and could not abide to imbrace a
woman.ouer and besides, if the said pizzle and shap of this beast be kept in any house, together
with a joint of the ridge bone, skin & alas it groweth too, the whole family shall agree together
well, and liue peaceably; now this ioint or knot about said they call Atlantion, and it is the very
first spondyle of them all. The same also they make no small reckoning of, but hold it for a spe-
ciall remedy for the falling sickness. Fry the grease or fat of an Hyæne, the fume therof (by re-
port) wil chase away serpents: a piece of the chawbone beaten smal to powder & eaten together
with

* Felle: some
read mell,
i. Honey.

A with anise seed, doth mitigat the quivering & quaking in a cold ague fit. A suffumigation made
therewith, draweth down womens sicknesse, if we may beleue magitians, who are grown to this
passe in their vanity, that they auouch for certain, that if an archer do bind vnto his arm a tooth
of an Hyæne, growing on the right side of the vpper chaw, hee shall shooor point blanke and ne-
uer misse his mark. Take the palat or roufe of the mouth of this beast dried and made hot toge-
ther with Ægyptian Alumne, put the same into the mouth and change it three times for new
stil, they promise it shall correct a stinking breath, and heale any vlcers or cankers in the mouth.
And as for those that weare vnder the soles of their feet within the shoe, a Hyæns tongue, there
is not a dog will be so hardy as to bay or bark at them. The brain of the Hyæne lying in the left
side of the head, easeth any deadly diseases of man or beast, if the nostrills be annointed there-
with. The skin of the forehead serueth as a countercharm against all witch-craft and inchaun-
ments. The flesh growing to the nape of the necke, being dry and made into powder, appeaseth
the pain in the loins of the backe, either eaten or drunk, it skils notwithstanding. For the griefe of si-
news, they giue order to make a suffumigation with the nerues of Hyæna, which run along the
shoulders and back. And the hairs growing about the muzzle of this beast, haue an amatorious
vertue with them, to make a woman loue a man, in case her lips be but touched therewith. The
liuer of the Hyæna giuen in drink, cureth the cholique and stone. As for the heart, be it taken in
meat or drink, it easeth all the paines of the body: the milt cureth the spleen: the kelle with the fat
about it, helpeth any inflammation of vlcers if it be applied with oile: the marrow within the
bones, appeaseth the griefe of the backbone and sinews, and finally, doth recouer and refresh the
wearinesse of the reins and kidneys. The sinews of this beast drunk in wine with frankincense, re-
store women to the fruitfulnesse of the wombe, especially when by indirect meanes of sorcery
they are become barren and vnapt for conception. The matrice of the female Hyæne giuen in
drink with the rind of a sweet pomegranat, is a very comfortable medicin for that part in a wo-
man. A suffumigation made with the fat taken from the hetchfill piece or loines, is singular for
those women that be in hard trauell of childe, and procureth them speedy deliuerance: the ma-
row or pith out of the ridge bone whosoever carrieth about them, shall find help against vain il-
lusions and fantasticall imaginations. The pizzle of the male Hyæna, if it be burnt, casteth a
fume which is good for them that haue any sinews pluckt with the cramp. Saue the feet of this
D beast, and the very touching of them is soueraigne for blear eyes, for ruptures, & inflammati-
ons: but this regard must be had, that the left foot be applied to those griefes in the left side, and
the right to the contrary. But wot ye what? if the right foot of the Hyæna chance to be carried
ouer a woman whiles she is in labour of childbirth, she shall surely die of it; but contrariwise,
let it be the right foot, she shall haue a quick dispatch and be deliuered with ease. The skin or
purse that holdeth the gall, being either drunke in wine or taken with meat, helpeth those that
for weaknesse of stomack be apt to faint and fall into cold sweats: and the bladder taken with
wine, cureth those that cannot hold their water. Now look what vrine is found within the blad-
der of this beast, you must thinke it is an excellent drink if it be mixed with oile, Sesame seed,
and hony, for any old griefe whatsoever. The first rib and the eighth wil make a perfume, which
E is passing good for those who are bursten: the spondyles or ioints of the ridge-bone, are as con-
uenient for women in trauell of child-birth: and the Hyæns blood taken inwardly with fried
barly meale, doth mitigat the wrings and gripes of the belly. If the side pofts or dore cheeks of
any houle be striked with the said blood, wherefoeuer Magitians are busied with their feats and
jugling casts, they shall take no effect, whether they be charms, exorcismes, or inuocations: in so
much as they shall not be able to raise vp spirits, nor haue any conference with familiars by any
means of conjuration, whether it be by torch-lights, by bason, by water, by globe, or otherwise.
The flesh of this beast eaten, is very effectuall against the biting of a mad dog, and yet the liuer
is of greater efficacy in this case. If there chance either flesh or bone of man or woman whom
this beast hath killed and deuoured, to be found in the maw, surely the perfume thereof is a pre-
sent remedy for the gout, as these Magitians would seeme to persuaade vs. But how if there be
F found the nails of man or woman there: then woe be to all those that were at the hunting and ta-
king of this beast, for it presageth that one of them is sure to die for it. Beside all this, they do
affirme, That either the excrements or bones which the Hyæna dischargeth out of the belly at
the time that she is killed, serue for countercharms or preseruatiues against sorceries and practi-
ses of Magitians. As for the ordure or dung which is found within her guts, being dried and ta-
ken

E c

ken

ken in drinke, is auailable against the dysentery: and the same reduced into a liniment with goose greafe and so applied, helpeth those that by some poison are infected all the body ouer. The greafe likewise of this beast vsed as an ointment, hath a singular property to cure the biting of a dog, so that the patient be couched vpon the skin of the said Hyæna, as say our Magicians: who affirm moreouer, that a decoction made with the ashes of the pastern bone of the left leg, boiled together with the blood of a weazil, causeth as many as be anointed all ouer therewith, to be odious in the eyes of all men. The same effect do they attribute to the decoction of the eie. But of all the fooleries that they haue broched as touching the Hyæna, this passeth and may go for the chiefe, That the hindmost end of the gut in this beast is of vertue, that no captain, prince, or potentat, shall be able to wrong or oppresse those who haue but the same about them: but contrariwise assureth them of good speed in all their petitions, and of happy issue in all suits of law and trials of iudgements. The concavity or wrinkle thereof, if a man do weare fast tied about his left arme, is so forcible to charme a woman, that if he do but set his eie vpon her, she will leaue all and follow him presently. The ashes of the haire growing therabout made into a liniment with oile, and applied accordingly, causeth those men who before were giuen to lewd wantonnesse and liued in bad name, not onely to become chaste and continent, but also to put on grauity and grow staide in their behauiour. Thus much of Hyæna.

For fabulous tales, the Crocodile may challenge the next place: a beast this is which naturally doth liue as well on land as in water: for two kinds there be of them; whereof the former (keeping thus in both elements) hath this especiall vertue, if we may beleue these Magicians, To prouoke vnto carnal lust, if the teeth which grew in the right side of the chaw, be hanged fast likewise to the right arme of man or woman. The eie-teeth of the said Crocodile, filled vp with frankincense (for hollow they be) and tied to any part of the body, put by those periodicall fevers which vse to return at sett and certaine hours, but then the patient must not for five dayes together, see the party who fastened the same about him. And they report likewise, that the little grauel stones taken out of their belly, be of the same vertue to driue away the shaking fits of agues when they are coming, which is the cause that the Egyptians vse ordinarily to anoint their sick folke with the fat of this beast. The other Crocodile resembleth this in forme; but far lesse he is, and keepeth only vpon the land, liuing vpon most sweet and redolent flowers. In which regard, much seeking there is after his guts, for the pleasant senteurs and odors wherewith they be stuffed full: this dung they call Crocodileia, a singular remedy for all the diseases of the eyes, and namely against cataraets, suffusions, and mistie films, if they be anointed with an eie-salue, made of it and the iuice of Porret mixed together. The same brought into a liniment with the oile Cyprinum, serueth to take away all pimples that rise in the face, and clenseth the skin from those spots that blemish the visage. But if it be incorporat with water, it scoureth whatsoever accidents be apt to run ouer the face, and reduceth the skin vnto the natie color; for it riddeth freckles, moles, and generally any spots or flecks that marre the beautie or fauour. The same is good to be drunke in oxymell to the weight of two oboli for the falling sicknesse: and applied in forme of a pessarie, it prouoketh womens fleurs. Now if you would chuse the best Crocodileia, take that which is whitest, brittle, or easie to crumble, least weighty in hand, and withall swelling in manner of a leuaine, if it be rubbed between the fingers. The manner is to wash it, as they do white lead called Cerusse. Sophisticated it is with amyll, or the scouring Fullers clay & Tuckers earth called Cimolia, but principally with the dung that sterlings meut, which are of purpose caught and fed only with rice. Now there is not a better thing in the world (say these Magicians) for the cataraet, than to anoint the eyes with it and honey together. And if a man may beleue their words, there is a soueraigne perfume made of the guts and the whole body besides, for women who are sicke of the mother, or otherwise diseased in the matrice, if they sit ouer it whiles it smoketh. In like manner, it doth them good to be lapped round about with wooll that hath bin so perfumed. The ashes of the Crocodiles skin, as well the bigger as the lesse, brought into a liniment with vinegar, and applied vnto those parts of the body which had need to be cut away or dismembred, causeth the patient to haue no sense or feeling at all either of saw or launcer. The very swoke also of the said skin burning, doth the semblable. The blood of both Crocodiles mundifieth the eyes, and causeth them to see cleare which are anointed therewith, removing the fil-nes and dispatching the spots that impeach the same. The very body or flesh it selfe of the Crocodile, all saue head and feet, is good meat sodden, for those

A those who bee troubled with the Sciatica: the same cureth an old cough, especially the chin-cough in children; and assuageth the paine of the loins. The Crocodiles haue a certaine fat in them that is depilatorie; for no sooner is the hare rubbed therewith, but presently it sheddeth. The said fat or greafe preserueth those who be anointed therewith, from the danger of the Crocodiles, and is excellent good to bee melted and dropped into the wounds made by their bite. The Crocodiles heart wrapped within a lock of wooll which grew vpon a black sheep, & hath no other color medled therewith, so that the said sheep were the first lambe that the dam yeained, is said to driue away quartane agues.

To this discourse of Crocodiles, wee shall not doe amisse if we annex other beasts in some sort resembling them, and which be likewise straungers as well as they. And to begin with the Chamæleon, *Democritus* verily made so great reckoning of this beast, that hee compiled one entire booke expressly of it, and hath anatomized euery feuerall member thereof: and certes, I cannot chuse but take great pleasure therein, knowing as I do by that meanes how to decipher and deliuer abroad the loud lies of vaine Greekes. This Chamæleon for shape & bignesse, is much answerable to the Crocodile last named, differing onely in the curbing or crookednesse of the ridge-bone, and largenesse of the taile. There is not a creature in the world thought more fearefull than it; which is the reason of that mutability whereby it turneth into such varietie of colours: howbeit of exceeding great power against all the sorts of hawkes or birds of prey; for by report, let them fly and soare neuer so high ouer the Chamæleon, there is an attractive vertue that will fetch them downe, so as they shall fall vpon the Chamæleon and yeeld themselves willingly as a prey to be torne, mangled, and deuoured, by other beasts. *Democritus* telleth vs a tale, That if one burne the head and throat of the Chamæleon in a fire made of oken wood, there will immediately arise tempests of rainy stormes and thunder together: and the liuer will do as much (saith he) if it burne vpon the tiles of an house. As for all the other vertues which the said author ascribeth to the Chamæleon, because they smell of witch-craft, and I hold them meere lies, I will ouerpasse them all, vnlesse they be some few, for which he deserueth well to be laughed at, and would indeed be reprobued by no other means better: namely, That the right eie of this beast if it be pulled out of the head whiles it is aliue, taketh away the pearl, pin and web in man or womans eyes, so it be applied thereto with goats milk. The tongue likewise plucked forth quicke, secureth a woman from the danger of childbirth, if shee haue it bound to her body whiles shee is in trauell. If there be found by chance a Chamæleon in the house where a woman is in labor, she shall soon be deliuered in safety: but if such an one bee brought thither of purpose, the woman is sure to die. Also, the Chamæleons tongue pulled out of the head whiles the Chamæleon is quicke, promiseth good successe in iudiciall trials. The heart bound within black wooll of the first shearing, is a most soueraigne remedy against quartan agues. The right forefoot hanged fast to the left arm within the skin of a Hyæna, is singular against the perills and dangers by theeues and robbers; as also to skar away hobgoblins and night spirits. In like manner, whosoever carry about them the right pap of this beast, may bee assured against al fright and feare. But the left foot they vse to torrefie in an oven with the herb called also Chamæleon, and with some conuenient ointment or liquor to make in certaine troches, wherof if a man do carry any in a box of wood about him, he shal go inuisible, as sayth *Democritus*, if we were so wise as to beleue him: who affirmeth moreouer, That whosoever hath about him the right shoulder of the Chamæleon, shall bee able to ouerthrow his aduersarie at the barre, and to vanquish his enimie in the field: but first, hee must be sure to cast away and make riddance of the strings and finewes belonging thereto, and to tread them vnder foot. As for the left shoulder, I am ashamed to relate, vnto what monstrous spirits hee doth consecrate it; and namely how by the vertue thereof, a man may cause what dreames and fantasticall illusions hee listeth, yea, and make those whom hee will himselfe, to imagine the same apparitions. As also, how the right foot of the said beast driueth away all such strange visions; euen as the lethargie will goe away by the meanes of the left side of this beast, which lethargie was occasioned by the right. Touching head-ache, hee sayth plainly, that the next way to cure it, is to besprinkle and wet the same with wine, wherein either of the two sides were foked. Take the ashes (quoth hee) of the left thigh or foot, chuse you whether, incorporate the same with the milke of a Sow, and therewith anoint the feet, it will be an occasion, speedily to bring the gout vpon them. But of the Chamæleons gall, for the most part, folk are in manner verily persuaded, that

that it will rid the pin and web, the cataraft also of the eies, with three daies anointing; chafe away serpents if it be dropped into the fire; gather al wezils in a country together, only by throwing it into the water, and fetch off haire if the body be anointed therewith. It is a common saying also, That the liuer of this beast is of the same effect, in case it be brought into a liniment with the lights of a hedge land: tode-like as, that all amatorious drinks & loue-charms become void of none effect by the said liuer. As for those who be troubled in mind & giuen to melancholy, they find remedy, if out of this beasts skin they drink the iuice of the herb Chamæle. Furthermore, the guts, and the dung therein contained (and that is worthy to be noted, considering this beast liueth vpon no meat at all) being striked vpon the dore of an enemies house, together with the vrine of apes, cause him to be hated of all the world. The like wonders they report of the Chamæleons taile, namely, how it will stay any violent streame of riuer; stop the course and inundations of waters, and withall, bring asleep and mortifie serpents. The same being aromatized or spiced with Cedar and myrrh, and tied fast to a branch of the Date tree growing double or forked, wil diuide the waters that be smitten therewith, so as a man may see what fouer is in the bottome. And would God Democritus himselfe had met with one ctop of this branch, to haue made him hold in so many lies as he hath told, considering hee hath reported this quality of it among other, namely, to repress intemperat speech and inordinat walking of the tongue. But euident it is, that the only reason why Democritus faulted that way (being otherwise a man of a singular wit and wholly addicted to the good of mankind) was an excessiue and extraordinary zeale that he had to profit and benefit the whole world.

Much like to this kind is the Skink (whom some haue named the land Crocodile) saue that the skin is whiter & more fine. But the principal difference is this, for that the bristles or scales are couched so, as they tend from the taile vpward to the head; whereas in a crocodile the same are set contrary. The biggest of this sort, be those of India: the next be they which are brought out of Arabia; & transported they be to vs salted. The muffle & the feet giuen to drink in white wine, do inflame the heat of lust; but especially when they be mixt with Satoryon and Rocket seed, of each one dram, mingled with two of pepper; and when they be wrought into trosches weighing euery one a dram, one of them must be taken at once. But the very flesh of the Skinks fides, drunk to the quantity of 2 oboli, with myrrh and pepper in like proportion, are supposed to be more effectual for this purpose. The same (as Apelles reporteth) taken both before & also after meat, is a singular preseruatiue against inuenomed arrows. Besides, it is one of the ingredients which go to the noble compositions that be called Antidors. Howbeit, Sestus is of opinion and doth write, that if a man drink aboute one dram weight of it in a hemin of wine, it is enough to indanger his life. Moreover, the iuice or broth of the Skinks flesh boiled and taken with honny, is thought to keep downe the fish and to coole lust.

As touching the riuer-horse called Hippopotamus, there is a great affinity or kindred rather between him and the crocodile, in regard that they both do haunt the same riuer, and participate both of land & water. This beast (as I haue shew'd hertofore) deuised first the practise of phlebotomy or bloud-letting. Great store there be of them beyond the Seignory Saitica in Ægypt. Take the ashes of this beasts hide, and reduce them with water into a liniment, it is singular to cure the broad biles or apostemations called Pani. The greafe, and likewise the dung, is good against the cold fits of agues, if the patient receiue the perfume thereof. The teeth which grow on the left side of the mouth, do ease the tooth-ach, if so be the gums be scarified therewith: the skin taken from the left side of the forehead, laid vnto the share and kept fast thereto, staierth the prouocations to venery. The ashes of the same doth cause the hair to grow again thick in those places, where by discafe it is shed. Take of the generoires of this water horse, the poise of one dram, and drink it in water, it is a good counterpoison against the venome of serpents. As touching their bloud, it serueth painters in good stead.

The Onces be likewise taken for strange and forrein, and of all foure-footed beasts they haue the quickest eie and see best: by the testimony of all writers, there is in the Island Carpathos, a singular kind of ashes made of their houfs, burnt together with their hide; and they hold, that if men drink therof, they will become chaste, were they neuer sollicitious and libidinous before: again, let women cast the same vpon their nature or priuie parts, it will coole their appetite of mans companie; yea and kill the itch in any part of the body, if it be rubbed therewith. And the vrine of this beast helpeth the Strangurie, to wit, the infirmities of the bladder when the water passeth

A passeth by drop-meale: which propertie they being by a naturall instinct aware of, so soone as euier they haue pissed, do hide and couer the vrine with mould, which with their feet they raise just ouer it, as it is commonly reported. The same vrine is prescribed for a good remedy in the pain or griefe of the throat. Thus much may suffice as touching forrein beasts: returne therfore now I will to those in this part of our world; and first declare the vertues and properties medicinal which are found common in all liuing creatures, yet making choise of those that be singular about the rest.

CHAP. IX.

B ¶ The common and ordinary medicines drawne as well from wild beasts as those which betame of the same kind. The vse of milk in Physicke, with the obseruations belonging thereto. Also of Cheefe, Butyr, the greafe also and tallow of beasts.

And to begin with Milk: these points following are to be obserued: *Imprimis*, Each liuing creature liketh best and findeth most good by the own mothers milk. *Item*, For nourses to conceiue with child whiles they giue suck, is a most hurtful thing to their babes: for after such a time, their milk will thicken and cruddle in manner of a cheefe (a dangerous matter for sucking infants) who thereupon be called Colostrati. Now the beestings, called in Latine Colostris, is that thick and spongy milk which is drawne first from the teat after the birth of the young, be it in woman or beast. Also, there is no milk so nutritiue as that of a woman, what soeuer it be: next vnto which, goats milk is thought to nourish most: whereupon haply arose the fable that Poets fained, who deuised, that *Iupiter* was suckled therewith. Howbeit, letting womans milke aside, the sweetest of all other is that which the Camels giue: but asses milk is supposed to haue most vertue and efficacie in it. Moreover, this is to be noted, that the bigger bodied beasts be more glad-milch, and their milk sooner passeth away through the belly and is easier digested than that of the smaller kind. Goats milk agreeth best with the stomach; the reason is this, because they brouse rather than graze: but cow milk is held to be more aromaticall and medicinable; howbeit ewes milk is the pleasanter, & yeeldeth more nourishment; norwithstanding it be not so wholesome, for that it is more fatty and grosse than any other. And generally, the milke which any beast giueth in the Spring, is more waterish & fuller of whey than in summer: time: like as the milke of any young thing is thinner than other. But simply the best milk is that held to be, which sticketh to ones naile and wil not run off. Milk is least offensive and hurtfull when it is foddren, especially with little grauell stones among. Cow milk of all other is thought meetest for to make the body soluble. But what milk soeuer it be, lesse ventrosities it ingendreth boiled than raw. In sum, this property hath milk in general, To heal all inward vlcérations, but chiefly of the kidnies, bladder, guts, throat, & lungs: applied outwardly, after a spare diet or abstinence from meat, it cureth the itch of the skin; & any wheals & breakings forth occasioned by phlegmatick humors. As for the diet drink made of cow milk (which they vse in Arcadia for the phthisick or consumption of the lungs, for those that be giuen to colliquations and to weare away, as also in case of milking when the habit of the body receiue no benefit by food) I haue written already in my treatise of herbs. We shall find vpon record in the Chronicles, diuers who by drinking asses milk, haue bin deliuered from the goat, as wel of hands as feet. The Greek Physitians, besides the generall kinds of milk, haue made mention of one more, which is artificial, and they name it Schiston: the maner of making it is thus: Take what quantity you will of any milke, but let it be of a goat especially, if you can come by it, seeth the same in a new earthen pan neuer occupied before, with certaine branches of fig-tree, such as be fresh and new gathered; but you must put to euery hemine of milke, one cyath of mead or honied wine: while it doth seeth, keepe it from running ouer the vessell, by plunging into it a siluer goblet or boll full of cold water, and take heed that none thereof doe run out: after it is thoroughly foddren take it from the fire; for when it is cooled, you shall see how the parts therof wil diuide, and the whey depart from the milky substance. Some there be, who take the very whey againe, being now very strong of the mead or Must aboute sayd, and boile the same vntill a third part thereof be consumed, and then set it a cooling abroad in the open ayre: The vse heereof is very effectual and commodious, if for fure daies space together, the Patient

tient take at times, with some rest between, one hemine thereof in a day; but after the drinking of this whey, if some exercise by gestation be presently vsed, it will haue the better operation. This drinke is vsually giuen to those that be subiect vnto the falling sicknes, the passions of melancholy, and the palfie; also for the leprosie, elephanisie, and all gouts or discales of the ioynts. But to returne againe vnto milke: a clystire made therewith, is excellent good against any inward gnawings and frettings occasioned by the taking of some strong purgatiue medicines. Also in case of the dysentery, or hot exulceration of the bowels, the decoction of milke foddren together with the grauell stones about the sea-side, or with barley ptisan, is passing good to be clysterized; but for the corrosion of the guts, the milke of kine or ewes is better than any other. Also for the dysentery or bloody flux, the milke that is injected by way of clystire, would be fresh and newly drawne from the vdder: for the cholique, it ought to be ministred raw without any boiling: in like manner is it to be vsed raw, for the diseases of the matrice, the sting of serpents, the phthisicke the poisons of the Cantharides, Salamander, Buprestis, & Pityocampe. But to grow vnto more particulars, cow milke is singular for them who be poisoned with drinking Colchicon, hemlock, Dorycnium, or the venome of the Sea-hare. As for asse-milke, it is souveraign good for those who haue taken inwardly, any plaster ceruse, * brimstone, or quick siluer: also to loosen the belly that is costive in a feuer: moreover, if the throat be exulcerat within, it is an excellent thing to gargarize therewith. The same is a very good restorative for them to drink, who after great weaknes are vpon their recouerie and would gather strength againe: such also as the Greekes call Atrophos, who haue no feeling nor benefit of their meat: also it may be allowed in an ague, so that the patient haue no head-ach. It was held in old time for a notable secret in Physicke, to giue vnto children before meat one hemine of asses milke; or at the end of a meale, if they felt any fretting or gnawing occasioned by their meat: but for default hereof, they vsed goats milke in stead of the other. The whey of cow-milke is about all, souveraign for those that be troubled with straitnesse of breath, so as they cannot fetch their wind but sitting vpright, if there be put to it a little cresses: also it is good therewith to anoint bleared eies, adding to euery hemine of milke foure drams of Sesame beaten to powder. Goats milke cureth the hardnesse and swelling of the spleen, especially if the goats being kept from meat two daies, were the third day fed with Ivy; of which milke the patient must drink three daies together, and forbear all other food: and yet milke otherwhiles is contrary to those who be giuen to head-ach, subiect to the debility of the liuer, and the opilation of the spleen; to such as haue the ague, occasioned by some infirmite of the sinews; or be troubled with dizinesse, with the murre, poise, and stuffing in the head; with the cough also, and bleared eies, vnlesse it be giuen as a purgation. Sows milke is of al other most excellent for the inordinat desire to the stooles, and straining thereupon without doing any thing; for the bloody flux also, and the phthisicke or consumption of the lungs. And some Authors there be, who affirme, that it is most wholesome for a woman to drink in any of the afore-named infirmities.

Of Cheefe, and the sundry kinds thereof, I haue spoken sufficiently in that discourse wherein I treated of Vdders, and the feuerall parts or members of liuing creatures. And verily *Sestius* attributeth the same effects to the cheefe made of mares milke, as he doth to that which is gathered of cow-milke: that kind of cheefe he calleth Hippace. Generally, all cheefe vn salted (or) fresh and Greene, is good for the stomack. Old cheefe stoppeth a laske, abateth flesh and maketh the body lean, yea, & is * hurtfull to the stomack. In sum, all salt meats take down those that be corpulent, whereas soft and tender viands do feed and nourish the body. Fresh cheefe applied with hony, reduceth the skin which is black and blew by reason of stripes, to the fresh and naturall color againe. * Old cheefe maketh the body costive, and assuageth the torments of the belly, if it be made into trofches, and those foddren in some stypticke or austere wine, and afterwards fried in a pan again with hony, and so applied. There is a kind of rotten & putrified cheefe, which the Greekes call Sapon: the same being punned with salt and drie Seruoises, and so giuen in wine to drinke, cureth the flux of the belly caused by the infirmite of the stomack. The cheefe made of goats milke, stamped into a cataplasme and so applied, healeth the carbuncles engendred about the priuy parts; so doth the soure cheefe also with oxymell. The same reduced into a liniment with oile, taketh away all spots in the skin, if the body be therewith annointed in a stouph or hot-house.

As touching Butyr, it is made likewise of milke, and among barbarous nations is held for the daintiest

A daintiest meat, and which doth distinguish the * rich and better sort from the poore commons. The milk of kine yeeldeth most butyr, whereupon it tooke that name: but the fattest Butyr is made of Ewes milke. Also there is a kind of Butyr gathered of Ewes milke: but in Winter the milke ought to be heated: whereas in summer time there needs no more to do but to presse it forth from the milk after much shaking & often agitation in certain long vessels (called cherns) hauing in the very mouth, a little narrow hole to receiue aire and giue vent to that within, or els otherwise stopped close, and bound vp with some cloth. Now in the churning, they vse to put thereto a little water, to the end that the milke may soure the sooner. After this beating and working of the milk, the thickest part [which is Butyr] floteth aloft, & is naturally of an oily substance. The rest they vse to boile in certain pans, & that which swims about, they take from hath, the better it is esteemed to be: & in very truth, stale butyr that hath bin long kept, is mingled in many compositions: for by nature it is * astringent, emollient, incarnatiue, & mundificatiue. Moreover, there is another way to make Oxygala, namely, to put four milke into the fresh and sweet which you would haue to be soure, and this kind of chern milke, four-milke, or butter-milk, call it what you will, is thought to be most wholesome for the stomacke. But the properties and effects thereof I will set down in another place.

Among the medicinable parts which be common to all liuing creatures, their fat deserueth greatest commendation: but especially swines greafe, which in old time they vsed with great ceremony and religion. Certes, euery at this day there is a solemne ceremony, that the bride newly wedded, as she entrench into her husbands house, should strike the side posts therewith for good luck sake. Hogs lard or greafe may be kept two manner of waies, either with salt, or as it is of it selfe vn salted: and indeed, the older, the better. The * Greeks in their books called it Axungia, because it is a beast that feedeth much of herb roots. Which is the cause also that their dung is much vsed for a number of purposes. And therefore take my words thus, that I meane no other swine but such as * feed and root in the field: among which, the female, especially a guelt that neuer farrowed, is more effectual than a [tame] bore, barrow hogge, or a breeding sow. But the greafe and dung both, of the wild bore, is preferred before al. Swines greafe then is imploied to goute an ointment made of it, with goose greafe, bulls tallow, and the greasie sweat of wooll carolin, and pitch. Hogs greafe alone vn salted and simply as it is, healeth burns and scaldings, yea, though one were scorched and sendged with snow. It cureth also kided heels, if it be tempered with the ashes of burnt barley and gall nuts pulverized, of each a like quantity, and so reduced into a salve. Also it is good to anoint merigals therewith, namely, when one part of the body is fretted & chafed against another: likewise it refresheth those that be weary & tired with much trauell: for an old cough, seeth of fresh hogs greafe, that is sweet, the quantity of three ounces in as many cyaths of wine, putting hony thereto, and let the patient drinke it. Old seame also that is tried and kept vn salted, made into pills and taken inwardly, cureth the phthisicke & consumption of the lungs. For surely if it haue taken salt once, there is no vse therof, vnlesse it be to mundifie and cleanse, or els before the part is exulcerat. Some there be who ordaine to seeth hogges lard & hony, of each three ounces, in three cyaths of wine, for a medicine to cure the consumption of the lungs: with this charge, that the first day after the patient take a quantity of tarre in a rare egge, hauing his side, breast, and shoulders well swadled before and emplaistered with the said composition: for so forcible it is, that if a plaster thereof be but bound to the knees, the very sent thereof will come vp to the mouth, and cause a kind of saluation, whereby the patient shall seeme to spit it vp againe. The greafe of a young guelt which neuer had pigs, is a very proper medicine for women, to make their skin supple and enen without wrinkles. But any hoggs seame tempered with beastes tallow or suet, to the quantity of a third part, & some pitch, all melted together, & made somewhat hot, is souveraign for scabs. Swines greafe that is pure and vn salted, if it be put vp beneath in manner of a collyrie or pessary, giueth comfort to the infant within the mothers wombe, which otherwise would haue bin ready to slip forth before time, and proue an abortiue fruit. The same being tempered with cerusse or litharge of siluer, into a salve, and so applied, reduceth any skars to the naturall colour of the other skin about them. But with

* Either for that the rich only are allowed to feed vpon butyr, or because they haue plenty thereof, and raise a yearly revenue for that commodity, whereas the rest can spare none from their own bellies: * *Quis magis virus respicit?* Some would amend this place, and for *[magis]* put in *[minus]* in a contrary sense: but I suppose he writeth in regard of barbarous people who make more account of such rancie butyr: like as the vnicuall fish in these dyes. * *Natura eius adstringere, some reade digere, it is digestive.* * And yet it is a latine name of *axis & ungus* because they vse to grease axeltrees therewith. * Not those that be franked or kept in sties.

* *Suppletur:* I marvaile hereat, considering that brimston may be taken inwardly with safety. I suppose therefore that for *Spum*, which is *Solum maticon*, is deadly dwale, (a pestiferous and venomous herbe) he read *Spum*, brimstone, in the author whom he followed.

* *Inutiliores:* ex *Discolor*, & *asurper*.

* *Pecunia*.

brimstone it cureth the raggednesse of the nails: it staieth likewise the haire of the head which G
is giuen to shed: also if it be mixed with a fourth part of gall-nuts, it healeth the vlcers in a w-
mans head: but if it be well smoked, it helpeth to preferue the haire of the eie-lids. An ounce
weight thereof boiled in one hemine of old wine, vntill there be three ounces and no more of
the whole remaining, is giuen (an ounce at once) to those who are in a phrissick. Some appoint
a little hony to be put thereto. The same together with Quick-lime reduced into a liniment, is
singular for the biles and impostumes called Pani, as also for felons and the hard tumors of wo-
mens paps: it serueth besides to cure inward ruptures and convulsions, spasmes, crampes, and di-
flocations. Being applie d with white Ellebore, it healeth corns, agnells, fissures, chaps and callo-
sities. But incorporat with the powder of a saltars pot-shard, it heales the swelling impostumes
behind the ears, as also the wens called the Kings euil, being ordered in like manner. If the body H
be well rubbed and annointed therewith in the baine or hot-house, it taketh away all itch, red
pimples & wheals rising in the skin. Moreouer, prepared after another sort, to wit, with old oile
together with the stone called by the Greekes Sarcophagus, beaten to powder, adding thereto
the herb Cinquefoile stamped in wine either with Quicklime or with ashes, and so reduced in-
to a liniment, it is very good for those that be troubled with the gout. Thereof also is made a
singular plaster against inflammations, in this wise, Take of the said grease the weight of four-
score and five pound, of white litharge of siluer one hundred pound weight, mix them both to-
gether. As for Bores grease, if there be a liniment made of it and rosin, it is thought to be excel-
lent good for to anoint therewith vlcers that be corrosiue and giuen to spread farther. [In old
time men vsed it most about the axletrees of their carts and wagons, anointing them therewith, I
that the wheels might turn about more easily: whereupon it took the name Axungia.] And be-
ing employed in this maner, it serueth for a medicin to cure the vlcers of the feet & priuy mem-
bers seruing to generation, by reason that it is mixed and coloured with the rust of the yron in-
corporat into it. The antient Physitians made most account alwaies of the said hogs grease, by
it selfe, which was plucked from the kidnies, for after it was clesned from the strings, veins, and
skins, they washed it often and rubbed it well in rain water, which done, they sod it in new ear-
then pots, shifting it out of one into another many times; and beeing thus tried and clarified,
they kept it for their vse. Howbeit, all are agreed, that when it hath taken salt, it is a greater e-
molliuic, it heareth also, discusseth and resolueth more: yea, & heing washed in wine, it is much
better than otherwise.

As touching the fat or grease of a Wolfe, *Massurim* writeth, that in old time it was esteemed
before any other, & had the price above all. And he saith, that new wedded wiues were wont vp-
on their marriage day to anoint the side posts of their husbands houses therewith at their first en-
trance, to the end that no charms, witchcrafts and forceries might haue power to enter in: thus
much of grease. Look what vertue grease hath, the same, be sure, is the suet and tallow endued
with which commeth from those beasts that chew cud: and although it may be handled & dres-
sed otherwise, yet in force it is nothing inferior. But what tallow soeuer it be, the best way of pre-
paring it, is after the skins or veins be rid away, to wash it first either in sea water or salt brine,
and then within a while to stamp it in a mortar, eftsoons sprinkling it with sea-water: after which
it ought to be sodden in many waters, vntill it haue lost all the sauer & rank tast that it had: and
then at last by setting it in the Sun continually, it will be reduced to a perfect whitenesse: more-
ouer, this is to be noted, that the best suet is that which groweth about the kidnies. But say that
old tallow is called for, and to be vsed in any cure, it ought first to be melted, and then anon to
be well and often washed in fresh cold waters; which done, it must be liquified a second time,
casting and pouring thereupon eftsoons the best odoriferous wine that may be gotten: after
which maner they vse to seeth it again and again, and neuer giue ouer, vntill the rank smell and
sent thereof be clean gone: and verily many are of opinion, that particularly the fat of Buls, Li-
ons, Panthers, and Cammels ought thus to be ordered and prepared. As for the vses & proper-
ties of these Pomonades, I will treat thereof in conuenient place.

Concerning marrow, it is a thing common to all creatures, like as the fat abouesaid. All the M
kinds thereof are emolliuic and incarnatiue: they dry also & heat the body. The best marrow
simply is that of Deere, as well red as fallow: next to it in goodnesse is calues marrow: and then
in a third rank follow kids and goats marrow. Prepared they ought to be and dressed, before Au-
tumn, when they be new and fresh washed, and dried in the shadow. But afterwards they must be
be

* If they come
from beasts of
hot nature: for
to herwise they
be temperat.

A be melted again and run through a finer sercer or pressed through linnen strainers, which done,
they should be put vp in earthen pots, and set in a cold place.

But of all those things which are generally to be found in euery living creature, the gall is
that which is of greatest efficacy in operation: for power it hath naturally to heat, bite, cut, draw,
discusse and resolu. The gall of smaller beasts is taken to be more subtil and penetratiue than
that of the greater, and therefore supposed to be the better for to go into eie-salues. Buls gall is
thought to haue a speciall faculty aboue all others, principally in setting a golden colour vpon
skins, & brasse. What gall soeuer it be, in the preparation thereof for any vse, regard must be had,
that it be taken fresh and new, and then the orifice of the burse or bag wherein it is contained,
ought to be tied fast with a good round packthred; thus being bound vp close, it must be cast in-
to boiling water, and there remain halfe an hour, within a while after, so soon as it is dried (out
of the Sun) it ought to be preserved and kept in hony. The gal of horses only is vtterly condem-
ned, & reputed as a very poison: which is the cause that the arch-Flamin or principall sacrificer
is forbidden by law expressly to touch an horse, notwithstanding that in Rome it is an ordina-
ry thing to sacrifice euen horses publickly: and not their gall alone but also their blood, is cor-
rosiue by nature, and putrifiatiue. The blood of Mares milke likewise, vnlesse they be such as
were neuer couered nor bare soles, doth corrode: in which respect it is good to eat away scurfe
about the brims of fores and vlcers: and verily * Buls blood fresh running out of the body, is
reckoned no better than venom: and yet I must except *Agira*, a city in Achaia, where the priest-
esse of the goddesse * *Ops*, at what time as she is to prophesie and foretel things to come, vseth
by drinking buls blood to prepare her self before she goeth down into the vault or shrouds out
of which she deliuereth her prophesies: so forcible is that sympathy, wherof we speak so much,
that otherwhiles it is occasioned either by a religious opinion & deuotion in mens mindes,
or els by the nature of some place. *Drusus* sometimes a Tribune of the commons in Rome, drank
(as it is reported) Goats blood, to make himselfe look pale & * wan in the face, at what time as
he meant to charge *Capio* his enemy with giuing him poison. And verily, the blood of a buck
goat is so strong, that there is not any thing in the world wil either sharpen the edge of any yron
tools sooner, or harden the same when it is keen, than it. And as for the ruggednes of any blade,
it will take it away more effectually and polish it better than the very file. Considering then this
diuersity which is seen in the blood of beasts, I cannot write thereof in such generall termes as
of a thing indifferently common to euery one of them, but I must be forced to speak particular-
ly of their severall effects. In which regard I will treat respectiue of beasts, according as they
do yeeld remedies against this or that malady: and first as touching those which are aduerse vn-
to Serpents.

To begin then with Stags and Hinds: no man there is so ignorant but he knoweth, that they
plague serpents to the very death, for they pluck them forth of their holes, and eat them when
they haue don. And not only whiles they be aliue do they war against serpents with the breath
of their nostrils, but also when they be dead, euery member and piece of their body is contrary
vnto them. Burne a piece of an Harts horne, you shall see how the smoke and smell thereof will
chase away serpents, as I haue obserued hertofore: & yet they say that the perfume of the bones
which are about the throat of a Stag, hath a contrary property, to gather them together. Let a
man lay vnder him Stags skins in stead of a matrace, he shall sleep securely, without any feare
that serpents will approach to do him harm. The rennet in their maw, or the rede it selfe, if it be
drunk with vineger, is a soueraigne antidot against their venomous sting: and look what day one
do but handle it, he shall be sure and safe from any danger by them. The generoits of a Stagge
kept vntill they be dry, like as the pizzle also made into powder and taken in wine, is a singular
counterpoison, resisting the venome of Serpents. Euen as the rim of the paunch, which is called
in Latine Centipellio. Who soeuer haue about them so much as the tooth of an Hart, or be an-
nointed with the marrow or suet of a Stag, Buck, or Hind-calf, need not to feare any serpents, for
they will flie from them. But aboue all remedies, there is none like to the rennet of a Fawne or
Hind-calf, such a one especially as was ripped out of the dams belly, as I haue shewed hereto-
fore. If together with Deeres blood there be burned the herbe Dragon, bastard Mariaram, and
Orchanet, in a fire made with Lentisk wood, Serpents (by report) will gather round together in-
to an heap: take away the same blood and put into the fire the root of * *Pyrethrum*, they will
scatter asunder againe.

* *Theriacetes*,
ther with poi-
soned himself.
* *Agira* or
Terra the
earth.

Invidia, for
Linos.

* *Pelitory* of
Spain.

I read in Greek writers of a certain beast lesse than a Stag, but like in haire, called Ophion, G which folk say is wont to be found only in the Isle Sardinia: but I suppose that the race of them is vtterly extint and gone. Wherefore I will forbear to write of the medicinable properties reported by that beast.

CHAP. X.

¶ *The medicines (against Serpents) found in the wild Bore, in Goats, and wild horses. Also of other remedies which diuers beasts do yeeld against all diseases.*

THe brains of a wild Bore is highly commended against the sting and venome of serpents. H So is the bloud likewise. Semblably, is the liuer kept and preserued long with Rue, if the same be drunk in wine. In like manner the fat of the wild bore incorporat with hony & rosin. Also the liuer of a tame bore being clenfed from the filaments and strings therein, taken to the weight of foure oboli, or the very brains drunke in wine.

If a man burn the horn or haire of goats, the fume thereof driueth away serpents, as it is commonly said: and the ashes that come thereof either drunke inwardly or applied in a liniment without, are of great force against their stings. Moreover, a draught of Goats milke taken with the grape of the vine Taminia, or of their vrine drunk with squilliticke vineger. Furthermore, it is said, that cheefe made of Goats milke together with Origan vsed in a cataplasme, or their tallow incorporat with wax, worketh the like effect. A thousand medicines besides are reported to be drawn from this beast, as shall hereafter appeare: whereat for mine own part I much maruel, considering, it is commonly said that he is neuer out of a feuer. The wilde of this kinde do afford medicines more effectuell than the tame, and those as I haue said multiplie exceedingly. As for the Bucks or male Goats, they haue medicinable properties apart by themselves. And Democritus saith, That the Buck which the dam bare alone, is of greater efficacy than any other: who affirmeth moreover, that it is very good to anoint the place stung with serpents, with Goats dung sodden in vineger: also with the ashes of the said dung fresh made, and tempered with wine into a liniment. In sum, as many as hardly are cured of serpents stings, recouer thereof passing wel, if they ordinarily haunt Goat-pens and stals where they be kept. But such as would haue a more speedy & assured cure, take the panch cut out of a Goat newly killed, together with the dung found therein, & presently bind the same fast to the place affected, so soone as they be stung. Others perfume the flesh newly hurt, with kids hair burnt: & with the same smoke chase away serpents: they vse also to apply their skin newly flaid, to the wound: like as the flesh and dung of a horse that lieth out and feedeth abroad in the field: the rennet likewise of an Hare in vineger against the prick of a scorpion and the venomous tooth of an hardishrew. Moreover, it is said, that as many as rub and anoint their bodies with hares rennet, need not feare their stinging. If any be hurt by a scorpion, Goats dung helpeth them; but the better, if it be boiled in vineger: and in case one be poisoned with swallowing down those venomous flies called Buprestes, he shall find great help by eating lard and drinking the broth or decoction thereof. Furthermore, if a man round an asse in the eare, and say closely, That he is wounded by a scorpion, the pain and grievance thereof will immediatly passe away: yea and any venomous thing whatsoever, will flie from the fume of his lungs as it burneth: also it is good for those who are stung by scorpions, to be perfumed with the smoke of calues dung. If a man be wounded by the biting of a mad dog, some there be who cut round about the place to the very quick, laying thereto the raw flesh of a calfe, and then giue the patient to drink the broth of the said flesh boiled, or els hogs greafe stamped with quick-lime. Others highly praise the liuer of a buck Goat, affirming that if it be once applied, he shall not fall into that symptome of hydrophobie or fearing water, incident to those that be bitten with a mad dog. They commend also a liniment made of goats dung and wine or hony tempered together: like as the decoction of a grey or badger of a cuckow and a swallow, taken in drink. For the biting of other beasts, it is an ordinary practise to lay vnto the sore, dry cheefe made of goats milke, together with origan, but they giue direction to drink the same in some conuenient liquor: in case one be bitten by a mans tooth, they prescribe boeufe sodden and applied, howbeit the flesh of a calf is more effectual; with this charge, that this cataplasme be not remoued before the fift day. It is a common saying, that the muffle or snout

A snout of a Wolfe kept long dried, is a countercharm against all witchcraft and forcery; which is the reason that they vsually set it vpon gates of countrey farms. The same force the very skin is thought to haue which is flaid whole of it self, without any flesh, from the nape of the neck. And in truth, ouer and aboue the properties which I haue reported already of this beast, of such power and vertue it is, that if horses chance to tread in the tracks of a Wolfe, their feet will be immediatly benumbed and astonied. Also their lard is a remedy for those who are empoisoned by drinking quick-silver. Asses milke if it be drunke, doth dull and mortifie the force of any poison: but more particularly, if any haue taken Henbane, the viscus gum of the herb Chamæleon, Hemlock, the sea-Hare, the iuice of Carpathum, the poison Pharicum, or Dorycnium: also in case that cruddled milke haue done harm to any, for surely it is no better than poison, especially the first beestings, if it quail and cruddle in the stomacke. To conclude, Asses milke hath many other medicinable properties which we will speake of hereafter. But remember alwaies to vse this milke whiles it is fresh and new drawne out of the vdder, or els not long after, & then it must be warmed: for there is not any milke that sooner loseth the vertue. Moreover, the bones of an Asse well broken, bruised, and sodden, are giuen for a counterpoison against the venome of the sea-Hare. And for all these purposes before said, the milke and bones of the wild Asses be thought more effectual.

As touching wild horses, the Greeks haue written nothing, because throughout all Greece there are none of them to be scene. Howbeit, whatsoever medicinable vertues be attributed to horses, the same we must think more forcible in the wild than in others. Neither had the Greeks any experience of those Neat or Buffles called Vri and Bisontes: & yet the forest of India be full of wild buls & kine. Now by good reason and proportion, we are to think, that whatsoever cometh from them, is more auailable in Physicke, than from the tame of that kind. And verily, Cow milke is said to be a generall counterpoison, able to kill any of those venoms abouenamed. Ouer and besides, if the dangerous Lilly called Ephemerum Colchicum, be taken inwardly and setled in the stomack, or if the Greene flies Cantharides haue bin giuen in drink, the said milke will send vp all againe by vomit. And as for the Cantharides, the broth of Goats flesh will doe the like. Against those corrosiue poisons which kill by exulceration, the tallow of a calfe or any Boeufe, is a soueraigne medicine. As for the danger that cometh by drinking Horse-leaches, Butyr made of Cows milke, is a singular remedy, if it be taken with vineger, heat with a gad of Steele. The same alone without any other thing is a good counterpoison, for if oile be wanting, butter may serue the turn as well. Being ioined with hony, it healeth the sores occasioned by the biting of the Porceleets called Multipedæ. The broth made of their tripes, if it be drunke, is thought to kill any poison abouenamed: and besides, the Aconite and Hemlock: so doth the suet of a Calfe. Greene cheefe made of Goats milke, is good for them that haue drunk the venomous viscositie issuing out of the herb Chamæleon, called Ixias: but their milke is a remedy against the flies Cantharides and the venomous hearbe Ephemerum, if it be drunke with the grape Taminia. Goats bloud sodden together with the marrow, is taken against the poisons called Toxicæ; and kids bloud against the rest. The rennet found in the maw of a kid, hath a peculiar vertue to mortifie the venom of the foresaid viscus gum Ixias, as also of the herb it self, Chamæleon the white, yea, and Buls bloud: for which the rennet of an Hare with vineger, is a singular defensatiue. Against the venomous Raie or Puffen called Pastinaca Marina: the pricke or sting also of any sea-fish, the said rendles of an Hare, Kid, or Lamb, is a singular antidot, taken to the weight of one dram in wine. As for the rennet of an Hare, it is one of the ordinary ingredients that go to the composition of all preseruatiues and counterpoisons.

There is a kind of Butterflie that vseth to fly about candles as they are burning, which is reckoned among poisons. The aduersatiue remedy against it, is a Goats liuer: like as their gal is soueraigne against any venomous drinks made of the rusticke weazill.

CHAP. XI.

¶ *Receits and remedies for many kinds of maladies, taken from sundry beasts.*

BUt now will I returne to the remedies appropriate to diseases respectiue to the particular members of the body: and first to begin at the head: Bears greafe mixed with Ladanum, and that kind of Maidenhaire which is called Adiantum, retaineth the haire of the head which is

is giuen to fall off: also the places that be already bare, it replenisheth again with new haire: the same being incorporat with the fungous excrecence growing about the candle-snuffe, as also with the foot found sticking to the lockers of lamps and candlestickes, causeth the haire of the eie-lids to come thick. Mixed with wine, it is good against the skurfe and dandruffe among the hairs: for which purpose serueth the ashes of Harts-horn burnt and applied with wine: the same also preferueth the haire from breeding lice and nits. Likewise, Goats gall mixed with Fullers * earth and vineger, if the head be washed withall, so as the hairs may dry againe by little & little. Semblably, the gall of * Buck-goats tempered with Buls stale, killeth lice: now if the sayd gall be old, adde thereto brimstone, and it scoureth besides the dandruffe. It is thought, that the ashes of an asse pizzle will make the haire to grow thick, and preserue them from being grey, if the place be first shauen and well rubbed therewith, or anointed with the liniment made of it and oile, punned together in a leaden mortar. Likewise, the vrin of a yong Asse sole is supposed to thicken the haire: but there would be mixed some Spiknard with this washing lie, to rectifie the strong sent of the said vrin. Buls gall mixed with Egyptian Allum, serueth for a liniment to make the haire come againe, if the bald place be anointed therewith warm. As for the running skals of the head, there is not a better thing to cure them than Buls vrin: so doth stale chamber lie, if there be put to it Sowbread and brimstone: howbeit, Calues gall is of greater efficacy in this case, which if it be mingled with vineger, and the head rubbed therewith hot, riddeth nits also. Calues suet stamped with salt and reduced into a liniment, is singular good for the fores in the head. In these cases great account is made of Fox greafe, but especially of their gall and dung, tempered with an equall portion of Senvy and so brought into an ointment. Take the powder or ashes of Goats horn, but principally of the Bucke, put thereto sal-nitre and the seed of Tamarisk: incorporat all with butter and oile into an vnguent. It is wonderfull effectuell in keeping haire from shedding, so that the head be first shauen. Semblably, the ashes of a dogge burnt, & made into a liniment with oile, causeth the haire of the eie-brows to look black: goats milk by report taketh away nits. An ointment made with their dung & hony together, causeth the hair to grow thick, in places despoiled thereof by occasion of some diseases. Likewise the ashes of their house incorporat with pitch, keep the haire on which is about to shed.

As touching the pain of the head, the ashes of an Hare burnt, mixed with oile of Myrtles, al-lay the same: so doth the blown water which is left in the trough after that a boeufe or Asse hath done drinking, if the patient take a draught of it: and if we may beleue it, the genitall member of a he-Fox, worne about the head in maner of a wreath, cureth the head-ache. The ashes of a Harts horn brought into a liniment with vineger, oile rosat or oile of Ircos, hath the like effect. For watering eies there is a singular ointment made of boeufe tallow boiled together with oile. And the ashes of Harts horn serueth by way of iniunction to cure their asperity and roughnes: for which purpose the very tip and points of the knags are thought more effectuell. The excrements or dung of a Wolfe are good to anoint the eies for the catara&t. The same reduced to ashes and made into a liniment with the best Attick honey, is singular for those whose sight is dim and troubled, so that the eies be anointed therewith: in which case, Beares gall is excellent. The greafe of a wild Bore incorporat with oile rosat, is singular good for the bloody fals or chil-blanes called Epiny&tides.

The ashes of an Asses house mixed with Asses milke, taketh away the cicatrices of the eies, together with the films and pearls that trouble the sight, if they be annointed therewith. The marrow of a Beefe taken forth of the right leg before, punned with foot, and so incorporat together in manner of a liniment, rectifieth the disordered hairs, and other accidents of the eye-lids and corners of the eies: but for to haue an excellent foot, proper to make a salve for to beautifie the eies, it ought to be gathered from a wicke or snuffe made of Papyr reed, and burning with Sesame oile, in such sort as the same may be wiped away with a wing into a new earthen pot that neuer was vsed: & verily, this is a soueraigne foot to hinder the growth againe of haire after they be once plucked vp from the eie-browes. Of an Oxe gall tempered with the white of an egge, are made eie-salues reduced into rolles, which beeing dissolued in water, serue to annoint the eyes for foure daies together. Calues suet with Goose greafe and the iuice of Basill, is singular for all the accidents whereto the eie-lids be subiect. The marrow of a Calfe, incorporate with equall weight of wax and common oile or oile Rosat, together with an egge, maketh a soueraigne liniment for the Strian or any other hard swellings in the eie-lids. The violent rheums that

A that fall into the eies, are repressed and allaiued with a cataplasme of tender cheefe made of goats milke foked in hot water, and so laid too: and if there be any tumor or swelling risen by occasion of such a flux, it would be applied with hony: and both of them, as well with swelling as without, ought to be fomented with warme whey. But say the eies be inflamed and bleered onely, without any * extraordinary moisture appearing in them, the little muscles lying within the loins of a swine, roasted and afterwards punned to a cataplasme, and so applied, do quite rid away the same bleerednesse. It is commonly said, that goats be neuer troubled with bleered eies, nor yet roe-bucks or does, by reason of certain herbs which they feed vpon: and for that their sight is as good by night as day, therefore certain pills be ordained for the infirmities of the eies, made of their dung, inwrapped within wax, for to be swallowed at the change of the Moone. Many

B there be who are of opinion, that such as be dim-sighted and see little or nothing toward night (whom the Greeks call * Nyctalopes) are cured with goats blood, especially the male: also with the liuer of a goat sodden in some austere or hard wine. Some giue direction, to annoint the eies all ouer with the graue or dripping of the said liuer roasted, or else with the gall of a goat, and to feed of the said flesh, with this regard, That whiles the same is a seething, the eyes may receiue the vapor and steem thereof. And of this opinion they be, that the said medicine will do the better, if the goat be of a bright ruddy colour. Moreover, they would haue the eyes of the patient to be fomented with the vapor and fume that riseth from the decoction of the liuer whiles it boileth: but others there be, that prescribe to take the smoke thereof as it riseth or

C frieth. As for goats gall, there be that vse it many waies prepared; some with hony, against the fumosities that trouble and dim the eie-sight: others, with a third part of white Ellebore, for the pin and web: others againe with wine, against cicatrices, pearles, obscurity of sight, films and spots. But for the eie-lids, after the haire which pricked and offended the eie is pulled out, they applie it with the iuice of Beets, suffering the said liniment to dry vpon the eie-lids. If any tunicles of the eie be broken, they take womans milke to apply vnto it. In sum, for all infirmities of the eies whatsoever, they hold a goats gall which is old and hath bin long kept, to be more soueraigne and effectuell in operation than any other. Neither doe they reiect the dung of this beast, but repute a liniment made of it and honey, to be as good for waterie eyes, as the marrow for the paine thereof: likewise the lungs of an hare. And verily the gall of an hare (as it is commonly reported) incorporat with cuic or honey, and so applied, helpeth those that be dim-sighted. Furthermore they ordaine, to rub and annoint the eies against their inflammation and bleedrednesse, either with woolues greace, or else with swines marrow. And no maruell, for they say, That whosoeuer vse to carry about them in a bracelet a foxes tongue, shall neuer be troubled with foreeies.

For the pain & infirmities incident to the ears, there is not a better nor more excellent thing than the vrin of a wild bore saued and kept in a glasse: the gall likewise of a wild bore or sow, as also of a boeufe, mixt with Cicinie oile and oile Rosat, in equall quantity, is a singular remedy: but especially buls gall, dropped into the ears warm with the iuice of Porret, or els with hony, in case they be impostumat within and run with water. The same alone by it selfe warmed in the rind of a pomegranate, is excellent to take away the ranke and strong sauour of the eares: and if any part within be broken, the said gall instilled with womans milke, healeth it effectually. Some there be, who ordaine the eares to be well washed with it so prepared, for to remedy the difficulty and hardnesse of hearing: others vse to put into the eares wooll, washed before in hot water, and inclose therewith a peece of a serpents slough, with vineger: but if the deafenesse be the greater, they infuse the said gall into the eares, tempered with Myrrhe and Rue, and so made hot all together in the pill of a Pomegranate. Fat lard also is good for this purpose: and the greene dung of an Asse instilled with oile Rosat, provided alwaies, that all these medicines be warme when they be dropped into the eares. But the some that a horse doth froth, is better than all these: or the ashes of horse dung fresh made and burned, mixed with oile of Roses. In this case likewise are commended boeufe suet, goose greafe, and fresh butter. The vrin of a Goat or bull, yea and stale chamber-lie which fullers vse, made hot, and the vapour thereof receiued into the eare, at the narrow mouth or necke of a bottle, cureth the deafenesse thereof. Some put thereto a third part of vineger, and a quantitie of the pisse of a calfe which is yet a suckling and neuer tasted grasse: yea and others there be, which put thereto the dung mixed with the gall of the said calfe. The skin or slough also which snakes cast off, is very good to be applied vnto the

* Nyctalopes

* Nyctalopes, are they also called, who see better in the night than by day: according as the word importeth.

* Creta Cimolia
* Hircium.
* Somerende
* Scropanum.
* Swines gall.

ears, but they ought to be well chaufed and set into an heat before. Now are these medicines to be inclosed within wooll, and so applied. Moreouer, calues tallow, with Goofe greafe and the iuice of Basill, is good for the hearing: also calues marrow incorporat together with the poudre of cumin, and so powred into the ears. The slimy sperme of a bore which passeth from the flap of a sow after she is brimmed, if it may be gotten before it touch the ground, is singular for the paine of the ears. If the ears be crackt and hang flagging down, there is nothing better than glue made of calues pizzles, if the same be dissolued in water. For other impediments of the ears, the fat of foxes is very good. In like manner, Goats gall, with oile of Roles warme, or the iuice of leeks: or if there be any rupture within the ears, the said gall must be applied with breest-milke. For those who be hard of hearing, or haue their eares running and suppurate within, it is not amisse to drop into them a beasts gall, with the vrine of a shee-goat or of the male, it makes no matter. But these medicines howsoeuer they are to be vsed, are thought to be more effectual by far, in case they were put into a goats horne, and so hung in the smoke for the space of 20 dayes together. Also there is great commendation of the rennet of an hare, if there be one third part of a Roman denarius thereof, and halfe a denare weight of gum Sagapene, conincorporat in Aminean wine. As for the swelling impostumes behind the ears, bears greafe represseth and keepeth them downe, if there be a cerot made thereof, together with the equall weight of wax and bulls tallow: some there be who put Hypocistis thereto: and butter alone is good to annoint them with, so that they were fomented before with the decoction of Fenigreeke. Howbeit, of much better operation it would be, in case Nightshade were added thereto. The stones of a fox, bulls bloud also dried and reduced to powder, be commended in this case. Moreover, the vrin of a shee goat made warme, and so dropped into the ears: the dung likewise brought into a liniment with hogs greafe is very good.

hogs greafe is very good
To come now to the infirmities of the teeth: if they be loofe and shake in their sockets, the afhes of harts horn will fettle them firme and faft again: if they ake, the fame afhes are verie good to eafe the paine, whether the teeth be rubbed or wafhed therewith. But fome are of opinion, that the powder of the faid horne not burnt at all, is far better than the afhes in thefe cafes: howbeit, there be dentifrices made both of the powder and alfo of the afhes. Moreouer, the afhes of a wolues head is thought to be a foueraigne remedy for the pains incident to the teeth. Now it is well knowne, that among the excrements of a wolfe, there be many times bones found, which if they be hanged about the necke, arme, or other parts of the body, haue the fame effect. Likewise the crudled rendles of an hare infused into the eare, are fingular for the tooth-ache: the afhes alfo which come of the head burnt, is a pretty dentifrice for to rub the teeth withall: but if you put Nard thereto, it doth correct and palliat a finking breath. But fome there be, who chufe rather to mingle therewith, the afhes of mice and rats heads. There is found in the fide of a hares head a certaine * sharpe bone like vnto a needle, herewith, Phyficians giue counfel to fcarifie the teeth and let the gums bloud, for the tooth-ache. Take the bone of a beaft, fet it on fire, and when it is red hot, hold it clofe to the teeth that be loofe and ake withall, it wil fet them faft againe: the fame being reduced into afhes, and tempered with myrrhe, is a proper dentifrice to blaunch the teeth. The bonie fubftance likewife of hogs cleyes burnt and calcined, is of the fame force and operation: alfo the hollow hetchill or whirlebones of their hips, about which their hucklebones turne, worke the like effect if they be brought into afhes. Well knowne it is, that if the fame be conuighed downe by a horne into the throat of horkes and fuch like beafts, they will cure the wringing torments of the botts that fret and gnaw them in the bellies: and beeing burnt, they are fingular good to confirme and faften the teeth that bee loofe and doe shake. Alfo if the teeth be payned by occafion of fome blow giuen vnto them, Affes milke helpeth them: fo do the teeth of the faid beaft, if they be calcined and reduced into afhes: this infirmitie is helped alfo with the roughwert or corne of an horfe if it be infused into the eares with oile: this bunch is called by the Greekes Lichen: and it is not that which is named Hippomanes, whereof I haue no purpofe to fpeak (confidering it is a hurtful and venomous thing) but a certaine excrescence growing about Horfe knees, and about their houfes. Moreouer, in the heart of an Horfe there is found a bone, like for all the world to the eye-teeth of a dogge: this they hold to be a very foueraigne thing for to fcarifie the teeth when they ake. Alfo if one take a tooth out of one of the chawles of a dead horfe, it will eafe his owne that aketh. fo it be correspondent in place and number to that which is in paine. The sperme that paffeth from

A from the mature of a mare after she hath been couered by a stallion, if the wicke of a candle of lamp be therewith besmeared and set a burning, doth represent a most strange and monstrous sight of horse heads, as *Anaxilans* hath reported: euen so will that of the shee Asse, make a shew and apparition of Asse-heads. As for Hippomanes before named, it is so strong and forcible a venome, especially to incite and stirre vnto lust, that being vpon a time poured into the brazen mettall that was cast into the forme and similitude of a mare at Olympia, the stone-horses which came neare vnto the said image, were set into such a heat and so farre enraged, that they could not by any means be held back but they would needs couer the said brazen mare. Moreover, the glew that Carpenters and Ioyners vse, cureth the tooth-ache, if the same be boyled in water, and the teeth annointed therewith, but the same within a little while after must be removed, and the mouth presently washed with wine, wherein were sodden the pill of sweet pomegranats. Furthermore, if the teeth be ill affected, a collution made with goats milke, or buls gal, is thought to be a remedy of great efficacy. Finally, the ashes of the ankle bones of a female Goat whiles they be fresh and new, are counted an excellent dentifrice to whiten the teeth: so are the said bones of all other four-footed beafts, reared or nourished about a ferme house, if they be in like manner calcined: which I note but once for all, because I would not repeat one thing so often.

С Ч А Р. XII.

¶ Remedies obserued out of the bodies of beasts, for the accidents that befall to the visage, necke, and breast.

IT is thought generally, that the skin of the face may be made smooth and without wrinkles, tender and delicate, yea and be kept faire and white, with asses milke: for well knowne it is, that some dauntie dames (forsooth) there be, that keep and maintain daily in ordinary to the number juit of 500 the Asses for this purpose: according to the first example of the Emperesse *Poppaea*, wife to *Nero* the Emperour; for she vsed commonly to bath in Asses milke, and deuised whole baines to swim therewith: and euer as shee rode in progresse, or remooued from place to place, she had her curie of the Asses in her traine attending vpon her for no other intent, but only to wash and bath her body in their milke. As for the pimples and wheales that breake out in the face, if they be annointed with butter, they will weare away and be gone; and the sooner, if Ceruss or Spanish white be tempered therewith: but pure butter alone without any thing else mingled with it, killeth any fretting humors in the face that be corrosiue, if so be that presently after the inunction, barly meale be cast vpon the place. The gleane of a Cow hauing newly calued, taken whiles it is moist and so applied, is good for any vlcers of the visage. There is another receit made for this purpose, which may seeme but a fantastical and foolish thing, howbeit, for to satisfie and please in some sort, our fine dames that are desirous of such deuises, I am content to set downe: They say (forsooth) that the pasterne bones of a young white bulkin or steere, sodden for the space of 40 daies and nights together, vntill such time as they be resolued into the liquor, if the face be wet with a fine linnen cloth dipped in the said decoction, it causeth the skin to looke cleare and white, and without any riuels or wrinkles; but the said liniment must be kept all night to the face in manner of a maske. Moreouer, they say, that bulls sherne is an excellent complexion forsooth, to set a fresh rosat or vermillion colour in the ball of the cheeke: and the liniment Crocodilea, made of Crocodiles ordure, doth it no better: but then they giue order, that the face be washed with cold water both before and after this dressing. The dung of a calfe tempered and wrought in ones hand with oile & gum, is singular good to take away sun-burning, or any thing whatsoever whereby the colour is decayed and lost. As touching the vlcers and chaps appearing in the lips or face, the suet of a Calfe, or beasts tallow, incorporat with Goose grease and the iuice of Basil, maketh a singular pomado to amend and redresse those defects and imperfections. There is another composition also for this purpose, to wit, calues suet and deeres marrow mixed together, with the leaues of the white *Saint Mary* thistle, punned all together and reduced into a liniment. The same operation hath any marrow, though it be of a cow, and the broth of cow boeufe. The tectars and wild-fires breaking forth about the mouth and nose, there is not the like medicine againe to be found, to kill and

extinguish, than a glew made of a calues genetoirs, dissolved in vineger with quicke brimstone, G
and mingled together with a fig-tree branch; with this charge, that when it is fresh made, the
place affected be anointed twice a day therewith. This glew boiled in hony and vineger, is sin-
gular for the leprosie: which disease, the liuer also of a calfe applied hot, doth cure: like as goats
gall healeth the foule white leproy called Elephantiasis: but an oxe gall and sal-nitre mixed ther-
with taketh away the leproy and the filthy dandruffe appearing in the skin. The vrine of an asse
taken about the rising of the Dog-star, clenseth the face from all spots: so doth the gall as well
of an asse as a bull, vied alone by it selfe, after it hath bin well broken and tempered in water, and
the old skin of the face taken off; but then the patient must forbear to goe abroad either into
the Sun or wind. The like effect hath buls tallow or calues gall, incorporat with the seed of Sa-
uorie and the ashes of an Harts horne, if the same be burnt at the beginning of the Dog-daies. H
Asses greafe is a soueraigne thing to reduce vnto a fresh and natie colour, any skars or places
of the skin blemished with the stools remaining of ringworme, tetter, and leprosie. The gall of
a buck-goat incorporat with cheefe, sulphur vit, and the ashes of a sponge, and brought to the
consistence and thicknesse of honey, taketh away moles and pimples. Some make choise rather
of old galls which hath been long kept to vse in this case, mingling therewith hot brans to the
weight of one obolus, and four times as much of hony, but first the said spots and specks ought
to be plied well with chaufing and rubbing. The suet of the same Goat, tempered with Gith
or Nigella seed, Brimstone, and Floure-de-lys root, is verie effectuell for this purpose. Sem-
blably it is good for the chaps in the lips, if it be incorporate with Goofe greafe. Deeres mar-
row, rosin, and vnuencht lime. I finde it recorded in some Authors, that they who are giuen to
haue red pimples appearing in their face, are disabled for exercising any sacrifices belonging to
Art Magicke.

If the tonsils, throat, and windpipe, be either inflamed or exulcerat, they finde much ease by
cow milke, or goats milke, so the patient gargarize therewith warme as it commeth new from
the beaf, or otherwise made warme againe afterwards: but goats milke is the better of the twain,
if mallows be sodden therein, and a little salt. For blisters in the tongue and throat, the broth
made of tripes is very good to be gargarised: and more particularly, for the inflammations and
fores incident to the tonsils or almonds of the throat, the kidnies of a fox dried are singular, if
they be beaten into powder and reduced into a liniment with honey. The gall of a bull or goat
mixed with hony, serueth right well for the squinancy. The liuer of a grey or badger tempered K
with water and made in manner of a collution, rectifieth a strong and stinking breath: the can-
kers also and sores in the mouth, are healed with butyr. If a thorne, fish-bone, or any other such
thing sticke in the throat, take the dung of a cat, rub & annoint the place wel without-forth, the
same (by report) will thereupon come vp againe, or passe downward. As for the swelling wens
called the kings euill, either the gall of a bore doth scatter and dispatch; or else of a boeufe, if
the place affected be annointed therewith warme: for hares rendles tempered with wine and put
into a linnen cloth, is good to be applied vnto the same onely when they be fore and run. The
ashes also of the house both of horse and asse, incorporat with oile, water, and hot vrine, into a
liniment, & so applied, doth resolue them before they be broken. Of the same effect is the ashes L
of an Oxe or Cowes clec, applied vnto the place with water: as also their dung laid too very hot
with vineger. In like manner Goats sewet with quicke-lime, or their dung sodden in vineger
and the genetoirs of a fox. For this purpose, there is much good done with sope: an inuention
deuised by the French for to colour the haire of the head yellow: made it is of tallow and ashes:
the best of all other is that which they make of Beech-wood ashes and Goats suet; and the
same after two manner of waies; either thicke and hard, or else liquid and soft: but the one as
well as the other is verie much vsed in Germanie, and a great deale more indeed by men than
women.

The crickes and pains in the neck, are much assuaged by rubbing the nape of the neck with
butter or beares greafe: if the same be stark and stiffe, there is nothing in the world better than
beasts tallow, the which, together with oile, is very good for the kings euill before said. The
painfull *cramp that draweth a man back, so as he cannot bow his head forward (which conuul-
sion the Greeks name Opisthotonos) is much eased by infusing into the eares the vrine of a shee
goat, or with a liniment made with their dung and bulbe roots.

If the nailes be bruised, it is passing good to tie about them the gal of any beaf whatsoeuer. As

* Cupinus &
posterganeus,
capinus. Auto-
liano.

A As for the risings and sore excrescences about their roots, buls gall dissolved in hot water, and
so applied, easeth that griuance: some there be who put thereto brimstone and alumne, of each
a like weight.

Moreouer, it is said, that a wolues liuer taken in a draught of wine warme, cureth the cough:
also a bears gall mingled with hony: or the ashes made of the vppermost tips of a beasts horne:
likewise the froth or flauer of an horse mouth: and some say, that be the cough neuer so bad, it
will make an end thereof in three daies drinking. Semblably, the lights of a stag, together with
the throat dried in the smoke, and afterwards puluerized and brought into a loch or liquid ele-
ctuary, is good for the cough, to be taken ordinarily euery day: and for this purpose, the lungs
of the spitter in this kind of red deere, is thought to be more effectual. In case a man spit blood,

B the ashes of Harts is much commended: and the rendles of an hares maw taken in drinke to the
weight of a third part of a denier, with Terra Samia and Myrtle wine, cureth it perfectly. The
ashes likewise of Hares dung drunk in wine late in an euening, staith the cough which is busie
in the night season: also a perfume made with the hair of an hare, dischargeth the lungs of those
tough and viscous humors which stick vnto them, and are not otherwise easily remoued. The
purulent vlcers in brest and lungs, remaining after a pleurisie or peripneumony: the strong and
stinking breath also proceeding from the lights, are cured most effectually with an electuarie
made of butter, boiled with a like quantity of Attick hony, vntill it look reddish, if the patient
take thereof euery morning the measure of one ligula or spoonfull: some in stead of hony, chuse
rather to put thereto the * rosin of the Larch tree. If one do reach or cast vp blood, it is said, that

C cowes blood, taken moderately and with vineger, is of great force and efficacy to stay the same:
but to think that this is meant of buls blood, were great folly and rashnesse. Howbeit the strong
glew that is made of a buls skin, taken to the weight of three oboli in warm water, is soueraigne
for an old infirmity of reaching and fetching blood vpward.

* Which is
our Turpe-
tine.

CHAP. XIII.

¶ Receipts for the paine of stomacke and loines: also for the infir-
mities of the reins.

D IF there be an vlcere growne in the stomacke, drinke the milke of an Asse or Cow, and it will
heale it. Stew a peece of boeufe in wine and vineger among, the broth thereof is singular for
the gnawing and fretting in the stomacke: the ashes of an Harts horne is verie good to drie
vp rheumes and catarrhes, that haue taken a course thither. As for those that cast vp blood, the
fresh blood of a Kid taken to the quantity of three cyaths, with the like proportion of sharpe
vineger, and so drunke as hot as may be: the rendles also of the said Kid drunke with vineger, so
as there be two third parts of the vineger to one of the rundles, is a singular remedy for the said
infirmities.

For the grieve of the liuer, caused by obstructions, the liuer of a wolfe dried and taken in honi-
ed wine, is a proper receipt. So is the liuer of an Asse being dried and brought into powder with
two parts of stone parsley, and so incorporat with three nut kernels and hony, which composi-
tion, the patient must vse to eat. In which case, goats blood is highly commended, if it be prepa-
red so as it may be taken with meat.

Moreouer, it is said, that for them who be short winded, there is nothing so good as to drinke
the blood of wild horses. In the next place to it, great account is made of Asses milke warme, or
sodden together with bulbe roots, so that the patient drinke the whey that commeth thereof,
putting to three hemines of the blood one cyath of white garden cresses, infused first in water,
and then tempered with hony. The liuer also or lungs of a fox, taken in some grosse wine like
Alegant: or a bears gall in water, doth open the wind-pipes stuffed with fleame, and giueth free
liberty for the wind to go and come.

Furthermore, Beares greafe is exceeding good for the paines in the reins of the backe, yea and
for any place els that hath need of emolliuities, in case it be wel rubbed therewith. Also in these
cases, it is thought meet, to take the ashes either of a bores or sowes dung which hath bin long
made, and therewith to spice a cup of wine.

But before I proceed any farther, it is to be noted, that Magitians also haue medled with this
part of Physicke, and haue deuised strange medicines, drawne from the parts and members of
beasts.

beasts. And first of all they would make vs beleuee, that be a buck-goat neuer so much intraged, G do but stroke him by the beard, he will come into good order and be quiet againe: cut and lop the same off with a paire of sheers, he will not stray away nor depart to another flock. But to returne to the griefe of the reins: the Magitians adde to the foresaid medicine, goats dung, which being put into a linnen cloth, and the same well greased, they giue direction to hold in the hollow ball of the hand, as hot as may be indured; with this regard, that if the paine be in the left side, this medicine be made in the right hand, and so contrariwise. Moreover, the dung or treadinges which must serue this turn, they giue order, that it be gathered and taken vp with the point of a brassen needle or bodkin. Now the foresaid medicine must be held in the hand so long, vntill the patient perceiue that the vapor thereof do pierce as far as the loines: which done, they appoint afterwards to anoint the head with the iuice of leeks stamped: to rub the loines also with H the said dung tempered with hony: giuing counsell, to eat the stones also of an Hare, for to appease the said pain. As for those that be troubled with the Sciatica, they ordaine a cataplasme of oxe or cow dung, to be laid vpon the griued place, but it ought first to be lapt within some leaues, and so made hot in the embers. For the pain in the kidnies, they giue order to swallow downe the kidnies of an Hare raw, or at leastwise foddren, yet so, as the patient touch them not with his teeth.ouer and besides, they do say, that whosoever haue about them the ankle bone of an Hare, shall not be griued with the belly ach. As touching the paine of the spleene, the gall of a swine, be it Bore or Sow, taken in drink, or the ashes of Harts horn in vinegar, assuageth the same. But the most effectuall and soueraigne remedy of all other, is the milt of an Asse which hath bin long kept; for within one three daies the benefit thereof will be felt, and the patient I shall find ease. Also, for the disease of the spleen, they vse to giue in oxymell, the ordure of an asses sole, which first came from it after it was soled (and this dung the Syrians call Polea:) furthermore, for this infirmity the tongue of an horse which hath bin kept dry a long time, giuen in wine, is a present remedy: and this is a secret which *Cacilius Bion* reporteth that he learned of the Barbarians, while he conuersed among them. In like manner, a beasts milt whether it be cow or oxe, hath the same operation, if it be vsed in that manner: but say it be fresh and new taken out of the beast, then it ought to be either roasted or foddren, and so taken as meat. ouer and besides, take 20 heads of garlick, pun them all, and after they be bruised, put them into a beasts bladder with a sextar of vinegar; apply the same to the region of the spleene, it assuageth the pain. And if all be true that these Magitians say, the milt of a calfe is singular good for the malady of the spleen; but then it must be bought at the same price that the butcher setteth first vpon it, without hucking and beating it lower for to haue any thing abated; because in their opinion (so ceremonious they be) therein lieth a great matter. Now when it is thus bought, it would be slit through the length in two parts, & both pieces attached to the shirt of the patient; with this charge, That when he is about to put on his other cloths and make himselfe ready, he suffer the said pieces to drop down to his feet, and then take them vp again, and so dry them in the shadow: for in thus doing, the diseased spleen of the sick party will likewise fall and settle down, so as the patient shall sensibly perceiue himself to be deliuered of that infirmity. Finally, the lungs of a Fox dried in the ashes and so drunk in water, is good for the spleen: as also the milt of a kid, applied to the griued part accordingly. K

CHAP. XIII.

¶ For to stop a leak and knit the belly: for the flux proceeding from the imbecillitie of the stomacke: for the dysenterie or bloody flux: for the ventosities and inflation of the belly: for ruptures: the straining vpon the sege without doing any thing: for the wormes in the guts, and for the cholique.

TO stay the running out and extraordinary loosenesse of the belly, these medicines following be conuenient: *Imprimis*, the blood of a stag: *Item*, the ashes of an harts horne: the liuer of a bore fresh and without any salt at all, taken in wine: likewise the liuer of a sow roasted, or of a male goat foddren in one hemine of water: the crudled rennet in a hares maw, drunk in wine to the quantity of a cich-pease, or in water, in case the patient haue an ague. Some there be, who put gall nuts thereto, others content themselues with Hares blood alone foddren with milke. Also the ashes comming of horse dung drunke in water: the ashes of that part of an old bulls

A bulls horne which groweth next to the head, strewed into a draught of water. In like manner, Goats blood foddren vpon coles. A Goats skin or fell, haire and all boiled together, yeeldeth a decoction which is good in this case to be drunke.

Contrariwise, to loose the belly: the runnet found in a Colts maw: the blood of a femal goat, or els hermarrow or liuer, are thought conuenient laxatiues. *Item*, a plaster made with a wolues gal, together with the iuice of a wild Cucumber, and applied to the nauil. Also a draught either of Mares or Goats milke, taken with salt and hony. The gall of a she-Goat is good for this purpose, if it be taken with the iuice of Sowbread and a little Allum. But some there be who think it better to put thereto salnitre and water. Buls gall stamped and incorporat with Wormwood, made into a round ball, and so put vp in stead of a suppositorie, will giue a stoole, and make the body soluble.

Butter eaten in any great quantity, is good for those who haue a flux occasioned by the weakness of the stomack, and a dysenterie or bloody flux: so is a Cowes liuer: the ashes of an Harts horn, taken to the quantity of as much as three fingers will comprehend, in a draught of water: likewise the rennet of an Hare wrought in dough for to make bread: or if the patient do voyd blood withall, the same ought to be incorporat in parched Barley meale. The ashes of a Bores, Soves, or hares dung, is good to spice a warme potion of wine in these infirmities. Moreover, an ordinary Veale broth, as it is commonly giuen, is counted one of the remedies for these kind of fluxes abouenamed, whether they come of feeble stomacke or exulcerat guts. But if the patient drink Asses milk for this purpose, it will be the better, if hony be put thereto. Furthermore, the

C ashes of an Asse dung taken in wine, is as effectuall in operation as the rest, for both diseases. As also the first ordure of the Asse sole, which we termed Polea in the former chapter. The ciuds or rennet of an horse sole maw, called by some Hippace, is soueraigne for such lasks, yea, though the patient did shere blood vpon the stoole. The ashes also of horse dung, and the powder of Horse teeth is said to be singular: yea, and Calues milk foddren and so drunke. But if the flux do proue to be a dysentery, Physicians giue aduise to put thereto a little hony: if gripes come thick, they prescribe the ashes of Harts horn, or buls gall tempered with Cumin seed: and the fleshy substance of a Gourd, to be laid in maner of a cataplasme to the nauil. The tender cheefe curd of Cowes milke clysterized, is passing good both for the stomack flux, and also for the bloudie flux. In like sort the butter made of Cows milk taken to the quantity of foure hemins with two ounces of right Turpentine, either in the decoction of Mallows or oile of Roses. The suet of a Calfe, or beasts tallow, is likewise an ordinary remedy in these cases. But diuers there be who seeth the marrow forth as well of the one as the other, with meale, wax, and a little oile, yet so, as the broth be clear, that it may be supped off. Their marrow also is vsually incorporat in the paste whereof bread is made, and so taken with great successe. Goats milke foddren vntill the halfe be consumed, is reputed also a proper medicine. And in case the guts besides be wrung & griped; there would be put thereto a little vnpressed wine of the first running, called Mere-goutte: howbeit, some there be who think it sufficient for to appease the torments of the wombe, to drinke Hares rennet but once in a draught of wine warm: but the wiser sort and those that deale more warily, think it good withall to make a liniment of goats blood, incorporat with barley meale

E and rosin, & therewith to anoint the belly. And they also aduise their patients for any violent flux of the belly whatsoeuer, to apply thereto soft cheefe: but if the flux be from the stomack, or dysenterical, they prescribe old cheefe to be grated and giuen to the patient in wine, with this proportion, that in 3 cyaths of wine there be a third part of cheefe. Goats blood boiled with this marrow, is singular good for the dysentery or bloody flux. The liuer of a female goat roasted, is a soueraigne medicine for the fluxions of the stomack, but it were better if the male Goats liuer were taken in drinke after it hath bin foddren in some green and austere wine, or with oile of Myrtles reduced into a cataplasme, and so laid to the nauil: some seeth the same in water, from six sextars to one hemine, and put Rue thereto. Others roast the milt of a goat, male or female (& skilleth not) and vse it for the same purpose, or else they take the suet of a buck goat with bread that hath bin baked on the hath vnder the embers. But aboue all they hold, that the suet taken from the kidnies of a she goat, & so drunk alone by it selfe, is a singular remedy for these infirmities: but they inioin the patient presently therupon to drink a little cold water. Yet there be others who ordain the same suet to be boiled in water with fried barley groats, Cumin, Dill, and vinegar mixt all together. And they giue order to such as haue the stomack flux to anoint their bellies

The eight and twentieth Booke

bellies with Goats dung sodden with honey. And for both these fluxions, as well from the stomack as the vicer of the guts, they prescribe the rennet of a Kid to the quantity of a Beane for to be drunk in Myrtle wine: also a pudding made of the bloud thereof, which kind of meat we call in Latine * Sanguiculus. Moreouer for the dysenteric, they ordaine to iniekt into the guts by a clystire, Bulls glue resolued in hot water.

For any ventosities, Calues dung is holden to be singular good for to resolue them, if it be sodden in wine and the decoction thereof vsed. But if the guts be diseased any waies, the rennet of red Deere is very effectually, sodden with Lentils and Beets, and so eaten with meat. Likewise the ashes of the haire of an Hare boiled with hony. Also to drink Goats milk sodden with Mal-lowes and a little salt put thereto, is good for the said infirmities: but if the rendles be mixed therewith, the operation will be the better. Of the same vertue is Goats suet, taken in any warm supping, with this charge, that the Patient drinke presently vpon it cold water. Moreouer, it is said, that the ashes of a kids hanch hath a wonderfull vertue to soulder the rupture, whereby the guts are false downe. Likewise, Hares dung sodden with hony, and taken euery day to the quantity of a Beane, is a medicine for a rupture, so soueraigne, that it hath bin knowne to cure them who were past all hope of remedy. Much commended also is the decoction of a Goats head sodden, haire and all together.

The disease called Tenefmos, which is a desire to go often to the stoole without doing any thing, is cured by drinking of Asses and Cowes milke.

All the sort of worms bred in the guts, the powder of Harts horn taken in drink, doth expell. There be, as I said before, certaine bones found among the excrements of a Wolfe, which if they be hanged about the arme, do cure the Collicke; if this regard were had before, that they neuer touched the ground. As for Polea (whereof I made mention before) which is the first ordure of an Asses sole, it is singular good in that case. Likewise the powder of a Sows dung taken in the decoction of Rue sodden in water, with Cumin, is singular for the collicke. Finally, the ashes of a yong Harts horne while it is new come vp and tender, incorporat with the shell fishes of Barbary, stamped shels and all together, and so taken in a draught of wine, is highly commended for the passion of the cholicke.

CHAP. XV.

¶ For the dolorous torments of the bladder: for the stone and grauell. The remedies for the infirmities of the members, of generation, of the fundament and the share.

THE vrine of a Bore helpeth those who be tormented with the paine in the bladder, and the stone: yea, and the very bladder of the Bore eaten as meat, is singular good in that respect. Howbeit, if the one and the other were permitted to be consumed before in smoake, you should see a greater operation. Now the said bladder ought to be first sodden & then eaten: and if a woman be troubled with the said griefs, she is to chuse the bladder of a wild sow. There be found also in the liuers of Swine certain little stones, or els hard callosities like vnto stones, and white of colour, such as we may see daily in our tame swine: which being beaten into powder and drunk in wine, do expell the stone and grauell within our bodies. And verily the Bore feedeth himselfe so far forth charged with his own vrine, that vnlesse hee be deliuered thereof before, he is not able to flie before the chafe, but suffereth himselfe to be taken as if he were inclosed and fast bound within net and toile: and they say that his vrine doth burne him within. The kidnies of an Hare kept vntill they be dry, then made into powder and drunk in wine, doe thrust forth the stone. In the pestle and gammond both of a swine, there be certain ioint whirlobones as I haue said before, which if they be sodden, do yeeld a broth that is very good for the easie passage of vrine. Likewise, the reins of an Ass dried, pulverized, & giuen in pure wine of the grape, do cure the diseases of the bladder. The furots or rugged werts in horse legs & the corns about their hoofs called Lichenes, drunk either in simple wine or meath for the space of 40 daies together, do expell the stone and grauell engendred in the body: the ashes also of an horse house, taken in wine or water, is good in that case. In like maner Goats dung drunk in honied wine, is singular for those accidents; but especially that of the wilde Shamois is much more effectually. Moreouer, the ashes of Goats haire is thought to auaille much in these diseases.

As touching the botches and carbuncles which arise in the priue members; the brains and bloud of a Bore or Sow are thought to be proper remedies for them: and say there be some cancerous or corroding vlcers in those parts, the liuer of a Bore or swine burned in a fire made principally of Luniper wood, together with the Papyr reed and Arfenicke, doth heale the same: so doth the ashes of their dung. Or els take a Cow or Oxe gall and Egyptian Allum, wrought and incorporat together with * Myrrh, to the consistence of honey. Beets also sodden, yea, and their flesh boiled in wine and so applied as a cataplasme. In case they be running sores: the suet and marrow of a calfe boiled in wine, or Goats tallow tempered with hony and the iuice of the brier, are reputed to be soueraigne. Now if the said sores spread farther stil, it is said, that their dung incorporat with hony or vineger, doth much good: as also butter and nothing els simply applied to the grieved place. If the cods do swell, the suet of a calfe made into a liniment, with sal-nitre put thereto, keepeth downe the tumour. Of the same operation and effect is the dung also of a Calfe boiled in vineger.

Such as cannot hold their vrine, but that it passeth from them against their wiils, finde great helpe by eating of a Bores bladder roasted or broiled. And verily the ashes of a Bore or Sows cleyes, is singular good against the involuntary shedding of vrine, if a cup or drinke be spiced therewith for the patient to take. Likewise, the bladder of a Sow burnt and giuen to drink, serueth well in this infirmity: so doth the bladder of a kid, or the lungs in that manner vsed. Furthermore, it is said, That the brains of an Hare taken in wine, is singular to helpe this infirmity. Semblably, the stones of an Hare broiled and eaten, or the rennet in the Hares maw, incorporat with Goose grease in Barley groats. The kidnies besides of an Ass, reduced into powder and drunk in pure wine of the grape. The Magitians haue a deuise by themselves, and they affirme, That for to hold ones vrine, it is passing good to drink the ashes of a Bore pizzle in sweet wine: but they instruct the patient withall, to make water in a dogs kenel, and in so doing, to say these words, *I do this, because I would not pisse my bed as the dog doth his couch*. Thus much for the incontinency of vrine. Now if one be pent and would gladly void vrine, let him take the bladder of a Swine, so that it neuer touched the ground, and apply the same to the share, for it will prouoke the water to passe.

But to come vnto the diseases of the * seat: there is nothing so good for them as Bears gall, incorporat together with their grease. Some put thereto litharge of siluer and Frankincense: in which cases butter is very good, if with Goose grease and oile of Roses it be reduced into a liniment: the consistence or thickenesse of which composition, must be such as the grieved place will admit; namely, that it be gentle and smooth, so as there be no paine in the anointing. Also Bulls gal is a soueraigne medicine applied thereto vpon soft lint: for it wil quickly skin the chaps and clefts in the fundament. If that part be swelled, the suet of a Calfe is very good to anoint it therewith: but if the tumors appeare about the share, then there would be Rue iointed thereto: as for other infirmities incident to those parts, nothing better than Goats bloud, tempered with parched Barly meale. In like manner, for the hard knobs in the seat called Condylomata, Goats gall by it selfe is a speciall remedy: so is the gall of a Wolfe tempered in wine and so applied.

For the biles and impostumes rising in any place therabout, there is not a better medicine to scatter and dissolue them, than Bears bloud or Bulls bloud, dried first and so beaten to powder. But the soueraigne remedy of all others, is the stone which a wilde Ass is said to void with his vrine, at what time as he is killed in chafe: which stone as it cometh first forth of his body, seemeth very liquid and thin, but being shed once vpon the ground it groweth thicke and hard of it selfe. This stone tied to the twist or inward part of the thigh, is said to dispatch all collection of humors that might ingender biles and botches; or at leastwise so to resolue them, that they shall neuer impostumat and come to suppuration. This stone is very rare and hard to be found, for it is not in euery wild ass: but surely famous it is and much spoken of by reason of this medicinal property that it hath. Moreouer, the vrin of an Ass together with Nigella, otherwise called Gith, is singular good in these cases. Likewise a liniment made with the ashes of an horse house incorporat together with oile and water: so is the bloud of any horse, but especially of a stallion: the bloud also and gal of a Cow or Oxe. Their flesh moreouer, which we call boeuf, hath the same effect, if it be laid warme vnto the place. The ashes also of their cleies tempered with water and hony. The vrine of the Goats; the flesh of the male Goats boiled in water. In like manner their dung sodden with hony. Bears gall or the gall of a bore: last of all, the vrine of a Sow

applied

hemorrhoids,
chaps, fissures,
and swelling
biggs.

applied vnto the place with wooll. As touching the galls, which by ouermuch riding on horse-back be incident to the twist and the inner parts of the thigh, as euery man knoweth full well, which do burne and chaufe the skin in those parts; the some slime which a horse yeeldeth, as well from his mouth as his cullions, is foueraigne therefore, if the place be annointed therewith. It falleth out many times that there arise swellings in the very thare and groine, by occasion of some fores or vlcers in other parts of the body, for the repressing of which, there is a present remedy, namely, to take three horse hairs, and to tie them in as many knots, and so conuey them into the said vlcer which is the cause of such tumors.

CHAP. XVI.

¶ Proper remedies for the gout: the falling sicknesse: for such as be taken or stricken with a Plannet or dead palse: for the Iaudise, and fractures of bones.

A Cerot made of Beares greafe, Bulls tallow, and wax, of each an equall quantity, is singular good for the gout in the feet. And yet some there be who adde vnto them Hypoquists and Gall nuts. Others preferre a male Goats tallow, together with the dung of a female goat, Saffron, or Mustard seed, and the branches of Yvie stamped with Parietary also of the wall; or els the floures of the wilde Cucumber, reduced all into the forme of a cataplasme and so applied. In like manner, others vse a pulstesse made of beafts dung & the mother of vineger tempered together. Some magnifie & highly commend in this case the dung of a calfe, which hath not as yet tasted of grasie, or Bulls blood alone without any other thing: likewise a wolfe sodden in quicke till all the flesh be gon and nothing but bones remaining: or els a liue Wolfe sodden in oile till the said oile be gellied to the height or consistence of a cerot. Semblably, there is good account made of the tallow of a hee goat, with as much Parietary of the wall, and a third part of Senvy: as also of the ashes of Goats dung incorporat with hogs greafe: moreover, it is said, that the best thing that the patient can do for to haue ease of the Sciatica, is to endure the said dung as hot as possibly he can, vnder his great toes, till it be ready to burne them. For all other joint-gouts as well in feet as hands or elsewhere, the gall of a Beare is a foueraigne medicine: as also a Hares foot bound fast to the place affected. And some are of this opinion, that the gout of the feet will be assuaged, in case a man cut off the foot of a quick hare, & carrie it about him continually. As touching kibes, beares greafe cureth them: so it healeth also the chaps in the feet: but more effectual it is, in case there be allum put thereto: for which purpose Goats suet is commended: the pouder also of horse teeth: the gall of a bore or sow: the lights likewise of a swine, together with the fat laid to the place. Now if the feet be subatted, galled, and bruised in the sole by treading or stumbling against that which offendeth them, the same medicines be very good: but say they are benumbed and frozen with cold, the ashes of Hares haire bringeth them into order again. The lungs also of an Hare slit and skied & so laid too, is good for any bruise or contusion in the feet, or the ashes of the said lungs applied thereto. Contrariwise, if they be scorched, and burnt with the heat of the sun, they find a most foueraigne cure by the greafe of an asse: likewise by boeufe tallow & oile of roses mixed together. The corns, agnells, chaps, & callosities of the feet, the fresh dung of a bore or sow doth heal, if it be applied thereto in form of a cataplasme, and not remoued before the third day. Of the like efficacy are the ashes of a swines ankle bones, the lungs of a bore or sow, or of a stag. If one haue galled his feet by the fretting & stubbornnes of hard shoes, the vrin of an asse together with the mire that is made of the same vrin vpon the ground, doth heal if it be applied to the place: the corns or agnells find much ease by boeufe suet & the pouder of frankincense reduced into a liniment. But kibed heels are best healed with the ashes of lether burnt, especially if it were an old shoe. Again, if the feet haue bin wronged by strait shoes, take the ashes of a goats skin tempered with oile. As for the painfull swelled veins, named in Latin Varices, there is a foueraigne cataplasme to assuage their griefe, made with the ashes of calues dung boiled with lilly roots, & a little hony put thereto: the same is singular for all impostumat inflammations that tend to suppuration. This medicin is good also for the gout in the feet, & for all diseases of the ioints, if so be the said dung came from an ox calf: The ioints if they haue gotten a sprein by any rush, find remedy by the dung of bore or sow, if it be laid to hot in a linnen cloth. The dung also of a calf that yet sucks & neuer did eat grasie, hath the same effect: euen as goats dung boild with hony in vineger: the raggednes of nails haue a proper remedy of

A of calues dung, of goats treddles likewise, if there be red Arsnick or Orpinent mixed therewith. As touching werts, there is not a better thing to take them away than the ashes of Calues dung tempered with vineger, or the durt that is made by the vrin of an Asse.

B For those that be subiect to the falling euill, it is singular good to eat the genetours of a bear, or to drinke the stones of a Bore either out of Mares milk or plain water: also the vrin of a bore mingled with oxymell. But more effectually in operation is that vrin which hath bin suffered to dry as it lieth in the own bladder. The stones likewise of a sow which are taken from her when she is spaiued, if they be kept vntill they be dried, and so brought into pouder, are excellent in this case taken in the milk of a sow, with this charge, that the patient abstain from wine for certain daies together, both before and after the receiuing of this medicine. For this infirmity also they vse to giue the lungs of a hare poudered or kept in salt, with a third part of frankincense in white wine for 30 daies together. Also the rennet or cruds found in the maw. The braines of an Asse first dried in the smoke * within certain leaues, drunk to the weight of halfe an ounce euery day in honied water; or the ashes of the said beafts house, taken to the quantity of 2 spoonfulls daily for a months space, are appropriat medicines for this malady. In like manner, their stones preferred dry and reduced into pouder, serue to spice their drink, whether it be the milk of Asses (which is the best) or shere water: the pellicle wherein the yong sole was lapped in the dams womb, specially if it were a male that was soled, is of great force to withstand this disease, if the patient do but smell thereto when the fit is comming. Some giue counsell to eat the heart of a black he asse, together with bread: but in any wise it must be done abroad in the open aire, and when the moon is but one or two days old at the most. Others prescribe to eat the flesh; & there be againe who aduise to drinke their blood dilaid with water for 40 daies together. Some take horse stale, mingling it with smiths water fresh out of the forge for the said purpose: & with the said drink cure those that be lunatick & mad at certain seasons. Mares milk is ordinarily giuen with good successe to those that be troubled with the falling euill: so are the rugged * werts growing vpon horse legs to be drunk in oxymell. And to this effect the Magitians would haue a dish of meat made with goats flesh roasted against a funeral fire, where some dead corps is burnt: who ordain besides their tallow and bulls gall, of each an equall weight, to be sodden, and then to be put vp again into the bladder or bursle of the said gall, that it touch not the ground in any case; and being thus prepared, the patient forsooth must drinke it in water standing vpon the dore sill, and vnder the very lintell thereof. Now, if you would know whether a man be subiect to this sickness or no, do but burn before him either a Goats or Stagges horne, the very smoke or fume thereof will bring the fit vpon him, if he be tainted therewith.

Concerning those that be suddenly taken with a dead palse of the one side of their body, it is said that the vrin of an Asse sole incorporat with Spikenard into the form of a liniment, is very good for them, if the inunition therewith be vsed.

E For the Iaudise, Harts horn burnt and reduced into ashes, is a very proper medicine: so is the blood of an asse sole drunk in wine. Likewise the * dung of an asses sole which came first from it after it was soled, giuen to the quantity of a bean in a draught of wine, cureth the Iaudise within three daies. The same operation and effect there is in the first ordure that a colt maketh after it is come into the world.

If any bone be broken or brused, there is not a more present remedy than the ashes of a cheek either of a wild bore or tame swine. In like maner, their lard sodden & tied round about the broken bone, doth consolida and fonder it again wondrous soon. And verily if there be any ribs in the side broken, the foueraigne and only remedy commended, is goats dung tempered with old wine, for it openeth, draweth, and healeth the fracture thoroughly.

F As touching feuers, the feeding vpon the venison of red Deere driueth them all away, as I haue before shewed: but more particularly, if it be any of these Typicke and Periodicall agues, which be intermittent and return by fits, there is not a better thing, if we may beleue Magitians, than to take the right eie of a wolfe, salt it, and so tie it about the necke or hang it fast to any part of the patient. Of these feuers, there is one called a quotidian, which the Greeks name Amphemerinos; & from it (by their saying) a man shal be thoroughly rid, in case he let an asse blood in the eare vein, and drinke three drops thereof iust in 3 hemines of water. But against the Quartan ague, the Magitians giue order to wear about the neck or hanging to the arme cats dung, together with the claw or toe of a * scriche Owle, but so as they may not fall off nor be remoued

moued before seuen fits be past. Now tell me (I pray you) what was he that could find out this secret first? Gladly would I learne what reason there is in this mixture, and why an owles claw or toe was chosen about all other for this purpose? Certes, there be some of them yet more modest than their fellows: and they haue giuen out, That the liuer of a Cat killed in the wane of the Moone, laid vp in powder with salt, is to be giuen in a draught of wine a little before the access or fit of a Quartan. And these magicians haue yet another pretty receipt against such agues: for they take the ashes of a Cow or Oxes mucke, and sprinkle it wel with the vrin of a yong boy; wherewith they anoint the toes of the patient: but to his hands or arms they bind the heart of an Hare; which done, they ordain also to giue him before the fit, the Hares rennet in a draught of drinke. To conclude, they say, that a fresh greene cheefe made of Goats milke, out of which the whey hath bin well pressed, is singular to be giuen in hony.

CHAP. XVII.

¶ Proper remedies against the trouble of the braine by reason of Melancholy, against the leibargie, dropicks, shingles, and S. Anthonies fire. Also for the paine of the sinewes.

THe dung of a Calfe sodden in wine, is an excellent remedy for those who are given to melancholy. For to raise and awaken them that are in a lethargie, there is not a better thing than the rough werts growing upon an Asles leg, if the same be tempered with vinegar into a liniment, and the nostrills anointed therewith: also the perfume of the horne or haire of a Goat: yea, and a bores liuer: which is the cause that it is given ordinarily to those that haue the drowie disease, and be alwaies sleepe.

For the phthysicke, the liuer of a wolfe foddren in wine is very good: likewise the lard of a lean running sow feeding only vpon grasse: as also Asse flesh foddren and eaten with the broth: and verily in Achaia this is the principall course they take for the cure of that diseafe. Moreouer, it is said, that to receiue through a pipe or reed the smoke of the dry dung made by Cow or Oxe lying forth and feeding only vpon green grasse, is very wholsome for those that haue the phthysicke or consumption of the lungs. Also there be who calcine the tips of Boeufs horns, & taking the measure of two spoonfulls of the ashes, incorporat the same with hony, make it vp into pills, and so swallow them down for the said malady. Many there are who affirm, That the phthysicke and cough be cured by eating a kind of portage made with Frumenty corne and goats suet: and they hold opinion, That the said suet taken fresh and sweet and so dissolved in mead, with this proportion, that to every cyath of the mead there be put an ounce of suet, and that order be taken to mingle them thoroughly well, with a branch or sprig of Rue among, is a foueraigne medicine for those infirmities. There is one writer of good credit & authority, who vpon his certain knowledge doth auouch, That there was one so far gone in a phthysicke, that he was giuen ouer by the Physitians, & yet he recovered by drinking the suet of a Shamois or wild goat, together with milk, of each one cyath at a time. Others say, that much good hath bin found by drinking in sweet cuit, the ashes of swines dung, as also by the lungs of a red Deer, especially the Spitter of that kind, dried in the smoke, reduced into pouder and so drunke in wine.

In case of the dropsie, the vrin of a Bore found in his bladder given to the patient in drink by little and little, helpeth very much: but of greater efficacy it is, if the same be permitted to drie within the bladder. Furthermore, the ashes of Harts dung, & namely of that Deer which is called the Spitter: as also of Neats dung, such I mean as go abroad and feed with the heard (& that they call by a peculiar name * Bolbiton) is a souveraign remedy for the dropsie. Mary, if the patient be a woman, there must be choise made of cow dung; but if a man, the dung of the other sex is to be taken: and this I may tel you is such a secret mytery, that the Magitians would not have to be revealed & made known. Many other medicines there be for the dropsie, to wit, the dung of a Bull calve vsed in a liniment: the ashes of a calves dung drunk in wine, with an equall quantity of the wild parsnep seed: goats blood together with the marrow, eaten with meat: it is thought that this blood will worke the better, if it be taken from the male Goats; provided alwaies, that they feed vpon the Lentisk tree, and then no doubt it will do the deed surely.

As touching *S. Antonies* fire, the shingles, &c. the meanes to quench the flame, is to annoint the place with Bears greafe, and especially the fat that is found about the kidnies: also with the greene

A greene dung of a calfe, cow, or ox. Some vse hard cheefe made of goats milke and porret together: also the fine scrapings of a fags skin fetcht off with a pumish stone & brought into powder, and so applied with vinegar. For the rednesse of the skin with much itching, the fume of an horse mouth, or the ashes of his house, is a singular medicine. If there be any wheals or small pox proceeding of fleam, do annoy the skin, no better thing than a liniment made of asse-dung ashes incorporat in butyr: say these wheals or pimples appear blackish and swert by reason of melancholy, dry cheefe made of goats milke brought into an ointment with hony and vineger, is good to rub the body withall in a bain or hot house, without any vse of oile at all. For blisters and angry meazils, the ashes of swines dung are thought to be very meet: as also the ashes of harts horn, so that the place be rubbed with them and water together. If there be any dislocation or bone out of ioint, the green dung of a bore or sow is good to be applied: so is that of a calfe: the fume frothing from a bore, laid to the place with vineger: and goats dung with hony.

There is not a better thing to bring down any swelling, than a cataplaine of raw beefe: and as for any hard tumors, swines dung made hot and dried in an earthen pot, sheard, or upon a tile, is excellent to discusse and resolute them: the greafe of a wolfe is exceeding good to break any impostumation that is grown to ripenesse: so is neats dung made hot vnder the embers: or goats treddles sodden in wine or vinegar: as touching fellons & such like apostumations, boeuf tallow with salt is much commended for to resolute them: & if the place be much pained, it were good to dip the said tallow in oile, and to melt the same without any salt: and in like manner is goats C seuet to be vsed. For a burn or scald, there is a proper salve made of bears greafe and lilly roots: for which purpose, the dung of bore or fow that hath bin long kept, is very good: so is the ashes of their bristles (such as pargettars whiting brushes be made of) wrought and incorporate with greafe: also the ashes of a beatts ankle or pastern bone tempered with wax and the marrow either of a deere or bul: like as the dung of an hare. And verily, goats treddles are so accomodate to this cure, that (by report) they will heal a burn without any skar at all. The most excellent glew is made of the ears and pizzles of bulls: and there is not a better thing in the world than it, for to heal any place burnt or scalded, but nothing is so much sophisticate, what with other old skins and hides, and what with old shoes and such like leather, boiled again and made into glew. The most fast and strongest glue which a man may trust vnto, is made at Rhodes, and that is it, which D painters & phyficians most vs: the whiter that the same is, the better is it esteemed: that which looketh black, and is hard withall and brittle like wood, is reiected.

It is thought, that for the pain of the sinewes, goats dung boiled in wine with honey is souveraigne, yea though a nerue began to putrifie: convulsions, crampes, and sprenes of nerues upon some violent stroke, are cured with bores dung gatherd in the spring & so dried. After the same manner, such as be overstrained and plucked with the draught of any charriot, or wounded with the wheels going over them; and generally, howsoever the blood be fetled black vnder the skin by contusion or bruise, if the places be anointed with the said dung, though it were greene and fresh, much ease and help in eueth therupon: howbeit, some think that it were better to seeth the dung first in vineger; and others reduce the same being drie into powder, and promise them that be either bursten, wounded and bruised inwardly, or haue bin ouerthrowne and faine from on high if they drink it in vineger, that they shall haue help thereby. But the better, and those that loue not to make the greatest boast of their medicines, vse the ashes thereof with water. And verily it is said, that the Emperor *Nerow* was wont in this kind of drink to take great pleasure, and with it to refresh himselfe, when his purpose was by that means to win a name, and approue himselfe a doubtrie wight, in running with coaches in the great cirque or shew place. To conclude, next to the dung of a bore, is commended that of a fow or any other hog, and thought to be in a second place of operation.

CHAP. XVIII.

¶ Medicines to staunch blood : to heale ulcers, cancerous sores, and the wild scab : also what medicines they be that draw thorns, prickles, or what faeuer sticketh within the flesh. Finally, proper receipts to cicatrize and skin a wound or sore.

THe rennet of any Deere or a Hare, vsed in vinegar, stancheth bloud. The ashes also of the haire of an hare: likewise of Asse dung: yea and the very ashes of their haire made into a liniment with any conuenient liquor, hath the same effect: but if you would haue it work
Ggg more

remedie, to the end, that afterward they might haue help again by the same in like cases) & ther-
upon (as our countryman *Varro* is persuaded) after that the said temple was burned, hee profes-
sed that course of Physick which is called * Clinice. Whereby Physitians found such sweetnes,
that afterwards there was no measure nor end of fees: inso much, as *Prodicus*, a discipule of *Hippo-
crates*, and borne in *Silymbria*, erecting that kind of practise in Physicke, which is called * *Iatra-
liptice*, opened by that meanes the way to enrich euen those, who vnder Physitians were employ-
ed in rubbing and anointing mens bodies, yea, and brought gaine to other base and seruile mi-
nisters attending vpon their cures. After them came *Chrysippus* in place: who through his much
babble and prating, wherewith he was well furnished, altered the Theoricke and speculative
Physicke of * *Hippocrates* and *Prodicus*, with all their principles: whom succeeded *Erasistratus*,
Aristotles sisters son, and he chaunged also many of *Chrysippus* his rules and receits, notwithstanding
he was a scholler of his and brought vp vnder him. This *Erasistratus* for curing king *Antiochus*,
receiued of his sonne *Ptolemaus* (king after him) one hundred talents: which to beginne
withall, I note by the way, that you may see how (euen in those daies) Physitians were well re-
warded for their pains and skill. But in proceesse of time one *Acro*, a citizen of *Agrigentum* in
Sicilie, much commended by the authority of *Empedocles* the famous naturall Philosopher, be-
gan in that Island to institute another faction and sect of Physitians, who grounding altogether
their worke and operation vpon experience, called themselues Empiriques. Thus there beeing
diuers schooles of Physick, the professors in euery one of them entred into contention and vari-
ance, some siding this way and others taking the contrary; vntill at length *Herophilus* entred the
stage, who reprobued and condemned as well the one as the other: and reduced the pulses or bea-
ting of the arteries vnto the times and measures in Musicke, according to the degrees of euery
age. Long after it was not, but this Philosophicall subtilty of his sect was giuen ouer and aban-
doned, because the profession thereof required of necessitie so much learning and literature: and
albeit that *Aesclepiades* when he began to profess Physick, brought with him an alteration of all
that was before, yet (as I haue already related) his Physick continued no longer than others: for
Themison (a scholler and auditor of his) so soon as euer his master was departed this life, altered
quite all that hee wrote and nored at first from his mouth, and betooke himselfe to a new pra-
ctise, according to his owne head and fantasie. But what became of it? Surely within a while af-
ter, *Antonius Musa*, Physitian to *Augustus* the Emperour, put downe that which *Themison* had set
vp: and that by the authority and warrant of the said Emperour his patient, whom he deliuered
from a dangerous disease, * vnto directly a contrary cure to that which had bin practised be-
foretime. Many other Physitians there were of great name, whom I ouerpasse: but the princi-
pall and most renowned of them all, were the *Cassij*, *Calpitanij*, *Aruntij*, *Albuij*, and *Rubrij*, who in
their time might dispend in fees allowed them out of the Princes and Emperours Exchequer,
vnder whom they liued, 250000 Sesterces apeece, by the yeare. And as for *Q. Sertinius* the
Physitian, he complained of the Emperours whom hee serued, and challenged them for that hee
had no greater reuenues than 50000 Sesterces by the yeare from them: whereas he was able
to make account, that by his practise in the city hee gained yearely 600000 Sesterces, being re-
tained Physitian to certain houses, which he could readily name at his fingers ends. A brother
of his receiued no lesse in fees from *Claudius Caesar* the emperor. And albeit these brethren spent
a great part of their wealth & substance in building sumptuously at Naples, wherby they adorn-
ed and beautified that city, yet they left behind them in goods vnto their heires after them, to
the worth of * thirty millions; which was such an estate, that vnlesse it were *Aruntius* only, there
was neuer any known before those daies to haue died so wealthy. After these men, there arose
one *Vettius Valens*, who ouer & besides his profession of Physicke and Rhetorick, which hee ear-
nestly followed, grew into a greater name, by reason of the familiar acquaintance hee had with
Messalina the Empreffe, wife to *Claudius Caesar*. This minion of hers taking his time, and seeing
how mighty he was, followed his fortunes and erected a new sect and practise of Physicke. But
within the compasse of that age, and namely in the daies of the Emperour *Nero*, in commeth
* *Thessalus*, who woon the name from all the Physitians of former times, and ouerthrew the pre-
cepts and doctrine of his predecessors, raging and faring as if he were mad, in open inuectiues
against all the professors of Physicke that euer were: and with what spirit, policie, wit, and dex-
terity he performed this, it may be gathered sufficiently by this one argument (if there were no
more) that vpon his sepulchre or tomb, which remaineth at this day to be seen in the high way

or

A or causey Appia, he triumphed ouer them all, and intituled himself by the name of * *Iatronices*.
And in very truth, neuer marched there player to the stage, or coachdriuer to the publick cirque
for to run a race, better attended and with a greater traine of followers, than hee when he passed
along the streets: and yet *Crimas* of Marfiles put him down and outwent him far in credit and au-
thoritie: and that by the means of a twofold skill and knowledge wherein he was seen: For be-
sides his ordinary profession of Physicke, he shewed himselfe more warie and ceremonious in
all his practise than any other before him, by reason of the deepe insight that he had in the Ma-
thematicks; obseruing the course of the starrs, chusing good daies and houres, and going euer
by his Almanakes and Ephemerides, whensoever he ministred vnto his patients, inso much, as
in their very diet he was so precise, that he would not allow them to eat or drink but with great
B regard of times and seasons. Whereby he grew to such wealth, that of late he bequeathed by his
last will & testament * ten millions of Sesterces vnto his natie citie Marfile toward the fortifi-
cations therof, besides the walls that he caused to be built and emmanteled about other townes,
which cost him little vnder the foresaid summe. Whiles this *Crimas*, with such other as himselfe,
seemed with their astrologie to command the course of the destinies, and to haue mens liues at
their own disposition, all on a suddain one *M. Charmis*, a Marfilian likewise, put himself forward
and entred the citie of Rome, who not onely condemned the former proceedings of the ancient
Physitians, but also put downe the baines and hot houses: hee brought in the bathing in cold
water, and persuaded folke to vse the same euen in the midst of Winter: nay, he feared not to
C giue direction vnto his sicke patients for to sit in tubs of cold water. And I assure you, my selfe
haue seen ancient Senatours, such as had been Consuls of Rome, all chilling and quaking, yea
and starke againe for cold, in these kind of baths: and yet they would seeme to endure the same,
to shew how hardy they were. And verily, there is a Treatise extant of *Annæus Seneca*, wherein
he approues highly of this course. Neither is it to be doubted, but such Physicians as these, who
hauing won credit and estimation once by such nouelties and strange deuises, (thoat at no other
marke but to make merchandise and enrich themselues euen with the hazard of our liues. And
hereupon come these lamentable and wofull consultations of theirs about their patients, when
in you shall see them ordinarily to argue and disagree in opinion, whiles one cannot abide that
another mans iudgment should take place, and seem to carry away the credit of the cure. From
hence also arose that Epitaph of his (whofoeuer he was) that caused these words to be engrauen
D vpon his vnhappy tombe, *Turba medicorum perij, i.* The variance of a sort of Physitians about me,
were the cause of my death. Thus you see how often this art from time to time hath been alte-
red, and daily still it is turned like a garment new dressed and translated: inso much, as wee are
carried away with the vain humor of the Greeks, & make sail as it were with the puffs of their
proud spirit: For euer as any of these new commers can venditat and vaunt his owne cunning
with braue words, straightwaies we put our selues into his hands, and giue him power to dispose
of our life and death at his pleasure; and without further regard, are as obedient to him as a
souldiour to his captaine and Generall of the field. A strang matter that we should so do, con-
sidering how many thousands of nations there be that liue in health wel ynough without these
Physicians, and yet I canot say altogether without Physicke. Like as the people of Rome also
E (notwithstanding the Romanes were euer knowne to be forward ynough to entertaine all good
arts and disciplines) continued for the space of six hundred yeares and above, after the founda-
tion of their citie, and knew not what a Physician meant, but afterwards they did cast a great
fancie to Physick also: howbeit vpon some little experience thereof, they were as ready to loath
and condemne it, as they were desirous before to haue a taste and triall of it. And here I thinke it
not amisse in this corrupt age of ours wherein we liue, to discouer and relate certain principall
examples of our ancessours, worthy to be noted in this behalfe.

And to begin withall, *Cassius Hemina*, an ancient Historiographer, doth report, That the first
Physician that euer came to Rome, was one *Archagathus*, the sonne of *Lysanias*, from out of
Peloponnesus, which was when *L. Amylius* and *M. Livius* were Consuls, and in the yeare after
the foundation of the citie of Rome 535. And this mine Author saith, that he was enfranchi-
sed free denizen of Rome, and had a shop provided for him, standing in the carrefour of *Acilium*,
bought at the charges of the citie for to entertaine his patients, and therein to exercise his cun-
ning. Called he was (by report) The vulnerarie Physician or Chirurgion: wonderfull much see-
king & running there was after him, and none more wealthie than he at his first comming. But

soon after, when hee was knowne once to carry a cruell hand vnder his poore patients, in cutting, lancing, dismembing, and cauterizing their bodies, they quickly began to alter his name, and to terme him the bloody Butcher or Slaughter-man: whereupon not onely all Physitians, but Physick also grew into a bad name and became odious; as may appeare euidently by the monuments and books of *M. Cato*, a worthy personage, and in regard of whose vertues and commendable parts, his triumph and Cenforship, as famous & honorable as they were, deserue the least part of his authority and reputation; so much was there in himselfe, about the gifts and graces of Fortune. I will therefore insert in this place, word for word, an Epistle of his vnto his sonne *Marcus*, touching this matter, wherein he thus writeth: Concerning these Greekes (*sonne Marcus*) I will write in place and time conuenient, what I haue found out and knowne by them in Athens: and namely, that it were good to looke into their books and readethem (as it were) by the way, but in no wise to study vpon them much and learn them thoroughly. I haue already giuen the attempt, and intend to conuince and put downe the wickedest race and most peruerse and obstinat kind of them. And learne this of mee, as from the mouth of a true Prophet, That whensoever this Greekish Nation shall bring into Rome their Philosophie, they will corrupt and marre all: but let them send once their Physitians hither, you shall see a greater wrecke and confusion thereby. For I assure thee, they haue plotted and sworne one to another for to murder all * Barbarians by means of their Physicke. And euen to effect and bring this about, they will be fed also and take money, to the end, that both we should trust them the rather, and they also haue the better meanes to worke the feat and dispatch folke with more facility. As for vs, it pleaseth them usually to name vs Barbarians; yea, and they giue vnto vs more filthy termes than any others, and mis-call vs * Opiques. Well, remember thou once for all, that I haue giuen thee warning of their Physitians, and forbidden thee to be acquainted with them. Now *Cato*, who wrote this letter, died in the six hundred and fifti yere after the foundation of our city, when himselfe was fourscore yeres old and fye: whereby a man may see that he wanted not grounded knowledge when he deliuered this speech vnto his sonne, for hee had both the practise of former times in publicke affaires, and age sufficient of his owne to furnish him with experience of priuat examples. What say we then to this resolution of his? Are wee to iudge and beleue that hee hath condemned thereby a thing so necessary and profitable as Physicke is? God forbid: for himselfe setteth downe a little after, what Physick, and what medicines both he and his wife were acquainted with, and by meanes whereof they came to be so aged as they were: and those were no other (verily) but the vse of simples, whereof wee now are in hand to treat. He saith moreover and professeth, that he hath made one Treatise expressly, containing certaine receipts for the cure of his son and seruants, and for the preseruatiue of their health: the which I haue not omitted, but disperfed here and there, according to the occurrences of accidents and diseases of sundry sorts, whereof I haue had some occasion to speak of, and still shall haue more, whereby it is plain, that our ancient forefathers blamed not the thing it self, I meane, Physicke, and medicines, but the Art and cunning of Physitians, who had the handling thereof. And most of all, they held off and were afraid to entertaine those amongst them, who fought such exceeding gaines for their handie worke, especially where they indangered their liues withall. And that they made some account of Physicke, may appeare by this, that when they receiued *Asculapius* as a canonized god into their Kalender, they built one temple for him without the city of Rome: yea, and the second which in his honour they erected, was situate within the Island apart from other buildings. Also at what time as by vertue of an edict all other Greekes were banished Italy, Physitians were excepted; and that was many a yere after *Cato* his time. And here by the way, one word will I speake to the honour of our Romanes for their singular wisdom and prouidence; namely, That howsoeuer they are growne to good prooffe and be accomplished in all other Arts and Professions of the Greekes, yet their grauity hitherto hath bin such, as they would not giue themselves to the practise of this only Science. And notwithstanding the exceeding wealth that accrueth by Physicke, yet very few or none of our naturall Roman citizens haue medled therewith. And those also that haue betaken themselves vnto it, presently haue forsaken their native language, and gone to the Greeke tongue. For this opinion verily there is of this Art, That if the Professors thereof handle it in their vulgar and mother tongue, or otherwise in any other than Greeke, all the authoritie, grace, and credit thereof is lost, euen with those that be altogether vnlearned and know not so much as the Greeke Alphabet. See the nature and foolish propertie of our Countrymen, to haue lesse confidence and trust in those things which concerne their life and health, if they be intellegible and deliue-

Questionum
Romanarum.

A deliuered to their capacity; than in others, which they vnderstand neuer a whit! And hereupon verily it is come to passe, that the art of Physicke hath this peculiar gift and priuiledge alone; That whosoever professeth himselfe a Physitian, is straightwaies beleueed, say what he wil; and yet to speake a truth, there are no lies dearer sold or more dangerous than those which proceed out of a Physitians mouth. Howbeit, we neuer once regard and looke to that, so blind we are in our deep perswasion of them, and feed our selues each one in a sweet hope and plausible conceit of our health by them. Moreover, this mischief there is besides, That there is no law or statute to punish the ignorance of blinde Physitians, though a man lost his life by them: neither was there euer any man known, who had reuenge or recompence for the euill intreating or misusage vnder their hands. They learne their skill by indangering our liues: and to make prooffe & experiments of their medicines, they care not to kill vs. In a word, the Physitian only is dispensed withal, if he murder a man: so cleare he goeth away without impunity, that none so hardy as once to twit or challenge him for it: but say that one be so bold as to charge them with any vntoward dealing; out they cry presently vpon the poor patients, at them they rail with open mouth, they are found fault with their vnruleinesse, distemperature, wilfulnesse, and I know not what: and thus the sillie soules that be dead and gone, are hent & bear away the blame. The decuries or bands at Rome of those knights which are deputed and called Iudges, are not chosen but by an ordinary triall and examination of their estate, quality, and person, and the same by the principal of that order and degree, both taken and approued: streight inquisition there is made of their demeanor from house to house: of their parentage also, yea and true information giuen to the electors before they can be chosen. Mint-masters, such as are to giue their judgement of mony, and the touch of coin, be not taken hand ouer head: but if any be more skilfull than others therein, they are sent for (rather than to faile) as far as from Calis and the straits of Gilbretar. And for to pronounce sentence as touching the banishment of a Roman citizen, the five deputed or elected delegats (named Quinquagiri) had no warrant or decree passed before 40 daies were expired. But for these Physitians, who are the judges themselves to determine of our liues, and who many times are not long about it, but giue vs a quick dispatch & send vs to heaven or hel, what regard is there had, what inquiry and examination is made of their quality and worthines? But surely, wel enough are we serued, and we may thank none but our selues, if we come by a shrewd turn, so long as there is not one of vs hath any care or desire to know that which is good for his life and health. We loue to * walk (forsooth) with other mens feet. * We read, we looke by the eyes of others: we trust the remembrance of another, when we salute any man and to conclud, in the very main point of all we commit our bodies and liues to the care and industry of others: No reckoning is there now made of the riches and treasure of Nature: but the most precious things indeed which serue for the maintenance and preseruatiue of health and life, are vtterly rejected and cast away: no account make we of any thing and think our owne, but to liue in pleasures and dainty delights. I will not leaue my hold of *M. Cato*, whom I haue opposed as a shield and buckler against the enuie and sight of this ambitious and vain-glorious Art: neither will I giue ouer the protection of that honorable Senat which hath judged no lesse; and that without catching aduantage of the sinfull pranks & lewd parts which are committed and practised vnder the pretence of this art, as some man haply would look that I should set them abroad: for to say a truth, is there any trade or occupation goeth beyond it for poisoning? what is the cause of more gaping and laying wait after wils and testaments, than this? What adulteries haue bene committed vnder the colour hereof, euen in Princes and Emperors palaces? as for example, *Eudemus* with *Livia* the Princeesse, & wife to *Drusus Caesar*: *Valens* likewise with the Queen or Emperesse about named, *Messalina*. But say that these crimes and odious offences are not to be imputed vnto the Art it selfe, but rather to be charged vpon the persons, I meane the corrupt and lewd professors thereof: yet surely I am of this beleefe, that in regard of these enormities, *Cato* was as much afraid of the entrance of Physicke, as of some Queene into the citie of Rome. For mine own part, I mean not to say ought of their extreme auarice, of the merchandise, spoile, and hauocke that they make when they see their patients in danger of death, and drawing to their end; nor how high they hold (as it were in open market) the easement and release of the sicke mans pains, whiles he is vnder their hands; ne yet what pawns and pledges they take as earnest of the bargaine, to dispatch the poore Patient out of the way at once; and lastly, of their hidden secrets and paradoxes, which forsooth they will not divulge abroad, but for some round

summe

funime of money. As for example, that a cataract or pearle in the eie is to be couched rather and driuen down by the needle, than quite to be plucked forth: wherby it is come to passe, that it is a very good turne & the best for vs (as the case standeth) that we haue so great a number of such murderers and theues in the commonwealt: for I assure you it is not long of any shame and honesty (whereof there is none in them) but their malicious emulation, being so many as they are, that the market is well fallen, and the prices come down of their workmanship. Notorious it is, that *Charmis* the abouenamed Physitian that came from Marfiles, bargained with one patient that he had, to haue 200000 Sesterces for his cure, and yet hee was but a stranger and a prouincial inhabitant. Also as well knowne it is, that *Claudius Cesar* vpon a condemnation and judgement, tooke at one time by way of confiscation, one hundred thousand sesterces from one *Alcometes*, who was no better than a Chirurgion or Wound-healer: who beeing confined into France, and afterwards restored, gathered vp his crums again & got as much within few yeares. I am content also, that these faults should be laid not vpon the art, but the men that professe it: Neither verily do I mean to shew and reprove the base, abject, and ignorant sort of that crew: nor how little order and regiment they obserue in the cure of diseases, or in the vse of baines and hot waters: how imperiously they prescribe otherwhiles to their patients most strait diet: and again, when they are ready many times to faint & die vnder their hands for want of sustenance, how they be forced to cram them as it were, and giue them meat vpon meat, oftentimes in one day, before they haue digested the former viands. Moreouer, how they do and vndo, altering the manner and course of their proceedings a thousand waies, misliking and bethinking themselves after they haue done a thing: making a mish mash and mingle mangle in the kitchen of those viuals which they ordain for their poore patients: besides a deal of mixtures and sophisticated compositions of drugs and ointments. For there is no superfluity tending vnto vain pleasures and wanton delights that hath ouerpassed their hands. And since I light vpon the mention of these drugs and spices, for mine owne part I am verily perswaded, that our ancestors and forefathers were nothing well pleased with the bringing in of such forraie wares, which beare so high prices and are extream deare: and that *Cato* neuer thought of these drugs and mixtures, nor foresaw these corruptions by them occasioned, when he blamed so much and condemned this art of Physick. Yet see what account there is made of a composition called * Theriacke, deuised onely for excesse and superfluity: composed it is of diuers ingredients far fetcht and deare bought: whereas Nature hath bestowed vpon vs and presented to oure eies so many wholesome simples, and euery one of them by it selfe medicinable and sufficient. Moreouer, another antidore and confection there is, consisting of no fewer than 54 fundrie sorts of drugs and ingredients, all of diuers weights, and some of them are prescribed to carrie the poyse precisely of the sixtieth part of one denarius or dram. Now would I gladly know what god he was (for surely it passeth the wit of man thus to dispense the ingredients, and calculat their vertues, to a single scruple) that taught first this subtil and intricat composition? By which it appears manifestly, that this geere bewraith onely a vaine ostentation, and all to giue a glorious and wonderful lustre to the art, for to make it better accepted and more vendible. And yet the very Artists themselves are not ywis so skilfull, as to know that whereof they make profession. For I my selfe haue seene these that goe for Physitians, put commonly into their medicines and receipts *quid pro quo*, and namely, in stead of the Lidian * Cinnabaris, * Minium; which is no better than a very poyson, as I will proue and shew hereafter in my Treatise of Painters colours: which error proceedeth only from this, that they are not wel seen in Grammar, nor in the proper signification of words. But these and such like errors touch and concerne the health of euery one in particular. As for those abuses in the art of Physick, which *Cato* feared, foresaw, and would haue preuented, they be such as are nothing so hurtfull and dangerous as the rest, and indeed small matters in the opinion of man: and such as the principall Professors and Masters of this Art do auow and confesse among themselves. Howbeit, euery one of these deuises, as harmlesse as they seem to be, haue been the ouerthrow of all vertue and good manners in our Romane State, I mean those things which we doe and suffer in our health: our exercise of wrestling, our greasing and anointing with oile for that purpose, brought in forsooth and ordayned by these Physitians for to preserve our health. And what should I speak of their drie stouues, hot houses, and ardent bayns, which they would beare men in hand to be so good for digestion of meat in their stomackes? Yet could I neuer see any, when he came forth of them vpon his own feet, but he was more heauy, & found himselfe

¶ Treaclic.

¶ Sanguis Draconis Sang- dragon Lacryma species, a kind of gum
¶ Metallicum, a minicall Vermilion.

A himselfe feeblere than before he went in: and as for those who haue bin more obseruant of their rules than the rest, and wholly gouerned by them, I haue known many such caried out for dead, or else extream sicke. To say nothing moreouer of the potions and drinks ordained by them, to be taken in a morning fasting, for to vomit and scour the stomack therby, and all to make way for to quaffe and carouse again vpon it more lustily. I forbear also to write of their rofins and pitch-plaisters deuised by them for to pluck away and fetch off the haire where Nature hath ordained it to grow, wherby they would seem to effeminate our men. I bath also to speak how euery our women haue prostituted their nakednes and priuities vnto them, by occasion of these their wanton deuises. In sum, conclude we may, that considering these enormities and corruptions which haue crept into our life, by nothing more than by the meanes of Physick, *Cato* was a true prophet indeed, and his oracle is verified & fulfilled euery day, when he said, That it was sufficient to look cursorily into the writings and witty deuises of the Greeks, without farther studying therupon and learning them thoroughly. Thus much I thought good to speak in iustificati- on of that Senat and people of Rome, who not without great reason continued 600 yeares without the entertainment of Physicians; and against that Art which of all others is most dangerous and fullest of deceit: in regard wherof, it hath bleeared the eies of good men, and they be those who haue giuen credit & authority thereto. And withall, thus much may suffice to meet with the fond opinion and foolish persuasion of those, who are rauished and caried away with a conceit, esteeming nothing good for the health of man, but that which is costly and pretious. For certes I doubt not, but some there be who will loath these receipts taken from diuers beasts, wherof I shall haue occasion to speak hereafter. But I comfort my selfe again herein, That *Virgil* disdained not to name the very pismires and the weevils; * blind beetles also delighting in darknesse, and their nests wherein they keep; of which he wrote, notwithstanding he was not vrged thereto vpon necessitie. Neither did *Homer* think it improper, to mingle the description of a shrewd and vnhappy flie, euen with the heroicke battailes of the gods: ne yet dame Nature, who hath brought forth and made man, thought it any disparagement to her maiestie for to engender also these sillie and small creatures. And therefore let euery man consider their vertues, properties, and effects, and not regard so much themselves. To come then to those things that are most common and known, begin I will at sheeps wooll, and birds eggs, to the end that by that means due honour may be yeilded to the chiefe and principall of all others, as it doth appertain. Howbeit, I must of necessitie speak of some other things by the way as occasion shall be offered, notwithstanding the place be not so proper & fit for them. Neither wanted I means sufficient to furnish this worke of mine with many gallant matters and pleasant discourses, if my delight and mind had been to looke after any thing else but a plaine and true narration, according to my first desseine and intention: For well I wot, that I might haue inserted here and there, the rare receipts which are reported to be of the ashes of the bird Phoenix, and her nest; but that I know all to be meere fabulous, howsoeuer they make a pretence of truth. Besides, I count it a very mockerie and no better, to deliuer vnto the world those medicins which are not to be but once in the reuolution of a thousand yeares.

CHAP. II. ¶ The vertues and properties of Wooll.

E The ancient Romans attributed vnto Wool great authority, & had therein a certain religious and reuerent opinion of holines: in so much as new wedded wiues by an old custom and ordinance at Rome, were wont with great ceremonie to adorn and bedeck with wooll the side-polls of the dore or entrie into their husbands house, on the marriage day. Now besides the vse of wooll for decent apparel, & defence against cold weather, that which is vnwashed and full of the sheeps sweet serueth in Physick, and is a soueraign remedy for sundry accidents, being applied with oile, wine, or vinegre, according as need requireth, either in mitigation of pain, or mordication and coriotion, and according as our purpose is, to bind, or to enlarge and open any part: and namely, it is imploied in dislocations of members, and grieue of sinues, if it be laid to the affected place, well sprinkled & wetted with the said liquors, that it might be alwaies moist. But more particularly, for disjointed members, some put thereto a little salt: others take rue, & when they haue stamped it, incorporate the same with some conuenient grease, & so apply it in manner of a cataplasme vpon sweate wooll: after which manner, it is good for contusions or bruises & swellings. Also it is said, that if the teeth & gums be well rubbed with such wooll and

H h

honey

hony mingled together, it will cause the breath to be the sweeter: a suffumigation or perfume therof is singular for the frensie: applied with the oile of roses, it stanches bleeding at the nose: or otherwise if the ears be well stopped therewith, and a little garlick conueied withal therinto. Moreouer, it is laid to inueterat sores with good successe, so that hony be put thereto. Soake wooll in wine, vinegre, or cold water and oile, and then wring and presse the same forth, it heales any wound. The wooll of a ram well washed in cold water, & afterwards steeped in oile, is singular for womens infirmities, and particularly allaieth the inflammation of the matrice: but in case it be faln downward and readie to slip out of the bodie, a perfume therof receiued beneath, staiteth the same and keepe it vp. The fattie wooll of a sheep being either applied, or put vp in manner of a pessarie, drawes down the dead infant out of the mothers belly: and yet the same otherwise represseth the immoderat flux of womens fleurs. If it be couched hard & close within the wound occasioned by the biting of a mad dog, it serueth to great purpose; but with this charge That it be kept bound thereto & not remoued vntill the seuenth day be past: applied vnto whit-flaws and impostimations about the naile-roots, with cold water, it cureth them: the same, if it be dipped & foked in a medly made of salnitre, brimstone, oile, vinegre, and tar, all dissolved together and ready to boile, and so laid as a cataplasme to the loins as hot as the patient can abide it, changing it twice a day, appeaseth the paine of those parts. Take the greasie wooll of a ram, bind therewith very hard the joints of the extreame parts, as namely the fingers and toes, you shall see how it will stanch bleeding. [Howbeit, note this, that the wooll growing vpon the sheeps neck is euer best and most medicinable: and if we regard the country from whence it comes, that of Galatia, Tarentum, Attica, and Miletum, is alwaies reputed better than any other.] Furthermore, the greasie or sweatie wooll of a sheepe, is proper to be applied to any raw places where the skin is fretted off, to contusions, bruises looking black and blew, strokes, cruishes, rushes, rubs, and gals; as also from them who are tumbled down from some high place, for the head-ach and other pains; and lastly, for the inflammation or heat of the stomack, being decently applied with vinegre and oile rosat. Reduced into ashes and vsed as a liniment, it is singular for them that be crushed or squeezed, wounded, burnt, and scalded. This ashes entrench also into collyries and cie-salues: it serueth for hollow vlcers & fistuloes: like as for the ears when they run filthie matter. For these purposes aboue specified, some sheare it from the sheeps back: others chuse rather to plucke it: and when they haue clipped off the vpmost parts, or forced it lay the same forth to dry: they toze & card it also, and then bestow it in an earthen pot not fully baked, which they besmeare all ouer with hony, and so burn & calcine it to ashes: others put vnder, smal chips or slices of torchwood, and lay certain beds or courses thereof between the locks of wooll; and after they haue besprinkled the same with oile, set all one fire: which done, the ashes that come therof they put into little pans or vessels, & poure water thereon: and after they haue well stirred the said ashes with their hands, they suffer it to settle downe to the bottom, which they do oftentimes, alwaies changing the water till such time as a man may perceiue the ashes at the tongues end to be somewhat astrigent, but not biting: and they lay vp their ashes for their vse. A great * scourer and cleanser this is, and therefore most effectually to mundifie the eye-lids.

* *Ystus sme-
lica* is out of
Dios. not sep-
arata, as is com-
monly read:
for how can it
be corrosiue if
it bite not at
all.

* *Siccatur*, or
rather *Sacca-
tuz*. I. streine it
through a lin-
nen bag.

Moreover, the very filthie excrements of sheep, & the sweat sticking to the wooll of their flanks, between their legs & the concavities thereabout (which they call Oesypum) is thought to haue infinit number of medicinable properties: but the best Oesypum simply is that which comes from the sheep bred about Athens. This sweet or filthie excrement, call it what you wil, is prepared and ordered many waies; but the principall is that which is gathered from the wooll newly taken from between the legs & shoulders of the sheep, and presently tozed ready for to be carded: others are content to take the sweatie filth of any wooll, so it be fresh plucked or clipped from the sheep, and whether it be the one sort or the other, they let it dissolve over a soft fire in a pan of brasse: which done, they set it a cooling, and take off the fat that swims aloft, & gather it into an earthen vessell. As for the rest which remained behind of the first stuffe, they set it on the fire again, that the fumes may boile forth of it: after this the fat that floated aboue, as well the former as the later, they wash in cold water, & let * it drie in a linnen cloth, expose it to the heat of the Sun, that it may frie therein vntill it be blanchd white and look pure and cleare: then is it put vp in tin boxes or peuter pots, and referred for vse. The true mark to know which is good Oesypum, after it is thus tried & putrified, is thus: if it haue a rank smel still of the first filthines which it had from the sheep: also, if when you rub it with your hand in water, it melt not, but in

L

M

A the working look whitish like vnto cruse or white lead: a soueraigne thing it is for the inflammation of the eies: for the hard callosities also that grow vpon the eye-lids. Some there be who yeeldeth forth all the sweet and fattinesse; the which they suppose to be the best Oesypum that watering of the angles of the eies. Well, this fatty excrement thus clarified, incorporat with ration: the same tempered with Melior and Butyr, maketh an excellent liniment for all inflammations of the matrice: the chaps also and swelling piles or biggs in the fundament. Many other vertues it hath, which I will digest into their seuerall places, and speake of them accordingly. B As touching the filthie excrements hanging to sheeps tails, and baltered together into round shooke in the head, if they be rubbed therewith, also for the gums, though there were gotten into alone, or else with sulphur vif, it is passing good to be applied to any place in paine, whereof the dents which happen vnto the priue parts. In sum, of such vertue is wooll, that there is no cataplasme, pulstesse, or plaister, in manner applied to a grieved place, but the same hath wooll laid in the very sheep that beare it, in case they haue lost their stomacks and feed not: for pluck the wooll that groweth to their tails, and therewith tie the same as hard as is possible, you shall see them presently fall to their meat: But it is said withall, that the rest of the taile which is vnderneath the said knot where it was bound, will quickly become mortified, and die.

* *Dalidium* can-
cin.

CHAP. XIII.

¶ The nature and properties medicinable of Eggs.

Great societic and affinitie there is between wooll & eggs; in this regard, That if they be applied both together in a frontall to the forehead, they repress all violent fluxes & rheums falling into the eies: but you need not take for this purpose any wooll that hath bin dressed or clenched with the * Fullers scouring weed: neither is it required, that in this case there should be vsed any more but the white of an egg, and the same ought to be infused or spread vpon the fore said wooll, with the pouder of Frankincense: & in very truth, the white of an egg alone, if it be infused or dropped into the eies, is sufficient to restraine the flux of humors thither, yea and saffron thereto, and vse this gleere or white of the egg beaten, in stead of water, for all collyries or medecins appropriat to the eies. The white of an egg incorporat with fresh butyr, is so soueraigne for the red and bloudshoten eies which put little children to pain, as none in this world better; nay there is not in a maner any other vsed in that case. The same beaten and tempered with oile, assuageth the heat of *S. Anthonies* fire, if there be leaues of beets laid vpon the place and kept bound thereto. The white of an egg incorporat with salhormoniacke finely puluerized, doth extend and turn backward, the haire of the eyelids which grow inward into the eies: the same with pine nut-kernels, & a little hony mingled withall, and so reduced into a liniment, takes away the pimples that arise in the face: annoint the visage therewith, it will keep it from being sun-burnt. If one be scalded with hot water, lay quickly an egg to the place, yelke, white, and altogether, it will take out the fire and preserue it from blistering: some put thereto barley meale and a little salt: but say the place be blistered & exulcerat with any burne or scald, parched barley with the white of an egg and swines greafe, is an excellent medicine to heale the sore: and the same cataplasme is much vsed in the cure of the hamorroids, piles, and chaps of the fundament; and especially in children, for to reduce the tiwill into the right place, if it hang forth, for the rifts and chaps which appeare in the feet, take the white of an egg sodden or roasted, the weight of two deniers of ceruse, as much of lecharge of siluer, and myrrhe, with a little quantitie of wine; incorporat all together into a cataplasme, there is not a better medicine for them: and for the inflammation called *S. Anthonies* fire, the white of an egg beaten together with Amydum or starch-floure, is right soueraigne. It is said moreover, that the white of an egg is very good to conglutinat or sowder any wound, yea and two expell the stone and grauell out of the body.

* *Radicula*,
called before
Struthium.

The yelke of an egg sodden vntill it be hard, and tempered with a little saffron, with hony also G
and breft-milke, and so reduced into a liniment, allaieth the pain of the eies, if they be anointed
or fomented therewith: or if the same be incorporat with oile rofat & honied wine, and so spread
vpon a quilt of wooll and applied, it workes the same effect. Others there be who take the yelke
or an hard egg, mix therewith the powder of persley seed, adding thereto fried barley meale dried,
and honied wine, with which composition they annoint the sore eies. Also the yelk of a soft egg
alone, supped off and swallowed down cleare that it touch not the teeth by the way, is singular
good for those that be troubled with the cough, with the rheume or catarrhe that hath taken a
good way to the breft or pectorall parts; yea and the roughnesse of the throat & pipes which causeth
hoarsenesse: but principally if one be bitten with a worme or serpent called * Hæmorrhoids, let
him both sup off the yelke of an egg raw or soft, and apply it also to the wounded place. It hel- H
peth the infirmities of the reins; it healeth the fretting, excoriation, and vlcers of the bladder;
yea and cureth those that reach & cast vp blood. Fiue yelks of eggs supped off raw in one hemin
of wine, are singular good for the dysenterie or bloody flux, and namely, with the powder of
the shels from whence they came, the juice of Poppie, and a little wine withall. For the flux of
the belly proceeding from a feeble stomacke, they vse to giue the said yelks of eggs raw, with as
much in weight of good and full raisins, and the rind of a pomegranat, with direction to the pa-
tient, for to take this medicine three daies together by euen portions, and no more one day than
another: for which purpose also, there is another way to vse them, namely, to take three yelks of
an egg, to incorporat the same in as many onces of hony and old lard, putting thereto three I
cyath, also of good old wine, and stamped all together into one composition vntill such time
as it be reduced to the consistence or thicknesse of hony, of which the patient must drinke as
need requires, with water, the quantity of an hazle nut at a time. Also it is good to lay three eggs
in vinegre for three daies together, and vpon the fourth day to eat them, for the foresaid flux of
the stomacke: after which maner it auaieth much to take them against the oppilations & hard-
nesse of the spleene: but to such as are subiect to casting and reaching blood vpward, Physicians
prescribe to take them in three cyaths of new wine. Some vse the yelks of eggs that haue bin old
kept, for to reduce the skin that is blacke and blew to the fresh and liuely colour again; but they
incorporat the same in hony with bulbe roots: the same sodden and drunk in wine, doe repress
the immoderat flux of womens months: but applied raw with oile and wine, they discurse & re- K
solve the ventosities within the matrice. Incorporat with oile rofat and goose grease, they are
good to be applied to the nape of the neck for the cricke and pain thereof: being roasted against
the fire hard, and so presently applied hot to the seat, they are good for the griefs and accidents
of the fundament: but more particularly for the swelling piles and bigs rising in those parts,
they would be laid too with oile of roses. Being sodden in water vntill they be hard, they serue
very well for any burne or scald; with this charge, That presently the ashes of the same egg-shels
calced upon burning coales, be applied to the place, and then to annoint the same with the
foresaid yelks and oile rofat mixed together. Now it falleth out sometime, that eggs be all yelke
within, & haue no white at all; namely, when the hen hath coued & sitten ouer them three daies
together, and then be taken away from vnder her; and such kind of eggs the Greeks call Schista,

*Daletampius
would haue
the same eggs to
be dried and
reduced into
pouder, &c.*

Take the eggs from vnder the hen when they be full of chicken, a little before they spring and
the chicke be hatched, together with halfe as much of gal nuts, and giue the same for to streng-
then a feeble and weak stomack; with this caution, That the patient haue eate nothing in two
hours before. And so me doe aduise for the dysenterie or bloody flux, to giue the said chickens
sodden egg and all together, putting thereto one hemine of austere or sharpe wine, and an equall
quantitie of oile and parched barley groats drie. The fine pellicle or skin that is within the egg-
shell, being taken from it (whether the egg be raw or sodden it skilth not) healeth the chaps
that are in the lips, if it be applied thereto. The ashes of an egg-shell drunke in wine, stoppeth
the issue of blood gushing out at any part: but the same ought to be burnt, or calced without
the pellicle or skin aforesaid; and so it makes an excellent dentifrice also to cleanse and scoure
the teeth white: a liniment made with the said ashes and myrrhe together, staies the superfluous M
flux of womens terms. And here I cannot chuse but note vnto you by the way, the strange pro-
prie and wonderfull nature that egg-shels haue: for so hard compact and strong they be, that
if you hold or set an egg endlong, no force nor weight whatsoever is able to break and crush it,
so long as it standeth freight and plumbe vpright, vntill such time as the head incline to a side
and

A and bend one way more than another. Eggs entire and all whole as they be [i. white, yelke, shell
and skin] taken in wine with rue, dill, and curmin, helpe women in hard trauell to speedie and ea-
sie deliuerance. Eggs incorporat with oile & rosin of the cedar mixed together, are singular good
for to heale scabs and to kill the itch: put thereto the root of Cyclamin, [i. Sow-bread] it hea-
leth the running skalls of the head: for those that reach vp purulent matter out of the chest,
or spit blood, it is good to sup off a raw egg together with the juice of vnser leeks, and an equall
quantitie of Greekish wine; but first all must be warmed, before that it be giuen to the patient.
Against a cough, they ordaine eggs sodden and stamped together with hony, and so to eat them;
or else to sup them off raw, with wine cuit & oile, of each a like quantity. If a man haue any sore
or vlcer in his secret parts seruing for generation, it were very good to inject one egg tempered
B with three cyaths of wine cuit, and halfe an ounce of Amylum or starch-floure, presently vpon
his coming forth of the baine or hothouse. An excellent liniment there is made of sodden eggs
stamped together with cresses, for the sting or biting of serpents. How many means there be
whereby eggs doe good as meat, there is not one but knoweth: for euen in their going downe,
they passe through any tumor or swelling of the throat, and with their kind heat foment those
parts by the way. There is not any kind of viand in the world besides it, that nourisheth a sicke
man, without any offence or burden at all to the stomacke; and it may go well enough for meat
and drinke both. As touching eggs sodden in vinegre, and how their shels may be made soft and
tender thereby, I haue already shewed; such eggs if they be wrought and knead with meale into a
dough or past, do make a kind of bread which is soueraigne for all fluxes of the stomack. Some
C there be who think it better to take these eggs thus mollified & resolved in vinegre, and to torri-
fie the same betwene two platters of earth, supposing that being thus prepared, they serued not
only to stop a lask, but also to repress the immoderat flux of womens monthly tears: but in case
the said fluxions be excessive and beyond all measure vehement, they are to be supped off raw,
with water and meale in maner of a grewell or pottage: or else the yelks may be boiled by them-
selves in vinegre, vntill they be hard, and then a second time be fried & torried afterwards with them-
grosse pepper, and in this sort they will die any loosenesse of the bellie. And yet there is another
singular remedie for the bloody flux, namely, to put the meat of a raw egg in a little earthen pot
that neuer was occupied, and to add thereto as much hony as may amount to the quantitie of the
egg, to the end that all be of equall proportion; then, within a while after to temper therewith
D the like measure of vinegre & oile both, and to beat them all together oftentimes, that they may
be well conccorporat and vnited in one. In which composition, this is to be obserued, That the
better that every one of these ingredients is that enter into this confection, the more excellent
operation and speedier remedie will ensue therupon. Others there are, who in stead of oile and vi-
negre, put in red rosin and wine, according to the former rate and proportion: howbeit they tem-
per the said medicine after another sort, for they put in of oile, only as much as the egg comes
to, adding thereto of the pine-tree barked * two sixtie parts of a Romane denier, and one sixtie
part of Sumach, which I called Rus, and fiue oboli weight of hony, with this charge, That they
be all boiled together; and that the patient eat no other meat whatsoever for the space of foure
hours after. Many there be, who to cure and ease the wringing gripes and torments of the belly,
E take two eggs and foure cloues of Garlick, which they pun and stamp together; then they heat
them ouer the fire in one hemine of wine, and giue this mash vnto the patient to drinke. To
conclude, because I would not willingly omit any thing that may commend eggs and giue grace
vnto them, know thus much moreover, That the gleere or liquid white of an egg with quicke-
lime, maketh an excellent sement to soudre or vnite any broken pieces of a glasse together: be-
sides, of such strength and efficacie they are, that neither a piece of wood no nor so much as any
parcell of cloath wet or dipped in the white of an egg will burn, but check the violence of the fire.
Howbeit, note that all which I haue spoken of eggs, is to be meant those that hens only do lay: for
as touching other birds eggs, I will write in their due places, for as much as they are not destitute
of many peculier vertues and singular properties of their own.ouer & besides, I will not ouer-
F passe one kind of eggs besides which is in great name and request in France, and whereof the
Greeke authors haue not written a word: and this is the serpents egg, which the Latins call An-
guinum. For in Summer time yerey, you shall see an infinit number of snakes, gather round to-
gether into an hpape, entangled and enwrapped one within another so artificially, as I am not
able to expresse the manner thereof: by the means therefore, of the froth or saluation which they
yeeld

considering that all our medicins proceed from that conuenience and repugnancie which is in the nature of all things, whereof we haue so much spoken. As we may see for example in these punies or wall lice (the most ilfavoured and filthy vermine of all other, and which we loth and abhor at the very naming of them) for naturally they are said to be aduersatiue to the sting of all serpents, and principally of the Aspis: nay they are thought to be a counterpoysion against any venomous thing whatsoever: and folke ground their reason hereupon, because looke what day that Hens do eat a wal-louche, the same day there shall no Aspis haue power to kill them. And it is said moreover, That the very flesh of such hens as haue eaten such punies, is singular good for those that be stung alreadie by the said serpents. Other receipts there be set downe by our great masters in Physicke, as touching this foule vermine: but those which carie most modestie with them and haue greatest respect vnto manhood & humanity, are these, namely, to rub or annoint the place which is stung, with the said wal-lice and the blood of a Tortoise together: also to chase away serpents, with the smoak or perfume of them: likewise if any beast which hath swallowed down horse-leeches, do take them in drink, they will either kill them or driue them out, yea, and in what part soeuer they are fettled and sticked fast, they will remoue them and make them to fall off. And yet some there be who vse this naftie and stinking creature in eie-salues, for they incorporat them in salt & womans milk, and therewith annoint their eies: yea, and drop for them into the eares with honey and oile of rose mingled together. Others there be who vse to burne these punaifes or wal-lice, such especially as be of a wild kind, and instill them into the eares. Touching other medicines and incorporat their ashes in oile of Roses, and instill them into the eares. Touching other medicinal properties which they attribute vnto them, namely for impostumes and bitches that are broken and run, for the Quartan agne and many more maladies: although they giue direction to swallow them down in an egge, or else enclosed within wax or a beane, I hold them for lies, and therefore not worthy to be related in sadnesse. Marie I will not say but there is some probability and apparence of reason why they should put them in those medicines which are ordained for the lethargie: for surely they are knowne to be very proper against that drowlines, which is occasioned by the venom of the Aspis: to which effect seuen of them be ordinarily giuen in a cyath of water, or but foure, if the patient be a child. In case of strangurie also, when a man pisseth dropmeale, they vse to put wall-lice into a syring, and so conueigh them into the passage of the yard. See the goodnesse and industrie of dame Nature, the mother of all, how she hath produced nothing in the world but to good purpose and with great reason. And yet here is not all that they report of these lice called punaifes: For they say, that whosoever carie two of them in a bracelet about his left arme, within a lock of wooll (but the same forsooth must be stollen from some shepheard) he shall be secured against those agues that come ordinarily in the night season: but say their fits vse to returne by day time, then the said punices ought to be lapped in a reddish elout of a carnation colour. Contrariwise, the worme called Scolopendra is an enemy vnto these wall-lice, and killeth them.

As for the Aspides, look whomsoever they haue stung, they die vpon it with a kind of deadly sleepinesse and benumbednesse in all their lims: and to say a truth, of all serpents that creep vpon the ground, they are most mortall, and their wounds least curable. Their venom if it enter once so farre, that it come to bloud, or doe but touch a greene wound, there is no remedie but present death: marie if it light vpon an old sore, the danger is not so speedie, nor the force so quick. Otherwise let the same be taken in drinke to what quantitie soeuer, it is harmelesse and doth no hurt at all: for setting aside that senselesse drowlines which it influcth, putrefaction and infection it causeth none: which is the reason, that the flesh of those beasts which die of their sting is meat good enough. I would pause and make some stay in reporting a remedie that these Aspides do yeeld, but that I haue my warrant from *M. Varro*, whom I know to haue deliuered the same, euen when he was fourescore yeeres old and eight: namely, That there is not in the world so good a thing to cure the bitings of the Aspides, as to giue the party who is wounded thereby, some of their vrine to drinke.

To come now vnto the Basiliske, whom all other serpents do flie from and are afraid of: albeit he killeth them with his very breath and smel that passeth from him; yea, and (by report) if he do but set his eie on a man, it is enough to take away his life: yet the Magicians set great store by his bloud, and tell wonders thereof: and namely that being of it selfe as blacke and as thick congealed as pitch, yet when it is washed and dissolued, it looketh more cleare and pure than

* At which
yershe would
haue bene
ashamed to
tell alle.

* Cinna-

*Cinnabaris. Vnto it they attribute strange and admirable effects: For whosoever (say they) carie it about them shall & gracious with princes or great potentats, yea, and at their hands obtaine a grant of all their petitions: they shall find fauour with the gods above, and speed in all their praiers: remedie they shall haue of all diseases: and no forcerie or witchcraft shall take hold of them. And some of them there be who call it the bloud of *Saturne*.

As for Dragons, they haue no venome in them. And if it be true that our Magicians say, if a Dragons head be laid vnder the threshold of a dore, after due worship and adoration of the gods, with praiers & supplications vnto them for their fauourable grace, that house shall surely be fortunat. The eies of a Dragon preserued drie, pulverised and incorporat with honey into a liniment, cause (by their saying) those who be annointed all ouer therewith to sleepe securely, without any dread of night-spirits, though otherwise they were fearfull & timorous by nature. Moreouer, if we may beleue them, the fat growing about the heart of a Dragon, lapped within a peece of a Buckes or Does skin, and so tied fast to the arme with the nerues or sinues of a red Deere, is very auailable, and assurth a man good successe in all sutes of law. The first spondyle or turning joint in the chine of a Dragon, doth promise an easie and fauourable access vnto the presence of princes & great states. The teeth of a Dragon lapped within the skin of a roe buck or wild Goat, and so bound fast with the sinewes of a Stag or Hind, do mitigat the rigor of great lords and potentats, causing them to incline to their petitions and requests, who present themselves before them. But about all other receipts, one composition there is which bewraith the impudent and lying humor of these Magicians, who promise vndoubted and infallible victory, to those that haue it about them, and this it is: Take (say they) the taile and head both of a Dragon, the haire growing vpon the forehead of a Lion, with a little also of his marrow, the froth moreouer that an Horse someth at the mouth, who hath woon the victory and prife in running a race, and the nailes besides of a dogs feet: bind all these together with a peece of leather made of a red Deere skin, with the sinues partly of a Stag and partly of a fallow Deere, one with another in alternatiue course: carrie this about you and it will worke wonders. Impostures all, and loud lies. And verily, it is as gracious a deed to discouer and lay abroad these impudencies of theirs, as to shew the remedies for the sting of serpents, considering how these deuices be no better than meere mischiefes and forceries, which hurt and bewitch poore patients, and such as trust in them. True it is, that all venomous beasts flie from those that be annointed with Dragons greafe. Likewise they cannot abide the strong & virulent sauour of the rat of India called Ichneumon: in so much as they stand in dread of them who are annointed with a liniment made of the ashes of their skin incorporat in vinegre. Moreouer, lay the head of a Viper to the place where she hath wounded one, it is a soueraign remedie: yea, though it were the head of any other Viper than it which inflicted the wound, it is infinitely good. Likewise if a man do hold vp the same Viper that inflicted the sting, at a staues end ouer the smoak of wood burning, or the vapor of seething water (and yet, say they, warie enough they be thereof, and will auoid it) or annoint the place with a liniment made of her ashes burnt, it is sufficient to heal the sore. *Nigidius* mine Author affirmeth, That serpents after they haue stung one, are forced by a certain necessitie and instinct of Nature to returne vnto the party whom they haue hurt. The Scythians yerey vse to slit a vipers head between the eares for to take forth a little stone, which she is wont to swallow when she is affrighted. Others make vse of the whole head as it is. Certaine trochisks there be, made of a Viper, called by the Greeks Theriaci: for which purpose they cut away at both ends as well toward the head as the taile the breadth of foure fingers, they rip her belly also, and take out the garbidge within: but especially they rid away the blew string or vein that sticketh close to the ridge bone. Which done, the rest of the bodie they seeth in a pan, with water and dill seed, vntill such time as all the flesh is gon from the chine: which being taken away, and all the prickie bones therto belonging, the flesh remaining they incorporat with fine flour, & reduce into trochisks, which being dried in the shade, are reserued for diuerse vses, and enter into many foueraigne antidotes and confections. But here is to be noted, that although these trochisks be called * Theriaci, yet are they made of vipers flesh onely. Some there be, who after a Viper is cleansed as abovesaid, take out the fat, and seeth it with a sextar of oile vntill the one halfe be consumed: which serueth to driue away all venomous beasts, if three drops of this ointment be put into oile, and therewith the body be annointed all ouer. Moreouer, this is held for certaine, that there is no sting or bit of serpents so mortall and incurable otherwise, but the entrailles of

* A kind of
gum, called
Sanguis Dra-
conis.

* Theriaci. For
the trochisci in the
primitive and
naturall signifi-
cation is more
general of the
bit of vipers, which
is any wild or
venomous
beast.

the

counter charme against all forceries and witchcrafts : and more particularly, if a Bat be borne G thrice round about a sheepe-coat, and then hanged vpon the lintell of the dore, with the heeles upward, it will serue for a singular preservative to defend the sheep from all such harmes. As for the bloud of a Bat, they commend it highly for healing the sting of serpents : if together with the leaues or seeds of a thistle it be applied to the place.

Touching the venomous spider called *Phalangia, they know not in Italy what it is, for all there be many kinds thereof: for some are like vnto Pismires, but that they be far bigger; their heads be reddish, the rest of their body black, howbeit here and there marked with white spots. The sting of this spider is more keene and sharpe than that of the waspe. It liueth ordinarily about ouens and mils. The best remedie against the prick of their sting, is to present before the eyes of the patient, another spider of the same kind: for which purpose folke vse to keepe them in store, when they find any of them dead. Their cascs or skins brought into powder and taken in drink, haue the like effect to young weazils or kitlings, as I haue declared before. A second sort there is of these venomous spiders Phalangia, which the Greeks distinguish from others by the name of Lupus. Those that be of a third kind, and yet named Phalangia, are the spiders which be couered all ouer with a certain downe, and of all the rest haue the biggest heads. Cut one of them and rip the bellie, you shall find within two little wormes or grubs, which (if it be true that *Cecilius* hath left in writing) hinder women from conception in case they be knit within a peece of leather of a red deere skin, and tied to their armes or other parts of their bodie before the sunne rising; but this vertue continueth not about one year. Thus haue I shewed one receipt only, of all those that *keepe women from conceiuing; which I may be allowed to do in regard of some wiues, who being too fruitfull and ouercharged with child bearing, haue some reason to play them a while and rest from teeming: and therefore may be pardoned, if they vse some such meanes therefore.

There is another kind of spiders, which the Greeks call Rhagion, for that it resembles a black grape kernill: these haue a very little mouth vnder their belly, and as short legs, as if they were vnperfect and not fully made. Look where they bite, the pain that ensueth is much like to that which is occasioned by the sting of a scorpion: and their vrine who are hurt by them, seemes to shew to the eye, cobwebs stiring aloft. I would say, that this spider were the same that *Asterion*, another kind of them, but that these haue certaine raies or streakes of white. Their sting or prick causeth loosensse and feebleness of the knees. As for the blew spider, which carrieth a blacke downe or cotton, it is worse than both the former, causeth trouble and dimness of the eyes by their pricking, yea, and vomiting of matter resembling cobwebs. And yet there is another Phalangium worse than it, which commeth neare in shape to the Hornet, but that it hath no wings at all, and look whomsoever it biteth, they are sure to become leane and pine away. The venomous spider, called by the Greeks Myrmecion, is headed like vnto an Emmet: the bellie is blacke, howbeit marked with certain white spots: their sting is as painefull as that of Wasps. But as touching that kind of Phalangium which is called *Tetragnatum, there be two sorts thereof: The one, which is the worst of the twaine, hath the head diuided directly in the midst with a white line; whereas in the other, the said line or seame runneth crosse ouerthwart. These make the mouths to swell whom they haue bitten. But those that be of a dead asht colour, and yet whitish behind, are not so quicke with their prick as the rest: Of which colour there is another sort that be altogether harmlesse: and these be our common spiders or spinners which against wals vse to stretch out their large webs as nets to catch poore flies. Now concerning the remedies appropiart to any prick or biting of the foresaid Phalangia, there is not a better thing than to drink in oxycrat, water and vinegre mingled together, the braines of a Cock or Hen with a little pepper. Also to take in drink siue Pismires, is thought to be a singular medicine: and withall to make a liniment of sheeps mucke ashes, tempered in vinegre, and therewith to annoint the grieved place. Moreouer, the said spiders themselves (of any kind whatsoeuer) resolued and putrified in oile, serue for the said purpose.

As for the mischeuous mouse called the Hardishrew, the runner found in a lambes maw taken in wine, healeth the hurt that commeth by her biting: also the application of a salve made with the ashes of a Rams cley incorporat with hony, worketh the same effect: so doth a young weazill or kitling, prepared and vsed in manner aforesaid in the Treatise of serpents. If one of these shrewes haue bitten a horse or other beast, it is good to lay vnto the place a mouse or rat

A new killed, with some salt, or else the gall of a Bat with vineger. The shrew it selfe being burst, and so laid fresh and warm to the sore, cureth the same: for this is obserued, That if one of them be with yong when she doth bite, presently she cleaueth in sunder. And in truth, the best & surest means to cure the hurt, is to apply vnto the wound the very shrew it selfe that did the deed, if possibly shee may be had; and yet the rest are very good: for which purpose they vse to be kept in oile, or els to be dawbed ouer with clay, to serue in time of need: also the earth taken from a cart-rut where a wheele hath gon, is thought to be a proper remedie for the said biting of a shrew, if it be applied thereto: for it is said, that this creature is by nature so benumbed or dull of mouing, that it will neuer go ouer a cart-track.

As touching Scorpions, the lizard named Stellio (by way of a reciprocall counterchange) is the greatest enemy they haue; inso much as at the very sight only of the said lizard, they will be affrighted and astonied and fall into cold sweats: and therefore people vse to putrifie & resoluue Stelliona in oile, and therewith anoint the wounds that Scorpions haue made. Some there be who make a kind of plaistre of the said oile and litharge of siluer boiled both together, wherewith they rub and anoint the grieved place. This lizard, which we name Stellio, the Greeks call Colotes, A scalabotes, and Galeotes: * it breeds not in Italy: but call it what you will, & wher-soeuer it is to be found, full it is of little red spots like lentils; a shrill noise it maketh, that pierceth the eares and goeth through ones head; it doth eat and graze like other beasts, which be marks all contrary to our Stellions or starre-lizards here in Italy. But to come againe vnto the prick of scorpions: it is thought good to rub the same with the ashes of hens dung, mixt with the liuer of a dragon: or to take a lizard that is bursten, and the same to apply vnto the affected place; or a mouse likewise which is clouen in sunder, also to lay to the sore the very same scorpion that did the harm; or to eat him roasted: and last of all, to drinke it in two cyaths of pure wine of the grape. Moreouer, this proper qualitie haue scorpions alone by themselves, That they neuer prick the ball of ones hand, nor sting at all vnlesse they may touch some haire. Furthermore, take any little stone whatsoeuer, and apply that side which lay next the ground vnto the wound, it will ease the paine: likewise any shell or potsherd which lieth with some part of it couered with earth, if it be taken vp and laid vnto the sore, with earth and all vpon it as it was found lying, is said to heale the same perfectly: but in nowise they that haue the applying of it must looke behind them: they ought also to take heed and be very carefull that the Sun shine not vpon them when they are about this businesse. Earth-worms or mads stamped and laid to, are very good to cure the biting of scorpions: and yet they serue besides for many other remedies; in which regard they be ordinarily preferred in hony.

For the sting of Bees, Wasps, and Hornets; for the biting also of those Horseleeches called Bloudsuckers, the Howlat is counted a soueraigne remedie, by a certaine antipathy in nature: also whosoever carry about them the bill of a Woodpecker or Hickway, shall neuer be annoyed with any of the foresaid vermin. The smallest kind of locusts likewise, which are without wings and be called Attelabi, be aduerses and contrarie vnto them all.

ouer & besides the Insects aboue named, there be in some places certain pismires also very venomous, which *Cicero* calleth Solpugæ: but they of Grenado in Spain, Salpugæ: howbeit few or none of them are to be found throughout all Italy. But what help is there for them and their poison? Surely the heart of a Reremouse, otherwise called a bat, hath an operation which is aduerses not only to them, but to all Ants besides.

As for the flies named Cantharides, I haue shewed before how contrarie they be to the venom of the Salamander: and yet considering how hurtful they be themselves, and a very poison to the bladder, causing intollerable pain if they be drunk down, much dispute & question there is among physitians, * how they should be taken and vsed; for how venomous they be, it may appeare by the practise of a certaine Egyptian physitian, whom by occasion that one *Cosinus* a knight of Rome, a great fauorite of the Emperor *Nero*, was infected with the foule tetra called Lichene, the said prince sent for out of Egypt to cure of that disease: but he prepared such a drink of Cantharides for his patient *Cosinus*, that it quickly cost him his life and brought him to his graue. Howbeit there is no doubt, but being applied outwardly they are not only harmlesse, but also very good, especially if they be incorporate in the juice of the blacke wilde Vine called *Vva* Taminia, and sheeps suet or goats tallow. Moreouer, albeit well knowne it is that these Cantharides be venomous, yet those Authors that write of them be not agreed and resol-

* And yet *Matthiolus* vpon *Diocorides* saith it is the *Tarantula* which is common in Tuscany.

* Namely, whether they are to be vsed inwardly at all? whether with their wings, head & feet, or without them.

ued, in what part that venom lieth: for some there be who are of opinion, that their feet are poisoned, others thinke their mischief is all in their head; and there be againe who deny both: but wherefoever the said poison lieth, all conclude jointly vpon this point, that their wings be medicinalable therefore, and do cure the same. As for the generation of these dangerous flies, they be ingendred of certaine little grubs or wormes; and most commonly vpon the spongyous baile which wee see to grow vpon the stalke or stem of the Eglantine: but surely the greatest plenty of them breed in an Ash tree. As for others that come of a white Rose bush, they are not so vehement in operation as the rest: and of them all, those worke most violently which are spotted and of diuers colours, streaked with yellow lines ouerthwart their wings, and besides are very plumpe and fat. The smaller sort, which also are broad and hairy, are nothing so powerful and speedy in their operation. But the worst of all, and least effectually in physicke, be those which are of one entire colour, and leane withall. Now for the manner of preparing and ordering of them for physical vses; they would be gotten when Roses be fully out: heaped vp together in one masse, and so bestowed in an earthen pot not pitched, varnished or nealed, the mouth wherof is close stopped with a linnen cloth: then are they to be hanged vp with the mouth of the said pot downward ouer some vinegre boiling with salt, vntill such time as by the fume or vapour thereof steeming through the said linnen clout, they be choked and killed: and afterward they be layd vp and reserued for vse. Of a causticke and burning nature they are, in so much as they will raise blisters, yea and leaue an eschar vpon the exulcerat place.

Of the like force be the wormes *Pityocampæ*, breeding in pitch trees: so is the venomous flie or beetle called *Buprestis*: and after the same maner be they prepared as the *Cantharides*: All the sort of them in generall be most effectually to kill the leprosie, and ilfaured tetter, called *Lichen*. Besides, they haue the name to prouoke womens monethly termes, and vrine, which is the cause that *Hippocrates* prescribed them to be vsed in a dropsie. To conclude with these *Cantharides*, I thinke it not amisse to note, That *Cato* synamed *Vticensis*, was accused and endited for selling of poison; because in the generall portsale of the kings goods, amongst other moueables, he held *Cantharides* at threescore sesterces a pound, and made so much money of them.

CHAP. V.

¶ Of the Ostrich greace, and of a mad Dog: of Lizards, Geese, Doves, and Weazils, with the medicines that they do yeeld.

* Some readeth
thirry.

I Cannot chuse but relate also by the way, vpon this occasion ministred, that at the same time Ostrich greace was sold for * eighty Sesterces the pound: and in truth it is much better for any vse it shall be put vnto, than goose greace.

As touching diuers sorts of venomous hony I haue written already: but for to repress the poison thereof, it is good to vse other hony wherein a number of bees haue been forced to die: and such hony so prepared and taken in wine, is a foueraign remedie for all those accidents that may come by eating or surfeiting vpon fish.

For the biting of a mad dog take the ashes of a dogs head burnt, and apply it to the fore, it wil saue the Patient from that symptome of being afraid of water, which is incident to such as be so bitten. [And now by occasion of speech know thus much once for all, That all things which are to be calcined require one and the same manner of burning, that is to say, within a new earthen pot neuer occupied before, well luted all ouer with strong cley, and so set into an oven or furnace vntill such time as the contents be calcined.] The said ashes made of a Dogs head is singular good likewise to be drunke in the same case: wherefore some haue giuen counsell to eat also a dogs head. Others seeke after the wormes that breed in the carcase of a dead dog, and hang the same fast about the necke or arme of the party that is bitten: or els they lap within a cloath some of the mensrual bloud of a woman, and put it vnder the cup or pots bottom out of which the patient drinketh. And there be some againe who burn the haire of the same mad dogs taile, and conueigh the ashes handsomely in some tent of lint into the wound. Moreouer it is commonly said, That as many as haue a Dogges head about them, no other Dogges will come neere to do them any harme. In like manner, if a man carry a dogs tongue in his Shooe vnder his great toe, there will no Dogges bay or barked at him. If hee haue

about

A about him a weazils taile, which hath bene let goe againe after it was cut away. There is to be found under the tongue of a mad dog, a certaine slimy and grosse spittle, which being giuen in drinks to those that are bitten, keep them from the feare of water, which symptome the Greeks call *Hydrophobia*: but the best and most soveraigne remedie of all other, is the liuer of the same dog that in his madnesse bit any body, eaten raw, if possibly it may be; if not, yet sodden or boiled any way; or else to cause the Patient for to sup the broth that is made of the same dogs flesh. There is a certaine little worke in dogs tongues, called by a Greeke name *Lytta* which if it be taken out when they be young whelpes, they will never after proue mad, nor lose their appetite to meat. The same worke giuen to such as are bitten with a mad dog, proueth them from beeing mad; but with this charge, that before they take the same, it must be carried three

B times about the fire. Also the braines of a Cocke, Capon, or Hen, is singular good against the biting of a mad dog: but if one haue eaten the same, the vertue thereof indureth but for that yeare onely, and no longer. It is commonly said, that the crest or combe of a Cocke well bruised and stamped, and so laid in manner of a cataplasme to the place bitten, is very effectually to cure it: as also the greafe of a goose incorporate with honey. Furthermore, some there be who vse to salt the flesh of dogs which haue bin mad, and so keepe it to giue in meat vnto those who chance to be bitten by others. There be, who take some young whelpes, male or female according to the sex of dog or bitch that hath bitten any one, and presently drowne them in water, causing the Patient to eat their liuers raw. The yellow or reddish dounge of a cock or a hen, dissolved in vineger, and applied to the sore, is singular good. The ashes also of an hardy shrewes taile, provided alwaies, that the shrew were let goe alieue, so soone as she was curt-tailed. Moreover, a piece of clay taken from a swallows nest, made into a liniment with vineger: or the ashes of young swallows newly hatched and burnt: the old skin alio or slough which a snake vseth to cast off in the spring time, stamped with a male crab-fish, and with wine brought into a Cataplasme, be all especiall remedies for the biting of a mad dog. As for the skinn or spoile of a snake, if it be put alone in a chist, presse, or wardrobe, among cloaths, it will kil the moth. But to come againe vnto a mad dog: his poison is so strong, that whosoever do but tread upon his vrine, especially if they have any sore or vlcere about them, they shall sensibly feelee hurt thereby. Now what remedie is there for such? None better than the dung of a caple, well wet and tempered with vineger, and the same laid very hot within a fig to the foresaid sore. These may seeme to

C some men strange things & monstrous; but lesse will they wonder hereat, when they shall heare and consider, that a stone which a * dog hath taken vp with his mouth and bitten, wil cause debate and dissention in the company where it is: and yet this is held for a certain truth, in so much as it is growne into a common prouerbe and by-word, when we perceiue those that dwell in one house together to be euermore jarring and at variance one with another, to say, You haue a dog-bitten stone here among you. Again, whosoever maketh water in the same place where a dog hath newly pissed, so as both vrines be mingled together, shall immediatly find a coldnesse and astonishment in his loines, as folke say.

That kinde of Lizard, which of some Greeks is called *Seps*, of others *Chalidicum*, hath a venomous tooth: howbeit, the same worke or serpent taken in drinke, cureth the bit which it selfe inflicted.

E If wilde Weazils haue empoisoned any body, let the patient take a large draught of the broth of an old Cocke, he shall finde it to be a very foueraign remedie therefore: but about all, it is most effectually against the poison of the herbe *Aconitum*; but then it must be giuen with a little salt among.

Against the poison of venomous Tadstoles and hurtfull Mushromes, hens dounge (I meane that part alone which is white) sodden with * Hyssope or honied wine, is singular good, for it represseth and killeth the malice thereof. And the same otherwise keepeth downe ventosities and stuffing of the stomacke, ready to choke one. Whereat I cannot chuse but maruell much, considering that if any other living creatures do tast never so little of the said dung (but man or woman onely) they shall be exceedingly vexed with winde in the belly, and other grievous wrings and torments.

F The Sea-hare is knowne to be venomous; but goose bloud taken with an equall quantity of oile is a foueraign counterpoison for it. Of this bloud, incorporat with the best *Terra Sigillata* of the Island *Lemnos*, and the iuice of the *S. Mary* thistle called *Bedegnar*, there be excellent trochisks

* For the maner of a dog is to be angry with the stone that is thrown at him, with our regard of the party that slung it: whereupon groweth the Prouerbe in Greeke, *οτι ο κυνς οτι ο βουλος*

* In hyssope de: collis, aut mul: some readeth, *collis aut mul: cum asyno de: collis in mul: i. Boiled with tried greafe of sheeps wool, in honied wine.*

trochifchs made weighing five drams apeece, which are vsually kept in a readineffe for to bee drunke in three cyails of water as a counterpoison and countercharme, against all venomous confectiōns and diuelliſh forceries: for which purpose ſerveth alſo a yong ſucking Weazill prepared in manner aforeſaid. The rennet in a lambs maw likewiſe, is paſſing good for any ſuch in- direct means wrought by poiſon or witchcraft: like as the blood of ducks and mallards bred in the realm of Pontus, and therefore their blood is ordinarily kept dry in a thicke maſſe, and as need requireth is diſſolved and giuen in wine: but ſome think, that the blood of the female duck is better than that of the mallard or drake. Semblably, the geſier of a ſtorke, and the rennet or read of a ſheep, is thought to be ſingular good for any poiſons whatſoeuer. The broth or deco- ction of Coleworts boiled with Rams mutton, hath a peculiar vertue againſt the Cantharides. Ewes milke alſo drunke warm, availeth much againſt all poiſons, vnleſſe it be the venomous flie Bupreſtis, or the deadly herb Aconitum. The dung of wild quois or ſtockdoves taken in drink, hath a ſpecial vertue to helpe thoſe that haue drunke quicke-ſilver. Finally, the fleſh of the or- dinary or common houſe weazill kept in ſalt, is a preſent counterpoison againſt all venome that goeth vnder the name of Toxicum, if one drinke of it the weight of two drams.

CHAP. VI.

¶ Medicines to bring haire againe in places that by ſome diſeaſe are bald: alſo to rid away nits: for to rectifie and keepe in order the Eye-lids, and the haire growing thereupon: for to cure the pearle in the Eye: and generally for all the accidents befalling to the Eyes: laſt- ly, for the impoſumet kernels behind the eares.

* The Latines in o d time af- ter the ſame analogie cal- led the dung offwine, Sa- cerda, of kine and oxen, Bu- cerda, like as the nature of men, Homerda

* This Idoll of the Panims, I take to be cal- led in the ho- ly Scripture, Beel-zub.

THe naked places in head or beard, are replenished again with haire by a liniment made of the aſhes of ſheeps dung incorporat in Cyprin oile & hony: alſo with the aſhes of mules or mullets houſes, applied with oile of Myrtles. Our countryman and Latine writer Varro affirmeth moreouer, That the dung of mice (which he by a proper name calleth * Muscerda) is a convenient medicine for the ſaid infirmity and defect: he attributeth alſo the ſame operation to the heads of flies applied freſh to the bald place, if ſo be the ſame were before rubbed hard, and in ſome ſort fretted with a figtree leafe. Some vſe in this caſe the blood of flies: others min- gle their aſhes with the aſhes of paper vſed in old time, or els of nuts, with this proportion, that there be a third part only of the aſhes of flies to the reſt, and herewith for 10 daies together rub the bare places where the haire is gone. Some there be again, who temper and incorporat toge- ther the ſaid aſhes of flies with the juce of the Colewort and breſt-milk: others take nothing thereto but hony. Certes, a ſtrange thing it is of theſe flies, which are taken to be as ſenſeleſſe and witteſſe creatures, yea, and of as little capacity and vnderſtanding as any other whatſoeuer: and yet at the ſolemne games and plaies holden every fifth yeare at Olympia, no ſooner is the bull ſacrificed there to the Idoll or god of Flies called * Myiodes, but a man ſhall ſee (a won- derfull thing to tell) infinit thouſands of flies depart out of that territory by flights, as it were thicke clouds. But to come again to the aforeſaid infirmity of haire-ſhedding: the aſhes of the heads, tails, yea and the whole bodies of mice burnt, are very good to make it come again; eſpe- cially if the haire went off by occaſion of ſome venomous matter or poiſon: ſo are the aſhes of an vrchin or hedgehog medled with hony: or the ſkin therof burnt and applied with tar. As for the head alone of an vrchin conſumed into aſhes, it is thought to be effectual for this purpoſe, that it will cauſe haire to grow again vpon a ſkar: but for the cure of the aforeſaid defect of haire, cal- led Alopecia, the places ought before the application of thoſe topicke medicines, to be wel pre- pared with the razor, and a ſnap ſme or rubificatiue made of muſtard-feed, vntill the place look red: howbeit, ſome chuſe rather to take vinegar vnto it. Here note by the way, that whatſo- ever vertue we attribute vnto hedgehogs, the ſame is more effectual in the porkeſpine. Moreo- ver, Lizards torried yea and calcined as I haue ſhewed before, with the root of reeds or canes that be green and new drawn (which that it may burne the better with the Lizards, ought to be ſliced ſmall) yeeld aſhes, which being incorporat well in oile of myrtles, doe retaine the haire and keep it from ſhedding, if the place be annointed therewith: and the green lizards in this cure and operation be ſimply the beſt: but if you would haue this medicine to work more effectual- ly, put thereto ſalt, Bears greaſe, and Onions ſtamped. Some there be, who in ten ſextars of old oile ſeeth ten greene Lizards, and therewith make a liniment, thinking it ſufficient therewith

A to annoint the place once a moneth, and no oftener. The aſhes of vipets skins doth raiſe haire quickly againe and make it grow apace, where it was ſhed: ſo doth Hens dung that is freſh and new, if the place be plied with annointing. Take a rauens egge, and mix it with the dung afore- ſaid in a veſſell of braſſe, and therewith rub and annoint the head (ſo that it were ſhauen before) it will cauſe the new haire to come vp blacke: but vntill this vnguent be dried vpon the head, the patient muſt hold oile in his mouth, for feare leſt the teeth alſo by this means turn blacke: and withall, this ought to be done in the ſhade or within houſe: and the aforeſaid ointment not to be waſhed off in 4 daies ſpace. Others in this cure, vſe the blood and brains of a raven, toge- ther with ſome thicke and deep coloured wine. Some boile a raven thoroughly, vntill the fleſh be parted from the bones, and in the dead time of the night when euery body is found aſleepe, put him vp into ſome pot or veſſell of lead. There be again, who hauing prepared and rubified the ſkin with ſalnitre, doe annoint the place where the haire is gone or groweth thin, with a liniment made of Cantharides and tar punned & incorporat together. Now for as much as Cantharides be of a cauſtick quality and corroſiue, great heed would be taken that they doe not fret and eat into the ſkin over deep. Now when the place is thus prepared, and lightly exulcerat, they ordain to apply thereto a liniment made of mice heads and their galls, incorporat and wrought toge- ther with their dung, putting thereto Ellebore and Pepper.

The head many times is peſtered with nits, but for to rid them away, there is not a better thing than dogs greaſe. Some for this purpoſe make a diſh of meat with ſnakes, dreſſing and ordering them as eels and ſo eat them; or els they take their ſlough which they ſlip off in the ſpring time, and drinke the ſame.

C Otherwhiles there be certaine branny ſcales called dandruffe, which ouer-ſpread the head: to clenſe it from this ſcurfe and deformity, it were not amiſſe to annoint the head with ſheeps gal tempered with fullers * ſcouring clay, and let it remaine on the head vntill it be drie.

For the painfull head-ache, it is commonly thought, that the heads of naked ſnails (I meane thoſe that be found without ſhells, and are vnperfect yet and not fully made) plucked from their bodies are a ſingular remedy to be hung about the neck or tied to the head; with this charge, that there be taken forth of their heads firſt a certain ſtony hard ſubſtance, which is made flat and broad like a thin grauell ſtone; and if the ſaid ſnails be but yong and ſmall, they vſe to ſtamp them, and in manner of a frontall apply them to the forehead. In like manner, the bones of a Vultures head, whether it be the common Geire, or that which the Greeks call *Ægyptios*, han- ged about the neck or faſtned to the arms: alſo the brains of the ſaid ſoule tempered with the oile of Cedar-roſin, driueth away the head-ache, if either the head be thoroughly annointed, or the noſtrils within forth, therewith. The brains of a crow or of an owle, being ſodden and eaten wil do as much. Some think it good in this caſe, to lap the head and forehead with the feathers or plume plucked from about the neck of a cocke, or with his creſted combe, but it muſt bee of ſuch a cock as hath bin cloſe ſhut vp as a priſoner and kept from meat and drinke a whole day and a night; but take this withall, the patient who is troubled with the head-ach, muſt faſt as long from all meat and drink. The aſhes of a rat or weazill applied to the forehead, eaſeth the pain, ſo doth a twig or ſtick taken from a purtocks neſt, laid under the pillow of the ſick perſon; yea and a liniment made of a mouſe ſkin burnt to aſhes, mixed with vinegar, & ſo applied.

E Many do ſay, that the little hard bone in the head of ſnails (ſuch eſpecially as are found betwixt two cart-tracks) if it be put through the eare, and hanged thereto within a little box of Iuorie, or otherwiſe tied faſt and carried about one within a piece of a dogs ſkin, is a remedy for the head ach that neuer fail-eth, and may ſerue to do many good. If the head be hurt, or the crown crackt, lay to the wound a copweb with oile and vinegar, and ſo let it lie, it will not lightly goe off vntill ſuch time as it be perfectly healed: this copweb is very good alſo to ſtaunch the blood * of wounds in a Barbers ſhon. But ſay that the blood gush out of the head, and from the brain, what is to be done in that caſe? Surely there is not a better thing to ſtay the flux thereof, than to in- ſtill and drop thereupon the blood of a goſe or ducke, with the greaſe of the ſaid ſouls, ſodden together with the oile of Roſes. And to returne once againe to the cure of the head-ach: Take a ſwallow feeding in a morning betimes, cut off his head (but let this bee done if poſſibly you can in the ful of the Moon) wrap it within a linnen cloth, and binde it to the head of the patient with the yarn that goeth to the ſelf edge or liſt of a piece of cloth: and ver ſome there be, who in- corporat the ſaid head within white wax, and therewith annoint the forehead, and withall, baſt

* *Creta cimolia* Tuckers earth.

* *Paludibus sanguine fillis* Either when the Barber would ſtop the or ſice of a vaine after blood letting; or when one that is newly wounded, cometh ſtraight bleeding to be dreſſed; or if his own raſor chance to go awry & ſhauo the quicke, while he hath a new blade ſhined to trim.

dogs haire downe to a bend or peece of cloth, and fasten the same close to the said forehead.

dogs haire downe to a bend or peece of cloth, and fasten the same close to the said forehead.
Let vs come lower to the eielids: it is said, that if one do eat the brains of a crow with meat, it will make the haire there to grow: so doth the tried greafe of sweatie wooll called Oesypum, if the edges or brims of the eielids be annointed with it and myrrh hot, with a fine penfill. Many promise the same effect, if there be taken the ashes of flies and mice dung, of each an equal portion; so as they both together amount to the weight of halfe a dram or denier Romane; adding thereto of Stibi or Antimonium * two six parts of a denier; so as they be all incorporat with Oesypum aforesaid, and therewith the eielids be annointed. Likewise young mice are imployed to the same purpose, being braied in a mortar with old wine to the consistence of those medicines which be called Acopa, and prepared to dissolue lassitudes. If any haire grow in the eielids vntowardly and be offensive to the eyes, or otherwise, pluck them forth, and annoint the place with the gall of an vrinch, they will neuer grow againe to trouble you: of the same operation and effect, is the humor or liquor that the eggs of the Star-lizard called Stellio, doe yeeld from them: the ashes of a Salamander: the gall of a green lizard, tempered with white wine and permitted in the Sun to thicken and dry vntill it haue gotten the consistence of hony, lying all the while in some bason or vessell of brasse: the ashes of young swallows with the milky iuice of the Tithymall: and last of all, the slime or froth that issueth from shel-snails.

the Thymall: and last of all, the flime or froth that issueth from their-nails: To come nearer to the very eies; the fiery red spots or pearles appearing in the chrySTALLINE humor, which the Greeks call Glaucōmata, may be cured (as our Magicians say) with the brains of a yong whelp or puppie that is but 7 daies old; so as the Chyrurgian with his probe or instrument, do conuey the same gainly on the right side, if the right eye be amiss; and contrariwise on the left side, if the other eie be affected. And some of them affirme, that the fresh gall of a foule called Asio will do as much: this Asio, is of the biggest kind of owls, who haue certaine feathers pricking vp like ears. *Apollonius Pitaneus* was of opinion, that for to cure the cataract in the eie, the gall of a dog was better than that of the Hyæna, so that it were applied thereto with hony: and he was pertuaded, that the same would take away the white spots or pearles of the eie, called Albugines. It is a generall speech, that to clarifie & quicken the eiesight that is dim and ouercast with a mist or cloud, a collyrie or eiesalve made with the ashes of mice heads and their tails, mixt with hony, is a singular medicine: but the same would bee much better in case the said salve were made vp with the brains or gall of an Ægle. The greafe and ashes of a rat burnt field mice: or at leastwise with the brains or gall of an Ægle. The greafe and ashes of a rat burnt and well incorporat in a mortar with the best Attick hony, is a soveraigne remedy for weeping and watery eies: so is Antimonium, otherwise called Strij, but what it this, I meane to declare in my treatise of Minerals. The ashes of a weazil is good for the cataract: so are the brains of a lizard or swallow: and if the same lizards & swallows be either braied in a mortar or foddend, and so applied to the forehead in manner of a liniment, they do repress the violent rheume that takerh to the eies: which effect they worke either alone by themselves, or els with fine floure of meale, or with Frankincense: and in this wise they help the eies and face * blasted and blistered with sun-burning. Moreover, there is not of all others a better medicine to cleare the eie and to rid away all thick flimes and mists that trouble the sight, than to burn the said lizards & swallows alive, and with an eie-salve made of their ashes and hony of Candy, to anoint them. The slough or skin of an Aspis, which she likewise somtyme casteth, tempered with the own greafe, mundifieth the eies of horses and such labouring beasts, if they be annointed therewith. Also, there is not a more soveraigne thing in the world for to remove the cataract, and dispatch the mists and cloudy films that dim the eies, than to burne and calcine a viper alive in a new earthen pot neuer occupied before, putting thereto of the juice of fenell the measure of one cyath, and some corns or crums of Olibanum or frankincense: and this medicine is commonly called * E-chion. Moreover, There is a collyrie or speciall eie-salve made of a viper suffered to putrifie in a pot of earth, so as the grubs or worms that come of the said carrion be stamped and incorporat in Saffron. Some burn a viper with salt in an earthen pot; and they are of opinion, that whosoever do lick the same salt, or let it melt at the tongues end, it clarieth the eies: and that they shall * keep the stomacke and all the body besides in good temper, yea, and liue long by that meanes. They vse to giue also of this salt vnto sheepe when they are not well at ease, and it is thought to be very wholsome for their health: yea, & it entereth into many antidotes & counterpoisons deuised against the venome of serpents. Some there be who vse to eat vipers ordinarily

of Plinie's Naturall Historie.

A rily at their table, for to preferre their eiesight. But for meat they prepare & order them in this wife: first, so soon as they haue killed a viper, they giue order to put salt into the mouth, vntill such time as it hath sucked out the venomous humor that lieth at the root of the teeth, and dissolved or consumed it: afterwards, when they haue cut away to the bredth of foure fingers from vnder the top of the head, and withall taken forth the intraines and garbage out of the belly, they seeth the rest of the body in water, or oile, together with oile and dill seed: and this flesh either they eat out of hand thus dressed, or els working it with some paste, they reduce the same into troches, that they may be preferred for their vie at sundry times. As touching the broth that is made of this decoction,ouer & besides that it is good in those cases before specified, this quality it hath namely to rid and cleanse the

B kill the itch that runnes aloft in the skin. The ashes of a vipers head calcined, are by themselves very effectuell without any thing els; but principally in clearing the sight, if the eyes be annointed therewith in some conuenient liquor: so is the grease also of the viper. As for their gall, I dare not be so bold as to approve that which others confidently haue aduised & prescribed: because (as I haue already shewed) the venome of serpents is nothing els but their gall. The grease of a snake mixed with verdegreece, healeth any part of the eye that is broken: but the slough or old skin which they cast off in the spring, doth clarify the eye-sight, if the eyes bee gently rubbed therewith. The gall of an Hulat likewise is highly commended for the white pearles, the cataracts and thick films which trouble the sight: the fat also of the said bird is as much praised for the clearing of the same. Moreover it is said that the gall of a viper is good for the clearing of the sight.

C for, to proue and trie her yong birds, vseth to force them for to lookedirectly vpon the Sunne) mingled with the best hony of Athens, serueth to annoint the eies, for the webs, filmes, & cataracts which trouble the eiesight. Of the same operation is the gall of a Vulture or Geire, incorporat with the iuice of Porret and a little hony. The like vertue also there is in the gall of a cock or capon, for the pin and web, and for the pearle in the eie, if the same be dissolued in water, yea and for the cataract, especially if the said Cock or Capon be all white. The dung likewise of cocks and capons, I mean that part only thereof which is ruddy and browne, they say, is singular good for those that be pore-blind or short sighted, such also as see not wel but about noon tide. They commend moreover the gal of an hen (but the fat especially) for the little blisters or spots that otherwise arise in the apple of the eie, and for the same purpose.

D them far, and forno cause els. But if there be put thereto the poudre of the red bloud-stone Hematites, and the yellow saffron-coloured Schistos, it is wonderfull how much better it will be for that purpose; yea, and to heale the tunicles of the eyes that be broken. Moreover, Hennes dung, as much only of it I meane, as is white, many vsē to keep in old oile within certaine boxes of horne, for to cure the white pearles that grow in the apple of the eye. And since I am entered thus farre into the dung of Pyllaine, I must aduertise you what is reported of Peacocks. That they doe eat and swallow downe againe the same dung which themselves haue meured for very enuie that they haue vnto mankind, knowing by a secret infinit of Nature how good it is for many vses. Furthermore, it is an opinion commonly receiued, that all the race of Faulcons, if they be boiled in oile Rose and Frankincense, will be good for the cure of the same.

¶ they be boiled in Oile Rolat, are soueraigne for any accidents of the eyes whatsoever, if they be bathed with that decoction. Semblably, it is said, that their dung reduced into a shes and incorporat in the best hony of Athens, is very good therefore: as also the liuer of a Gledé or Kite is much commended in those cases. Pigeons dung tempered in vineger, cureth the fistulae which are between the lachrymall corners of the eyes and the nose: and otherwise is singular for the white pearls and the cicatrices or films growing in the eyes. Goose dung and duckes blood be both of them very soueraigne for to soake out the blacke blood in the eyes, occasioned by some contusion or bruise, with this regard, that they be afterwards annointed with * Hyssöpe and Honey. The gall of a Partridge mixed with honey, of each a like weight, mightly cleareth the eyesight: so doth the gall of a fallow Deere applied simply alone, without any mixture or addition at all. But these galls cureth but the eyesight.

"Haliartos, i.

is the tried
grease of vn-
washed woolle.

pinion, because that blood is hotter, and therefore by so much the better. But when the eyes be dressed with this blood, it would not be forgotten, that there be a thin bolster boiled in honey, laid aloft, yea, and a lock of greafe wooll vpon it, which had bin soaked either in oile or wine. The blood of the fowls abouenamed helpeth those that cannot see toward a night: the liuer also of a sheep doth the same: but if the said sheep be of a russet or browne colour, the medicine will do the better: for as I obserued before in Goats, those that carry such a coat, bee alwaies esteemed best. Many giue counsell to foment and wash the eyes with the decoction of the said liuer: and if they be in pain and swollen withall, they aduise to annoint them with the marrow of a Mutton. They promise also, That the ashes of scrich-owles eyes put into a collyrie, will clarify the sight. Indeed the dung of Turtles consumeth the white pearles in the eyes; so doth the ashes of shell-snailles or hoddidods: as also the meuting of the kestrell Cenchris, which the Greeke writers will haue to be a kind of Hawke. As for the spot or pearle in the eye called Argema, it may be cured by all those medicines aboue rehearsed, so that they be applied thereto with hony. But the best hony simply for the eyes, is that wherein a number of Bees were forced to die. Whosoever hath eaten a young storke out of the nest, he shall (they say) continue many yeares together, and neuer be troubled with inflamed or bleared eyes: like as they that carrie about them a Dragons head. It is said moreover, That the Dragons greafe incorporat in honey and old oile, dispatcheth and scattereth the filmes and webs that trouble the sight, if they be taken betimes before they be grown too thicke. Some there be who at the full of a Moone put out the eyes of yong swallowes, marking the time when they haue recovered their sight againe: for then they pluck off their heads and burne them to ashes, which being tempered with hony, they vse for to cleare their owne sight, to ease the pains, and discusse the blearednesse of eyes, yea and to heale them, if they haue caught a blow or rush. As for Lizards, they vse to prepare them many and sundry waies for the infirmities incident to the eyes. Some take the green Lizard and put her close within a new earthen pot that neuer was occupied; and therewith of those little stones which the Greeks call * Cinadia, (and these are usually applied vnto the shere for the swelling glandules and tumors that many times rise there) marking euery one of them respectively by themselves: which being done, they take forth of the pot euery day one; & when the ninth day is come, they let out the Lizard, and then they keepe the said stones thus ordered and prepared, as soueraigne remedies to allay the pain and griefe of the eyes. Others get a green Lizard and put out her eyes, and bestow her in a glasse with a bed of earth vnder her in the bottom thereof, and withall, inclose within the said glasse certaine rings, either of solid yron or masse gold: and so soon as they perceine through the glasse, that the Lizard hath recovered her sight againe, they let her forth: but the said rings they keepe with great care and regard, as a speciall meanes for to helpe any bleared eyes. There be moreover who vse the ashes of a Lizards head in stead of Stibium or Antimonium; for to make smooth the roughnesse of the eye-lids. Some hunt after green Lizards with long neckes, which breed in sandy and gravelly grounds, and when they be gotten, burne them to ashes, with which they vse to repress the flux of waterish humors which begin to fall into the eyes, yea, and therewith consume the red pearls growing therein. It is said moreover, That if a Weasels eyes be pecked or plucked out of the head, they will come againe, and shew will recouer her sight: and therefore they practise the like with rings and them together, as I obserued before in Lizards. Furthermore, it is said, That as many as carry about them the right eye of a serpent tied vnto any part, it is very good for to stay the violent rheumes that haue taken to the eyes, but then in any wise the serpent must be let goe aliove after that she hath lost her eye. As touching those eyes which be euermore weeping, and do stand full of water continually, the ashes of the star-lizards head called Stellio, together with Antimonium, helpeth them exceeding much. The copweb which the common Spider maketh, that vseth to catch flies; but especially that which shee hath woven for her nest or hole wherein the lieth her selfe, is soueraigne good for the flux of humours into the eyes, if the same be applied all ouer the forehead, so as it meet with the temples on both sides: but wot you what, none must haue the doing hereof, either to get the said copwebs, or to lay it vnto the place, but a young lad not as yet vndergrowne, nor foureteene yeares of age: neither must he be seene of the partie whom hee cureth, in three daies after: ne yet during the space of those three daies must either hee or his Patient touch the ground with their bare feet: Which circumstances and ceremonies being duely obserued, it is wonderfull to see what a cure will follow

* Because they be found in the fish called Cinadia.

- A follow thereupon. Furthermore, it is said, That these white spiders with the long and slender legs, being punned and incorporat in old oile, be singular for to consume the white pearle in the eye, if the same be dressed with that composition. Also thote spiders that worke ordinarily vnder roofes, rafters, and boarded floores of houses, and weaue the thickest webs, if any of them be inwrapped within a piece of cloth and kept bound to the eyes or forehead, do retrain for euer the said rheumes and catarrhes that haue found a way to the eyes. The greene Beetle hath a property naturally to quicken their sight who do but behold them: and therefore these lapidaries and cutters or grauers in precious stones, if they may haue an eye of them once & looke vpon them, take no more care for their eye-sight, how it should serue their turnes when they are at their worke. Thus much of eyes.
- B As concerning the ears and the infirmities incident vnto them, there is not a better thing to mundifie and cleanse them than a sheepes gall with hony: and a bitches milke if it be dropped into them, easeth their paine. Dogs greafe tempered with Wormewood and old oile, helpeth those that be hard of hearing, so doth Goose greafe: howbeit, some put thereto the iuice of an Onion & Garlick, of each a like quantity. In this case also there is much vse of Ants eggs alone without any thing els: for as little and silly a creature as it is, yet it is not without some medicinal vertues: in so much, as Beares, when they feele themselves sickish or not well at ease, cure themselves with eating Pistmires. As for the manner of preparing as well the greafe of a goose as of all other fowls, this it is: first the fat ought to be clenfed and rid from all the skins, veines, and strings that are among it, and then to be laid abroad to the Sun in an earthen pan, couered ouer with a new lid of earth likewise which had neuer bin vsed: this done, the forehead pan must be set ouer seething water, that the said greafe may melt: and then it is to passe through linnen bags that it may be tried from all the grosse cratchens: and so they put it vp in a new earthen pot, & set it in some cold place against the time that it is to be vsed: howbeit, this is wel known, That if some hony be put thereto, it is lesse subiect to corruption or putrifaction. Moreover, the ashes of burnt mice incorporat in hony, or els sodden with oile of Roses, allaieth the pain in the eares if it be intilled into them. But in case some earwig or such like vermine be crept into the eares, there is not the like means to cause it to come forth againe, as is the gall of mice dissolved in vineger & dropped into them. Also when water is gotten into the head by the eares, Goose greafe, together with the iuice of an Onion, is singular good to draw it out. Moreover, there is a notable medicine made of dormice for all infirmities of the eares, which otherwise could not be cured, but were giuen ouer by all Physitians: for the making whereof, they take a dormouse and flea it, and after the guts and entrails be taken forth, they seeth the same with hony in a new earthen vessell. Howbeit, some Physitians there bee who thinke it better to boile the same with Spikenard, vntill a third part be consumed, and so referre it for their vse: and whensoever after there is need of it, the manner is to infuse the said liquour warme into the eare by a pipe or instrument called an Otenthyte. This is knowne by experience to heale all the accidents of the eares, though otherwise incurable. Also the decoction of earth worms boiled with Goose greafe is singular good likewise to be poured into the eares. But if the eares be exulcerat, broken out, and do run matter, the red worms ingendred about trees stamped in a mortar with oile, are very proper to heale the same, if they be applied thereto. Lizards that haue hanged vp a long time a drying with their mouths downward, if they be punned with salt, serue to heale the eares that haue caught some hurt either by bruise, crust, or stripe. But aboue all other, the Lizards that haue brown spots vpon them like rusty yron, and are straked along the taile with lines, are most effectual for these infirmities. As touching the Wool beads or Caterpillers, which some call Millepedes, others, Multipedes, or Centipedes, which are a kind of earth-wormes keeping vpon the ground, all hairy, hauing many feet, & courbing arch wise as they creep; and if you touch them, they wil gather round together: the Greekes, some call them * Oniscos, others Tylos: these * worms (I say) are very effectual to assuage the pain of the eares, if they be sodden with the iuice of Porrer in the rind of a pomgranat: some put thereto oile of Roses, & giue aduise to poure this medicine into the contrary eare that is not pained. As for that worm or vermin which riseth not archwise with some part of the body in creeping, the Greekes, some call it Sepes, others Scolopendra; which though it be lesse than the former described, yet mischievous enough & venomous: The snails that carry shels vpon their backe, and are usually dressed for good meat, applied with Myrrhe or the powder of Frankincense, are very good for the eares that be crackt: so are the little

* Pliny foundeth Oniscos (which we call a Sow or Wood-louse) with the Caterpillar or woolebead Millepede.

Indeed our Sows or woodlice, called otherwise Porcellions, and Multipedes, but not Millepedes, & which if one touch them, draw themselves round, are good for the eares: but not the foresaid Wool beads or Caterpillers. Millipedes, which in their creeping rise and fall, &c.

tle and broad snail brought into the forme of a liniment with hony, and laid too accordingly. G
 ly. The sloughs or skins that serpents cast, calcined upon a tile or potshard red hot, and so reduced into ashes and incorporat with hony, are very medicinable for all the accidents of the eares, if the same be dropped into them; but principally when they stink or yeeld from them a strong favour: but if they be full of purulent matter, and run withall, it were better to mingle the same with vinger in stead of hony: but best of all with the gall of a Goat, a Boeue, or a sea-Tortois. The foresaid sloughs or skins if they be above one yere old, or have caught much wet by raine and water, haue lost their vertue, & do no good, as some are of opinion. Moreover, the bloudie humour that commeth from a spider, either tempered with the oile of Roses, or els alone by it selfe vpon a locke of wooll, or with a little Saffron, is very good for the eares: so is the Cricket H
 flie vpon a locke of wooll, or with a little Saffron, is very good for the eares: so is the Cricket H
 perities to this poore creature, and esteemeth it not a little: but the Magitians much more a fair deale: and why so? Forsooth because it goeth as it were reculing backward, it pierceth and bo-
 reth an hole into the ground, and neuer ceaseth all night long to creake very shrill. The manner of hunting and catching them is this. They take a flie and tie it about the midst at the end of a long haire of ones head, and so put the said flie into the mouth of the Crickets hole: but first they blow the dust away with their mouth, for feare lest the flie should hold her selfe therein: the Cricket spies the silly flie. sealeth vpon her presently and claspeth her round, and so they are both drawne forth together by the said haire. The inner skin of a Hens giser, which the cook vseth to cast away, if it be kept and dried, and so beaten to powder and mingled with wine, is good to be dropped or poured hot into the eares that runne with matter: so is the fat also I
 of an Hen. There is a certaine kind of fattinesse to be found in the flie or insect called * Blatta, when the head is plucked off, which if it be punned & mixed with oile of Roses, is (as they say) wonderfull good for the eares: but the wooll wherein this medicine is inwrapped, and which is put into the eares, must not long tarry there, but within a little while be drawne forth againe; for the said fat will very soone get life and proue a grub or little worm. Some writers there be who affirm, That two or three of these flies called Blattæ sodden in oile, make a soueraigne me-
 dicine to cure the eares: and that if they be stamped and spread upon a linnen rag and so appli-
 ed, they will heale the eares, if they be hurt by any bruise or contusion: Certes this is but a na-
 flie and ill favoured vermine, howbeit in regard of the manifold and admirable properties which naturally it hath, as also of the industrie of our Ancestors in searching out the nature of K
 it, I am moved to write thereof at large and to the full in this place. For they have described many Kindes of them. In the first place, some of them be soft and tender, which being sodden in oile, they haue proued by experience to be of great efficacie in fetching off werts, if they bee annointed therewith. A second sort there is, which they call Mylæcon, because ordinarily it haunth about mils and bake-houses; and there breederth: these, by the report of Musa and Pylæon two famous Physitians, being bruised (after their heads were gone) and applied to a bo-
 dy infected with the leprosie, cured the same perfectly. They of a third kind, besides that they be otherwise ill favoured enough, carry a lothsome and odious smell with them: they are sharp
 L
 rumped and pin buttocke also: howbeit, being incorporate with the oile of pitch called Pisse-
 læon, they haue healed those vlcers which were thought, *Nunquam sana*, and incurable. Also
 led the Kings evil: the botches or biles named Pani, wounds, contusions, bruises, morimals,
 scabs, and fellons: but then their feet and wings were plucked off and cast away. I make no
 doubt or question, but that some of vs are so dainty and fine eared, that our stomacke riseth at
 the hearing onely of such medicines: and yet I assure you, *Diadormus* a renowned Physitian, re-
 porteth, That he hath giuen these foure flies inwardly with rosin and hony, for the jaundise, and
 to those that were so strait winded that they could not draw their breath but sitting vpright.
 See what libertie and power ouer vs these Physitians haue, who to practise and trie conclusi-
 ons vpon our bodies, may exhibite vnto their Patients what they list, bee it neuer so home-
 ly, so it goe vnder the name of a medicine. Howbeit, some of the more ciuile sort, and who M
 carried with them a better regard of man-hood and humanitie, thought it better and a more
 cleanly kinde of Physicke, to referue in boxes of horne the ashes of them burnt, for the vses a-
 boue named. Others also would beat them (after they were dried) into powder, and minister
 them in manner of a clystire vnto those that were * Orthopnoicke and Rheumaticke.
 Certes,

* which Pliny
 taketh for a
 kind of Scara-
 beus or Beetle.

* Orthopnoici:
 Such as canot
 take their
 wind but sit-
 ting vpright.

A Certes it is well knowne and confessed, that a liniment made of them will draw forth prickles,
 thorns, spils, and whatsoeuer sticketh fast within the flesh. Moreover, the honey wherein Bees
 were extinct and killed, is soueraigne for the diseases of the eares. As for the impostumes and
 swellings arising behinde the eares, called Pacotides, Pigeons dung applied thereunto, either
 alone by it selfe, or with barley meale and oatmeale, driueth them backe or keepeth them down.
 Also the liuer or brains of an Owle being resolu'd in some conuenient liquor, and applied ac-
 cordingly, cureth the accidents of the lap of the eare, and the foresaid impostumations, so doth
 a liniment made of the wormes called Sowes, together with the third part of rosin: and lastly,
 the crickets about rehearsed, either reduced into a liniment, or else bound to, whole as they be,
 are good in these cases. Thus much concerning those maladies about specified: it remaineth
 B now to proceed vnto other diseases, and the medicinable receipts respectiue vnto them, drawne
 either from the same creatures, or els from others of that kinde: whereof I purpose to treat and
 discourse in the next booke ensuing.

THE THIRTIETH BOOKE OF THE HISTORIE OF NATVRE,

WRITTEN BY C. PLINIUS

SECVNDVS.

The Proem.

CHAP. I.

¶ The originall and beginning of Art Magicke. When it first began, and who were the
 Inventors of it. By whom it was practised and aduanced. Also other
 Receipts or medicines drawne from Beasts.

E He folly and vanitie of Art Magicke I haue oftentimes already taxed and confu-
 ted sufficiently in my former books, when and wheresoever iust occasion and fit
 opportunitie was offered; and still my purpose and intention is to discover and
 lay open the abuse thereof in some few points behind. And yet I must needs say
 the argument is such as deserueth a large and ample discourse, if there were but
 this only to enduce me, That notwithstanding it be of all arts fullest of fraud, de-
 ceit, and couensage, yet neuer was there any throughout the whole world either with like credit
 professed, or so long time vpheld & maintained. Now if a man consider the thing well, no mar-
 nell it is that it hath continued thus in so great request and authoritie: for it is the onely Sci-
 ence which seemeth to comprise in it selfe three professions besides, which haue the command
 and rule of mans minde about any other whatsoeuer. For to begin withall, no man doubteth
 but that Magicke tooke root first and proceeded from physicke, vnder the pretence of main-
 taining health, curing and preventing diseases: things plausible to the world crept and insinua-
 ted farther into the heart of man, with a deepe conceit of some high and diuine matter therein
 more than ordinarie, and in comparison thereof all other physicke was but basely accounted.
 And hauing thus made way and entrance, the better to fortifie it selfe, and to giue a goodly
 colour and lustre to those faire and flattering promises of things, which our nature is most
 giuen

giuen to hearken after, on goeth the habit also & cloke of religion: a point I may tel you that euen in these days holdeth captiuate the spirit of man, and draweth away with it a greater part of the world, and nothing so much. But not content with this successe and good proceeding, to gather more strength and win a greater name, the intermingled with medicinale reccits & Religious ceremonies, the skill of Astrologie and arts Mathematical; presuming vpon this, That all men by nature are very curious and desirous to know their future fortunes, and what shal be- tide them hereafter, perswading themselves, that all such foreknowledge depends on the course and influence of the stars, which giue the truest and most certain light of things to come. Being thus wholly possessed of men, and hauing their senses and vnderstanding by this meanes fast enough bound with three sure chaines, no maruell if this art grew in proceesse of time to such an head, that it was and is at this day reputed by most nations of the earth, for the paragon & chief of all sciences: inso much as the mighty kings and monarchs of the Levant are altogether ruled thereby. And verily there is no question at all, but that in those East parts, and namely in the realme of Persia, it found first footing, and was inuented and practised there by *Zoroastres, as all writers in one accord agree. But whether there was but that one Zoroastres, or more afterward of that name, it is not yet so certainly resolved vpon by all Auhors: for Eudoxus (who held art Magicke to be of all professions philosophical and learned disciplines, the most excellent and profitable science) hath recorded, that this Zoroastres, to whom is ascribed the inuention thereof, liued and flourished * 6000 years before the death of Plato. And of his minde is Aristotle also. Howbeit Hermippus, who wrote of that art most exquisitely, and commented vpon the Poeme of Zoroastres, containing * a hundred thousand verses twenty times told, of his making; and made besides a Repertorie or Index to euery booke of the said Poësie: this Hermippus (I say) reports, That one Azonaces taught Zoroastres Art Magicke; which master of his liued 5000 yeres before the war of Troy. Certes I cannot chuse but maruell much, first, That this Science and the memoriall thereof should so long continue, and the Commentaries treating of it not miscary and be lost all the while, during such a world of years: considering besides, that neither it was ordinarily practised and continued by tradition from age to age; nor the successors in that facultie were professors of the greatest name, and renowned by any writings. For what one is there, thinke you among so many thousands, that hath any knowledge, so much as by bare heare-say, of those who are named for the only Magitians in their time, to wit, Apuleius & Zaratras Medians, Marmaridius of Babylon, Hippocrus the Arabian, and Zarmocenis of Assyria. For bookes haue we none extant of their writing, nor any monuments which beare record and giue testimonie of such clerks. But the greatest wonder of all is this, that Homer the Poet in his Ilias (a poem composed purposely of the Trojan war) hath not so much as one word of Magicke; and yet in his Odyssæa, where he discourseth of the aduentures, trauels, & fortunes of prince Phylles, such a do and stirre there is with it, as if the whole work consisted of nothing else but magicke. For what is meant by the variable transformations of * Proteus, or by the songs of the * Mermaids, whereof he writeth so much; but that the one was a great forcerer, the other famous witches or Inchantresses. As for that which he relateth of lady Circe, how shee wrought her feats by conjuration only, and raising vp infernal spirits; surely it fauoreth of art Magicke and nothing else. I muste much also, that after Homers time there is no writer maketh mention how this art arriued at Telmessus, a city [in the marches of Lycia] wholly addicted to religion, & so famous for the colledge of priests and soothsayers there: or at what time it made a voyage and passed ouer into Thessaly; where it reigned to rise, and was so vually practised in euery towne & city, that with vs here in these parts of the world it tooke the denomination of * that countrey, and retained the same a long time, notwithstanding that the word Magicke indeed was appropriate vnto a strange and far remote Nation. And verily, considering how about the time of the war and destruction of Troy, there was no other physick in vse but that which Chiron the Surgeon practised, and that during the heat and bloudy wars only; it seemeth very strange and wonderfull to me, That the nation of Thessaly, and the native country of Achilles [and Chiron] should become so famous for magicke: inso much as Menander also (a Poet by all mens iudgement so framed by nature for deep learning and excellent literature, as that he had no concurrent in his time that came neere vnto him) entituled one of his Comœdies, Thessalica; wherein he deciphered and depicted liuely vnto vs the whole order and manner of witches, with all their charmes and incantations, by the vertue whereof they would seem to pull the Moon down from heauen. I would

* For properly
the Magi were
the wise men
of Persia, and
yet at Rome
they vually
termed Magi-
tians by the
name of Thes-
salians.

A haue thought that Orpheus soon after and in the age next ensuing, had brought in first these superstitious ceremonies, by reason of the propinquity and neighborhood of that region, and that he proceeded therewith to the aduancement of physick, but for one thing which plucketh me back, namely, that Thrace his naturall country and the place of his birth, was altogether ignorant of Magicke, and knew not what it meant. But as far as euer I could finde, the first that is recorded to haue commented and written of this art, was Osthanes, who accompanied Xerxes K. of the Persians, in that voiage and expedition which (in warlike manner) he made into Greece: and to say a truth, he it was that sowed the seeds of this monstrous Art, and infected therewith by the way, all parts of the world wherefoeuer he went and came. Howbeit, those Authors, and historiographers who haue searched more neerly into the matter, set down another Zoroastres, born in the Isle Proconnesus, who wrote somewhat before Osthanes, of that argument: neuertheless, this is held for certain, That Osthanes was the man, who most of all other set the Greecke nations not onely in a hot desire, but also in a madding fit and iraged as it were after Magicke. And yet I must needs say that I haue obserued, that not only at first, but also from time to time, the greatest name that went of learned men and great philosophers, for their singular skill and profound knowledge, arose from the opinion that was of their insight in this Science. Certain it is, that Pythagoras, Empedocles, Democritus, and Plato, were so far in loue therewith, that for to attaine the knowledge thereof, they vndertooke many voiaiges and journies ouer sea and land, as exiled and banished persons, wandering from place to place, more like trauellers than students; and being returned againe into their owne countries, this Art they blazed abroad and highly praised; this they held as a secret and diuine myserie. As for Democritus, he raised a great name of Apollonices Capidones, and Dardanus of Phoenicia, as well by the Books of Dardanus his master (which he fetched from out of his sepulchre where they were bestowed) as also by publishing commentaries of his owne, which were extracts and draughts out of those authors and their writings; which afterwards, receiued and learned by others, so passed from hand to hand, and were so deeply ingrauen and imprinted in the minds and memories of men, that I assure you I wonder at nothing in the world so much, for so full they are of lyes, & so little or no truth, godlinesse, and honesty is contained in them, that men of iudgement and vnderstanding who approue and esteem his other Books of Philosophie, will not beleeue that these works were of Democritus his making: howbeit, this is but a vaine conceit and persuation of theirs; for well it is knowne & confessed, that Democritus led away an infinite number of people by this means, & no man so much, filling their heads with many faire promises, and the sweet impression thereof rauished their spirits after this Art. Moreover, there is yet one point more, whereat I wonder as much as at any other, to wit, that these two professions (Physicke I mean and Magicke) flourished both together in one age, and shewed themselves in their greatest glory; which was about the Peloponnesiack war in Greece, 300 yeres after the foundation of our citie of Rome; at what time as Hippocrates professed the one, and Democritus for his part published the other. Now there is another faction (as it were) of Magitians, which tooke the first foundation from Moses, * Iannes, and Iotapes, Iewes; but many thousands of yeres after Zoroastres: and yet the * Cyprian Magicke is later than so by as many yeres. But to come againe vnto our Magicke abovesaid: there was a second Osthanes in the daies of K. Alexander the Great, who (by reason that he attended vpon him in his train, during his journies and voiaiges that he made) was himself in great reputation abroad, and by meanes thereof gaue no small credit and authoritie to his profession; for that hee had opportunity thereby (as no man need to doubt) to trauell and compass the globe of the earth, and so to spread and divulge this learning in all parts. And verily, that this doctrine hath bin heretofore receiued in some nations of Italy, it appeareth as well by good euidences and records extant at this day in the body of our Law written in the 12 Tables, as by other arguments and testimonies which I haue alledged in the former Booke. Certes, in the 657 yere after the foundation of Rome citie, and not before (which fell out to be when Cn. Cornelius Lepidus and P. Licinius Crassus were Consuls) there passed a decree and act of the Senat, forbidding expressly the killing of mankind for sacrifice: whereby we may euidently see, that vntill this inhibition or restraint came forth, our progenitors and ancestors were giuen to those inhumane and monstrous sacrifices. No question there is verily, but that this Art of Magicke was professed in France, and continued vntill our daies: for no longer is it agoe than since the time of Tiberius Cesar, that their Druidæ (the Priests and Wisemen of France) were by his authority put down,

Kk

together

* It should seeme that these were the Magicians of Pharaoh, of whom S. Paul 2. Tim. 3. chap. maketh mention, who would haue counterfeited the miracles wrought by Moses; where note, that Pliny, ignorant in the holy Scriptures, and void of true religion, saith that Moses the prophet and faithful seruant of almighty God, with such forcerers and enchaunters, for the Paines, wanting the light of the Gospell, attributed all effects and operations about nature, to Magicke; & were not able to distinguish between miracles done by the finger of God or his ministers, and the illusions practised by the diuell and his lims.
* Some interpret this to be meant of Christianity, which was receiued with the first in Cyprus by the preaching of the Gospell, and as it is thought, by St. Barnabas; for that during the infancy of the primitive Church, many miracles were wrought by the Apostles and Disciples of our Sauour Iesus Christ; the heathen hold that Religion of Christians to be a kind of Magicke. Other vnderstand this place of the Priests of Cyprian Venus called Cynareans.

together with all the pack of such Physitians, prophets, & wizards. But what should I discourse any longer in this wife, of that Art which hath passed ouer the wide ocean also, & gone as far as any land is to be seene, even to the vtmost bounds of the earth; and beyond which, there is nothing to be discouered but a vast prospect of Aire and Water. And verily in Brittain at this day it is highly honored, where the people are so wholly deuoted vnto it, with all reuerence and religious obseruation of ceremonies that a man would think, the Persians first learned all their Magick from * them. See how this Art and the practise thereof is spread ouer the face of the whole earth! and how * those nations were conformable enough to the rest of the world in giuing entertainment thereto, who in all other respects are far different & diuided from them, yea and in manner altogether vnknowne to them. In which regard, the benefit is inestimable that the world hath receiued by the great prouidence of our Romanes, who haue abolished these monstrous and abhominable Arts, which vnder the shew of religion, murdered men for sacrifices to please the gods; and vnder the colour of Physicke, prescribed the flesh to bee eaten as most wholesome meat.

CHAP. II.

¶ The sundry kinds of Magicke. The execrable acts of Nero: and the detestation of Magicians.

Magick may be practised after diuers sorts, according as *Osthanes* hath set downe in writing: for it worketh by the means of (1) Water, (2) Globes or Balls, (3) Aire, (4) Starres, (5) Fire-lights, (6) Bassons, and (7) Axes: yea, and many other means there bee, that promise the foreknowledge of things to come: besides the raising vp and conjuring of ghosts departed, the conference also with Familiars and spirits infernall. And all these were found out in our daies, to be no better than vanities & false illusions, and that by the Emperor *Nero*: and yet was he neuer more addicted to play vpon the cythern, nor took greater pleasure to hear & sing tragical songs, than to study art Magick: and no maruell if he were giuen to such strange courses, hauing wealth & world at wil; and his fortunes besides attended vpon & accompanied with many deep corruptions of the mind. But amid those manifold vices whereunto he had betaken and sold himselfe, a principall desire he had, to haue the gods (forsooth) and familiar spirits at his command; thinking that if he could haue attained once to that, hee had then climbed vp to the highest point and pitch of magnanimity. Neuer was there man that studied harder, and followed any Art more earnestly, than he did Magick. Riches he had enough vnder his hands, and power he wanted not to execute what he would; his wit was quicke and pregnant, to apprehend and learn any thing, ouer and besides other means that he practised to bring about this deffine of his, which were so intollerable, that the world could not indure them: and yet he gaue it ouer in the end without effect: an vndoubted & peremptory argument to conuince the vanity of this Art, when such an one as *Nero* rejected it. But would to God he had conferred with familiars & spirits, yea & taken counsel of all the diuels in hell; for to be resolu'd of those suspitious which were gotten into his head, rather than giuen commission as he did to the professed bawds and common harlots in stinking stews and brothell houses, for to make inquisition from house to house after those whom he had in ieioultie. Certes, no bloudy and detestable sacrifices (how inhumane and barbarous soeuer) he could haue performed, but they had bene far more easie and tollerable, than those cruel imaginations which he conceiued, and whereupon he murdered most piteously so many good citizens, & filled Rome with their restless ghosts. But to return again to Art Magick, which *Nero* would so faine haue learned: what might be the reason that he could not reach vnto it? Surely these Magicians are not without their shifts & meanes of euasion to saue the credit of their art, if haply they misse and come short at any time of their purpose: for otherwhiles they beare vs in hand, that ghosts and spirits will not appeare, nor yeeld any seruice to those persons who are * freckled & full of pimples: and haply * *Nero* the Emperor was such an one. As for his limbs otherwise, he had them all, & found they were: besides, the set daies and times fit for this practise, and prescribed by Magicians, he might chuse at his good will & pleasure. Moreover, an easie matter it was for him to meet with sheep, cole black, & such as had not a speck of white or any other colour; for him (I say) who when he list could sacrifice men, and took greatest delight in those sacrifices: furthermore, he had about him *Tyridates*, the K. of Armenia, a great Magician, to giue him instructions. This prince *Tyridates* being vanquished and sub-

A dued by the Romane captains vnder *Nero*, and forced by their capitulations to present himselfe personally at Rome for to do homage vnto the Emperour, trauelled thither all the way by land (which was a fore charge to the countries & prouinces through which he passed, bringing with him as he did the whole pompe and train for the triumph ouer Armenia and himselfe) & came vnto *Cesar*. And why would not this *Tyridates* passe the seas and faile ouer into Italy, the nearest and most expedient way? Forsooth, so precise he was, that he made a scruple, and thought it vnlawful (as all magicians do) either to spit into the sea, or otherwise to discharge into it the necessary excrements that passe from mans body, therby to pollute and defile that Element. Many other magicians he brought with him in his traine. He instructed *Nero* in the principles of Magick, yea and admitted him to their sacred feasts, and solemne suppers, and all to enter him into that profession: but it would not be: for albeit *Nero* enthronized and enstalled *Tyridates* in his kingdom, and gaue him his royalties againe, all would not serue; for neuer could he receiue at his hands by way of remuneration and recompence, the skill of this Science. And therefore we may be fully assured and boldly conclude, That it is a detestable and abhominable Art, grounded on no certaine rules, full of lies and vanities, howsoeuer it carry some shew or shadow rather of veritie: and to say a truth, that certitude which it hath in effecting any thing, proceedeth rather from the diuellish cast of poisoning practised therewith, than from the Art it selfe of Magicke. But what needs any man to seek & hearken after the lies which the magicians in old time haue let flie and sent abroad? When I my selfe in my youth haue seen and heard *Apion* (that great and famous Grammarian) tell strange tales of the herbe *Cynocephalia*, which the Egyptians call *Oxyrites*, and namely that it hath a diuine and heavenly vertue, and was a singular preseruatiue against all poysons, charmes, and enchantments; but whosoever plucked or drew it out of the ground (saith he) could not escape present death. The same *Apion* reported in my hearing, that he hath conjured and raised vp spirits, to enquire and learne of *Homer*, what countryman borne he was? and from what parents descended? many hee durst not report what answer was made againe, either vnto him or them.

CHAP. III.

¶ Of Mould-warps: and of many other medicines taken from sundry beasts, which are in their kind either tame or wilde: and the same medicines digested according to diseases as they orderly follow.

One special argument this may be, to prooue the follie and vanitie of magicians, because of all other liuing creatures, they do admire & set greatest store by these wants or moulds, which Nature seemeth to haue condemned to perpetuall blindness and prison, shutting them vp as it were euermore in a dark dungeon, or keeping them rather vnder the earth, like as they were buried and enterr'd. And yet for all this, these wise men giue more beleefe to those signes which they spie in their bowels and entrails when they be opened, than to the inwards of any beast whatsoeuer. This opinion moreouer they haue of a mould-warpe, that there is not a creature more capable of religion, and fitter to be employed in sacrifice and diuine seruice, than it may they baste not to auouch & warrant, That whosoever swallowes down a whole the heart of a moule fresh killed, whiles it is yet warme and panting with life in it, shall haue the gift of diuination, and foretell the euent and issue of any businesse in hand. Moreover, they affirm, that the tooth of a moule-warpe taken out of her head whiles shee is aliue, is singular to allay the tooth-ach, if it be hanged about the necke, or tied to any part of the body. They talke of many other wonders wrought by this poore creature, which I purpose to deliuer as occasion shall be offered, in place conuenient. And yet when they haue all said that they can of them, that which carrieth the greatest likelihood and probabilitie, is this, That they should be good against the biting of these mufets or hardishrews, for as you haue heard me say before, the very earth that is pressed down with the wheels in a cart-tract, is proper for that purpose. But to leaue these moulds and to follow on still with this maladic of tooth-ach, the said magicians tel vs a medicine made of the ashes of a dogs head (dying of madnesse) that it should be passing good therefore, if it be mixed with the oile *Cyprinum*, & so dropped into the ear on the pained side: howbeit this care would be had, That the said dogs head haue no flesh at all sticking to the scalp or skull, when it is burned and calcined. They say moreouer, that the greatest eie-tooth of a dog growing on the

* As it appeareth by our old English Chronicles, which write of *K. Arthur*, the knights of the round table, and *Merlin* the prophet or magician. * No doubt hee meaneth England, Scotland, & Ireland, which seemed to be seuerat from the rest of the world; where in old time Magicke bare a great sway, and witches still swarm too much. * *Lentiginosus*. * *Succosius* in *Nero*: *corpora sunt maculosa & fada*. * His skin was full of foule spots.

* *Ad significandum Homerum*.

left side of his head serues well for this grievance, if the tooth that is in pain be scarried round about therewith. Also a bone growing out of the ridge or chine of a Dragon, will do as much; or that of the serpent called Enhydrius. Now are these serpents white of colour, and held al to be the male. The greatest tooth of this Enhydrius is thought to be singular for to scarrie or to let the painfull tooth bloud therewith: but in case the teeth in the vpper chaw do ake, they take two of the vpper teeth of this serpent, & apply them fast therto; but contrariwise if the nether jaw. They that hunt after crocodiles, vse to greafe themselves with the fat of this serpent. Moreover, it is good by their saying, to scarrie the gums about the teeth with the bones taken out of a lizards forehead at the ful of the moon; with this regard, that the same in any wise touch not the ground. Some of them there bewho make a collution with dogs teeth sodden in wine till the one halfe be consumed, and therewith wash the teeth that ake; but the ashes of the said teeth incorporated in hony, are singular good for little children which haue much a do in breeding their teeth. The same medicine is holden to be an excellent dentifrice for to make teeth look white. If the teeth that ake be hollow, they vse to put into the concavity thereof, the said ashes incorporated in mice dung, or els the liuer of a lizard dried. Also if one that is troubled with tooth-ach, set his teeth in a snakes heart & bite it, or hang the same about the neck or otherwise, it is thought to be an effectiual remedy for the said disease. Others there be of the magicians, who prescribe to chew and eat the flesh of a moufe twice in a month, and they assure vs by this means that we shall preuent and auoid the tooth-ach. Moreover, it is said that a decoction of earthworms boiled in oile & poured into the eare on that side where the tooth-ach is, doth giue great easement of pain. The ashes of the same mads burnt, put into the hole of a tooth that is rotten and worm-eaten, causeth it to fall out of the head with ease; and if the teeth that do ake be sound, rub them with the said ashes and the pain will cease. Now the said worms ought to be burnt or calcined vpon a tele or potsherd. Also a decoction of this kind of wormes sodden in squillitick vinegre with the root of a mulberie tree, is a soueraigne medicine to wash the teeth withall when they be in pain. Furthermore, the little grub or worue which is found in the herb Tazill, called *Pebe* *mus* Lauer, hath a wonderful operation to cure the tooth-ach, if it be put into the hole of a faulty tooth: and no maruaile, for the caterpillars that breed in coleworts, will presently fall off if they be but touched with this worm. The punaises also or wall-lice that come from mallows, infused into the ears with oile of rofat, assuage the tooth-ach. The small sandy grit that is found in the horns of shel-snails, conueied into an hollow tooth, presently allaiies the pain. The bare shels of the said snails, hollow as they be and void, calcined and reduced into a shes, and incorporat with myrrhe, are passing good for the gubs: but the ashes of a serpent burnt and calcined in an earthen pot, with salt among, helpeth the tooth-ach, if it be instilled into the eare on the contrary side, with oile of roses. The skin of a snake which she hath cast in the Spring, made hot in oile & the rosin of torchwood, is singular in this case to be distilled into eather of the ears, it makes no matter which: some put therto frankincense and oile of rofat. The said slough or skin of a snake thus prepared and put into an hollow tooth, causeth the same to fall out of their head without any pain or grieve at all. As touching white snakes, how they cast their slough at the rising or apparition of the Dog-star, I hold to be a meere fable; for it was neuer seen or knowne, that they did so in Italy: much lesse therefore it is credible, that in hot countries they should be so late ere they cast their slough. Moreover, it is commonly beleued, that the said slough kept long and incorporat with wax, draweth out a tooth most speedily, if it be applied thereto. Also, snakes teeth, either worn about the necke, or laid to teeth in pain, assuage their grieve. Some are of opinion, that a very spider all whole as it is, caught with the left hand, bruised and incorporat in oile of roses, and so dropped into the eare of the same side that the teeth ake, is very good to mitigat the pain. It is said also, that if a man take all the little bones of an hen (and saue those onely of the legs whole that be hollow) and keepe them in the hole or crany of a wall, and with one of the said bones either hit the tooth that ake, or scarrie the gumble about it, and then presently cast it away when he hath done with it, the paine will immediately be gon. The like effect hath the dung of a rauens, applied hard vnto the place within a locke of wood: likewise of M sparrows, tempered in oile hot and poured into the eare that is next vnto the pained tooth; but surely it will cause an intollerable itch: and therefore many thinke it a more safe and easie remedy, to burn young sparrows in a fire made of Vine-twigs, and the ashes that commeth from them to temper with vinegre, and therewith to rub the said teeth.

How to procure a sweet breath, & to take away the spots that blemish the face: and to amend the infirmities incident to the throat.

IT is said, that for to rectifie the offence of a strong and stinking breath, and to make it sweet and pleasant, it is good to rub the teeth with the ashes of mice burnt, and incorporat with honey. Some there be, who mingle therewith the root of fennell. If the teeth be pricked or scraped with a vulturs quill, it will cause the breath to be sowre: but to doe the same with the quill or prick of a porkepine, is a singular thing to strengthen the teeth and keepe them fast in the head. As touching the sores in the tongue, or the scabs and little vlcers breaking out about the lips, a decoction of swallowes sodden in honied wine, healeth them: but if the lips be chapped, there is not a better thing than to annoint them with the grease of a goose or hen. For the same purpose serueth the tried or rindled grease of swearie wooll, being incorporat with the powder of gall-nuts: also the white cobwebs that spiders doe weave, or else the little fine ones which they work vnder the planks and floors of high lofts, or rouses of houses. * If one chance to burne his mouth inwardly with some scalding broth or otherwise, the milke that a bitch giueth is a present remedie therefore.

As touching the spots that infect the skin of the face, the foresaid tried grease of wool vnwashed, called celypum, incorporat with the hony of the Island Corsica (which of al other is counted most vnpleasant and vntoothsome) is proper to subtiliat and scoure them: the same also laid to the face vpon a lock of wooll, causeth the scurfe or scales whereby the skin seemeth to pill, for to fall away: howbeit some thinke it better to put hony thereto. But say there appeare vpon the face any foule and thick morpew that hath pierced deep into the skin, it is good to rub the same with dogs gall, but first the place ought to be pricked thick with a needle that the medicine may enter in. If the skin look wan, or black and blew, take the light of rams or other sheep, cut them into thin slices like to skins, and lay them hot to the place, or els apply therto pigeons dung. The fat of a goose or hen, is a singular thing to preserve & keep soft, smooth, and dilicat, the skin of the face. As for the ringworms or ill fauoured tetteres called Lichenes, there is a proper liniment made either of the dung of mice incorporat with vinegre, or the ashes of an vrchin tempered with oile. But in this cure, the face ought to be bathed and fomented before with vinegre and salnitre. For to take away any spots or pimples arising in the face, there is not a better thing to apply to them than the ashes of the little broad snails which are commonly found in every place, incorporat with honey. And in truth, the ashes of any snails whatsoeuer, are astringent and hot, by reason of a certain absterfue qualitie that they haue; which is the reason that they enter into potentiall cauteries, or caustick & corrosiue medicines: and therefore they serue in liniments for to kill scabs, scurfs, mange, and leprosie; yea and to scoure away the foule spots called Lentils. Moreover, I read in authors of certain pisfoules greater than the rest, called *Herculanæ*, the which being stamped with a little salt put to them, are good for all the infections of the skin mentioned in the former receit. There is a kind of insect or flie called *Buprestis*, passing like to a long legged beetle, but seldom or neuer be any such found in Italy: kine and oxen catch much harme by this flie; for many times as they graze, they lick it vp with the grasse and swallow it down: and hereupon it tooke that name *Buprestis*: for no sooner commeth it to the gall, but it inflameth and setteth the beast into a great heat, wherupon it swelleth vntill it burst againe. So corrosiue it is (as I haue said before) that being incorporat with goats sewer, and so reduced into a liniment, it takes away the tetteres called Lichenes that be in the face. The bloud of a vultur (i. a geire) tempered with the root of white Chamæleon (I mean the herb so called) and the rosin of cedar, heales the leprosie, so that this liniment be couered with colewort leaues. Of the same effect are the feet of locusts braied in a mortar and incorporat with goats tallow. The greace of a cock, capon, or hen, wel stamped & wrought with an onion, is singular to scoure the spots and specks of the visage: also the hony wherein a number of bees were stifled and killed is proper for the said purpose: But about all, the greace of a swan is commended both for to cleanse the skin of the face from all flecks and freckles, and also take away wrinkles. As for the markes remaining after the cauterie or hor yron, there is no better means to take them out, than a plastre of pigeons dung and vinegre. If the rheume cause the mur, the pofe, or beaunisse in head, I find a pretie medicine to rid it away, by kissing only the little hairie muzzle of a moufe.

As touching the uvula and paine of the throat, they may be both of them eased and cured G with lambs ordure, which passeth from them before they haue bitten grasse dried in the shade. The juice or slimie humor that shel-snails yeeld when they be pricked through with a pin or needle, is singular good in a liniment for to be applied vnto the uvula; provided alwaies, that those snails do hang after, in the smoke. The ashes that come of swallows calcined & burnt, is likewise very soueraigne, being laid to the grieved place with hony; and in that sort prepared, it serueth also for the inflammation and swelling of the tonsils or amygdals of the throat. For the said tonsils and other accidents of the throat, a gargarisme of ewes milke is right soueraigne. There is a certain creeper called, a * Cheeslip, which if it be bruised or stamped, is good for the said infirmities: so is pigeons dung gargarised with wine cuit, or applied outwardly with salt nitre & dried figs. If the throat be troubled with hoarsnesse, occasioned by rheume or catarrhe, H the foresaid shel-snails do greatly mitigat the same infirmities, being first sodden in milke (all the fauce the earthy or muddy substance which they must be cleansed from) and then giuen in wine cuit to the patient for to drink. Some hold opinion, that the snails found in the Ile Astypalæa, are the best of all other for this purpose, but principally the absterfue substance that is found in them. The cricquet called Gryllus, doth mitigat catarrhs & all asperities offending the throat, if the same be rubbed therewith: also if a man doe but touch the amygdals, or almonds of the throat, with the hand wherewith he hath bruised or crushed the said cricquet, it will appease the inflammations thereof. To come now vnto the Squinancie: a goose gall incorporat with the juice of the wild cucumber, and hony together, is a most speedie and present remedy for it: also I the brains of an owle, and the ashes of a swallow drunk in water wel and hot, is good for the said disease: But for this medicine we are beholden to the Poët Ouid. Note that when I speak of any medicine (for what maladie soeuer) made of swallows, the yong wild ones are alwaies the better and more effectual in operation: and those you may know easily by the fashion of their nests where they do build: But if you would haue the best indeed, the yong ones of that kind which are called Ripariæ, passe al the rest for medicinable vses, for so they are commonly named which build in the holes of banke sides. Howbeit, some there be who assure vs, that we shal not need to feare that disease for a yeare together, if we do but eat any yong swallow, it skills not of what kind soeuer it be. Now the order of calcining them from their ashes, is to strangle them first, & so to burn them in their blood within an earthen vessell: and the ashes thus made, is usually giuen either wrought in past for bread, or else to be drunk; and some there be who mingle withall, K the like quantity of the ashes which come of weazils. And this kind of medicine thus prepared, they giue in drink euery day against the kings euill, and falling sicknesse. Moreover, swallows kept and condite in salt, are passing good for the Squinancie, taken in drinke to the weight of a dram at a time: and it is said, that their very nest giuen in drinke, cureth the said maladie. It is a common opinion, that a liniment made with the creepers called Sowes or Multipedes, is most effectual to cure the said Squinancie. And some there be who aduise to take one and twenty of these worms stamped, and to giue them in one hemine of mead or honied water for the said disease; but they must be conceiued downe the throat by a pipe or tunnell, for if this medicine touch the teeth once it will do no good. It is said moreover, that if one drinke the decoction of L mice sodden with veruaine, it is a soueraigne remedy for that disease: as also that a leather thong made of a dogs skin put thrice about the necke, will doe the deed. And some there be, who in this case vse pigeons dung mixed with oile and wine.

As touching the cricks of the nerues or sinewes that serue the nape of the necke; as also for the cramps that draw the head backward, they say, that a twig or branch of a vine taken out of a puttocks nest, and carried about one hanging to the necke or arme, is a speciall remedie for the abouenamed accidents.

CHAP. V.

¶ Medicines for the Kings euill that is broken and doth run: for the paines lying in the shoulders: as also for the griefe of the bowels about the midriff and precordiall parts.

The blood of a weazill is good for the wens called the king euill, when they be exulcerat & do run: so is the weazill it selfe sodden in wine and applied; provided alwaies, that they run

A not by occasion of any launcing or incision made by the Chirurgions hand. And it is commonly said, that to eat the flesh of a Weazill, is effectual for the cure. So are the ashes of a Weazill calcined vpon a fire made of Vine-twigs, if they be incorporat with Hogs greafe. Item, Take a green Lizard and binde it to the fore; but after thirty daies you must do so with another, & this will heale them. Some make no more ado but in a little box of siluer keep the heart of a Weazill & wear it about them. If women or maids be troubled with the kings euill, it were good to make choise of old shel-snails, and to stamp them shels and all into a plaister or liniment: but especially such as be found sticking to the roots of shrubs and bushes. The ashes of the serpent Aspis calcined, are likewise very good for this disease, if they be incorporat with buls tallow, & so applied. Some vse snakes greafe and oile together: also a liniment made with the ashes of snakes B burnt, tempered either with oil or wax. Moreover, it is thought that the middle part of a snake, after the head and taile both be cut away, is very wholesome meat for those who haue the kings euill: or to drinke their ashes, being in the same manner prepared and burnt in a new earthen pot neuer occupied, may if the said snakes chanced to be killed between two cart-tracks, where the wheeles went, the medicine will look much more effectually. Some giue counsell to apply vnto the affected place Crickets digged out of the earth, with the mould and al that commeth vpon: Also to apply Pigeons dung only without any thing els, or at the most to temper it with Barley meale or Oatmeale in vinegre. Likewise to make a liniment of a Moldwarps ashes incorporat with hony. Some there be who take the liuer of a Moule, crush and bruisse it between their hands, working it into a liniment, and lay the same to the fore, and there let it drie on the place C and wash it not off in three daies. And they affirme, That the right foot of a Moule, is a singular remedie for this disease. Others catch some of them, cut off their heads, stampe them with the mould that they haue wrought and cast vp aboue ground, & reduce them into certain trochisks which they keep in a box or pot of tinne, and vse them by way of application to all tumors and impostumes which the Greeks call Apostemata, and especially those that rise in the necke: but then they forbid the patient to eat porke or any swines flesh during the cure. Moreover, there is a kind of earth-beetles called tauri, i. Bulls: which name they took of the little hornes that they carry; for otherwise (in colour) they resemble tickes; some tearme them, Pedunculos terræ, earth-lice: These also worke vnder the ground like wants, and cast vp mould, which serueth in a liniment for the Kings euill, & such like swelling, as also for the gout in the feet, but it must not D be washed off in three daies space. Howbeit, this is to be noted, that this medicine must be renewed euery year, for the said mould wil continue no longer in vertue than one year. In sum, there be attributed to these beetles, all those medicinable properties which I haue assigned vnto the crickets called Grylli. Moreover, some there be who vse in manner and cases aforesaid, the *mould which ants do cast vp. Others for the Kings euill take iust as many mads or earthworms in number as there be wens gathered and knotted together, and bind the same fast vnto them, letting them to drie vpon the place: and they are persuaded that the said wens will drie away and consume together with them. There be again who get a Viper about the rising of the Dog star, cut off the head and taile, as I said before of snakes, and the middle part betwene they burne: the ashes that come thereof, they giue afterwards to be drunke for three weeks together, E euery day as much as may be comprehended and taken vp at three fingers ends: and thus they cure and heale the kings euill. Moreover, there be some that hang a Viper by a linnen thread fast tied somewhat vnder the head, so long till she be strangled and dead, and with that thread bind the foresaid wens or Kings euill, promising vnto their patients assured remedie by this means. They vse also the Sowes called Multipedæ, and incorporat the same with a fourth part in proportion to them, of true Turpentine: and they be of opinion, That this ointment or salue is sufficient to cure any impostumes whatsoeuer.

As touching the paines that lie in the shoulders, there is a proper medicine made in forme a liniment, with the ashes of a Weazill tempered with wax, which easeth the same.

To keepe yong boies from hauing any haire growing on their face, that they may seem alwaies yong, it is good to annoint their cheekes and chin with Ants egges. Also the marchants or hucksters that buy yong slaues to sell them againe for gain, vse to hinder the growth of haire as well of the visage, as in the armeholes and vpon the share, that they may be taken for yong youths still, by annointing those parts with the blood that commeth from lambs when they be libbed, which ointment doth good also to the armpits, for to take away the ranke and rammish smell

* Multipeda.

* For the martins or swallows called Apodæ, build not, but lay and breed in chinks and crannies of old walls.

* Of which being called more & more, come Maure hills, corruptly called Moule hills: for Ants were in old English called Maures: and Moules neuer cast vp such.

smell thereof: but first the haire there growing ought to be pulled vpon by the roots.

* The bowels,
as heart, liuer,
lights, &c.

* Prescribed
vino, not pre-
fused, vino.

* Because they
were brought
from the Isle
Melita, lying
within the
Sclavonian sea

Now that I am come to speake of the precordiall region of the body, know this, That by this one word *Precordia*, I meane the inwards or entrailes in man or woman, called in Latine * *Extra*, whensoever then there shall be pain felt in these parts or any of them, apply thereto a yong sucking whelp, and keepe it hard huggled to the place, doubtlesse the said grieve will passe away from the part to the puppie it selfe, as men say: and this hath been found true by experience in one of those whelpes * ripped and opened aliue, and the said bowels taken forth: for looke what part in man or woman was grieved, the very same was scene infected thereupon, in the puppie. And such whelpes thus vsed for the curing and taking vpon them our maladies, were wont to be entered with great reuerence and ceremoniall deuotion. As touching the pretty little dogs that our daintie dames make so much of, * called *Melitzai* in Latine, if they be euer and anon kept close vnto the stomack, they ease the paine therof. And in very truth a man shall perceiue such little ones to be sicke, yea, and many times to die thereupon: whereby it is euident, that our maladies passe from vs to them.

CHAP. VI.

¶ Of the diseases incident to the lights and liuer. Of those that vse to cast and reach vpon bloud at the mouth.

Mice are very good for the infirmities of the lungs, especially those of Barbarie, if they be first flaid, then sodden in oile and salt, and so giuen to the patient for to eat: Thus prepared and vsed, they cure them that either spit purulent and filthy matter, or else reach vpon there bloud. But a dish of meat made of snailles with shels, is most excellent for the stomacke. But for the better ordering and dressing of them: first they ought to siuer ouer the fire and take a few waulmes till they be parboiled, without touching or meddling one jot with their body: afterwards they must be broiled vpon the coales, without putting any thing in the world vnto them, and then to be serued vp in wine and fish pickle or brine called *Garum*, and so eaten. But the best for this purpose are those of Barbarie. It is not long agoe, that this experiment was found: but since it was once known, many haue done themselves much good thereby. But (that which I had well neare forgotten) many obserue to take them in some od number. Howbeit, as holosome as they are supposed to be otherwise, this discommoditie is found by them, That they cause those to haue a strong and stinking breath that vse to eat them. Being stamped without their shels, and so drunk in water, they helpe them that reach bloud vppward. But that you may know that there be degrees of them in goodness: The best snailles simply are they of Barbary, and namely, those about the quarter neere *Soli*: Next to them are much esteemed such as are gathered in the Islands *Astypelæa*, and *Sicilia*, for they are of a meane bignesse; for such as be grown very great, haue their flesh hard, and bevoid of humidity. Then are ranged in a third place, those that come from the *Balear* Islands, called *Cavaticæ*, because they breed in caues and holes. There be good also brought from the Islands *Capræ*. Holesom these shel-snailles may be well ynough: but toothsome surely they are not, whether they be old kept, or new taken. Those that be found in riuers, & which haue white shels, cary a rank and strong fauour with them: so do the wild sort that are not kept vp and fed in stewes & pits, and be hurtfull to the stomack, but good to loosen the bellie: euen so are all the sort of the little ones. But contrariwise, those that breed in the sea are better for the stomack than others: and most effectuall to allay the pains therof. Moreover, it is said, that they do most good, of what kind soeuer, if they be swallowed downe aliue & all whole with vinegre. Moreover, there be of these snailles called * *Aceratæ*, of a broad making, and growing in many and sundry formes; of whose properties, and how they are to be vsed, I will write elsewhere in place conuenient. The inner skin of a Hen or Capons gesser, preferred till it be drie, and reduced into powder, and so put into a cup of drinke like spice; the same also eaten fresh, & newly roasted or broiled, is singular for the catarrhes that fall into the breast, and for a moist cough. Shel-snailles punned raw & giuen in a supping with three cyaths of warm water, serue wel to appease & stay the cough. Take a piece of a dogs skin, and tie the same about any one of your fingers, which you will, it staies all rheumes and distillations. The broth made of *Patridges*, is soueraigne to comfort and refresh the stomack. As touching the grieve or paine of the liuer, it is said, That the flesh of a wild *Weazill*, or her liuer eaten, is a singular meat there-
fore.

* Haply so named, because they haue little or no bones, quass *quass* *quass*.

Afore: so be Ferrets roasted in manner of little pigs. The worms with many feet called sowes or chefeldips, are very proper for them that draw their wind short; but there must be one and twentie of them, neither more nor lesse, dissolved in the best Atticke hony, and so giuen in drinke and swallowed down by a pipe or tunill: the reason why they must be thus conueied through such a cane or tunill is this, because looke what cup or boule they so touch, they staine the same black. Some take of them to the quantitie of one sextar, and torrifie them vpon a pan or platter, vntill they looke white and be calcined, and then incorporat them in hony: [there be Latine writers who call this worme *Centipeda*, as if it had an hundred feet] and then giue direction, that they should be taken in hot water. Furthermore, it is said, That if the patient do either eat or drinke for the space of nine daies together one snail hot, stamped shell and all in three cyaths of wine, he shall find helpe, if he were giuen either to faint and swoone, or to be lunatick and to go beside himselfe, or else be subiect to the dizziness of the head. Others giue order to take them after another maner, namely, one the first day, the morrow twain, the third day three, the fourth two, and the fift one again: and in this wise they cure those who are shortwinded, or haue an impostume broken within their bodie. There is a kinde of Insect resembling a Locust, but that it hath no wings, which in Greek is called * *Tryxalis*; a Latine name it hath not found yet, as some do thinke: and writers there be not a few, who are of opinion, That it is the same that our Gryllus or criquet. Call it what you will: let there be twenty of them torrified and drunk in honied wine, it is reported for to be a singular medicine for those that cannot take their breath but sitting vpright: and for such as spit bloud. There is one writer who ordaineth to take snailles vn-washed, and to poure vpon them either the Mere-gout of the grape that runneth out first without pressing, or else sea-water, and so to boile them therein, and afterwards to eat them for a cough. And the same Authour giueth counsell, to pun them shels and all, and to take them with the foresaid Mere-gout to the same effect.

* or *Troxallis*,
according to
Alianus.

Touching inward impostumes broken, the hony wherein a number of Bees haue bin drowned to death, hath a peculiar vertue to heale them. The lungs of a Vulture burned to powder in a fire made of Vine-cuttings, giuen in wine morning & euening, if the patient be free from the ague; so there be put thereto one moitie of Pomegranat floures, and the floures of Quinces and Lillies as much of each, is a very soueraigne remedie for those that cast vp bloud out of their bodie: but if he be in a feauer, the same medicine would be taken in the decoction of Quinces.

As for the paine of the spleene, if we may belecue the reccits and prescriptions of the Magicians, the patient ought to haue the milt or spleen of a sheep spread and laid ouer the place: but the patient that hath the application thereof, must say these words withall, *This I do to cure the spleene*: Which done and said, the same milt of the sheep must be laid vp close and hidden within the wall or behind the feeling of the bed chamber where the sick body lieth, and sealed vp with a signet, for feare it should be taken away: with this charge, that he or she that hath the bestowing of it, repeat the foresaid charme nine times thrice ouer. If a dogs bellie be ripped aliue, and the spleen taken forth, whosoeuer cateth thereof, shall find it very good to ease them of the said maladie. But some content themselves with laying it fresh and warme to the region of the spleen. Others giue the spleen of a young whelp but two daies old, in squillitick vinegre, to the patient, but they make not the patient acquainted with the medicine what it is; or else they minister the spleen of an Hedgehog in the same manner. Likewise they giue the ashes of shell-snailles with Line seed and Nettle seed, putting thereto some hony: and this cure they continue vntill the patient be thoroughly whole. It is said moreover, That a green Lizard taken aliue, and hanged so in a pot iust before the dore of the patients bedchamber: with this charge, that euer as he goes in and out he touch the same with his hand, will worke the same effect. The ashes of a scritch-owls head reduced into an vnguent with oile, is good for this purpose, so is the hony wherein Bees were stifled: and lastly a spider, but especially that which they call *Lycos*.

The heart of the bird called a * *Houpe*, is highly commended for the paine of the sides. Also the ashes of shell-snailles boiled in *Ptisane* or husked Barley water: and some in this case apply the same otherwhiles in a liniment onely without any thing else. The ashes of a dogs head (I meane the bare skalle or skull onely) dying enraged and mad, is good to spie: a cup of drinke withall for this disease.

If the loines be pained, it is said, That the starre-Lizards called *Stellions*, comming from beyond sea sodden in wine together with the seed of black Poppie to the weight of halfe a denier

is very good, so the decoction be drunk: howbeit, this care must be had, that the head be cut off first, and the garbage taken forth. The green Lizards are good meat in this case, if they be dressed accordingly, and their feet and head cut away: so are shell-snails, braided shels and all together, and sodden in wine with fifteen grains of pepper. Some vse the feet and legs of an Ægle in this disease, pulling them away backward from the knees: and the right foot they apply fast to the paine of the right side: but the other if the contrary side be grieved. The many-foot Sowes or Cheeslips, which I called before Oniscos, help the same pains, if they be taken to the weight of halfe a denarius in two cyaths of wine.

To conclude with the Sciatica, the magicians giue order to put an earth-worm in a treene or wooden dish, which hauing bin cleft, was stitched vp again with iron wiew, or bound with a plate or hoope of yron: then to lade vp some water therewith, and in it to wash & rince the said worme very well, and then to enterre or burie the same again in the very place from whence it was digged forth: which done, to giue the said water anon to the patient for to drinke out the said wooden dish: and this they hold to be a wonderfull medicine.

CHAP. VII.

¶ Remedies for the dysenterie or bloudie flux. And generally for all diseases of the belly.

THe decoction of a leg of mutton sodden in water with Line seed, is singular good for to be supped off to stay a bloudie flux. So is old Cheese made of Ews milke: and sheeps suet sodden together in some austere wine. The same is singular for the Sciatica passio, and an old cough. The starre-Lizard Stellio, which breeds beyond sea, being slaied, garbaged, and dressed for meat, so that the head and feet be taken away, and so sodden and eaten, is commended also in this case. Moreover it is said, That two snails and one Hens egg, stamped the one as well as the other with their shels, and afterwards gently sodden in a new earthen pot with some salt & two cyaths of wine cuit, or else with the juice of Dates & 3 cyaths of water giuen to the patient to drink who is tormented with the dysenterie or bloudy flux, will bring great alleuian to the said disease. It is thought also, That the ashes of the said shell-snails calcined, if they be taken in wine with a little rosin, are soueraigne therfore. As touching naked snails without any shels, they be found plentifully in Affricke. Passing good they be for the bloudie flux, if 5 of them be burnt and calcined together, with halfe a denier weight of Acacia, & 2 spoonfulls of their ashes taken in Myrtle wine or some other austere & astrigent wine, and a like quantity of hot water. Some there be who in this sort vse all the snails of Barbary. Others thinke it better to take sue of the said snails of Affricke, or rather as many of the broad and flat sort, and to clysterize them for the dysenterie. But if the flux be exceeding vehement, then they put thereto of Acacia the quantitie of a beane. It is said moreover, That the spoile or slough of a serpent boiled with oile rosat in a vessell of tinne, is singular for the Dysenterie and Tinefme, to be injected by a clyster: Or if it be sodden in any other vessell, yet with an instrument or pipe of tin it is to be conueighed into the fundament, that the tiwille thereby may be annointed. The broth of a Cocke cureth these infirmities: but if it be of an old Cocke, it is the more effectually. And yet if the said broth be any thing saltish, it stirreth the bellie & prouoketh to the seege. The inward skin of an Hens gisier broiled and giuen with salt and oile, doth mittigate and appease the wrings caused by the flux of the stomacke. But then this regard must be had before, That neither the Hen haue any come giuen her, nor the patient feed vpon any graine some time before. Pigeons dung being burnt, and the ashes taken in drinke, is of great effect and vertue in these cases. The flesh of a Quoit or Stock-doue sodden in vinegre, is good both for the bloudie flux, and also for the loosenesse, proceeding from the imbecillitie of the stomacke. The Thrush or Mauis roasted with Myrtle berries, is soueraigne for the dysenterie: so is the Merle or black-bird. In which respect, great account also is made of the honey boiled, wherein bees were killed. [Of all the paines that be, the * lliacke passion is most sharpe and grievous to be endured. But it is said, That the blood of a Bat, torne and plucked in peeces aliue, is very good against it; yea, and if the bellie be annointed therewith, it caseth the torment thereof.] But to come againe vnto the flux of the bellie, shell-snails prepared and made in manner aforesaid for those that be short winded, are singular good for to stop the same, and to knit the bodie. So are their

* Or Affricke,

* Ulcer of the guts or bloudie flux.

* A continuall desire to the stoole without doing ought.
* *Dolores colicorum*. Some read *Colicorum*, of the Collicke.

* Which is the torture, or inflammation of the vpper small guts.

A ashes (if they were burnt and calcined aliue) taken in some austere or astrigent wine. The liuer of a cocke roasted, together with the skin of the gisier, which ordinarily the cocke casteth away, dried and kept, and so taken with a little of the juice of Poppy mixed with it, is of great power to remedy these accidents: others take the same skin whiles it is new and fresh, which they broil lone beaten to powder and taken in some grosse and astrigent wine, is singular to stay a flux of the belly. The wild Ring-doue or Quoit, boiled in vineger and water, is of the same effect. The A liniment likewise made of Pigeons dung and hony, is of great vertue, if the patients belly be annointed therewith.

B Touching those that haue feeble stomacks, and cannot concoct and digest their meat. It is said, That the maw or gisier of that kind of Geire or Vulture, which is called in Latine *Ossifragus*, dried, puluerized and drunk, is right soueraigne. Nay, if the patient doe but hold the same gisier in his hand whiles he is at his repast, it will help digestion. And in truth therbee diuers that for this cause weare these gisiers ordinarily about their necks: but I thinke it not wholesome to do so, long, for it maketh them leane as many as vse it, and spendeth their body.

To stay a flux of the belly, the blood of Mallards or Drakes is thought also to be singular good. The meat made of shell-snails, discusseth and scattereth ventosities. The Milt of a Mutton broiled to ashes and giuen in wine, is singular good to allay the wrings and torments of the belly. Of the same operation is the wild Quoit or Ring-doue, sodden in vineger and water. The greater kind of Swallows or Martins called Apodes, are no lesse powerfull, if they be sodden and taken in wine. The ashes of the bird Ibis plucked & burnt without his feathers, & so giuen to drink, work the same effect. But strange it is and wonderfull, if that be true which is reported as touching this malady, namely, that if a Ducke be applied aliue vnto the belly which is tormented with such wrings, she shall draw away the disease into her own body, and die of the torment, but the patient shall be eased by that means. These painful gripes likewise are cured with sodden hony, wherein Bees sometimes were drowned to death.

As for the Collick, there is nothing so good to assuage the paine thereof, as to eat Larkes, which the Latines name *Galerita*. Howbeit, some giue aduise and thinke it better to burne and calcine them in their feathers within a new earthen vessel, & so to stamp them to ashes or powder, and to drink therof foure daies together in water by three spoonfulls at a time. Others make no more ado, but take the heart of a Lark, and bind it to the inward part of the thigh: and there while it was warme. There is a family of the Asprenates, men of good quality and reputation, for that they had bin sometimes Consuls of Rome: in which house, of two brethren, the one was fully cured of the collick by eating these birds, and by wearing ordinarily the heart of one of them about his arme, inclosed within a bracelet of gold: the other being likewise troubled with the said disease, found remedy by a kind of sacrifice which he offered in a little chappell made with vnbacked bricke, piled vp archwise in manner of a furnace: and so soon as the sacrifice was finished, he stoop vp the same againe. That Vulture which is called *Ossifragus*, hath one gut of wonderfull nature, for it is able to concoct and digest whatsoever the said fowl deuoureth. And for certain this is known and generally receiued, that the nethermost end thereof cureth the collick, if the patient do but carry it about him. There are other secret and hidden diseases incident to the guts, wherof there be wonders told: and namely, that in these cases, if yong whelpes before they can see be applied for 3 daies together vnto the stomack especially, and the breast, so that they suck milke from out of the patients mouth the while: the said disease shall passe into the body of the poore whelpes, wherof in the end they shall die. Let the same be ripped & opened, then it will appear evidently what the cause was of the foresaid secret malady of the patient. But such whelpes ought when they are dead to be entered & buried. As for the Magicians, they auousch, That if the belly be annointed lightly with the blood of a Bat, the party thus dressed, shall not need to feare any paine of that part for one whole yeare after: or if it chance that one be pained in the belly, let him (say they) indure to drinke the water that runneth down from his feet when his legs be washed, and he shall find help anone.

¶ *Medicines against the stone and grauell: the paines of the bladder. The swellings in the cods and the share. Also for the biles and botches called Pani.*

FOr them that are troubled with the stone, it is good to annoint the region of the belly with Mouse dung. It is said, that the flesh of an Vrchin or Hedgehog is very good meat & pleasant in tast, if so be he were killed outright in the head at one blow, before that he had time to stee his owne vrine vpon himselfe: and looke whoeuer eat this flesh, shall neuer be subject to the disease of the strangury. The flesh of an Vrchin killed in this sort, helpeth the bladder, in case the vrine passe by dropmeale from it. But contrariwise, if the Vrchin chance to wet and drench himselfe with his owne vrine, as many as eat of the flesh shall fall into the infirmity of the strangury or pissing dropmeale. Moreover it is said, That earthworms drunke either in wine or cuit, is of great efficacy to breake or dissolue the stone: as also that snailles, prepared in that sort as they are ordained to be dressed for shortnesse of wind, work the like effect. Take snails naked out of their shels, and stamp them; giue 3 of them to the Patient to drinke in a cyath of wine the first day, two the morrow after, and the third day one againe, you shall see how it will helpe the strangurie or pissing dropmeale. But let the empty shels be burnt, the ashes therof wil scoure away and expell the stone. Semblably, it is said, that the same effect followeth vpon drinking the liuer of a water-snake: the eating of the ashes of scorpions calcined, either in bread, or with the locusts. Likewise, to take the little stones or grit that be found in the craw of a cocke, or in the giser or maw of a stock-doue: to beat the same to powder, and therewith to spice the drinke, is singular good for the infirmity aforesaid. To do the like with the skin of a Cocke or Hens giser, dried: or if it be new and fresh, to rost and eat it. Also for the stone and other difficulties or impediments of the bladder, it is good to take the dung of Quois or Stock-doues, with Beane meale. In like manner there is much help found by the ashes of Quois feathers, such as be of a wilder kind than the rest, taken with Oxymell. Moreover, the ashes of the guts of this bird giuen to the quantity of three spoonfulls: as also the nest of swallows: and Cricquets infused and dissolved in hot water, are commended for this purpose. Some helpe themselves with the giser of Ossifragus dried: others vse the decoction of Turtles dung boiled in honied wine, or els the broth of the Turtle it selfe. Furthermore, for the difficulty of vrine, it is wholsome to eat blacke birds or Merles, boiled with Myrtle berries: or Grasshoppers fried in a pan: & to drinke the fowls or Cheeclips called Oniscoi, folke make it not strange to do themselves good. But if there be pain in the bladder, it is said, That the broth made of Lambs feet, is soueraigne. If the body be bound or costive, a Cocke-broth causeth it to be soluble: and the same doth withall lenifie the acrimony of humors that cause the foresaid grieffe of the bladder. The dung of Swallows likewise procureth loosnesse of belly, in case it be tempered with hony to the forme of a suppositorie, and so put vp.

Touching the infirmities incident to the feat, the tried greafe of vnwashed wooll, (whereunto some adde Tutie and oile of Roses) the ashes also of a dogs head are soueraigne medicines: the slough likewise which a serpent hath cast, applied with vineger, is good, in case there be chaps and fissures in that part. Likewise, the ashes of dogs dung, which looketh white, incorporat with oile of Roses: & this receipt (they say) was the inuention of *Aesculapius*, and is besides most effectual to take away werts. The ashes of Mice dung, Swans greafe, & the tallow of Oxe or Cow, are helpfull for this infirmity. If the tuill or gut Longaon be relaxed and hang forth, it is good to annoint the same with the moisture issuing forth of shel-snails that is pricked through with a pin or needle, for it driueth it back againe to the right place. If the feat be galled, it is thought that the ashes of the wood-Mouse tempered with hony, cureth the same: or els the ashes of an Vrchin, together with the brains of a Bat, Allum, and the greafe tried out of vnwashed wooll, wil skin it againe. In like manner, Pigeons dung with hony: for the swelling blind hamorrhoids or piles called Condylomata, there is a proper remedy, namely, to rub the place with a spiders body, after the head and legs be cast away. Against the acrimony and sharpnesse of humors, that they should not fret and burne those parts, there is a faire liniment made with Goose greafe, in corporat with Barbary wax, white lead, and oile of rofat. So is the fat of a Swan. These medicines also

A also are said to heale the hamorrhoids that run.

For the pain of the Sciatica, it is thought that raw shell-snailles bruised are good, if they bee taken in Ammeine wine and pepper: also a greene lizard eaten as meate, without the feet, garbage, and head: so is the starre-lizard Stello, but thereto ought to be put the weight of three oboli of black poppy seed.

For ruptures, inward spasmes and convulsions, it auaileth much to take sheeps gal with breest milk. In case the priuities haue an itch & a fretting humor vpon them, or if some offensive werts arise in those parts, the dripping or graue that commeth from a rams lights roasted, doth much good, if the place be therewith annointed. As touching other accidents which happen to those parts, the wooll of a ram calcined and reduced into ashes, euen with all the filthinesse that is therein, is thought to be very good, so that the ashes be applied to the affected place with water. The fewer of the kell of a mutton, but especially that which groweth to the kidneys, incorporat with the powder of a pumish stone and salt, is much commended in this case: also greasie and vnwashed wooll soaked in cold water, is good to be applied to the place: the flesh moreover of a mutton calcined, so as the ashes be incorporat with water. Item, the ashes of a mules house: and the powder of caples teeth braied & puluerized, if the grieved place be strewed therewith.

To come lower to the infirmities of the cods: the powder of the bones of a dogs head without any flesh vpon it, puluerized, is singular therfore. If it fall out that one of the genitoirs be relaxed & hang down lower than his fellow, it is good to annoint the same with the waterish slime and some that commeth from shel-snails; so they say it is an excellent remedy: if there be any foule and malignant vlcers in those parts running with filthy matter, the ashes of a dogges head fresh killed are singular to heal the same: so are the little broad and flat shel-snails bruised and incorporat with vineger, if either the same or the ashes be applied thereto, also the honey wherein bees haue been killed mixt with rosin: the naked snailles likewise which bred (as I said in Barbarie, in case they be stamped & incorporat with the powder of Frankincense & the white of an egg, with this charge, that the said cataplasme be not taken off in 30 daies, by which time it will be ready to fall away of it selfe. Some in stead of frankincense, put the bulbous roots of small onions or scallions. For those who be troubled with the * waterish rupture, it is thought that the star-lizards Stilliones be wonderfull good, in case their head, feet, and guts, bee taken forth, and the rest of the body roasted, but the patient had need to eat of this meat often, and so it helpeth those who cannot hold their water. The like opinion there is of dogs greafe incorporat with * Alum de plume, if the patient take thereof to the quantity of a bean: as also the snailles of Barbary burnt, flesh, shell and all, so as the patient drinke their ashes. Furthermore, it is said, that the tongues of three geefe roasted and eaten, is a speciall remedy for this infirmity: and *Alumaxilans* is he that deuised this receipt.

Touching the biles called Pani, sheeps tallow incorporat with salt torrifacted, is singular good to breake them: but mice dung, with the fine powder of frankincense & orpiment or red Arsenicke, is as proper to resolute them: likewise the ashes of a lizard, and the lizard it selfe split alieue and applied hot thereto. In like maner cheeclips or fowls stamped and incorporat with the right terpentine, to the quantity of a third part, & so brought into a cataplasme. Some there be who to shel-snails punned, adde the common bole-armoniack. Also the ashes of the void shels only alone without the snailles mixt with wax, are of a resolute and discutient facultie. In like manner, a liniment made either of pigeons dung only, or els incorporat with barley meale or oatmeale. The flies called Cantharides mixed with quicklime, are a good potentiall cauterie, and open such biles as well as the Chirurgians launcet. The botches or swellings in the share, a liniment made with the small shel-snails and hony, doth assuage and mitigate. Finally, to keepe down the veins from swelling which be called Varices, it is good to annoint the legs of children with the blond of a lizard, but this must be don, while both the children and the party who hath the doing thereof be fasting.

CHAP. IX.

¶ *Receipts for the gouts of feet and hands: and generally for the paines or diseases of ioints whatsoever.*

THe tried greafe of vnwashed wooll incorporat with womans miik and white lead, is a very proper liniment to mitigate the pain of the gout: so is the liquid dung of sheep when they

run out behind. Their lights likewise, or a rams gal incorporat with their suet. Some split mice and lay them hot to the place: also the blood of a weazil reduced into a liniment with Plaintain; and the ashes of a weazil burnt alive, tempered with vinegar and rose water, and brought into a thin liniment, so that the place affected may be dressed with a feather. Others temper wax and oile of roses together. And there be again who vse dogs gal for this purpose, but in any wise the hand must not touch it, but the place ought to be annointed with a feather: likewise hens dung, and the ashes of earthworms mixt with hony, with this charge, that this cataplasme be not vndone or removed before the third day. Howbeit it is thought better by some, to apply the same ashes with water: but by others to vse vinegar in measure and with moderation, together with 3 cyaths of hony, hauing before hand annointed with oile of rose the gouty feet. It is said moreover that to drink broad snails, is a singular medicine to take away the gout of the feet, or the pain of any other ioint: the manner wherof is to stamp 2 at a time, and drink them in wine: some apply the same in a liniment with the juice of the herb Parietary. Others content themselves to bruise them and so to incorporate them into a cataplasme with vinegar. Many are of opinion, that the gout may be cured, if the patient vse oftentimes to take the salt, which together with a Viper was calcined in a new earthen pot: as also that it is very good to annoint the feet with Vipers grease. And they affirme constantly of a Kite that hath bin kept long dried, if the patient reduce it into powder, and drink thereof in water as much as three fingers will well take vp, it cureth the gout thoroughly. But if the feet be full of blood and swollen withall, they vse Nettles thereto. Some there be that take the yong feathers of a Kite so soon as they put forth, and stamp the same with Nettles to a liniment. The very dung likewise that these foules do meut, serueth in stead of a good liniment to annoint the painful gout in any ioint whatsoeuer: so do the ashes of a weazil or of shell-snails burnt or calcined and incorporate either with Amydum or gum Tragacanth.

If a man haue gotten a rap or rush vpon any ioint, there is not a better thing for to cure it than copwebs: some chuse for this intention, those which be woven by the spiders of ash colour: like as to vse the ashes of Pigeons dung with parched barley groats and white wine. In any dislocation of joints, the most present remedy that is knowne, is theepes suet tempered with the ashes of of womens haire burnt. This suet likewise serueth well to be applied with allum to the kibes of the heels: so do the ashes of a dogs head, or of mice dung. But in case there be any vlcere there not yet putrified, adde wax thereto, and it will skin vp and heale the same: and the like effect is wrought by the light ashes of crickets burnt and tempered with oile, or els with the ashes of the wild wood-mice mixt with hony: of earth-worms also incorporate with old oile: & lastly, many apply thereto the snails that be found naked & without their shels. And verily, the ashes of such snails burnt alive, heale all sores of the feet: howbeit, if the feet be galled & but lightly ex-coriated, there is not a better thing for them than the ashes of hens dung, or pigeons dung incorporate with oile. If the shoo hath rubbed off the skin, or fretted any part of the foot, the ashes of an old shoo-sole are singular good to heal the same: so are the lights of a ram or lambe. The powder of a caples teeth is a soueraigne and speciall remedy for the feet, if there ouste out any matter from vnder the nailes. The blood of a green lizard healeth the galls vnder the foot, yea, and cureth thoroughly the sore feet both of man and beast, if they be dressed therewith.

As for the corns and agnells which arise about the feet, it is good to besmeare them with the vrine of * Mule or mulet, together with the mire in the very place where they staied: also with sheeps dung. The liuer or blood of a greene lizard applied vpon some flocke to the place, or vpon a locke of wooll. Some vse in that order, earth-wormes stamped with oile, or the head of the star-lizard Stellio, incorporate in oile with a like quantity of Agnus Castus. Last of all, others take Pigeons dung foddren in vinegar, and lay the same to the place.

Touching werts, of what sort soeuer they be, there is not a more proper thing to make them fall off, than to bathe them well with the vrine, durt and all, of a dog where he lately pissed: or to apply thereto a salve of dogs dung ashes and wax: it is not amisse also to lay to them sheeps dung, or to rub them wel with Mice-blood new killed: or to apply a Mouse split along the mids aliae: the gall likewise of an Vrchin: the head of a lizard: or the blood: or lastly, the ashes of a lizard calcined: the old slough of a snake also. Lastly, hens dung incorporate with oile and salnitre. If all these medicines fail, begin the cure new with Cantharides incorporate with wilde grapes called Vva tamine: this is a corrosiue, & wil eat them out: but when they be thus fretted & ex-ulcerat

* Muli mulanet
Some take mu-
lu to be the
mule ingeh-
dred by a male
asse & a mare:
but Mula, to be
that mule that
cometh of
a horse and
female asse.

A ulcerat, the cure must be followed with those appropriat means which I haue set downe before in the healing of vlcers.

CHAP. X.

¶ Medicines appropriate for diuers and sundry diseases which possesse the whole body.

Returne we now to the cure of those maladies which are incident not to this or that mem-ber, but to the whole body. First and foremost, the Magitians say, that the gall of a blacke dog (a dog I say and not a bitch) is a singular countercharme and preseruatiue against all B forceeries, inchantments, and poisons, which may indanger a whole house, in case there be a per-fume made therewith to purifie the aire thereof, yea, and to hallow and blesse it against all such dangers. The like effect (say they) we are to look for, if the walls of the said house be sprinkled or striked with the blood of the said black dog, with this charge, To burne vnder the threshold or dore sell at the entry of the said house the genitall member of the same dog. Men may maruell well enough at these fooleries and absurdities of theirs: but surely wonder lesse will they thereat, who know what store they set by illfaured ticks, the foulest and nastiest creatures that be: and why do they thus magnifie so filthy a vermine? because (forsooth) this creature onely of all others hath no passage at all for the voidance of excrements, sucke it neuer so much: and no way there is but death with them when they are thus full, but so long only as they continue hun-gry and fasting: and yet they say, that they wil indure so a long time, euen a whole seuen-night together with abstinence and spary feeding: may let them feed stil to the ful, they wil not hold out so long, but burst again in fewer daies space. Well, this tick, so filthy as it is, and of so admi-rable and strange a nature in their conceit, they hold to bee of exceeding vertue to appease all paines and torments of the body whatsoeuer, in case a man take one of them, with the left eare of a dog, and carry them hanging to some part about him. And more than that, these Magiti-ans take marks by it, & presage of the life or death of their patients, for they hold it for a certain and assured signe of life, if one hauing a ticke about him, stand at the beds feet where the sick man lieth, and when he asketh him how he doth, and where he is amisse, &c. if the patient make answer readily vnto him: but in case hee make no answer at all, then surely hee shall die there is C no remedy. But take this withall: this ticke must be plucked likewise from the left eare of a dog, and the same dog ought to be cole-blacke without any specke of other colour. And Nigidius hath left in writing, that dogs will not all day long come neare vnto a man nor abide to see him, who hath plucked a ticke from an hogge. But to returne vnto our Magitians: they affirm, that such as be lunaticke and beside themselves, shall come againe to their right wits and senses, in case they be sprinkled with the blood of a moule. They auouch moreover and say, that if one seeth the tongue, eies, gall, and guts of a Dragon in wine and oile, and permit this decoction to coole all night abroad in the open aire, it is a soueraigne medicine to chase away such bugs, spi-rits, and goblins, wherewith folke be haunted and affrighted in the night season, if they bee an-nointed therewith all ouer their bodie, morning and euening. Nicander writeth, that who soeuer E carry about them the serpent Amphisbæna dead, or no more but the very skin thereof hanging fast to any part of their bodies, they shall finde it to bee a most soueraigne remedy for any through cold or chilling fit that hath surprised them. Nay hee staich not there, but addeth moreover and saith, that if the said serpent be bound vnto any part of a tree that is to bee felled and laid along, the workemen that hew at the butt thereof, shall feele no cold all the while; and the tree by that meanes shall the sooner and more easily bee cut downe and ouerthrowne. No maruell therefore, if this serpent afore said dare leaue his nest, and commit himselfe to the cold weather; for he ventureth first to come abroad, and is to be seene aboue ground before the Cuc-kow begins to sing. But since I haue made mention of the Cuckow, there comes into my minde a strange and miraculous matter that the said Magitians report of this bird; namely, that if a F man the first time that he heareth her to sing, presently stay his right foot in the very place where it was when he heard her, and withal marke out the print and just proportion of the sayd foot vpon the ground as it stood, and then digge vp the earth vnder it within the said compasse, looke what chamber or roome of the house is strewed with the said mould, there will no fleas breed there.

They say moreover, that the fat which is fleted or skimmed from the broth wherein dormice G and rats be foddren, is excellent good for those that be affraid of the palseie, and subject thereto: also that Sowes or Cheeslips called Millipedæ, prepared and taken in drink, in manner as I appointed for the squinancie, are singular for those that find themselves to be false into a phthytick or consumption of the lungs: so is a green Lizard (by their saying) foddren in three sextars of wine, till there be but one remaining, if the patient take thereof a spoonfull at a time every day, untill he feele himselfe warished and fully cured. Others assure vs of as great effect, by drinking the ashes of shell-snailles in wine.

As for the falling sicknesse, the tried greace of sweatie and vnwasht wooll tempered with a little myrrhe, so that the quantitie of them both arise to the bignesse of an hazell nut, cures the same, if it be taken infused and dissolued in two cyaths of wine, presently after the patient haue sweated and be come out of the baine. For the same disease, they ordaine the cullions or stones of a ram which haue bin kept long and dried, to be reduced into powder to the weight of halfe a denier Romane, and so to be taken in water, or else in one hemine of asses milke, howbeit with this charge, That the patient forbear drinking of wine five daies after, and as many before. Furthermore, they do highly commend the drinking of sheeps blood: likewise their gall in milke, but principally if it be the gall of a lambe sucking whelpes is very good in this case, if it be taken with wine & myrrhe, but first the head and feet must be cut away. Some for this purpose drink the furors or rough werts growing to the legs of a mule, in three cyaths of oxymell: others giue order to drinke in vinegre the ashes of the star-lizard Stellion, which breedeth beyond-sea and the tender skin or slough of the said Lizard (which the casts in the same maner as a snake doth) taken in drink, helpeth much. Some Physitians are so venturous and bold, that they haue giuen to those who be subiect to the falling sicknesse, the verie Stellion it self, after it is rid and clesed from the garbage or guts, and so kept dried; appointing their patients to drinke the powder thereof in some conuenient liquor, through a pipe of a cane: others appoint it to be rosted vpon a wooden broch or spit, and so to be eaten for meat. And seeing I haue occasion thus to write of this Stellio, and the skin thereof, it were very conuenient and necessarie in this place to shew the manner how the said slough (which is growne ouer him in winter) may be gotten from him when he hath turned himselfe out of it, considering that he vseth commonly to deuoure and eat it himselfe, because it should not do any man good; for there is not a beast againe more spightfull to mankind, and enuious of our commoditie: in so much as this word * Stellio is growne to be a reprochfull tearme among vs. Well, to meet with this skin of his (as craftie as he is to beguile men of it) they vse to obserue in hot summer daies, his nestling hole into which he is wont to retire himself: and ordinarily they find it to be in some hollow crannies about doors & windows, or else vnder vaults and sepulchres: when they haue espied where it is, they wait for the prime of the Spring, they set iust against his hole certaine little cages or leaps made of clouen and sluied reeds, and the same wrought and wouen good and thicke: and in very truth he delighteth to get betweene the streights and narrow passages of the staues and windings, whereof the said cages are made, for by means thereof he may the better slip himselfe out of that coat which cloggeth his body and maketh him vnweldie: and thus in getting through the said lattices, he leaueth the same behind him: but after he hath thus done, hard bested he is, for back he cannot the same way againe for to eat the said slough. Certes, there is not a medicine preferred before it, for the falling sicknesse: and yet good reckoning there is made of the brains of Weazles which haue bin kept and dried: yea and of the liuer so prepared, if they be reduced into powder and so taken in drinke: yea their very genetoirs, and bagg or matrice wherein they beare and breed their young; or their maw likewise sauied, dried and condite with coriander seed, are singular good for this maladie, as I haue heretofore noted: and so are their ashes. Some are of opinion, that it is good eating of them whole as they be, especially the wild kind, without any such preparing & dressing, but others esteeme ferrets to be as effectual as they, for the falling cuil. Moreover, it is said: that the green lizard eaten with some sharp sauce that quickneth appetite, is singular good in this case, but the heads and feet must be first taken away. Moreover, the ashes of shell-snailles together with line-seed & nettle-seed, brought into the form of a liniment with honny, cure those thoroughly of this disease who are all ouer annoiued therewith. But I like better yet, that for this maladie one should carrie about him the taile of a dragon bound within a buck or does skin to some part of his body, with the sinews of a stag or hind: or els to tie vnto the left arme

* Stellionatus
crimē as much
as conuenge,
or cony-
catching.

A arme the little stones that be taken out of the craw or giser of yong swallows: for it is said, that so soone as the old swallow hath hatched her birds, she giueth them such litle stones to swallow downe: but in case this dose be taken in the very beginning, and that the first time that one is false of this disease, there be giuen to him for to eat, the yong swallow that the dam hath first, he shall be deliuered from it clearly and neuer haue more fits. But at any time after, swallows blood and frankincense, or els the heart of a swallow fresh killed, cureth them that be surprized with this malady, if they swallow the same downe. Moreover, it is said, that the little stone found in a swallows nest, if it be but applied vnto man or woman that is false of this sicknesse, it will raise them out of the fit, and bring them againe to themselves immediately; but if they carry it tied to any part about them, they shall neuer haue fit againe. Much talke there is also of a kites liuer, that it should be of singular operation to this effect, if it be eaten as also of a serpents old skin which she hath cast off, that it will do no lesse. The heart of a vulture stamp together with the own blood, and giuen in drink 3 weeks together, worketh wonders in this disease. So doth the heart of the yong bird of a vulture, if the patient weare it about his arme, or hang it at his necke: but then they giue counsel, to eat the flesh of the vulture it selfe, & especially when he hath eaten his ful of mans flesh. Some of them ordaine the brest of a vulture to be drunk, but it must be out of a cup or maser made of the wood of Cerrus: and others there be who to this purpose cause the stones of a cock to be kept and dried, and the same to be giuen to the patient in water and milk, after he hath abstained five daies from drinking wine. To conclude, there haue bin of them, that prescribed vnto their patients in this case, 21 of these sandy or reddish flies (but they must be dead ones) for to be taken in drinke: howbeit, if they were but of a feeble complexion, they gaue fewer of them.

CHAP. XI.

¶ Against the Iaudise and Phrensie. Against Feaners and the Dropse.

THE excrement ingendred in the eares, called commonly Bare-wax, mightily withstandeth the jaundise: so doth that ordure also which gathereth about the vidders & tears of sheepe and goats, if the patient drinke thereof to the weight of one denier in two cyaths of wine, with some myrrh, though it be neuer so little: the ashes of a dogs head calcined, taken in honied wine: one of these sowes or Cheeslips with many feet, in one hemine of wine: earthworms in honied vineger with myrrh, be all excellent for the said disease. Moreover, it is said, that a hen with yellow feet is very good therefore, in case the said feet be clesed and washed first in faire water, afterwards bathed and rinsed in the wine that the patient is to drinke. The brains of a Partidge Ægle, or other birds of prey, taken in three cyaths of wine, is very proper also therefore. The ashes of dates; those also of the entrails of stork-doues, giuen in honied wine to the quantity of three spoonfulls, are soueraigne in this malady: likewise the ashes of sparrows burnt in a fire made of vine-wood, work the same effect, if they be taken in mead to the quantity of 3 spoonfulls. A bird there is called in Greeke Iærus, of the yellow colour which the feathers carry; which if one that hath the jaundise do but looke vpon, he or she shall presently be cured thereof, but the poore bird is sure to die for it: I suppose that this is the same bird which in Latine is called Galgulus.

As for the Phrensie, it seemes that the lights of a mutton, applied hot round about the head, and so kept fast, is soueraigne to bring their heads againe into temper, who are besides themselves. Say that true it were, that not only the brains of mice giuen in water to drinke, or the ashes of a weazil, but also the flesh of an archin kept in salt or dried, are very good for such as are bereft of their right wits, who will venture to giue them these medicines, be they neuer so certain and assured? For as touching the ashes verily of Scrich-owls (which these Magicians so highly commend for the phrensie) I take it to be one among many other of their illusions, whereby they mocke and abuse the world. But about all the course that they take in the cure of Feuers, saureth nothing at all of Physick, which indeed is opposite to all their rules and proceedings: for they haue diuided and digested the same into all the 12 signes in the Zodiack, according as the Sun or Moone passeth through any of them. All which, is nothing els but a meere mockerie to be rejected and vtterly condemned, as I will plainly proue and shew to the view of the eye by some few examples and instances gathered out of many. For in the first

place they ordain, that when the Sun is in Gemini, the combs, the ears, the nailes, and clawes of G cocks should be burned, and the ashes thereof tempered with oile, wherewith the sicke persons are to be annointed all ouer: but if the moon do passe through the said sign, the same cure (they say) is to be done with the ashes that come of their barbs & spurs: whiles either Sun or Moone be in Virgo, the cure doth alter, and is to be wrought with barley corns in the same manner vsed. But how if either of these 2 planets bee in Sagittarius? then the wings of a Bat must serue the turne. In case the moone be entred into Leo, they imploy the leaues and branches of the Tamariske; many it must be the tame and garden Tamarisk in any case. Lastly, if she be in Aquarius, they prescribe the coles made of box wood, punned and puluerized. Certes, I purpose not to run through all their receipts: such onely as are found and approued good, or at least waies carry some shew and probability thereof, I am content to set downe: as namely, when they giue order for strong odours and perfumes to be applied vnto patients lying of a lethargy, for to awaken and raise them out of their dead sleepe: among which peradventure, the stones of a weazill dried and long kept, or their liuer burnt, may doe some good. And whereas they thinke it conuenient to apply hot vnto their heads all about, the lungs of a Mutton, they speake not altogether besides sense and reason.

As for quartane agues, so far as much as it is often seen, that all the physicke that is vsed about them doth little good or none at all, be a Physitian neuer so Methodical, Rational, & Diligent, yea, though he visits such patients ordinarily, & be present with them by their bed sides: in that regard I wil not stick to relate many of their medicines and receipts for this disease; beginning first with those that are locall, and outwardly to be applied, hanged, or worn about any part of the body. *Imprimis*, they say, that the dust or sand wherein any hawke or bird of prey hath basked or bathed her selfe, is singular good for the quartane ague, if the patient wear it in a linnen cloth tied with a red thred. *Item*, the longest tooth in the head of a cole-black dog, is very proper for this purpose. There is a kind of bastard wesps, which the Greeks thereupon call *Pseudosphæces*, and ordinarily they do flie alone, and not in troupes as others doe; which, if they be caught with the left hand, and hanged about the neck vnder the chin, do cure quartans, as some Magitians say: howbeit, others attribute this effect to one of these wesps, which a man saw first the same yeare. Cut the head of a Viper off, or take out the heart aliue, and wrap the one or the other within a little linnen rag, and carry it about you, the quartane ague will be gone anon, by their saying. Some of them take only the little pretty snouts end of a mouse, or the very tips of K the ears, and injoin the patient to lap the same in a red carnation coloured cloth, and so to carry it about him; but then the mouse must in any case be let go again and not killed. Others pluck out the right eie of a green lizard aliue, which done, within a while after they chop off the head: then they infold them both in a piece of goats skin, and giue the patient in charge to haue the same about him: and many there be, who by the direction of magitians carry about them in like manner for the same purpose, one of these flies or Beetles that vse to roll vp little bals of earth: and in very truth, in regard of this kind of beetle, the greater part of Ægypt honour all beetles, and adore them as gods, or at leastwise hauing some diuine power in them: which ceremoniall deuotion of theirs, *Apian* giuerh a subtill and curious reason of, for he doth collect, that there is some resemblance between the *operations and works of the Sun, and this flie: and this hee I setteth abroad, for to colour and excuse the superstitious rites of his countrymen. Howbeit, the Magitians imploy in the cure of a quartan ague, another kind of them *which hath little horns turning backward, but they must be gotten likewise with the left hand, or els they will doe no good. As for the third sort, spotted with white, and called in Latine by the name of *Fullo*, they appoint one of them to be slit through in two, and the 2 pieces to be tied to both armes of the patient, whereas those of other kinds, they bind to the left arme only. Semblably they say, that the heart of a snake taken out of her body aliue with the left hand, cureth the quartan, if the patient carry it about him: as also, that who soeuer taketh foure of the knots or joints of a scorpions taile, together with the sting, and carrieth the same about him inwrapped within a piece of black cloth, with this charge, That for 3 daies space hee doe not see either the scorpion which M was let go, nor the party who tied the said cloth and that which is within it about him, he shal be deliuered from the quartan ague: but after the returne of the third fit, the patient must hide this clout and the joints afore said, & bury them in the ground: some there be who lap a caterpillar in a little piece of linnen cloth, & bind the same thrice about with linnen thred, making three

* Haply, because all these beetles be considered of the male sex, & none of them female: for in those little roundles of earth there breed grubs, which turne so be in the end beetles. * This beetle he called before *Tanymus*, i. Bull,

A three knots thereof, saying at the knitting of euery knot, that this they do to cure him or her of a Quartane feuer. Others carry about them a naked snail in a little piece of fine leather: or else foure heads of snails cut off and inclosed within a small reed. Many thinke it better to infold one of these sows or Cheellips within a Locke of wooll, and so to carry it about them against the quartane, or els the little grubs or worms whereof come the oxe-flies, before their wings bee grown. And there be that for this purpose fit themselves with those smal worms couered al ouer with a kind of down or Cotton, which are found in thickets, & among bushes or shrubs. Some of these Magitians giue direction otherwhiles to take 4 of the said wormes inclosed within a wal-nut shel, & to bind them to some part of the patient, or els the snails which be found naked without their shels. Others put a liue Stellion or star-lizard in some little casket or box, & lay B the same vnder the pillow or bolster where the patient laieth his head: but when the ague beginneth to decline and is like to go away, they let the Stellion go againe at liberty. They prescribe likewise to swallow downe the heart of a sea-gull or cormorant, taken forth of the bodie without any knife or instrument of yron: if not so, to keepe the same dried, to beat it to powder, and then to drink it in hot water. The hearts of swallows condite in hony, and so eaten, bee excellent good for the quartane ague, as our Magitians say. And yet some of them make no more ado, but giue of their dung to the weight of one dram, in 3 cyaths of goats milke and ewes milke, or els of wine cuit, before the acceffe come. Howbeit, others would haue the Swallows themselves to be eaten whole without any dressing at all. The people of Parthia drink for the quartan ague the fixt part of a denier weight of an Aspis skin, with the like poise of pepper, & they hold C it to be a soueraigne remedy. *Chrysippus* the Phylosopher was of opinion, and so he hath put down in writting, That to carry one Phrygianum tied to some part of the body, is excellent for the quartan. But what liuing creature he would meane by that same Phrygianum, neither hath he himselfe described, nor ever could I meet with any man that knew it: howbeit, I thought it good to set downe this remedy, being thus deliuered by so graue an Author as *Chrysippus* was, to stir vp the diligence of others, if haply there be any so industrious as will take paines to search farther into the thing, and learne what it might be.

In any of these long diseases which be called Chronique, it is commonly thought, That to eat the flesh of a Crow, & to apply vnto their body their * nest, is most excellent to bring them to an end.

* Nidum. Some made of Ieremy

D As for Terrian agues, it were an easie matter to try the experiments of such receipts as are giuen out for them: considering how the poore patients in hope of ease are willing enough & delighted to be doing and working conclusions: and namely to see whether the copweb, nest, and all, of that spider which they call * *Lycos*, incorporat with rosin and wax, & so applied as a fronsale to the forehead and temples on both sides of the head, will do any good to rid them away. Certes, some vse to wear about them the spider it selfe, inclosed within a quill or piece of a reed: in which sort it is reported to auail much in the cure of other feuers. Also it is thought, That a green lizard hung about the neck aliue in some box sufficient to receiue it, is as effectual. And these kind of medicines they affirm to be of great efficacy for to driue away those agues which by way of relapse vse often to return againe when they were thought to be cleane gone.

E Touching the dropsie, the tried greafe of sweety wooll taken in wine with a little Myrrh, so that the whole arise to the quantity of an Hazel nut, is supposed to be a singular receipt: but some put thereto Goose greafe also and oile of Myrtles. The filthy ordure that gathereth about Ewes vdders, hath the same effect. Likewise, the flesh of an vrchin long kept in powder or otherwise, and eaten, doth much good. To conclude, it is thought, that if the belly be rubbed well and annointed with that which a dog doth vse to cast by way of vomit, it helpeth those that bee in a dropsie, for it is reported to haue a speciall vertue to draw a water, and to drie vp the superfluous humidity ingendring that disease.

* i. Wolf. Supposed to be our common spider that hunteth flies.

CHAP. XII.

F ¶ Medicines for *S. Anthonies fire*, Carbuncles, fellons, burns, crampes, or contractions of sinewes.

THE suet or greafe of vnwashed wooll incorporat with oile of Roses and Tutie, is a proper liniment for *S. Anthonies fire*: so is the bloud of a tike, and earth-wormes reduced into an vnguent with vineger: but especially these Cricquets, crushed and wrought within ones hand

hand to the consistence of an vnguent and so applied. And this medicine last mentioned, is passing effectuall for the party himselfe that hath the handling of it: for it assureth him aforehand, that he shall not fall into the said disease in a whole yere following: but this Criquet must bee digged out of the ground with some instrument of yron, and the earth & all to be taken vp with it, for to serue in this cure. Moreouer, it is said, That goose greafe is very good in this case: so are the ashes of a Vipers head kept dried & then calcined, if the same be afterwards applied in form of a liniment with vineger. The old sloughs that snakes cast off, reduced into an vnguent with Bitumen and Lambs suet, quencheth this burning humor of S. *Anthony's* fire, if the body be annointed therewith tempered in water, presently after the baine.

As for Carbuncles, the means to rid them away, is to annoint them either with Pigeons dung alone, or els mixed with Linseed and honied vineger: likewise, it is good to make a cataplasme of those Bees which haue bin drowned or killed in their own honey, and lay the same vpon the sore. Others apply vnto them either a pulstise of fried Barley groats, or else a powder made with their meale. If there be a carbuncle risen in their priuities, the fattinesse of greasie and vnwashed wooll, incorporat in hony and the skales refuse or cinders of lead, into a salve, cureth it: and the same healeth generally all other botches or vlcers in those parts. Sheeps dung that is fresh and Greene, they hold to be singular for carbuncles, taken in the very beginning.

All tumors and hard swellings, which had need to be mollified, are made soft and brought downe most effectuallly with Goose greafe, or the fat of a Swan.

Moreouer it is said, That a spider laid to any fellon, before it be once named what thing it is cureth the same; but it must not be removed from the place before the third day. The mouse called an Hardshrew hanged vp aliue vntill it be dead, is very good for these fellons, in case it touch not the ground afterward, and that there be 3 circles or turnes made with it round about the fore, so that withall both the patient and the party that hath this cure in hand, spit vpon the floore three times in the doing thereof. Also the dung of Cocke or Henne (that which looketh reddish especially) tempered with vineger & laid to a fellon, healeth it: but the said dung ought to be fresh and newly meuted. Of the same operation and effect is the giser of a Storke boiled in wine. Some there be that take certain flies of some odde and vneuen number, bruise and work them into the consistence of a saue, with their *ring-finger, and therewith apply them to the fellon. Others vse for the said purpose the filth ingendred in sheeps ears: old sheeps tallow mixed with the ashes that come of womens haire, reduced into a liniment, serueth to cure the sayd accident: so doth rams suet mixed with the ashes of a pumish stone calcined, and a like quantity in weight of salt.

As for burns and scaldings, the ashes of a dogs head burnt, are singular good to cure the same: so be the ashes of Dormice tempered with oile; sheeps treddles also mixed with wax: the ashes of mice and shell-snails; and this medicine will skin them so cleane, that there shall no scarre remaine afterwards to be seen. In like manner, the greafe of Vipers: or the ashes of Pigeons dung calcined and reduced into a liniment with oile.

Touching the nodosities of the sinewes, the ashes of a Vipers head burnt and brought into an vnguent with the oile Cyprinum, is thought to be a soueraigne medicine for to resolueth them. Likewise, earth-wormes made into a cataplasme with honey, and so applied vnto the affected place. But if the said sinews doake and be pained, bind vnto them the serpent called Amphibana dead, and it will ease the grieft. The like effect you may looke for of Vultures greafe, together with the giser of the said foule, dried or stamped with old swines greafe or lard, and so reduced into a liniment. And if we may giue any credit to the Magicians, a drinke made of honied wine, spiced with the ashes of a scritch-owles head, together with a Lillie root, wil work the same effect.

In contractions of the sinewes, it is good to eat the flesh of stock-doues, especially if the same hath bin powdered and kept in salt. The flesh likewise of an Hedgehog is as good for crampes and spasmes: as also the ashes of a Weazil. The old slough that snakes leaue off, infolded within a piece of a Buls skin or leather made thereof, is good to be worn tied about one for to prevent this disease: and more particularly for those spasmes or convulsions that draw the sinewes of the neck so, as the head is pluckt backward, there is not a better medicine than to drinke the poise of three oboli of a kites liuer dried, in as many cyaths of mead or honied water.

When the skin turneth vp about the roots of the nails, or the excrecence of the flesh putteth the

A the fingers to pain, which accidents be called in Latine Reduvia, and in Greek Pterygia: it were good to vse to them the ashes of a dogs head calcined, or the matriee of a bitch sodden in oile; with this charge, to annoint them aloft with a liniment of butter, made of ewes milke and honny incorporat together. The bursie likewise or little bladder, which containeth in it the gall of any beast, is good for this purpose.

If the snails be ragged and rugged, it is not amisse to apply vnto them Cantharides incorporat with pitch, without reemouing this plaister before the third day: or els to lay vnto them Locusts fried in Goats suet: sheeps tallow also is good therefore. Some mix therewith Birdlime made with Misselto and Purcelane tempered together: others take Verdegriis or rust of brasie and the foresaid birdlime, but they remoue not the plaister off in three daies.

CHAP. XIII.

¶ Receipts for stanching blood: repressing or smiting backe the swelling incident to wounds: healing of vlcers and Greene wounds: and generally for curing of many other maladies. Remedies all taken from dumbe creatures.

T He suet that commeth from the kelle of a mutton, staies any flux of blood, if it be conueied into the place from whence it issueth: so is their rede, especially if it be the rennet of a yong Lambe tempered with water, either drawn vp into the nostrils or poured into them: this is thought to be such a soueraigne remedie, that when all others haue failed, it hath done the deed. The earthie substance sticking to shell-snails, hath the same effect: yea, and their verie flesh when they are pulled out of their houses. In case the nose do bleede excessively, take the said shell-snails, bruse them and lay them to the forehead: they will stanch the bleeding: the copwebs also put vp into the nostrils. As for the brains of a Cocke or Capon, they stop a flux of blood issuing from the braine. But say that blood do gush immoderately out of a wound: it is wonderfull how the ashes of horse dung, together with egg-shells, will stop the same, if it be laid thereto.

As for *wounds, the greafe of vnwashed wooll, incorporat with the ashes of torrifed and calcined Barley and Verdegriis, of each a like quantitie, and so made into a plaistre, healeth them. D The same is a soueraigne salve for any corrosiue vlcers, be they neuer so maligne & cankerous. It eateth and consumeth the dead flesh about the brims and edges of vlcers, yea, and brings downe the excrecence of proud flesh, reducing the same to be euen with the rest about it. The same doth incarnat likewise and skin the place after it is filled vp with yong flesh. If the vlcers proue to be ill fauoured cankers, it is thought, that the ashes of sheeps dung mixed with salnitre, is an effectuall powder for the same: and as great operation is attributed to the ashes of a Lambs leg bones, but principally if the said fores be of the nature of *Nunquam sana*, and will not skin vp, in these cases, for it eateth away all the excrecences of ranke flesh in vlcers, and there is not the like againe vnto it, for reducing all vnto an equalitie. The very dung also of sheep heat vnder an earthen pan and afterwards wrought into a masse or paste, assuageth the tumour of any vlcers: And it serueth likewise to mundifie and heale fistulaes, as also to rid away the chil-blaines or bloody fols, which are our night-foes. But of al other, the ashes of an horse head is most forcible in this case, for it consumes all superfluous flesh growing in sores, and heales vp the same afterwards, no Spodium better. And yet it is said, that mice dung is very good therefore: like as the ashes of Weazils dung. The hard callosties in the bottome of vlcers, the Cheeflips or Soves if they be stamped fresh and reduced drie into powder, do search thoroughly: like as all cankers also they cure, if they be incorporat with the right Turpentine and common *Bole-Armioniacke. And these medicines abovesaid are singular for those vlcers that be giuen to breed wormes, and thereby are dangerous. And seeing I am light vpon the mention of wormes, it would be noted, that there be diuerse sorts of wormes which haue wonderfull properties in these cases: For first and formost, the grosse and fat wormes breeding in wood & timber, which the Latins call Cossi, are soueraigne healers of any vlcers whatsoeuer. But if the same be burnt with an equall weight of Annise seed, and reduced into a liniment by meanes of oile, they haue a speciall vertue to cure those sores that be corrosiue, which the Greeks call Nomæ. Earthwormes are great healers, and

*Medico, & the fourth of new to the little finger.

*Vulueribus. Some e.d. Vlcibus.

*Simplif m take it for the sigillat: but it skill th not much, being this Kallat. Siop ca, Tord. Vltima, & Bole Armion, yea, and Terra Lemnia, little diff. in operation, siop ca. Armion, is the leyned thack. Vid. Erythim dare Metalia.

and soon do soulder greene wounds: in which operation they are so effectuall and speedy withal, G
That if the sinewes be cut quite asunder, it is a common opinion, that they will consolidat and
vntite them again in lesse space than a week: and therefore, because they should be ready and e-
uer at hand, many preferue them for this purpose condite in hony. Indeed, when they be reduced
into ashes, they are effectuall to eat downe the hard callosities growing in the sides and edges of
vicers, if they be incorporat with Tarre, or the Sicilian hony called Hyblæum. Some vfe them
dried in the Sun and tempered with vineger, for wounds: but this cataplasme they doe not re-
died in the Sun and tempered with vineger, for wounds: but this cataplasme they doe not re-
do much good: yea, and taken forth whole as they be out of their shels, stamped and so applied,
they conglutinat greene wounds, and stay the running farther of corrosiue vicers. Also there is a
certain liuing creature, which is called Herpes by the Greeks; the same hath a peculiar proper-
ty to heale any sore that * runneth on still and corrode as it goeth. For which kinde of vicers, H
snails, bruised shels and all, be passing good: and the same incorporat with Myrrh and Frankin-
cense, haue the name to heale sinewes that be cut in two: Moreouer, the fat of a Dragon dried
in the Sun, is very effectuall: like as the brains also of a Cock, to heale green wounds, if the pati-
ent withall eat salt to his meat, which was calcined together with Vipers flesh: and by this
means (they say) that any vicers will sooner yeeld to the cure, and be healed with more speed.
The renowned Physitian *Antonius Musa*, hauing certain Patients in cure vnder his hand, who
had vicers that were thought incurable, prescribed them to eat Vipers flesh; and wonderfull it
is how soone he healed them cleane by that means.

The ashes of certain Locusts without wings, called by the Greeks Tryxalides, cause the thick
roufs and escars that grow about the brims of vicers to fall off, and they consume the hard cal-
losities thereof applied with hony. The ashes likewise of Pigeons dung tempered with Orpi-
ment or Arsenick and hony, serue as a corrosiue to eat away any excrecence that ought to bee
consumed: the brains of schrich-owls incorporat with greafe, doth wonderfully conglutinat any
wounds. As for those morimals, named by the Greekes Cacoethe, the ashes of a rams shanke-
bones & legs mixt with breist milk, is singular to heale them, so that the said sores were first well
and thoroughly washed and bathed with fine linnen cloaths foked in some conuenient liquour.
There is a bird called an Hular, which if it be foddren in oile, & so resolued, is good therefore, in
case the same be incorporat with butyr made of ewes milk and hony. If the sides or brims of any
vicer be growne callous and hard, the Bees that are stifled and killed in hony, doe mollifie vnto
well. The blood and ashes of a Weazill calcined, doe cure the white filthy leprosie called Ele-
phantiasis. The wounds occasioned by whipping and scourging, the marks also and wales remai-
ning to be seen black and blew after such lashes and stripes, are done away and go presently out,
with applying thereto a sheeps skin fresh and newly flaid. If there be any joint bruised or crac-
ked, the ashes of a Sheeps leg bone, burnt, haue a special vertue to help the same: but much bet-
ter, if they be incorporat into a cerot with wax. Of the same operation there is another plaster
made, namely, if there be calcined with the former the jaws of the said Sheep, and a Harts horn:
and if the wax be softened and resolued with oile rosat. When bones bee broken, it is good to
apply vnto the fracture the brains of a dog spread vpon a linnen cloth or inwrapped therein, co-
uering the said cataplasme with wooll laid aloft, and the same est-soones moistened and wet
thoroughly [* in some astrigent liquor:] this manner of cure doth soulder them lightly in
14 daies at the farthest. The ashes also of field-mice work the like effect as speedily, if the same
be tempered with hony, or mingled with the ashes of earth-wormes: which also is able to draw
forth spils of bones, and make them to worke out. The lights of a Mutton and of a Ram espec-
ially, reduce skars to their liuely colour againe, futable vnto the skinne about: their tallow also
mixed with sal-nitre: so do the ashes of a greene lizard: the slough that snakes cast off in the
Spring boiled in wine: and Pigeons dung tempered with hony, and so applied. The same me-
dicines do take away the filthy white Morphew, called in Latine Vitiligo, if they be vfed with
wine: for which Morphew or infection of the skin, it is good to apply Cantharides, with twice
as much of Rue leaues, which the patient must indure and abide, lying still vpon the place in the
Sunne, vntill such time as the skinne begin to rise in pimples and little blisters. Afterwards it is
needfull to foment and bathe the said place thus offended, yea, and to annoint it wel with oile:
which done, to returne againe to the former emplastration, and so hold on this course by
turnes for many daies together, but in any wise to take heed that the exulceration in this cure
goc

* As oile of ro-
ses, or red wine

A go not ouer deep. For the same morphew, many giue order to make a liniment with flies & the
root of docks, and herewith to annoint the places infected with this morphew: also, to apply
thereto hens dung, I mean as much thereof as is white: for which purpose they keep the same in
oile within horne boxes, for to serue the turne as need requireth. Likewise, to annoint them with
the blood of bats, or the gall of an Vrchin tempered with water. As for the running scalls, the
brains of a schrich-owle is very good, incorporat with salt-petre: but dogs blood hath no fel-
low to repress the same: like as to kill the itch, the little broad snailles stamped and brought
into a liniment, are souveraigne. If there be any spill or shiuer of arrowes, if any piece of a dart or
whatsoever els stick within the flesh, which would bee gotten forth, split a liue mouse in the
middest, and lay the same hot to the place, you shall see how it will draw the same out. But a Li-
zard passeth all the rest, being in this wise slit along and diuided: or if the head onely be stam-
ped with salt, and applied accordingly. There be certain shel-snailles that creep in troups toge-
ther for to deuour the yong spring and green leaues of plants, which serue to this effect, if they
be punned with their shels and laid to the place. Those also that we vse to dresse and eat, if they
be taken forth of their shels: but if you put thereto the rennet of a yong hare or leueret, it is won-
derfull to see how effectuall they will worke. Snakes bones incorporat with the rennet of any
four-footed beast whatsoever, within lesse than 3 daies shew the same effect, and draw forth a-
ny thing that sticketh within the body. Finally, the flies called Cantharides are much commen-
ded for this operation, if they be stamped and incorporat with barley meale.

CHAP. XIII.

¶ Proper remedies for the cure of womens maladies: and to help them for to goo
out their full time, and bring forth the fruit of their womb fully
ripe and accomplished.

THE skin or secundine which an Ewe gleaneth after she hath yeaned, and which inlapped
the lambe within her belly, prepared, ordered, and vfed (as I said before) as touching goats,
it is very good for the infirmities that properly bee incident vnto women and occasioned
by their naturall parts. The dung likewise of sheep, be they rammes, ewes, or weathers, hath the
same operation. But to come vnto particulars, the infirmity which otherwhiles putteth them to
D passe their vrine with difficulty and by dropmeale, is cured principally by sitting ouer a perfume
or suffumigation of Locusts. If a woman after that she is conceiued with child, vse est-soons to
eat a dish of meat made of cock-stones, the infant that she goeth with shall proue a man child,
as it is commonly thought and spoken. When a woman is with childe, she meanes to preferue
her from any shift and slip that she may carry out her full terme, is to drink the ashes of Porke-
pines calcined: also the drinking of a birches milk maketh the infant within the womb to come
on forward & to grow to perfection, before it seek to come forth vntimely: also, if the child stick
in the birth, or otherwise make no haste to come forth of the mothers body when the time is
come: the skin wherein the bitch bare her whelps within her body, and which commeth away
from her after she hath pupped, hasteneth the birth, if so be it were taken away from her before
E it touch the ground.

If women in labour drinke milke, it will comfort their loins or smal of the back, Mice dung
delaied and dissolued in rain water, is very good to annoint the breasts of a woman, new laied, to
break their kernel, and to allay their ouermuch strutting presently after childbirth. The ashes of
hedgehogs preferueth women from abortion or vntimely births, if they be annointed with a li-
niment made of them and oile incorporat together. The better speed and more ease shall those
women haue of deliuerance, which in the time of their trauell drinke a draught of Goose dung
in two cyaths of water: or else the water that issueth out of their owne body by the natural parts
a little before the child should be borne, and that out of a weazils bladder. A liniment made of
earth-wormes, if the nouch or chine of the necke and the shoulder blades be annointed there-
F with, preferueth a woman from the pain of the sinews, which commonly followeth vpon child-
bearing: and the same send away the after-birth, if when they bee * newly brought to bed, they
drink the same in wine cuit. A cataplasme made of them simply alone without any other thing,
and applied to womens sore breasts which are impostumat, bring the same to maturacion, breake
them when they are ripe, draw them after that they runne, and in the end heale them vp cleane
and

* Grauidis,
et parturientis
perperis

and skin all again. The said earthwormes also if they be drunk in honied wine, bring down milk into their breasts. There be certain little wormes found breeding in the common Coich-grasse, called Gramen, which if a woman weare about her neck, serue very effectually, to cause her for to keep her infant within the wombe the ordinary terme: but she must leaue them off when she drawes neere to the time when she should cry out: for otherwise, if they be not taken from her, they would hinder her deliuerance. Great heed also there must be taken, that these wormes bee not laid vpon the ground in any hand. Moreouer, there be Physitians who giue women to drink 5 or 7 of them at a time, for to help them to conceiue. If women vse to eat snailes dressed as meat, they shall be deliuered with more speed, if they were in hard labour: let them be applied to the region of the matrice or naturall parts with Saffron, they hasten conception. If the same be reduced into a liniment with Amylum and gum Tragacanth, and laid too accordingly, they do stay the immoderat flux of reds or whites. Being eaten in meat, they are soueraigne for their monthly purgations. And with the marrow of a red Deere they reduce the matrice againe into the right place, if it were turned a to-side: but this regard must be had, that to every snail there be put a dram weight of Cyperus also. If the matrice be giuen to ventosities, let the same snails be taken forth of their shells, stamped and laid too with oile of Roses, they discusse the windnesse thereof. And for these purposes before named, the snailes of Aftypalæa be chosen for the best. Also for to resolu the inflation of this part, there is another medicine made with snailes, especially those of Barbarie, namely, to take two of them and to stampe them with as much Fenigreeke seed as may be comprehended with three fingers, adding thereto the quantity of four spoonfuls of hony, and when they be reduced all into a liniment, to apply the same to the region of the womb, after the same hath been well and thoroughly annointed all ouer with the iuice of Ireos, *i. Floure-de-lis*. There be moreouer, certaine white snailes that be small and long with all, and these be commonly wandering here and there in euery place. These beeing dried in the Sun vpon tiles, and reduced into powder, they vse to blend with bean floure, of each a like quantity. And this is thought to be an excellent mixture for to beautifie their body, and make the skin white and smooth. Also, if the itch be offensiue, so as a woman be found euer and anon to scratch and rub those parts, there is not a better thing therfore than the little flat snails, if they be brought into a liniment with fried Barly groats. If a woman with child chance to step ouer a Viper, shee shall be deliuered before her time of an vnperfect birth. The like accident will befall vnto her, in case she go ouer the serpent Amphisbæna, if the same were dead before. And yet if a woman haue about her in a box one of them aliuie, shee shall not need to feare the going ouer them, though they were dead. And one of these Amphisbænes dead as it is, and preserued or condite in salt, procureth safe and easie deliuerance to a woman that hath it about her. A wonderfull thing, that it should be so dangerous for a woman with childe to passe ouer one of them which hath not bin kept in salt: and that the same should be harmelesse and do no hurt at all, if immediatly after it hath bin so kept, shee stepped ouer it. A perfume madewith a snake long kept and dried, procureth the desired sicknesse of women. The old slough of a snake, which shee hath cast, applied vnto the loines of a woman that is in labour, helpeth her to better speed: but it must be remoued presently after that shee is deliuered. Many vse to giue it vnto women with child for to be drunk in wine with frankincense: for being taken otherwise it causeth abortion. The rod or wand whereby one hath parted or taken off a frog or toad from a snake, helpeth women that be in trauell of childbirth. And a liniment made with the ashes of the vnwinged Locusts called Tryxalides & hony tempered together, helpeth forward their monthly purgations. The spider likewise that commeth downe spinning from aloft, hanging by her fine thred which she draweth in a length, if she be caught with the hollow of the hand, bruised & applied accordingly, worketh the same effect: but take the same spider winding vp her yeanne, and returning back to her nest vpward, it wil worke contrariwise, & stay the fleurs of women. The Ægie stone called A tires, because it is found in an Ægles nest, preserueth & holdeth the infant still in the mothers womb to the full time, against any indiret practise of sorcery or otherwise, to the contrary. If a woman be in hard labor of childbirth, put a Vultures quill vnder her feet, it will helpe her to a more speedy deliuerance. Great bellied women, as it is well knowne & found by prooffe, ought to be very chary and to beware of rauens eggs, for if they chance to goe ouer one of them, they shall fall to labour presently, and slip an vntimely birth with great danger of their life. It seemeth to many, that the meuting of an Hawke drunke in honied wine, maketh women which were

A were barren before, to be fruitfull. Certes, the greafe of a goose or swan doth mollifie any hard tumors, schirrh, and impostumations of the matrice and secret parts. Goose greafe mixt with the oile of roses and * Ireos, * preserueth womens breasts after they be newly brought to bed. In Phrygia and Lycaonia it is found by experience, that the fat of the Bistard or Horn-owle is very good for greene women lately deliuered, if they be troubled with the pricking or shooting paines of their breasts: but for women that are in danger to be suffocated with the rising of the mother, they haue a liniment also made with the beetils or worms called Blattæ. The ashes of Partridge eggs calcined, mixed with brasse ore called Cadmia, and wax, and so reduced into a cerot, preserueth womens breasts plump and round, that they shall not be riuelled or flaggie: and it is thought, that if a woman make three imaginary circles round about them with a partridge egg, they shall continue knit vp and well trussed, and not hang downward if sauoredly: let a woman vse to sup them off, shee shall be both a fruitfull mother of many children, and also a good milch nurse for to reare them vp. Also it is a generall receiued opinion, that if womens paps be annointed all ouer with goose greafe, it will allay the griefe and paine thereof: likewise there is not a better thing for to dissolue and scatter Moon-calues and such like false conceptions in the wombe: or to mitigate the scurfe or manginess incident to that member, than to apply to those parts a liniment made of punaises bruised or stamped to the purpose.

Bats blood hath a depilatorie facultie to fetch off haire, and lett the growing thereof; howbeit sufficient it is not alone to worke that feat in boies cheeks and chins whom we would keep smooth and beardless, except the place be rubbed afterward with the seed of rocket or hemlock: and in this manner if they be dressed, either no haire at all will come vp there, or els it will neuer be but soft downe: it is thought that their brains also wil worke the same effect. Now these brains be of two sorts, to wit, red and white: howbeit some giue counsell to mingle with the said till her flesh be thoroughly sodden, and as tender as may be, hauing before rid her from all her bones; and it they vse for a depilatorie: but first they plucke vp all those haire by the roots which they would not haue to grow any more. The gall of an vrchin is a depilatorie, especially if it be mixed with the brains of a Bat, and goats milke. Item, the ashes thereof simply, mingled with the milk of a bitch of her first litter; so that the haire which we would not haue to come againe be plucked vp; or if those places be annointed therewith where neuer yet grew any, none shall spring there afterwards. The same effect (by report) hath the blood of a tick that was taken from a dog: and finally, the blood or gall of a swallow.

CHAP. XV.

¶ Many Receipts handled together disorderly one with another for sundry maladies.

It is said, that Ants eggs stamped & incorporat with flies likewise punned together, wil giue a louely black colour to the hairs of the eie-browes: also if a woman be desirous that her infant should be born with black eies, let her eat a rat while shee goes with childe. To preserue the haire from being gray and grise, annoint them with the ashes of earth-worms and oile oliue mixt together. If sucking babes be wrang or gnawne in the belly, by reason of some cruddled milk which they draw from their nurses, or doth corrupt so in their stomach, it is good to giue them in water the rennet of a yong lambe to drink: but in case this accident commeth by cauling of the milk, they vse to giue vnto them the said rennet in vinegar for to discusse the same. For the paine that they abide in toothing, the brains of an * hare is soueraigne to annoint their gums withall. It falleth out that yong infants many times be tormented with an vnaturall heat and burning of their head, called Sirialis; for to ease and cure them thereof, they vse to take the bones that are found in dogs dung, and to hang them about their necks or arms. Yong infants are subiect to ruptures and descents of the guts, in which case it is good (some say) to apply a greene lizard vnto their bodies whiles they lie asleepe, and to cause it to bite the place: but then afterward the said lizard must be tied fast to a reed and hung vp in the smoke: for look how it decaieeth and dieth by little and little, so shall the rupture knit and heale again. The foamie moisture that shell-snails yeeld, if childrens eies be annointed therewith, doth not only redifie and lay streight the hairs of the eie-lids which grow crooked into the eies, but also nourisheth & causeth them to grow. The ashes of burnt shell-snails reduced into a liniment with

* Irino, as followeth in the next chapter: not arano, as it is in most prints.
* From swelling, hardness, or the ague, as women call it.

* Leporis or percoris, (i. e.) of a Sheepe

kincense and the white of an egg, doth in the space of 30 daies cure those that are bursten belled. In the little horns of shell-snails there is found a certaine hard substance resembling grit or sand, which if it be hanged about a young infant, is a means that it shall breed teeth with ease. The ashes of snail shells when the snails are gon, incorporat in wax, and applied to the feat of the fundament, putteth backe the end of the tiwill that is fallen down and ready to hang out of the body: but you must not forget to mingle with the said ashes the bloody substance that is let out of a vipers brains when her head is pricked. The braines of a viper if they be put in a little fine skin, & worn by a yong child, helpeth it to breed teeth without any great pain: for the same purpose serue also the teeth of serpents, so they be chosen the biggest that are in their heads: rauens dung wrapped in wool and hung to any part of yong infants, cureth the chin-cough.

Some things there remain as touching this argument, which hardly methinks I should not handle seriously & deliuer in good earnest: howbeit since there be diuers writers who haue put them down in writing, I must not passe them ouer in silence. They are of opinion and doe giue order, to cure the rupture and descent of the guts in little children, with a lizard: but how? first it ought to be of the male kind which is taken for this purpose; and that may soone be knowne, if vnder the taile it haue one hole and no more: then there must be vsed all means possible that the said lizard do bite the tumor of the rupture through a piece of cloth of gold, cloth of siluer, or purple: which done, the said lizard must be tied fast within a new cup or goblet that neuer was occupied, & so set in some smoky place where it may die. If little infants pisse their beds, a ready way to make them containe their water, is to giue them foddren mice to eat. If there be any suspection of forcerie, witchcraft, or enchantment practised for to hurt young babes, the great horns of beetles, such specially as be knagged as it were with smal teeth, are as good as a countercharm and preseruatiue, if they be hanged about their necks. There is (as they say) a little stone within the head of an ox or cow, which they vse to discharge and spit out when they be in danger of death; the same if it be taken out of one of their heads which is suddenly stricken off before the beast bewate therof, & hanged about an infants necke or other part of the body, is wonderful good for breeding of teeth. Semblably they prescribe their brains to be caried about them in like maner, & for the same purpose: also the little bone or stone found in a naked snails back. Moreover, the anointing of childrens gumbs with the brains of a yong sheepe, is singular good and effectual to cause them to breed their teeth with facilitie: like as goose grease instilled with the iuice of basil into their ears, cureth the infirmities therof. There be in many prickly herbs certain rough & hairy worms, which if they be hung about the necks of yong infants, do presently cure them, if haply there were any thing in their meat that sticke and lay hard in their stomack, for they wil cause them to puke it vp. To prouoke sleep there is not a better thing than the tried grease of vnwashed wool, with some myrrh, be it neuer so little infused & dissolved in two cyaths of wine, or els incorporat with goose grease and wine of myrtles: for which intent they vse to take the bird called a Cuckow, and within a hares skin tie it to the patient; or els to bind the bil of a yong heron to the forehead, within a piece of an asse skin: and they are of opinion, that the same bill alone is as effectual, so it be well washed in wine: contrariwise, the head of a bat dried and hanged about the neck, keeps one from sleep altogether. A lizard drowned to death in the vrin of a man, disableth him from the vse of venery, who * drank the liquour whereof that vrine came: and no maruel, for why? the magitians repose a great thing in a lizard in loue matters. The excrements of snails which resemble dung, as also the dung of pigeons, tempered in a cup of wine and giuen to drink, coole fleshly lust. The right lobe or side of a vultures lungs prouoke men to Venus sports, if they cary it about them enwrapped within a cranes skin. In like maner the yelks of five pigeons eggs incorporat with swines grease to the weight of one denier Roman, and so supped off, work the same effect. Some eat sparrowes vsually for this purpose, or sup their eggs. Also there be who carry about them the right stone of a cock, inclosed fast within a piece of leather made of a rams skin, and to good effect, if all be true that magitians say: who affirm also, that those women who are anointed with a liniment made of the ashes of the bird Ibis, incorporat with goose grease and the oile Ireos, shal if they be conceiued with M child go out their full time: and they say, that whosoever be anointed with a liniment made of the stones of a fighting cocke and goose-grease, shall haue but little mind to performe the act of generation: or if the same be tied vnto any part of them within a piece of leather made of a rams skinn. In like manner, it is said that the stones of any other dunghill cock are of the same effect,

* Biberit, some
reide fecerit,
i. who made
the said water.

A effect, if together with the blood of the said cock, they be but laid vnder ones bed. If one pluck the haire out of a naules taile while the stallion couereth her, and bind the same together in a wreath or knot, & apply them to the legs or loins during the act of generation, they will cause (women) to conceiue whether they will or no. Whosoever maketh water vpon the very place shal find himselfe thereby more vnlustie to the worke of Venus. A wonderfull thing it is (if it be true) which they report likewise of the ashes of a star-lizard or Stellion; that if the same be enshitt the same into the right hand, it wil coole one as much. Moreover, that if one put vnder the pillow where a woman laies her head, a few flockes, or Locke of wooll soked well in batts blood, it wil set her on to desire the company of a man; or if she do take a goose tongue either in meat or drink. The old skin or slough that snakes do cast off in the Spring, whosoever drinketh in his ordinary drink, it will kil all the vermin or lice of the body within three daies: so doth the whey of milke after the cheefe is gathered, if one drinke the same with a little salt. If the braines of a weazill be put into the rendles or rennet that goeth to the making of cheefe, they say that the cheefe so made, shal neither corrupt all summer long, nor be eaten by the mouse. The ashes of the same weazill giuen to chickens or young pigeons among the past that is made for to feed them, secureth them from the weazill. Furthermore, it is said, that if a batt be tied vnto a horse or mare or such labouring beasts that are pained in their staling, they shal soon haue an end of that grieue and impediment: if they haue the wringing of the guts, or be troubled with the bots, there will ensue ease of their paine, presently vpon the making three turns or compasses round about their shap and naturall parts with a stockdoue. But see a maruellous matter! the doue being let go, dieth forthwith; and the beast immediatly is deliuered from paine. Moreover, if you would know a remedy against drunkenesse, marke this experiment; Giue for three daies together to great drunkards the eggs of an owle continually in their wine, they will take a loathing same before he sit downe to drinking, shal not be overtaken or drunken, how freely soeuer he powreth downe the wine. The ashes of swallowes bills incorporat with myrrhe, will secure any man from drunkenesse, and cause him to beare his drinke well, in case the wine that he drinketh be spiced therewith: And *Horus* king of the Assyrians, deuised first this receipt against drunkenesse.

Quer and besides all this, there by many other singular properties behind, worthy to be noted, which are attributed vnto sundrie beasts, and doe properly pertaine to this present treatise handled in this booke: for these magitians tel vs of a certain bird in Sardinia called Gromphæna, like vnto a crane, but I beleue verily that the Sardinians at this day know not what bird it is. Within the said Island and prouince, there is a beast called *Ophion, which in haire only resembleth a stag, but in no place els doth it breed: and the very same authors haue told vs of another by the name of Sirulugus, but they set not downe in writing either the description what manner of beast it shoulde be, nor the place where it should breed. I doubt not verily but such fortune there were, considering that they haue shewed diuers medicines that they do affoord. And *M. Cicero* writeth of a beast named Byturos, which gnaweth the vines in Campania.

CHAP. XVI.

¶ Strange wonders reported of certaine beasts.

Here remains yet certain wonderfull things to be spoken of, depending vpon those brute creatures, of which I haue treated already: namely, that whosoever haue about them the secondine of a bitch, that is to say, the skin wherein her whelps lay within her belly, or hold in their hands either the hair or dung of an hare, no dogs will bark at them whereuer they come. Also that there be a kind of gnats called Muliões, which liue not about a day. Moreover, as many as haue about them the bill of a woodspecke when they come to take honey out of the hie, shall not be stung by Bees: againe, let a man giue to swine among their meat, or in a morcell of past or bread, the brains of a rauē, they will follow him whither soeuer he goes. Furthermore, that if one be strewed with the dust wherein a mule hath wallowed & tumbled her self, he shal bewel cooled in loue, how amorous soeuer he were before. Quer & besides, take a rat & cut

out his stones, and so let him go againe, he will make all other rats to run away. Make a mash or drench of a snakes skin, salt, red wheat called Far, with some wild running thyme, stamped all together, in one and the same day; put all into wine and conuey the same into the throat of a cow or ox, about the time that grapes begin to ripen vpon the vine, the said beasts will stand to health for a whole yeare after: or giue them young swailowes, and cause them to let the same downe their body in some past or bread at three seuerall times. Gather the dust together out of the place where you see a snake hath gone and made a tract, fling the same vpon a swarme of bees, they shall returne againe to their hieue. Tie vp the right stone or cullion of a ram, he shall get none but ram-lambs. And looke whosoever haue about the strings or sinewes taken from the wings and legs of a crane, they shall not be tired and faint in any labour that they take. If you would haue mules not to winse and fling out with their heels, giue them wine to drinke. Last of all, I cannot overpasse one notable and memorable example as touching the house of a mule: when *Antipater* should send the venomous water of the fountaine *Styx* for to poyson king *Alexander* the great, he could meet with no matter that would hold this poyson, without piercing and running through it, but onely the house of a mule: and to the knowledge hereof hee came, by the direction of *Aristotle* the Philosopher, who deuised a cup to be made thereof. A foule staine and blot of *Aristotles* name, for being priuie to such vilanie, and setting it forward as he did. Thus much of Land-creatures: it remaineth now to returne againe to those of the Waters, and their vertues in Physicke.

THE XXXI. BOOKE OF THE HISTORIE OF NATVRE, WRITTEN BY C. PLINIVS SECVNDVS.

The Proem.

CHAP. I.

¶ The medicinable vertues of creatures liuing in water. The admirable nature of waters.

Now followeth the discourse of Water-beasts, and how beneficiall they be vnto vs in regard of Physicke: wherein verily dame Nature (the mother and workemistress of all things) sheweth how little idle shee is, not ceasing euen there also by her continuall operations to make knowne her wonderful power, among the waues and surging billowes, amid the reciprocal tides of the sea, ebbing and flowing in their alternative turnes; yea and in the swift course and streames of great riuers. And verily, to say a truth and speak as it is, there is no part of the World wherein the might and majestic of Nature more appeareth, than in the waters: for this one Element seemeth to rule and command all the rest. Waters deuoure and swallow vp the earth: waters quench and kill the flames of fire: they mount vp aloft into the aire, and seeme to challenge a seignorie and dominion in the heauens also; whiles by a thick feeling and floore as it were of clouds, caused by the dim vapours arising from them, that vitall spirit which giueth life vnto all things, is debarred,

stopped.

of Plinies Naturall Historie.

A stopped and choaked. And what might the reason els be of thunder and lightnings flashing and breaking forth in that violence, and causing such trouble and broils, as if the world were at war within it selfe? And can there bee any thing more wonderfull and miraculous, than to see the waters congealed aboue in the aire, and so to continue pendant in the skie? And yet as if they were not contented to haue risen thus to that exceeding height, they catch and snatch vp with them into the vpper region of the aire, a world of little fishes: otherwhiles also they take vp stones, and charge themselues with that ponderous & weighty matter which is more proper to another Element. The same waters falling downe againe in raine, are the very cause of all those the wonderfull nature thereof, and namely, how the corne groweth vpon the ground, how trees and plants doe liue, prosper, and fructifie by the means of waters, which first ascending vp into the skie, are furnished from thence with a liuely breath, and bestowing the same vpon the herbs, cause them to spring and multiply; we cannot chuse but confesse, that for all the strength and vertue which the Earth also hath, shee is beholden to the Waters, and hath received all from them. In which regard, aboue all things, and before I enter into my intended discourse of Fishes and beasts liuing in this Element, I meane first to set down in generality the maruellous power and properties of water it selfe, and to illustrate the same by way of sundry examples: for the particular discourse of all sorts of waters, what man liuing is able to performe?

CHAP. II.

¶ The diuersitie of waters: their vertues and operations medicinable: and other singularities obserued therein.

THere is in maner no region nor coast of the earth, but you shall see in one quarter or other waters gently rising and springing out of the ground here and there, yeelding fountains in one place cold, in another hot; yea and otherwhils there may be discouered one with another neere adioyning: as for example, about * *Tarbella* a towne in Guienne, and the Pyrenean hills, there do boile vp hot and cold springs, so close one vnto the other, that hardly any distance can be perceiued between. Moreover, sources there be, which yeeld waters neither cold nor hot but luke-warme, and the same very wholesome and proper for the cure of many diseases; as if Nature had set them apart for the good of man only, and no other liuing creature beside. To these fountains so medicinable, there is ascribed some diuine power, in so much as they giue name vnto sundry gods and goddeses, and seeme to augment their number by that means: yea & otherwhiles great towns & cities carrie their names: like as *Puteoli* in Campanie; *Statyella* in Liguria; *Aqua Sextia* in the prouince of Narbon or Piemont: but in no countrey of the world is there found greater plenty of these springs, and the same endued with more medicinable properties, than in the tract or vale *Baianus* within the realm of Naples, where you shall haue some hold of brimstone, others of alum; some standing vpon a veine of salt, others of nitre, some resembling the nature of Bitumen, and others againe of a mixt qualitie, partly soure, and partly salt. Furthermore, you shall meet with some of them, which naturally serue as a stoupe or hotte house; for the very steeme and vapour only which ariseth from them, is wholesome and profitable for our bodies: and those are so exceeding hot, that they heat the baines, yea and are able to make the cold water to seeth & boile again which is in their bathing tubs: as namely, the fountaine *Possidiana* within the foresaid territory *Bajanus*, which name it tooke of one *Possidius* a so hot, that they are able to seeth an egg or any other viands or cates for the table. As for the *Licinian* springs, which beare the name of *Licinius Crassus*, a man may perceiue them to boile and reeke againe, euen out of the very sea. See how good Nature is to vs, who amid the waues and billows of the sea, hath afforded healthfull waters! But now to discipher their vertues in Physicke according to their seuerall kinds: thus much in generality is obserued in these baths, That they serue for the infirmities of the sinewes, for gout of the feet, & sciatica. Some more properly are good for dislocations of ioints, and fractures of bones: others haue a property to loosen the bellie & to purge: and as there be of them which heale wounds and vlcers, so there are againe that more particularly be respeciuely to the accidents of the head and ears: and among the rest, those which beare the name of *Ciceronian*, and be called *Ciceronian*, be soveraign for the eyes. Now these

is a memorable manour or faire house of plaifance, situat vpon the sea side in the very high way G which leadeth from the lake Auernus to the cittie Puteoli; much renowned for the groue or wood about it, as also for the stately galleries, porches, allies, and walking places adioyning therunto, which set out and beautifie the said place very much: this goodly house, *M. Cicero* called Academia, in regard of some resemblance it had vnto a colledge of that name in Athens, from whence he tooke the modell and patterne: where he compiled those books of his which carrie the name of the place, and be called * *Academicæ questiones*: and there he caused his monument or sepulchre to be made, for the perpetuities of his memoriall, as who would say, he had not sufficiently immortalized his name throughout the world, by those noble works which he wrote and commended vnto posteritie. Well, soone after the decease of *Cicero*, this house and Forrest both fell into the hands and tenure of * *Antistius Vetus*; at what time, in the very forefront as it were H and entrie thereof, there were discovered certaine hot fountaines breaking and springing out of the ground, and those passing medicinable and whole some for the eies. Of these waters, *Laurea Tullius* (an enfranchised vassall of *Cicero*) made certaine verses, and those carying with them such a grace of maiestie, that at the first sight a man may easily perceiue how affectionat and deuout he was to the seruice of his lord and master: and for that the said Epigram is worthy to be read not onely there, but also in euery place, I will set it downe here as it standeth ouer those baines to be seene, in this Decasticon.

*Quo tua, Romane vindex clarissime lingue,
Sylua loco melius surgere iussa virer,
Atque Academia celebratam nomine villam.
Nunc reparat cultui sub potiore Vetis
Hic etiam apparent lymphæ non ante repertæ,
Lanquidæ quæ infuso lumina rore leuant.
Nimirum locus ipse sui Ciceronis honori
Hoc dedit, hæc fontes cum patefecit ope,
Vt quoniam totum legitur sine fine per orbem,
Sint plures, oculis quæ medeamur, aquæ.*

O prince of Romane Eloquence, loe here thy Groue in place How Greene it is, where planted first it was to grow apace: And *Vetus* now, who holds thy house, Faire Academic high, Spares for no cost, but it mainteins and keeps in better plight. Of late also, fresh fountaines here brake forth out of the ground, Most whole some for to bath sore eies, which earst were neuer found. These helpfull springs, the Soile no doubt, presenting to our view, To *Cicero* her ancient lord, hath done this honour due; That since his books throughout the world are read by many a wight, More waters still may cleare their eyes, and cure decaying sight.

In the same tract of Campaine, and namely toward Sinuessæ, there be other fountaines called L Sinuessan waters: which haue the name not only to cure men of lunacie and madnes, but also to make barrain women fruitfull and apt to conceiue. In the Island Enaria there is a spring which helpeth those that be troubled with the stone and grauell: like as another water which they call Acidula, within 4 miles of Teanum in the Sidicins country, and the same is a ctually cold: also there is another of that kind about Stabij, called by the name of Dimidia: like as in the territory of Venafrum, that which proceeded from the source Acidulus, and gaue name to the foresaid water Acidula. The same effect they find who drink of the lake Velinus, for it breakes the stone. Moreover, *M. Varro* maketh mention of such another fountain in Syria at the foot of the mountaine Taurus. So doth *Callimachus* report the foresaid operation of the riuer Gallus in Phrygia: howbeit they that take of this water must keep a measure, for otherwise it distraits their vnder- M standing, & driues them besides their right wits: which accident hapneth to those (saith *Ctesias*) who drink of the red fountain (for so it is called) in Æthiopia: as touching the waters neer Rome called Albulæ, they are known to heale wounds: these waters are neither hot nor cold: but those which go vnder the name of Cutiliæ in the Sabins country, are exceeding cold, & by a certain mor-
dication

A mordication that they haue, seem to suck out the humors & superfluous excrements of the body, being otherwise most agreeable for the stomacke, sinewes, and generally for all parts. There is a fountain at Thespiæ, a city in Bœotia, which doth great pleasure to women that would faine haue children; for no sooner drinke they of the water, but they are ready to conceiue: and of this propriety is the riuer Elatus in Arcadia. In which region also the Spring Linus yeeldeth water, which if a woman with child do drink, she shall go out her full time & not be in danger to slip an vnperfect birth. Contrariwise, the riuer Aphrodisium in Pyrrhæa, causeth barrennesse. The mention of one *Titius*, a man of good worth and sometime lord Prætor, who was so bewraied B & painted all ouer his face with spots of Morpheus, that he looked like an image made of spotted marble. Cydnus, a riuer of Cilicia, hath a vertue to cure the gout; as appeareth by a letter written from *Cassius* the Parmezan vnto *M. Antonius*. Contrariwise, the waters about Trœzen are so bad, that all the inhabitants are thereby subject to the gout and other diseases of the feet. There is a citie in * Gaule named Tungri, much renowned for a noble * fountaine, which runneth at many pipes: a smacke it hath resembling the rust of yron, howbeit this tast is not perceiued but at the end & loose only: This water is purgatiue, driues away tertian agues, expels the stone and cureth the Symptomes attending thereupon. Set this water ouer the fire or neare to it, you shall see it thick and troubled, but at the last, it looketh red. Between Putcoli and Naples, there be certain wels called Leucogæi, the water wherof cureth the infirmities of the eies, and healeth I hath ranged the moores or fens of Reate, for that the water issuing from them, hath naturally a propriety from all others, to harden the houses of horses feet. *Endemus* reporteth, That in the territory of Hestîæa, a citie in Thessalie, there be two springs, the one named Ceron, of which, as many sheepe as drinke, proue black: the other Melas, the water wherof, maketh black sheepe turn white: let them drinke of both waters mingled together, they will proue flecked and of diues colours. *Theophrastus* writeth, That the riuer Crathis in the Thurius country, causeth both kine and sheepe as many as drinke thereof, to looke white: whereas the water of Sybaris giueth them a black hew. And by his saying, this difference in operation is seene also vpon the people that vse to drink of them: for as many as take to the riuer Sybaris, become blacker, harder, and withall of a more curled hair than others: contrariwise, the drinking of Crathis causeth them to look white D to be more soft skinned, & their bush of haire to grow at length. Semblably in Macedony they that would haue any cattell to grow white, bring them to drinke at Aliacmon the riuer: but as many as desire they should be brown or black, driue them to water at Axios. The same *Theophrastus* hath left in writing, That in some places there is no other thing bred or growing but brown and dusky, in so much as not only the cattell is all of that lere, but also the corne on the ground, & other fruits of the earth; as among the Messapians. Also, at Lusæ, a city of Arcadia, there is a certain wel, wherein there keep ordinarily land-mice. As for the riuer Aleos, which passes through Erythræ, it makes them to grow hairie all their bodies ouer as many as drinke thereof. In Bœotia likewise, neare to the temple of the god *Trophonius* & hard by the riuer Orchomenas, there be two fountaines; the one helps memory, the other causeth obliuion, wherupon they * took their names. E In Cilicia, hard at the town Crescum, there runs a riuer called * Nus: & by the saying of *M. Varro*, whosoever drinke thereof, shall find their wits more quicke, and themselves of better conceit than before. But in the Isle * Chios there is a spring, which causeth as many as vse the water to be dull and heauie of spirit. At Zamæ in Affrick, the water of a certain fountain, makes a cleare & shrill voice. Let a man drinke of the lake Clitorius, he shall take a misliking and loathing of wine, saith *M. Varro*. And yet *Endoxus* & *Theopompus* report, That the water of the fountaines be- fore said make them drunk that vse it. *Mutianus* affirmes, That out of the fountain vnder the temple of father *Bacchus*, within the Isle Andros, at certaine times of the yere for 7 daies together, there runneth nothing but wine, in so much as they call it the wine of god *Bacchus*: howbeit, remove the said water out of the prospect and view (as it were) of the said temple, the tast wil turne to be waterish again. *Polyclitus* writeth of a certaine fountaine of Cilicia neere vnto the citie Soli, which yeeldeth an vnction or oleus water, that serueth in stead of oile. *Theophrastus* reports the same of another fountain in Æthiopia, which hath the like quality. And *Lycus* saith, That among the Indians there is a fountaine, the water wherof is vsed in lampes to maintaine light. And the like is reported of an other water about Bebat in [the capitall citie of Media,] *Theopompus*

* Like as *Tusculane questiones*, which he made in *Tusculano*, a ferme or house that he had in *Tusculum*.
* A noble man of Rome, Consull with *D. Lælius* *Calpurnius*, anno ab urbe condita 747.

* Otherwise called *Aniger*: but this name itooke of *Alphion*, which signifieth a kind of white morpheus. He meaneth the Low-countries, called sometime Belgica Gallia. * Called now the parish of Spaw.

* For the former is called *præcis*, or *præcis*, the latter *præcis*, wit and vnderstanding. In Chio,

Theopompus writeth, That neere to Scotusa [in Macedonie] there is a lake, the water wherof is so-
ueraign for the healing of wounds. Morcouer, king *Inba* hath left in writing, That in the Troglodites country there is a lake, for the hurtful water that it beareth, called the Mad lake, which thrice a day becommeth bitter and salt: and as many times for, it turneth to be fresh and sweet: which course it keeps also in the night season, breeding otherwise white serpents twenty cubits long, of which it is crawling full. The same Prince (mine author) reports, That in Arabia there is a spring boiling out of the ground with such a force, that it scorneth and checketh any thing that is throwne into it, and cannot be kept downe with any weight whatsoeuer. *Theophrastus* maketh mention of the fountain Marfyas in Phrygia, neere vnto the town Celæna, which casteth vp great stones. And not farre from it be two other springs *Clæon and Gelon, so called by the Greeks for the contrary effects which they worke. At Cizicum there is a fountain of *Cupid*, and whosoever drinke of the water thereof, shall lay aside and forget all affection of loue, as *Mutinus* doth both report and beleue. At Cranon there is a hot spring, and yet not so boyling as many others be: the water thereof, if it be put into a bottle or flaggon of wine, will maintain the heat thereof for three daies together, that it shall drinke hot. In Germany beyond the riuier Rhene, there be waters so hot, that whosoever drinketh thereof, shall sensibly find the heat in his body 3 daies after: The springs that yeeld this water be called Mattiaci. This peculiar property besides hath this water, that about the edges and brims thereof there engender pumish stones. Now if any man suppose some of these strange reports to be incredible, let him learne & know, that in no part of the world Nature hath shewed more admirable works than in this element of Water. And albeit in the beginning of this mine historie I haue written in ample manner of many a wonder obserued in the waters, yet somewhat remaineth still to be related. For *Ctesias* saith, That the Indians haue a lake or poole, wherein nothing will swim, but all sinks to the bottom. And *Calius* also our countryman auoucheth, That the leaues which fall into the lake Avernus will settle downward and not flote aboue. And *Varro* auoucheth moreover, That what birds soeuer flie ouer it, or approach the aire and breath thereof, they will die presently. Contrariwise, in Apulcidamus a lake of Affrick, nothing goes down, but all swims aloft. The like doth *Appian* report of Phinthia, a fountain in Sicilie: as also of a lake in Media, and namely the pit or well of *Saturne*. The fontaine Limyra is wont ordinarily to change his seat, and to passe into places adioyning, but neuer for nought, prefaging alwaies thereby some strange accident to ensue. And wonderfull it is, that the fishes therein should follow and do the like. Now when this water is thus removed, the inhabitants of the country, desirous to know the issue of things to come, repaire thither as to an Oracle, and seek to be resolu'd by the foresaid fishes, and therewith offer to them some meat: if they come vnto it and swim away with all, it is a good token, & this they take for an affirmatiue answer, as if they said, Yea, to their demands: but in case they refuse the meat and flit it away with their tailes, they collect the contrary, and this is their flat nay. There is a riuier in Bithynia called Olachas, running close to Briazus (which is the name both of a temple, and also of the god therein honoured) the water wherof will discouer and detect a perjured person: for if he that drinketh thereof, feele (as it were) a burning fire within his body, take him for a false forsworne villaine. Furthermore, in Cantabria or Biscay the fountains of the riuier Tamaricus, are endued with a secret vertue to presage and foretell future euents: and three heads or sources there be of them, eight foot distant one from another: they meet all at length in one channell, and maintaine the great and mighty riuier Tamaricus. Howbeit, twelue times euery day, yea and otherwhiles twenty times they are dry, and haue no shew at all or appearance of water, notwithstanding there be another fountain or well neere to them, that yeeldeth plenty of water, and neuer giueth ouer running. And this is held for an ominous and fearefull presage, if when folke are desirous to see them, they seeme not to run at all: as it was seene of late daies by *Lartius Licinius*, sometime lord Pretour and afterwards Lieutenant Generall vnder the Consuls. For within a feuen night after, a great misfortune happened vnto him. In Iurie there is a riuier which euery Sabbath day is dry. Thus much of waters medicinable and miraculous, and yet not simply hurtfull. Contrariwise, there be others of as wonderfull a nature, but dangerous to they are and deadly withall.

Ctesias writeth, That there is a fontaine in Armenia, breeding and bringing forth black fishes: wherupon, as many as feed, are sure to die for it immediatly. I haue heard the like reported of such dangerous fishes about the head of the riuier Danubius, vntill a man come to a fountain

* Non tu ridet,
i. flata, & pater,
i. Rife. For the
one causeth
weeping, the
other inuouch
to laughter.

A taine which presently dischargeth it selfe into the channell of the said riuier; for beneath that place such fishes go not, nor enter lower into the riuier. And hereupon the fontaine is by the generall voice of people taken to be the very source and head of Danubius aforesaid. The selfe same accident as touching fish, is reported by a poole in Lydia, called the poole of the nymphs. In Arcadia neere vnto the riuier Pheneus, there floweth a water out the rockes called Styx, which is present death to as many as drink thereof, as heretofore I haue shewed: And *Theophrastus* saith moreover, that in this water there be certaine small fishes (a thing that a man shall neuer see in any other venomous fountains) and those likewise are as deadly as the water. *Theopompus* writeth, That in Thracia there be waters about the place called Chropfos, which kill those that drinke thereof. And *Lycus* maketh report of another fontaine in the Leontines countrey, wherof as many as drink die within three daies. *Varro* hath left in writing, That neere to the hill Soraete there is a fontaine foure foot large, which at the rising of the Sunne ouerfloweth like boyling water: but the birds that haue tasted of the water die presently, and are there to be seene lying dead. For this secret mischiefe there is besides in many of these waters, that they are faire and cleare to see to, and thereby seeme to allure both man and beast to drinke thereof, for their ownebane and destruction: as we may see by Nonacris in Arcadia; for surely this fontaine giueth no suspicion at all, wherby we should mistrust a venomous quality, and yet some are of opinion, That the hurt which commeth thereby, proceedeth from excessive cold; and they ground their reason vpon this, That the water issuing out of it into riuers and rills, will congeale and grow to a stony substance. It fareth otherwise about the vale of Tempe in Thessalie, where the water of a certaine fontaine is fearfull to see to, and there is no man but abhorreth the sight thereof, besides the corrosiue quality that (by folks saying) it hath, to fret and eat into brass and yron: the best is, that (as I haue shewed before) it runneth not farre, and the course that it holdes is but short. But wonderfull it is, that a certaine wild Carob should enuiron this source round about with his roots, and the same continually beare purple flours, as it is reported to do. Also, in the very brinke and edge of this fontaine there is another herbe of a kind by it selfe, which abideth fresh and Greene from one end of the yeare to another. In Macedonie, not far from the tombe of *Euripides* the Poet, there be two riuers run together, the one yeelds water most wholesome for to be drunke: the other is as noisome and deadly. Neere to Perperena, a towne in Troas, there is a spring the water wherof giueth a stonie coat or crust to all the earth that it either ouerfloteth or runneth by: of which nature are the hot waters issuing out of a fontaine neare Delium in Eubœa; for look what way soeuer the riuier runs, you shal see the stones to grow still in height. About Eurymena, which is in Thessalie, there is a well, cast into it any chaplets or guirlands of floures, they will turne to stones. There runneth a riuier by Colossi, a city in Phrygia, into which if you throw bricke or tiles that be raw and vnbacked, you shall take them forth againe as hard as stones. Within the mines of the Isle Scyros there is a riuier, which conuerteth into stone all the trees that it runneth by or toucheth, as well the boughs as the bodies. In the famous and renowned caues called Corycia, all the drops of water that distill from the rocke, turne to be as hard as stones: and no maruell, for at Meza in Macedonie, a man shall see the drops of water become stone, as they hang to the very vaults of the rocke, much like to yfickles from the caues of houses in Winter time: whereas at Corycum abouenamed, the said drops turne into stone when they are fallen downe, and not before. In certain caues they are to be seene conuerted into stones both waies, and some of them are so big, as they serue to make columnes and pilastres of, and those otherwhiles of diuers colours to the eye: as may be seene in the great caue of Phausia, which is within the Chersonese of the Rhodians. Thus much may suffice by way of examples, to shew the varietie of waters, with their sundry vertues and operations.

CHAP. III.

¶ The qualitie that is in waters. How a man may know which be good and wholesome from such as be naught and unwholesome.

Much question there is & controuersie among physicians, What kind of water is best? and yet with one generall consent they condemne, and that iustly, all dead and standing waters; supposing those that run to be better: for it standeth with good reason, that the very agitation and beating vpon the banks as they beare streame in their current, maketh them more subtil, and

subtile, pure, and cleare, and by that meanes they get their goodnesse. Which considered, I G
maruaile very much at those who make most account of the * water gathered and kept in ce-
sternes: But they ground their opinion vpon this reason, because raine water is of all others
lightest, as consisting of that substance which was able to rise and mount vp aloft, and there to
hang about in the aire. Which is the cause also, that they preferre Snow water before that
which commeth downe in shoures: and the water of yce dissolued, before the other of melted
Snow; as if the water were by yce driuen together and reduced to the vtmost point of finenesse.
They collect hereby, that these waters, to wit, raine, snow, and yce, be all of them lighter than
those that spring out of the earth: and yce among the rest farre lighter than any water, in pro-
portion. But this opinion of theirs is to bee reputed as erroneous, and for the common good
and profit of mankind to be refuted: For first and formost, that leuitie whereof they spake, can
hardly and vneath bee found and knowne by any other meanes than by the fence and feeling
of the stomacke: for if you goe to the weighing of waters, you shall perceiue little or no differ-
ence at all in their poise. Neither is it a sufficient argument to prouoe raine water to be light,
because it ascendeth on high into the aire, for wee may see stones likewise drawne vp into the
clouds: and besides, as the raine falleth downe againe, it cannot chuse but be infected with the
grosse vapours of the earth. Whereby it commeth to passe, that wee find raine water ordina-
rily to bee most charged and corrupted with ordure and filthinesse: and by reason thereof it
heateth most quickly and corrupteth soonest. As for snow and yce, that they should bee
thought to bee composed of the subtile parts of this Element, and yeeld the finest water,
I wonder much, considering the neare affinitie which is betweene them and haile, which might
induce vs also to thinke the same of it: but all men confesse and hold, that the same is most
pestilent and pernicious for to bee drunke. Moreouer, there are amongst them not a few, who
contrary vnto the opinion of other Physicians their fellowes, affirme flatly and confidently
the water of snow and yce to bee the vnwholesome drinke that is, for that all the puritie and
finenesse thereof hath bene drawne and sucked out. And in very truth, wee find it by ex-
perience, that any liquor whatsoever doth diminish and consume greatly by beeing fro-
zen and congealed into an yce. Wee see besides, That ouer-grosse and foggie dewes breed
a kinde of scurfe or scab in plants: white frosts burne and sedge them: and both of these, the
hore frost as well as the dew, proceed from the same causes in a manner that snowes doe.
Certes, all Philosphers agree in this one point, That raine water puttifieth soonest of any
other, and least while continueth good in a ship, as saylers know full well. Howbeit, *Epige-
nes* auoucheth and affirmeth, That the water which hath bene seuen times puttified and as
often purified againe, is subiect no more vnto putrifaction. And as for cesterne waters, the
Physicians also themselves confesse, That they breed obstructions and schirrhosities in the
bellie, yea, and otherwise be hurtfull to the throat. As also, that there is not any kinde of wa-
ter whatsoever, which gathereth more mud or engendreth more filthie and illfaoured ver-
mine than it doth. Neither followeth it by and by, that all great riuer waters indifferently are
the best: no more than those of any brooke, or the most part of ponds and pooles are to
bee counted and esteemed most wholesome. But of these kinds of water wee must conclude
and resolute with making distinction, namely, That there be of euery sort thereof those which
are singular and very conuenient, howbeit, more in one place than in another. The kings and
princes of Persia bee serued with no other water for their drinke but from the two riuers, Cho-
aspes and Euleus onely: And looke how farre soeuer they make their progresse or voyage
from them two riuers, yet the water thereof they carry with them. And what might the rea-
son be therefore? Certes, it is not because they be riuers which yeeld this water, that they like
the drinke so well: for neither out of the two famous riuers, Tygris and Euphrates, nor yet
out of many other faire and commodious running streames doe they drinke. Moreouer,
when you see or perceiue any riuer to gather abundance of mud and filth, wote well, that ordi-
narily the water thereof is not good nor wholesome: and yet if the same riuer or running streame
bee giuen to breed great store of yeeles, the water is counted thereby wholesome and good
enough. And as this is a token of the goodnesse, so the wormes called * Tineæ, engendered
about the head or spring of any riuer, is as great a signe of coldnesse. Bitter waters of all o-
thers bee most condemned: like as those also which soone follow the spade in digging, and
by reason that they lie so ebbe, quickly fill the pit. And such be the waters commonly about
Troezen.

* Which some
take for Sows.

A Troezen. As for the nitrous, brackish, and * salt waters found among the deserts, such as trauell
through those parts toward the red sea, haue a deuise to make them sweet and potable within
two houres, by putting parched barley meale into them; and as they drinke the water, so when
they haue done they feed vpon the said barley grots, as a good and wholesome gruel. Those spring
waters are principally condemned, which gather much mud and settle grosse in the bottome:
those also which cause them to haue an ill colour who vse to drinke thereof. It skilleth also very
much to mark if a water staine any vessels with a kinde of Greene rust; if it be long before pulle
vp, and lastly, if it furthor vessels with a thicke rust wherein it vseth to be boiled: for all these
be signes of bad water.ouer and besides, it is a fault in water, not only to stink, but also to haue
any smack or tast at all, yea though the same be pleasant and sweet enough, and inclining much
C to the rellice of milk, as many times it doth in diuers places. In one word, would you know a
good and wholesome water indeed? Chuse that which in all points resembleth the aire as neere
as is possible. At Cabura in Mesopotamia there is a fountaine of water which hath a sweet and
redolent smel: setting it aside, I know not any one of that qualitie in the whole world againe:
but hereto there belongs a tale, namely that this spring was priuiledged with this extraordinary
gift, because queen *Luno* (forsooth) sometimes bathed and washed her selfe therein: for other-
wise, good and wholesome water ought to haue neither tast nor odor at all. Some there be who
iudge of their wholesomnesse by their ballance, and they keep a weighing and poising of waters
one against another: but for all their curiositie they misse of their purpose in the end; for sel-
dom or neuer can they find one water lighter than another. Yet this deuise is better and more
certain, namely, to take two waters that be of equal measure and weight: for looke whether of
them heateth and cooleth sooner, the same is alwaies the better. And for to make a trial herof,
lade vp some seething water in a pale or such like vessel, & set the same down vpon the ground
out of your hand, to ease your arm of holding it hanging long in the aire, and if it be good wa-
ter, they say it will immediatly of scalding hot become warm and no more. Well, what waters
then, according to their sundry kindes in generalitie, shall we take by all likelihood to be best?
If we go by the inhabitants of cities and great towns, surely, wel-water or pit water (I see) is sim-
ply the wholesomest. But then such wells or pits must be much frequented, that by the continual
agitation and often drawing thereof, the water may be more purified, and the terren substance
D passe away the better by that means. And thus much may suffice for the goodnesse of water re-
spectiue to the health of mans body.
But if we haue regard to the coldnesse of water, necessarie it is that the Wel should stand in
some coole and shadowie place not exposed to the Sun, and nathelss open to the broad aire,
that it may haue the full view and sight (as it were) of the sky. And about all this, one thing
would be obserued and seen vnto, that the source which feedeth it spring and boile vp directly
from the bottom, and not issue out of the sides: which also is a main point that concerns the per-
petuitie thereof, and whereby we may collect that it will hold stil, and be neuer drawn dry. And
this is to be vnderstood of water cold in the owne nature. For to make it seem actually cold to
the hand, is a thing that may be done by art, if either it be forced to mount aloft, or fall from on
E high, by which motion and reuerberation it gathers store of aire. And verily the experiment
herof is seene in swimming; for let a man hold his winde in, he shall feele the water colder by
that means. Nero the Emperor deuised to boile water, & when it was taken from the fire to put
it into a glasse bottle, and so to set it in the snow a cooling: and verily the water became thereby
exceeding cold to please and content his tast, and yet did not participate the grossenesse of the
snow, nor draw any euill qualitie out of it. Certes, all men are of one opinion, that any water
which hath been once sodden, is far better than that which is still raw. Like as, that after it hath
been made hot, it will become much colder than it was before, which I assure you came first
from a most subtil and witty inuention. And therefore if we must needs occupy naughty water,
the only remedy that we haue to alter the badnesse thereof, is to seeth it wel until the one halfe
F be consumed. Now if a man desire to know the vertue and commoditie of cold water: first, it or-
dinarily stancheth any flux of blood, if it be cast vpon the place. Also if one be not able to en-
dure the heate in a bain or hot-houfe, the best way to auoid this inconuenience, is to hold in his
mouth cold Water all the while. Moreouer, many a man hath found by a verie familiar expe-
rience,

* *Salsus*, al-
though some

rience, that the coldest water in the mouth is not alwaies the coldest in the hand. And contrari- G
wise, when it is exceeding cold without to be felt, it is not so sensibly cold within to be drunk.

Of all Waters in the world, that which wee call here in Rome Martia, carrieth the greatest name by the generall voice of the whole City, in regard both of coldnesse and wholesomnesse. And verily we may esteeme this water for one of the greatest gifts that the gods haue bestowed vpon our city. In times past it was called Aufseia, and the very fountaine from whence it cometh, Piconia. The head or source thereof ariseth at the foot of the vtmost mountains of the Pelignians: it runneth through the Marsians country, and passing through the lake Fucinus, it tendeth no doubt euen then directly toward Rome; but anon it is swallowed vp within a hole vnder the ground, so as it is no more seen vntill it shew it selfe again in the territorie of the Tiburtines; from which place it is conueyed vnder vaults, and so carried through to Rome by arch-work for the space of nine miles. The first that began to bring this water to the city, was Ancus * Martius one of the Roman Kings. Afterwards Qu. * Martius Rex, in his Pretorship finished the said worke: and when in proceffe of time it was fallen to decay, M. Agrippa repaired it againe: who also brought the water named Virgo to the city, which hath her head eight miles from Rome, in a certaine noue or by-corner about two miles turning from the great port way leading to Præneste. Neere vnto it runneth the riuer Herculaneus: but this water keepeth stil behinde, as though it fled from it, whereupon it tooke the name Virgo. Compare these two riuers together which are conueyed to Rome, you shall see the difference before said as touching the coldnesse of waters; for looke how cold Virgo is to the hand, so much is Martia in the mouth. But long ago haue wee of Rome lost the pleasure and commoditie of these two Rills, I through the ambition and auarice of some great men, who haue turned away these waters from the City, where they yielded a publike benefit to the Commonwealth; and deriued them for their priuat delight and profit, into their owne mannors and houses in the country, for to water their gerdens, and serue to other vses.

And here in this place I thinke it not impertinent to adioine to this present treatise, the manner and skill of searching and finding out waters. And first to speake in general terms: springs ordinarily be found in Vallies, in the pitch or crest of some little hill where it hath a fall and descent, or else at the foot of great mountaines. Many are of opinion, That in any tract whatsoever, that side or coast which regardeth the North is giuen to haue water in it. And verily it were not amisse to shew how Nature disporteth her selfe and worketh variably in this behalfe. First, a man shall neuer see it raine on the South side of the mountaines in Hyrcania, which is the reason, that on that part onely which lieth to the North they are giuen to beare wood, and be full of forrests. But Olympus, Ossa, Parnassus, Apenninus, and the Alpes, be replenished with Woods on all sides, and are furnished with their Springs and Riuers euerie where. In some countries the hills be Greene, and watered on the South side onely. As for example in Candy, the mountaines called * Albi: so that there is no heed to be taken by this, for the rule holdeth not alwaies. But to come now vnto particulars: Looke where you see growing Rushes, Reeds, or the * Herbe whereof I made relation before, be sure you shall find water vnderneath. Item, Wherefoeuer you finde Froggs lying in any place vpon their breasts, make account of good store of water there. As for the wilde and wandering Sallow, the Aller tree, L Agnus-Castus, or Yvie, they come vp many times of their owne accords, in some low grounds where there is a settling or stay of raine water fallen from higher places: inso much as they that goe by these signes to finde some Spring may soone be deceived. A surer aime yet by farre, is a mist or exhalation, which a man may discouer a farre off a little before the Sunne rising. And for to espie it the better, some there be who get vp into an high place, and lay themselves grouel long with their chinnes touching the ground; and by that meanes discerneth where any such smoke or vapor doth arise. There is also another speciall means besides to find out Waters, but knowne it is vnto those onely who be skilfull and expert in this feat. For they that are guided by this direction to Water, goe forth in the hottest season of the yeare, and about the noone-tide of the day to marke the reuerberation of the Sunne beames in any place: for if this repercussion and rebounding appeare moist, and namely when the face of the earth looketh dry and thirstie, they then make nodoubt but to finde Water there. But they had need to looke so intently and earnestly, that oftentimes their eyes ake and

lib. 26.

A and be pained withall. For auoiding which trouble and inconuenience, some betake themselves to other experiments, and namely, they dig a trench or ditch five foot deep within the ground; the mouth whereof they couer all ouer with earthen vessels of potters worke vnbacked, or els with a barbars brazen bason well enuiled; and withall a lamp burning: ouer all which, they make a little arch-work of leaues and boughs, and mould thereupon. Now if they come within a while after to this place, and either see the earthen pots broken or wet, or perceiue a dew or sweat standing vpon the brasse, or finde the lamp aforesaid gon out, and yet no want of oile to maintain themselves they shall find water if they sink the pit deeper. Some there be, who for better assurance hereof make a fire in the place, and burne it thoroughly, for then the vessels aforesaid if they proue to be wet, giue a more infallible hope of a spring. Moreover, the very leire it selfe of the soile, if it be spotted with white specks, or be altogether of a reddish bright colour, promising spring water to be vnderneath; for if the ground look black, lightly the water wil soon fail if there be any spring there found. If you chance to light vpon a vein of potters clay or chalk, make account you shall meet with no spring there, sink as deep as you will: and therefore work-change of euery coat (as I may so say) of the earth as they dig, to wit from the black delfe, vntil they meet by degrees with the veins aforesaid. Furthermore it is to be noted, that the water which is found in clay grounds is alwaies sweet and potable: like as that which a stony and gritty soile doth yeeld, is commonly colder than any other: and such a kinde of ground also is allowable for the prooue of good waters, for it ingendreth sweet and wholesome water, light also of digestion, and pure withal, by reason that as it passeth by a soft grit as it were, through a strainer, all the grossnesse thereof it leaueth behind sticking thereto. As for * thicke sand & gr- gather mud. Ground giuen to beare * pibbles or the grosser sort of grauell, giue vs no security that the springs therein wil hold all the yeare long, howbeit the water is very good & pleasant. The hard and compact grauell called the male grauel, and the land which seemeth full of black and burnt carbuncle stones, bringeth forth wholesome waters, and the sources be sure and perdurable. But red stones yeeld the best simply, and those that we may be sure will neuer giue out stone, or vpon flint, wee may boldly reckon of wholesome and euermore lasting springs; and this gift they haue beside, to be passing cold. Moreover, in digging and sinking pits marke this for an assured and infallible signe that you approach vnto water; namely, if the earth appeare and shew moist more and more, still as you go lower and lower: also if the spade enter more willingly, and goe downe with ease and facilitie. When pionsers haue wrought deepe vnder the ground, and then chance to meet with a veine of brimstone or alume, the dampe will stop their breath, and kill them presently, if they take not the better heed: and therefore to foresee and preuent this danger, they vse to let downe into the pit a candle or lampe burning; for if it goe out, they may be sure it hath met with the dampe. Therefore if pits be subiect to the rising of such vapours, cunning and expert workemen make on either side of such pits, both on the right hand and the left, certaine out-casts, tunnels, or venting holes, to receiue those hurtfull and dangerous vapours, whereby they may evaporate and breathe forth another way. Otherwhiles it falls out, that the aire which they meet with in digging very low, doth offend the pionsers, albeit there be no brimstone nor alume neere: but the ready meanes to amend the same and auoid the danger, is to make winde and fresh aire with continuall agitation of some linnen cloathes. Now when the pit is sunke and digged as far as to the water, the bottome must be layd, and the lowest sides of the wall reared of stone simply without any mortar made of [lime and] sand, for feare lest the veins of the source be stopped. Some waters there are, which in the verie prime and beginning of the spring are of this nature, That they grow to be exceeding cold, namely such as haue their source or spring lying but ebb; for they are maintained only of winter rain: Others againe begin to be cold at the rising of the Dog-starre. And verily we may see the experience both of the one and the other about Pella the capitall city of Macedonie: for the water of the meere or marish there before the towne in the beginning of Summer is cold; and afterward when the weather is at the hottest, the spring water in the higher parts of the Citie is so extreame cold that it is readie to bee frozen. The semblable happeneth in Chios, where

* In Topos.

there

there is the same reason of the hauen and towne it selfe. At Athens, the great and famous fountain named Enneacrunos, in a rainy or stormy summer is colder than the pit water or well in *the* *piters* garden, within that city; and yet the said Well water if it be a dry season, will stand with an ice at Midsummer.

CHAP. IV.

¶ The reason of certaine Waters that appeare and be hid againe suddenly.

BVt about all others, the waters of pits or wells be ordinarily most cold about the * retreat or Occultation of Arcturus, yea and many times they faile in the mids of summer, and all of them in maner grow very low for the space of toure daies, at the time of the setting of the foresaid star. Many there be which haue little or no water in them all winter long, and namely about the hil Olympus, where it is spring first ere the waters return and find the way into their pits. And verily in Sicilia, about the cities Messana and Mylae, during winter the springs are altogether dry; but in summer time they run ouer the brinks of their Wells and pits, maintaining pretty riuers. At Apollonia a city in Pontus there is a fen neere the sea side, which in Summer only ouerfloweth, and especially about the rising of the great Dog-star, many if the summer be colder than ordinarie, it is not so free and plentifull of water. Some Springs haue this qualitie with them, to be drier for shoures and raine water: as for example, in the territorie of Narnia, a city in the duchy of Spoletto, which *M. Cicero* hath not forgot to insert among other admirable things, in his treatise of Wonders: for of this territorie hee writeth in these termes, That in a drought it was durty, and in rainy weather dusty. Moreover this is to be noted, That all waters are ordinarily more sweet in winter than in summer, but in autumn least of all, and in a dry season lesse than at other times. Neither are the riuer waters most times of like taste, by reason of the great difference that is in their chanel; for commonly the water is such as the earth & soil through which it passeth, and doth participat the qualitie and tast of those herbs always which it passeth and runneth by. No manuell therefore if the water of one and the selfe-same riuer be found in one place more vnwholsome and dangerous than in another. It falls out many times, that the brooks and rills which enter into great riuers, do alter their water in the very taste (as we may see by experience in the famous riuer Borysthenes) inso much as such great riuers be overcome with the influence of such riuerets, and either their owne taste is delaied by them, or clean drowned and lost. And some riuers there be which change by occasion of rain: the prooffe whereof was thrice seen in Bosphorus, when by reason of the fall of some fast shoures, the floods that ouerflowed the fields destroyed all the corne vpon the ground. The like also fell as often in Egypt; for the rain that fel caused all the washes arising from the riuer Nilus, which watered the grounds, to be bitter, whereupon ensued a great plague and pestilence to the whole region. It chanceth many times, that presently vpon the cutting and stocking vp of Woods, there arise and spring certaine fountaines which beforetime appeared not, but were spent in the nourishment of the tree roots; as it fell out in the mountain Hæmus, when as *Cassander* held the * Gallogreeks besieged; for when the woods thereupon were cut down to make a palaisad for a rampier, presently there issued forth springs of water in their place. Moreover, it hath bin oft times known, that by occasion of spoiling some hills of the wood growing therupon, the springs haue met altogether in one streame, and done much hurt in sudden ouerflowing the vaile beneath; whereas the trees before-time had wont to drink vp, digest, and consume all the moisture & wet that fell and fed the said waters. And verily it auaieth much for the maintenance of water, to castre with the plough, and to till a ground; thereby to break vp and loose the vppermost callositie and hide (as it were) of the earth, that kept it clunged and bound. Certes it is recorded for a truth, that vpon the raising and destroying of Arcadia (a towne so called in Creet) wherby the place was dispeopled, all the fountaines waxed dry, and the riuers in that tract (which were the inhabitants fell to earing and ploughing any grounds within their territorie, the foresaid fountaines appeared again, and the riuers returned to their former course.

A

CHAP. V.

¶ Divers historிக்கal obseruations touching this point.

Moreouer, Earthquakes, as they discouer sometimes new springs and sources of water, so otherwhiles they swallow them vp that they are no more seene like as it hapned (as it is well knowne) 5 times about the riuer Pheneus in Arcadia. And in manner abovesayd, there issued forth a riuer out of the mountaine Corycus, so soone as the peasants of the country began to break it vp for tillage. But to return again to the change and alteration of waters: wonderfull they must needs be (no doubt) when there is no euident cause thereof to be knowne: as namely in Magnesia, where all the hot waters of the baines suddenly became cold, without any other change besides of the tast: also in Caria, where standeth the temple of *Neptune*, the riuer which was knowne before to be fresh and potable, all on a sudden turned into salt water.ouer and besides, is not this a strange miracle, that the fountain Arethusa in Syracuse, should haue a sent or smell of dung, during the solemne games and exercises at Olympia? But there is some probable reason to be rendred hereof, Because the riuer Alpheus passeth from Olympus vnder the very bottom of the sea into that Island [of Sicily] where Syracuse standeth, and so cometh to the foresaid fountain. The Rhodians haue a fountain within their * Cherstone, which euery ninth yere purgeth it self & sends out an infinit deale of ordure and filthines. And as the tast & smell of waters do alter, so their colours also do change: as for example, there is a lake in the country of Babylon, which euery summer for the space of 11 daies, looketh red: and Borysthenes also in the summer time, runneth with a blewish colour like * violers, or the sky; and yet a most pure and subtile water it is of all other: which is the reason, that it swims aloft and floteth naturally vpon Hypanis the riuer. In which two riuers, there is another maruell reported, That all the while a Southern wind bloweth, the riuer Hypanis is discerned aboue it. But there is one argument more besides, that proueth the water of Borysthenes to be passing light & thin, for that there arise no mists out of it, may it is not perceived to yeeld any exhalation or breath at all from it. To conclude, they that would seem to be curious and skillfull in these matters, do obserue and affirme, That generally all waters grow to be heavier after that mid-winter is once past.

D

CHAP. VI.

¶ The maner of water-conduits. How and when those waters which naturally are medicinable, ought to be used. Also for what diseases it is good to saile and take the aire of the Sea. The vertues and properties of se waters as touching Physicks.

IF a man would convey water from any head of a spring, the best way is to vse pipes of earth made by porters art; and the same ought to be 3 fingers thick, and one jointed within another, so as the end of the vpper pipes enter into the nether, as a tenon into a mortaise, or as a box into the lid; the same ought to be vnited and laid euen, with quicklime quenched and dissolued in oile. The least leuell for to carry and command water vp hill from the receit, is one hundred foot; but if it be conveyed but by one canal and no more, it may be forced to mount the space of two Actus, i. 240 foot. As touching the pipes by means whereof the water is to rise aloft, they ought to be of lead. Furthermore, this is to be obserued, That the water ascend alwaies of it self at the deliuerie, to the heigh of the head from whence it gaue receit: if it bee festened a long way, the worke must rise and fall often in the carriage thereof, that the leuell may bee maintained still. As for the pipes, ten foot long apiece they would bee, if you do well. Now if the said pipes of lead be but * five fingers in compass, ordinarily they should weigh sixty pound: * if they be of eight fingers size, they must carry the weight of one hundred pound; but in case they bear a round of * 10 fingers, their poise would be at the least 120 pound; and so the rest more or lesse according to this proportion. Those pipes be called properly in Latine Denarie, the web or sheet whereof beareth ten fingers in breadth, before it be turned in and brought to the compass of a pipe: like as Quinariæ, when the same is halfe so broad. Moreover, this is to be obserued, That in euery turning and twining of an hill, the pipe ought of necessity to be five fingers round and no more, for to repress and breake the violence of the water in the current. Likewise the vaulted heads which receiue and contain water from all the sources meeting together, must

be of that capacity, as need requireth.

And since I am false into the treatise and discourse of fountains, I wonder much at *Homer*, that he hath made no mention at all of hot springs, and yet otherwise throughout his whole poem, hee bringeth in oftentimes those who bathed and washed in hot baines. But it may verie well be, that the reason thereof is, because in those times there was not that use of them in physick as at this present: for now adays, if folk be amiss or ill at ease, straightwaies they run to the baines and bath for remedy. And in truth, those waters which stand vpon brimstone, be good for the sinews: such as come from a veine of slume, are proper for the palseie, or such like infirmities proceeding from resolution of the nerues. Moreouer, they that hold of bitumen or nitre (such as be the fountains. *Curilita*) be potable and good to be drunke, and yet they are purgatiue.

To come to the vse of natural baines and hot waters: many men in a brauery sit long in a bath, and they take a pride in it, to endure the heat of the water many hours together; and yet is there nothing so hurtfull for the body: for in truth, a man should continue little longer in them than in ordinary artificial baines or stoups; and then afterwards when he goeth forth, hee is to wash his body with fresh cold water, not without some oile among. Howbeit, our common people here, thinke this to be very strange, & will not be brought to it: which is the reason, that mens bodies in no place are most subject to diseases: for the strong vapours that steme from thence, stuffe and fill their heads; and although they sweat in one part, yet they chile in another, notwithstanding the rest of their bodies stand deep within the water. Others there are besides, who on the like erroneous conceit, take great joy in drinking a deal of this water, struing avice who can poure most of it downe the throat. I haue my selfe seen some of them so puffed vp and swolne with drinking, that their very skin couered and hid the rings vpon their fingers; namely, when they were not able to deliuer againe the great quantity of water that they had taken in. Therefore this drinking of much water is not good to be used, vnles a man do effoonly eat * salt withall. Great vse there is and to good purpose, of the mud which these fountains do yeeld; but with this regard, that when the body is besmeared and bedawbed outwardly therewith, the same may dry vpon it in the Sun.

* For to irritate and prouoke the expulsive faculty to send all forth againe.

Well, these hot waters be commonly full of vertue; howbeit, this is not generall, That if a spring be hot, by and by we should thinke it is medicinable, for the experience of the contrary is to be seen in *Egesta* of Sicily, in *Larissa*, *Troas*, *Magnesia*, *Melos*, and *Lipara*. Neither is it a sure argument of a medicinable water (as many are of opinion) if a piece of silver or brasse which hath bin dipped therein, lose the colour: for there is no such matter to be seene by the naturall baths of *Padua*; neither is there perceived in them any difference in smell from others.

Concerning Sea waters, the same order and mean is to be obserued, especially in such as be made hot, for to help the pains and infirmities of the sinews: and many hold them good to souder fractures of bones, yea and to cure their bruises and contusions: likewise they haue a desiccative vertue, whereby they dry rheumaticke bodies, in which regard, men bath also in sea water actually cold. Moreouer, the sea affoordeth other vses in diuers and sundry respects, but principally the aire thereof is wholesome for those who are in a phthisicke or consumption (as I haue before said), and cureth such as doe reach or void blood vpward: and verily, I remember of late daies, that *Annaeus Gallio* after that he was Confull, tooke this course; namely, to saile vpon the sea for this infirmity. What is the cause thinke ye, that many make voiajes into *Egypt*? surely it is not for the aire of *Egypt* it self, but because they lie long at sea, and be sailing a great while before they come thither. Furthermore, the vomits also which are occasioned at sea by the continual rolling and rocking of the ships neuer standing still, are good for many maladies of head, eies, and breast, and generally they doe cure all those accidents, for which the drinking of *Elleboro* serueth. As for sea water to be applied simply of it selfe vnto the outward parts, physitians are of opinion, that it is more effectual than any other, for to discusse & resolu tumors: & more particularly, if there be a cataplasme made of it and barley meale sodden together, it is singular for the swellings behind the eares, called *Parotides*. They mingle the same likewise in plasters, such especially as be white and emollientes: and if the head be hurt, and the * brain touched and offended, it is soveraigne to be infused into the wound. It is prescribed also to be drunke: for albeit the stomack take some offence and hurt thereby, yet it purgeth the body well, and doth evacuate melancholick humors and black choler, yea, and if the blood be cluttered within the body, it sendeth it out oneway or other, either vpward or downeward. Some haue ordained it to be

A be giuen for the quartan feuer; others aduise to saue and keep it a time, for to serue the turne in case of Tinesmes, which are vnordinat strainings at the stoole to no effect: also for all goutts and pains of joints: and in very truth, by age & long keeping, it forgoeth al that brackish tast, which it had at the first. Some boile it before: but all in generall agree in this, To vse for these purposes mixture of fresh water with it; and before their patients do drinke it, enioyne them to vomit: and then also do they mingle with it, either vineger or wine for that purpose. They that giue little oxymell, for to prouoke the patient to vomit againe. Moreouer, they vse otherwhile to minister a clystere made of sea water, first warmed: & verily there is not a better thing than it for to bath and foment the cods withall, if they be swelled either with ventosities or waterish humors. Alrat: and in like manner they kill the itch, cure scabs, tetterts, and ringwormes. Seawater serueth wel to wash the head, & to rid it of nits and filthy lice: yea, and reduceth black and blew marks in the skin, to the fresh and liuely colour againe. In all these cures, after the vse of salt-water, it is passing good to foment the place affected, with vineger hot.ouer and besides, it is thought to be very wholesome and good against the venomous stings of serpents; and namely, of the spiders *Phalangia* and scorpions. Semblably, it cureth those that be infected outwardly with the noythermore, a perfume made with sea-water and vineger, is singular for the head-ach. If it be clysterized hot, it allaieth the wrings and grindings of the belly; yea, and stateth the violent motions of cholericke humors working vpward and downward. Those that be once chaufed and set into an heat with sea water, shall not so easily feeble cold againe. When womens paps are ouer-grown, and so exceeding great that they meet and kisse one another, there is not a better thing to take them downe, than to bath in a tub of sea-water: the same also may serue to amend the griefe of the bowels and precordiall parts, yea, and to restore those that be exceeding leane and worn away. The fumes and vapors of this water boiling together with vineger, are soveraign for those that be hard of hearing, or troubled with the head-ach. Sea water hath this especiall property, that of all things it scoureth away rust of yron soonest. The scab that annoieth sheepe, it healeth, and maketh their wooll more soft and delicat. But what meane I to say thus much of sea water, knowing as I do full well, that for those who dwell far vp into the maine, and inhabit the inland parts, all this may seem needlesse, and superfluous? And yet there hath bin means deuised to make artificiall sea-water, wherewith euery man may serue his own turn when he will. In which inuention, one wonderfull thing is to be seen; namely, if a man put more than one sextar of salt to foure of water, the nature of the water will be so soone overcome, that salt shall not dissolve nor melt therein: but if you mingle one sextar of salt just with foure sextars of water, you shall haue a brine as strong as the saltiest water that is in the sea: but to haue a kind & most mild brine, it is thought sufficient to temper the foresaid measure of water with 8 cyaths of salt: and this water thus proportioned, is very proper for to heat the sinewes, without any fretting of the skin at all. There is a certain compound sea water kept in manner of a Syrrupe, which they call *Thalassomeli*, made of Sea-water, hony, and raine water, of each a like quantiry. Now the foresaid sea-water they ferch for this purpose out of the very deep, and this composition they put vp in earthen vessels well pitched or varnished, and reserue it for their vse. An excellent purgatiue this is; for besides that it clenseth the stomacke without any hurt or offence thereof, the tast and smell both are very pleasant and delectable. As touching the mead called *Hydromell*, it consisteth in times past of rain water well purified, and hony: a drink ordained and allowed onely to sick and feeble persons when they called for wine, as being thought lesse hurtfull to be drunke: howbeit, rejected it hath bin these many yeares, and condemned: for by experience it was found at length, to haue the * same discommodities that wine, but farre short it was of the good and wholesome qualities of wine.

Moreouer, soasmuch as sea-faring men and saylers be many times at a fault for fresh water, and thereby much distressed, I thinke it good to shew the means how to be provided for the supply of this defect. First and foremost therefore, if they spread and display abroad certaine fleeces of wooll round about a ship, the same will receiue and drinke in the vapours of the Sea, and become moist and wet withall; presse or wring them well, you shall haue water fresh enough.

* Namely, aduise to the head & sinews

Item, let downe into the sea within small nets, certain pellets of wax that be hollow, or any other void and empty vessels wel closed & luted, they will gather within them water that is fresh and potable: for we may see the experience hereof vpon the land: take sea-water & let it run through cley, it will become sweet and fresh.

But to proceed vnto the other medicinable properties of water: let there be any dislocation in man or beast, by the swimming in water (it matters not of what kind it be) the bones wil very quickly and with great ease be reduced into joint againe.

It falleth out many times that traouellers be in feare and danger of some sicknesse, by change of waters, and such especially as they know not the nature and quality of. To prevent this inconuenience, they drink the water cold which they doubt and suspect, so soone as euer they be come out of the baine; for then they shall find it presently.

As touching the mosse which is found in the water, foueraigne it is for the gout, in case it be applied outwardly: mix oile thereto, and reduce it into the forme of a cataplasme or liniment, it caseth the paine, and taketh down the swelling of the feet about the ankles. The some & froth that floteth about the water, causeth warts to flie off, if they be well rubbed therewith.

The very sand likewise vpon the sea shore, especially that which is small and fine, & the same burnt as it were with the heat of the Sun, is a foueraigne remedy to dry vp the watery humors in a droppe, if the body be couered al ouer therewith; and to that purpose it serueth also for rheums and catarrhs. Thus much may suffice concerning water it self: it remaineth now to treat of such things as the water yeeldeth. In which discourse, begin I wil (as my order and manner hath bin in all the rest) with those matters which be chiefe and principall, and namely, salt and spunges.

CHAP. VII.

¶ *The sundry kinds of salt: the making thereof: the vertues medicinable of salt: and diuers other considerations respectiue thereto.*

SALT is either artificiall or naturall: and both the one and the other is to be considered in many and diuers sorts, which may be reduced all into 2 causes: for salt commeth either of an humor congealed, or els dried. In the gulfe or lake of Tarentum, the salt is made of the sea water dried by the heat of the summer Sun, for then you shall see the whole poole converted into a masse of salt: and verily the water there, is otherwise very low & ebbe, and not about knee high. The like is to be seen in Sicily within a lake called Cocanicus; as also in another neare to Gelas: but in these, the brims & sides only about the banks, wax dry and turn into salt, like as in the salt-pits about Phrygia and Cappadocia. But at Alpenchum, there is more plenty of salt gathered within the poole there, for you shall haue the same turn into salt, euen the one halfe to the very mids. In which lake, there is one strange and wonderful thing besides, for look how much salt a man taketh out of it in the day, so much ordinarily will gather againe by night. All the salt of this sort is small, and not growne together in lumps. Now there is another kinde of salt, which of the owne accord commeth of sea-water, and it is no more but the some or froth which is left behind sticking to the edges of the banks, or to rocks. Both the one & the other become thick and hard in manner and form of a candied dew: howbeit, that which is found in the rocks, is more quicke and biting than the other. There is besides of salt naturall, a third distinct sort from the former: for in the Baetrians country there be two great and huge lakes, which naturally do cast vp a mighty quantity of salt: the one lieth toward the Scythians, and the other bendeth to the Ariens country: like as neere to Citium, a city in the Isle Cyprus, and about Memphis in Egypt, they draw forth salt out of lakes, and afterwards dry the same in the sun. Moreover, there be certain riuers which beare salt, and the same congealed aloft in their vpper part, in manner of yce, and yet the water runneth vnderneath and keepeth the course wel enough. As for example, about the sluices and straits of the mount Caspius; and thereupon they be called the Riuers of salt: as also in other riuers of Armenia, and about the Mardians country. Moreover, Oxus and Orthus, two riuers passing through the region Baetria, carry ordinarily downe with them in their streame, great peeces and fragments of salt, which fall from the mountaines adjoining vnto them. There are besides in Barbary, other lakes, and those verily thicke and troubled, which ingender and beare salt. But what will you say, if there be certaine Fountaines of hote Waters which breed Salt? And yet such be the Baynes or Springs called Pagafai.

Thus

A Thus far forth haue I proceeded in those kinds of salt which come of waters naturally. There are besides certain hills also which are giuen by nature to bring forth salt, and such is the mount Oromenus among the Indians, wherein they vse to hew salt as out of a quarry of stone, and out of it, than either by their mines of gold, or the pearles which those coasts do yeeld. Furthermore it is euident, that in Cappadocia there is salt * Minerall, digged out of the earth: and it appeareth plainly, that it is a salt humor congealed within. And verily, they vse to cut it out of the ground after the maner of * glasse stone in lumps: and those exceeding heauy, which the peasants commonly call * crums of salt. At Carrhae, a city of Arabia, all the walls thereof, as also the houses of the inhabitants, be reared & built of hard stones: and the same be laid by Masons worke, and the joints closed and foured by no other mortar but plain water. K. Ptolomaeus, at what time as he incamped about Pelusium, a city of Egypt, and cast vp a trench to fortifie the same, found such a mine or quarry of salt as these, which was a president to others afterward to sinke pits betweene Egypt and Arabia, euen in the waste and dry quarters, where vnder the delfe of sand they met with salt. After which manner also they practised to dig in the desert & dry sands of Africk, and found more as they went, euen as far as to the Temple and Oracle of Iupiter Ammen. And verily they might perceiue this salt to grow in the night season, according to ken of, for the salt * Ammoniacum, so called, by reason that it is found vnder the sands. In C in long lumps or pieces, and those not transparent: the tast is vnpleasant, howbeit, this salt is of good vse in Physicke. The clearest thereof is taken for the best, especially when it wil cleaue directly into streight flakes. A strange and wonderfull nature it hath if it be right: for so long as it lieth vnder ground within the mine, it is passing light in hand, and may be easily welded, take it forth once, and lay it abroad aboue ground, a man would not beleue or imagine how exceeding heauy it is. But surely the reason thereof is euident: for the moist vapors contained within those mines where it lieth, beare vp the said pieces of salt, and are a great ease to those that deale therewith, much like as the water helpeth much to the stirring and managing of any thing within it, be it neuer so weighty. Well, this Ammoniacke salt is corrupted and sophisticate, as well with the pit salt of Sicily called Cocanicus, as also with that of Cypresse, which is wonderfull like vnto it. Moreover, neare Egellata, a city in high Spaine, there is a kind of sal-gem or Minerall salt digged: the peeces or lumps wherof are so cleare, as a man may in a maner see through them: and this hath of long time bin in great request and of such name, as the Physitians giue vnto it the price and praise aboue all other kinds. But here is to be noted, that all places where salt is found, are euer barren, and will beare no good thing els. And thus much may be said concerning salt that commeth of the owne accord.

As touching salt artificiall, made by mans hand, there be many kinds thereof. Our common salt, and whereof we haue greatest store, is wrought in this manner: first they let into their pits a quantity of sea-water, suffering fresh water to run into it by certain gutters, for to bee mingled therewith for to help it to congeale, whereto a good shower of raine auaileth very much, but aboue all the Sun shining therupon, for otherwise it wil neuer dry & harden. About Vtica in Barbary they vse to pile vp great heaps of salt in manner of Mounes: which after that they be hardened and seasoned in the Sun and Moone, scorne all raine and foule weather, neither will they dissolue, inso much, as folke haue enough to doe for to break and enter in with pick-axes. Howbeit, in Candy the Salt is made in the like pits, but of Sea-water onely, without letting in any fresh water at all. Semblably, in Egypt, the Sea it selfe ouerfloweth the ground which (as I take it) is already foked and drenched with the water of Nilus, and by that means their Salt is made. After the same manner they make salt also out of certain wells, which are discharged into their Salt-pits. And verily in Babylon, the first gathering or thickening of the water in their salt-pits, is a certain liquid Bitumen or Petroleum, an oleous substance, which they vse in their lamps, as we do oile: and when the same is scummed off, they find pure salt vnderneath. Likewise in Cappadocia they do conuey and let in water out of certain wells and fountaines into their Salt-pits. In Chaonia there be certaine * Springs of saltish water, which the people of that country doe boile, and when it is cooled againe, it turneth into Salt: but it is but dull and weak in effect, and besides, nothing white. In France and Germany the maner is when they would make salt, to cast

Sea.

* Sal Gemma.

* Lapis specularis, vitrum vel glacies Martis Or Lapis Arabicus. Micra Salis.

* Or asper in Greek, which is sand.

This seemeth to be our Bay-salt.

* This is the order of salt with vs in our wiches here in England.

sea-water into the fire as the wood burneth. [In some parts of Spain there be salt springs, out of which they draw water in manner of that brine, which they call Muria.] But thoseverly of France and Germany be of opinion, that it skilleth much what wood it is that serueth to the making of such fire. Oke they hold the best, as being a fewell, the simple ashes whereof mixt with nothing els, may go for salt. And yet in some places they esteeme Hazell wood meeter for this purpose. Now when the said wood is on fire and burning, they poure salt liquor among, wherby not only the ashes but the very coales also will turne to be salt. But all salt made in this sort of wood, is black. I reade in *Theophrastus*, That the Islanders of Imbros were wont to boile in water, the ashes of reeds and canes, vntill such time as there remained little moisture vnconsumed, and that which was left they vsed for salt. The brine or pickle wherein flesh or fish hath bin kept salt, if it be boiled a second time vntill the liquor be spent and consumed, returneth to the own nature, and becommeth salt again. Certes, we find, That the salt thus made of the pickle of Pilchards or Herings, is of all others most pleasant in tast. As touching the salt made of sea-water, that of the Isle Cypres, and namely, that which comes from Salamis, is commended for the best. But of poole salt, there is none comparable to the Tarentine and Phrygian, especially that which they call Tarteus, of the lake Tatta: and in truth, both these kinds of salt be good for the eies. The salt brought out of Cappadocia in little earthen pipes, hath the name to make the skinne slick and faire; but for to lay the same plain and euen, and make it look full and plump without riuels, the salt which I called Citteius hath no fellow. And therefore women after they be newly deliuered of child, vsue to annoint and rub their bellies with this salt, incorporate together with Gith or Nigella Romana. The driest salt is euermore the strongest in tast: the Tarentine salt is taken for to be most pleasant and whitest withal. Otherwise, the whiter that salt is, the more brittle it is, and readier to crumble and fall to powder. There is no salt but raine water will make it sweet and fresh. The more pleasant it will be & delicat to the tast, in case the dew fall therupon: but North-east winds ingender most plenty therof. In a Southerly constitution of the weather, and namely when the wind is full south, you shall see no salt ingendered. The * floure of salt (commonly called Sperma-Ceti) is neuer bred but when the Northeast winds do blow. The salt Tragafæus wil neither spit, crackle, leap, nor sparkle in the fire; no more will Acanthus (so called of a towne of that name): neither doth the some of salt, nor the gobbets and fragments, ne yet the thin leaues or flakes thereof. The salt of Agrigentum, a city in Sicily, will abide the fire and make no sparkling; put it into water, it will keep a spitting and crackling. Great difference there is in salt, in regard of the colour. At Memphis [i.e. Caïre] in Egypt, the salt is of a very deep red: but about the riuier Oxus in Bactriana, more tawny or inclining to a russet. And the Centuripine salt within Sicily is purple. About Gela in the same Island, the salt is so bright and clear, that it will represent a mans face, as in a mirrour. In Cappadocia, the Minerall salt which they dig, is of a yellow Safron colour, transparent, and of a most redolent smell. For any vse in Physicke, the Tarentine salt was in old time highly commended aboue the best: after which they esteemed most, all the sea salts; and of that kind the lighter, and that which especially is of the nature of some: for the * eies of horses and Bœufes, they made great reckoning of the Tragafæan salt, and that of Granada or Boetica in Spaine. For dressing of viands and carnes; for to be eaten also with meat; the better is that salt, which sooner melteth and runneth to water. That also which by nature is moister than others, they hold to be better for the kitchen or the table (for lesse bitterness it hath) and such is that of Attica and Eubœa. For to powder and keep flesh meat, the dry salt, & quicke at tongues end is thought to be meeter than other, as we may see in the salt of Megara. Moreover there is a certain confite or condit salt, compounded also with sweet spices & aromaticall drugs: which may be eaten as a dainy kind of gruel or sauce; for it stirreth vp and whetteth appetite, eat the same with any other meats: in so much, as amongst an infinit number of other sauces, this carrieth away the tast from them all; for it hath a peculiar smatch by it selfe, which is the cause, that the pickle Garum is so much sought after for to giue an edge to our stomach: & not only we men are solicited & moued by salt more than by any thing els too: our meat, but muttens, Bœufes, and horses also haue benefit thereby in that respect: they feed the better, giue more store of milke, and the cheefe made thereof hath a more dainty and commendable taste by that means. And to conclude all in one word, the life of mankind could not stand without salt, so necessary an element (if I may so say) it is for the maintenance of our life, that the very delights & pleasures of the mind also are expressed by no better term than Salt: for such gifts and conceits

* *Malos-anthos* which he rendreth *flour-salt*: whereas indeed *Flour-salt*, the floure of salt, is another thing, as himselfe sheweth elsewhere by the name of *sennifima salis*.

* *Sennifima*.

A of the spirit as yeeld most grace and contentment, we vse in Latine to call Sales. All the mirth of the heart, the greatest cheerfulness of a lightsome mind, & the whole repose & contentment that a man findeth in his soule, by no other word can be better shewed. Moreover, this terme in Latine of Sal, is taken vp and vsed in war, yea, and diuers honours and dignities bestowed vpon braue men for some worthy seruice, go vnder this name, and be called Salaries. And how highly our ancestors accounted therof, it may appeare by the name of that great port-way or street Salariæ, so called, because all the salt that went into the Sabines country, passed that way. Moreover, it is said that *Ancus Martius* K. of Rome, was the first that erected the salt-houses, and gaue vnto the people a congiary or largesse of 6000 Modij of salt. And *Varro* writeth, That our ancestors in times past vsed salt ordinarily in stead of an household gruell: for they were wont to eat salt with their bread & cheefe, as may appeare by the common proverbe that testifieth so much. But most of all we may gather in what request and account salt was in sacrifices and oblations to the gods, by this, that none are performed and celebrated without a cake of meale and salt. Furthermore, where salt is truly made without any sophistication, it rendereth a certain fine and pure substance (as it were) the most subtile cinders of ashes: which as it is lightest, so none is so white as it. There is that also which is called the Floure of salt, altogether different from salt, as being a kind of dew, of a moister nature, resembling safron in yellow colour, or els inclining rather to a sad red or russet colour, and is as a man would say, the rust of salt: the strong & vnpleasant smell likewise, which commeth neere vnto that of the pickle Garum, bewraith, that it is a distinct thing from salt, as well as from the froth thereof. This Floure of salt came first from Egypt, and it seemeth as though it floted vpon the riuier Nilus, & were carried down the stream thereof. And yet there be some fountains which doe beare and put vp the same, vpon which it swimmeth aloft. Of this kind, the best is that which yeeldeth a certain fatty and vnctuous oyle: for this you are to think, that salt is not without a kinde of fattinesse, wonderfull though it be. This floure of salt is sophisticated & commonly coloured with red ocre, or els many times with portshards reduced into powder: but this deceit may be quickly known and found by water; for if it be a false and artificial colour, water will wash it off: whereas the true floure of salt indeed, will resolute by nothing but by oile, and verily the Apothecaries & confectioners of sweet oiles and ointments, vse it most of all for the colour sake, when they would giue a fresh & lively hue to their compositions. Being put vp in any vessell, it seemeth white & hoarie aloft: but the middle part within, is as I haue said, more moist ordinarily. As touching the properties of this floure of salt, by nature it is biting, hot, and hurtfull to the stomack; it moueth sweat, and looseth the belly taken in wine & water; good also it is for to enter into those ointments which are devised for lassitude and wearinesse: and by reason of the abstersiue faculty that it hath, fit for sope and scouring bals. Nothing so effectuall to cause the haire to fall from the eie-lids. As for the ressedence or grounds thereof, setting in the bottom of the pot where this floure is kept; they vse to shog and shake the same together, to bring it again to the colour of Safron.ouer and besides, there is in salt-houses another substance like brine, which in Latine is called Salsugo or Salsilago, altogether liquid; saltier in tast than sea-water, but in strength far short of it, and different, and yet is there one kind more of an exquisite and dainty liquor in manner of a dripping, called Garum, proceeding from the garbage of fishes, and such other offall as commonly the cooke vseth to cast away as it lieth foking in salt: so as if a man would speak properly, it is no other but the humor that commeth from them as they do lie and putrifie. In old time this sauce was made of that fish which the Greeks called Garon, where by the way this commeth to my mind, that if a woman sit ouer the perfume or suffumigation of the head of this fish while it burneth, it is of power to fetch away the afterbirth that staith behind when the child is borne.

CHAP. VIII.

¶ Of the fishes called * *Scomberi*. Of fish pickle: and the fish sauce, named in old time *Alex*.

NOW adaies the most dainty and exquisite Garum is made of the fish called *Scomberi*; and that in new Carthage, where there groweth such store of Spart or Spanish broome; and namely, in the stews and ponds by the sea side where fishes are kept salted. In times past, and yet it beareth the name of the * *Allies* sauce, as their Garum, so costly and so much in request,

* Commonly taken for *Maquerels*.

* *Gallus* being

quest, that every 2 gallons thereof might not be bought much vnder the price of a thousand sesterces. Certes setting aside sweet perfumes & odoriferous ointments, there was not a liquor almost in the world that began to grow vnto a higher rate & reckoning, in so much as some places and people carried the name thereof, and were innobled thereby. And verily in all Mauritania, Granada in Spaine, and Cartheia, the inhabitants lie in wait to fish for these Scombris, and to take them as they enter out of the Ocean into the straits of Gilbretar, and all for this Garum, being indeed good for nothing els. The city Clazomenæ in Asia, the townes Pompeij & Leporis, are much renowned for this sauce: like as Antipolis, Thurijs, and of late daies, Dalmatia for their pickle. The grosse grounds or dregs of this sauce, before it be strained, purified, and fully finished, is called Alex, even the very defect & imperfection thereof. Howbeit, of late time men haue gone in hand to make the said Alex or Garum of one kind of fishes apart by themselves, which otherwise are good for little or nothing, & of all others be smallest: this fish we in Latin call Apua, the Greeks Aphye, for that it is engendered of raine and showers. In the territory of Forojulium, the fish whereof they make this sauce they call * Lupus. But in proceſſe of time Garum arose to excesſe, both in price & varietie of vse: in so much as there grew an infinit number, of diuers kinds: for one sort there was of Garum that in colour resembled old honied wine, and became so cleare and sweet withall, that it might wel enough haue bin drunk for wine: another kind there was, which our superstitious votaries vse, for to keep themselves chaste & continent; & the Iews also in their holy sacrifices employed the same, especially that which is made of skaly fishes. In like manner, the other sauce, Alex, is come to be made of Oysters, sea Vrchins, sea Nettles, Crabfishes, Lobsters, and the liuers of sea Barbles. In sum, thus wee haue deuised a thousand waies to dissolue salt with the consumption of the substance of fish, and all to procure appetite to meat and to content the belly.

Thus much I thought good to note cursorily, as touching those sauces which are so greatly longed after in the world; & the rather for that in some sort they serue in the practise of Physick: for the grosse liquor or sauce Alex, healeth the scab in sheep, if the skin be scarified or skinned, and the same Alex poured thereupon. Also it is singular against the biting of a mad dog, or the prick of the sea dragon: the same likewise serues to loke linnen wreaths to be laid in wounds or rents made of lint to bee put into sores. As for Garum, it healeth any fresh burne, if a man drop it vpon the place, without naming it, or saying that it is Garum: good it is besides for the biting of mad dogs, but especially for the Crocodiles tooth: as also for running vlcers which be either corrosiue or filthy. Of wonderful operation & effect besides for the sores of the mouth, and ears, as also for their pains. The pickle Muria likewise, or that salt liquor that cometh from salt-fish, called in Latin Salsugo, is astringent, biting, discussive, and drying: singular for to cure the dysentery or bloody flux, yea, though there were an eating vlcere within the guts: for the Sciatica and inueterat fluxes of the stomach, it is soveraign: and to conclude, those that dwell far from the sea in the midland parts of a country, vse to bath and foment themselves with it in lieu of sea water.

C H A P. X.

¶ The nature of Salt, and the medicinable vertues thereof.

SALT, by nature standeth much vpon fire, & yet an enemy it is and contrary vnto fire, it flieth from iccating and consuming all things whatsoever: astringent it is, deficcative, binding, and knitting. It keeps from putrefaction, bodies that be dead, and causeth them to endure so a world of yeares. In physick it is held for mordant, burning, caustick, and mundificative. It doth subtiliat, extenuat, and dissolue. Contrary it is to the stomach, and serueth not but only to proue appetite. With origan, hony, and hyssope, it is singular against the sting of serpents: and more particularly of the horned serpent Cerastes, if it be applied with origan, cedar-rosin, pitch or hony. Being drunk with vineger, it helpeth those that be pricked with the Scolopendre: and applied as a liniment with oile or vineger, and a fourth part of line seed, it is good against the sting of scorpions: also with vineger alone, for the sting of hornets or wasps & such like. Incorporated with calues tallow, it serues much to cure the migrim, skals in the head, small pocks, meales, & werts which begin to breed: also for the accidents of the eyes, to wit, the excreſcence of superfluous flesh in those parts, or the turning vp of skin about naile roots of fingers or toes.

But

But principally for the eyes, and therefore it entrencheth into collyries and eie-salues. Howbeit for these purposes aboue named it is thought that the salt named Tattaues, of the lake Tatta, is most commended, as also the other lake like it, called Caunites. If the eyes be bloud shotten, or orels with * Hyssop & hot water, with this charge, to foment or bath the place afterward with a kind of salt brine. But aboue all, Spanish salt would be chosen for this effect: & it is also good against cataracts and suffusions of the eyes: if it be ground with milke vpon some touch-stone, whetstone, or hard porphyrit marble. More particularly, it is singular for the black bloud gathered in the eyes, if it be folded within a little linnen cloth, & so applied: but the same ought to be dipped oftentimes in hot water, and so the place to be oftentimes patted withall. For the cankers or sores in the mouth, it is good to lay salt vpon fine lint. In case the gumbs be swelled, it were not amisse to rub them therewith. Being beaten and reduced into small powder, it serueth for the roughnesse of the tongue. Moreover it is said, That whosoever hold euery morning vnder his teeth from being worm-eaten or rotten. The same incorporat in raisins without stones, and in boeuf suet, with a little origan, leuen, or bread, is soveraign for the leprosie, fellons, tetter, ringworms, and the wild scab. But in all these accidents, the salt of Thebais in high Egypt is most commended: and of this they make choice also to kill the itch. A gargarism or collution thereof of salt but it helpeth the squinancie, and the rather if it be vsed inwardly with oile and vineger, so as at the same time it be applied without the throat also in a liniment with tar. If a cup of wine be dressed therewith it softneth the belly being costive. The same also taken in Wine chaſeth out of the body all worms and any hurtful vermin besides. Held vnder the tongue, it incheate of bairns or stoues the longer. Singular it is for the grief of the sinues: but in the practise and vse of this receipt, it would be obserued especially, that there be applied about the shoulders and reins of the back, sachels or bags full of salt, and the same made hot oftentimes in seething water: for so it easeth the pain. Being giuen in drink, or laid to exceeding hot in the said bags, it asswageth the collicke and other wrings in the belly, yea and the Sciatica. Beaten small, and applied in manner of a cataplasme, with meale, honey, and oile, it is soveraign for the gout in the feet. Where I may not forget the obseruation of this soveraign receit, which putteth vs in mind, that there is nothing better for the whole body [of such especially as be subiect to the gout] than * salt and Sun together. For thus we see, That our fishers at sea ordinarily haue boiled downe for the gout in the feet. But salt moreover takes away cornes of the feet, and kibes in the heels. Being chewed in the mouth and so applied, or els with oile, it healeth any burn or skald, and keeps the skin from rising into blisters. With vineger and hyssop it cureth S. Anthonies fire, and all vlcers that be corrosiue. It heals likewise cankerous sores, if it be applied with wild vine grapes. Reduced into fine powder and laid to with barley meale, it is soveraign for vlcers corrosiue such as be called Volues, and do eat deep to the very bone; so there be laid ouer the same and the part affected, a linnen cloath well soked and bathed in wine. A proper remedy it is for the jaundise, and riddeth away the itch occasioned thereby, if the patient be rubbed all the bodie ouer with it, oile, and vineger, against a good fire vntill hee doe sweate. But with oile alone it serues for those that feel themselves weary. Many physitians haue cured those that be in a dropsie with salt, and haue ordained to rub their bodies with oile & salt together, who are in an ague, for to auoid the extremitie of heat: and they hold opinion, That there is not a better thing to dispatch an old cough, than to be licking euere and anon of salt. They haue giuen order also by way of elistre to minister salt vp into the body, for the Sciatica. To apply the same also to eat away proud or dead flesh in any vlcers. Being lapped within a linnen cloath, and applied to the biting of Crocodiles, it is soveraign, so that the place affected were well patted withall, and pressed hard before. Moreover, good it is to be taken in honied vineger against the dangerous Opium. Brought into a cataplasme with honey and meale, it is of great effect to rectifie any dislocation of bones which be out of joint: and in that sort it taketh downe all tumors or swelling bunches. A collution or fomentation therewith allayeth the tooth-ache: and a liniment also made with it and Rosin worketh the same effect. For all these accidents before named,

the

* Hyssope, Some read Oessopo.

* Salt & Sile.

the some of salt found sticking to rockes, or floating vpon the sea water, is thought to be more conuenient than any other salt. But to conclude, any salt whatsoever it is serueth well for those medicines that be ordained either to take away lassitudes, or to enter into those sope balls that are to polish the skin and to rid it from wrinkles. If either a boeufe or mutton be rubbed with salt, it will kill the skab or mange in them: for which purpose also they giue it vnto the sayd beasts for to lick: and more particularly it is spurted out of ones mouth into horses eies. Thus you see what may be said as touching salt.

CHAP. X.

¶ Of Nitre, and the sundry kindes thereof. The manner of making Nitre. The medicines and obseruations to it belonging.

I May not put off the treatise concerning the nature of Salnitre, approaching so neer as it doth to the nature of salt: and the rather am I to discourse of it more exactly, because it appeares evidently, that the physicians who haue written thereof were altogether ignorant of the nature and vertues of it: neither is there any one of them who in that point wrote more aduisedly, than *Theophrastus*. In the first place this is to be noted, That among the Medians there is a little Nitre ingendred in certain vallies which in time of drought became all hoary & grey therewith and this they call *Halmirhaga*. There is found also some of it in *Thracia* neere vnto the *Citie Philippi*, but in lesse quantitie, and the same all fouled and bewraied with the earth, & this they name *Agion*. In times past men haue practised to make Nitre of okewood burnt; but neuer was there any great store of it made by that deuise: and long it is since that feat was altogether giuen ouer. As for waters & fountains of nitre, there be enow of them in many places, howbeit the same haue no astrigent vertue at all. But the best Nitre is found about *Clyte* in the marches of *Macedonie*, where there is most plenty thereof, and they call it *Chalastricum*: White and pure it is, and commeth neereft to the nature of salt. And verily a lake or meer there is standing altogether vpon nitre, and yet out of the midst thereof there springeth vp a little fountain of fresh water. In this lake there is ingendred Nitre about the rising of the Dog-star for 9 dayes together: then it stayeth as long, and beginneth fresh againe to flote aloft: and afterward giues ouer. Whereby it appeareth that it is the very nature of the soile that breedeth it; for knowne it is by experience, That if it cease once, neither heat of Sun nor shoures of rain wil serue or do any good. Besides, there is another wonderful propertie obserued in this lake, that notwithstanding the foresaid spring or source do seeth and boile vp continually, yet the lake neither riseth nor ouerfloweth. But during those nine daies wherein it is giuen to yeeld Nitre, if there chance to fall any shoures, they make the nitre to taste the more of salt. And say that the North-East winds do blow the while, the Nitre is nothing so good and cleere, by reason of the mud mingled withall, which those winds do raise. Thus much of Nitre naturall.

As for artificiall Nitre, great aboundance there is made of it in *Egypt*, but far inferiour in goodnesse to the other: for brown and dusky it is, and besides full of grit and stones. The order of making it is all one in manner with that of salt, sauing onely that in the salt houses they let in sea water, whereas into the boiling houses of Nitre they conuey the water of the riuer *Nilus*. Whiles *Nilus* doth rise and flow, you shal haue the said nitre-pits or workhouses dry: but as it fallerh and returneth again toward the channel, they are seene to yeeld a certaine moisture, (which is the humor of nitre) and that for the space of forty daies together, with no rest or intermission between, as there is about *Clyte* in *Macedonie* aboue said. Moreover, if the weather be disposed to rain during that time, they employ not so much of *Nilus* water to the making of Nitre. Now so soon as the said humor beginneth to thicken, presently they gather it in all hast, for feare it should resolute again and melt in the nitre pits. In this nitre, as well as in salt, there is to be found between whites a certaine oleous substance; which is held to be singular good for the farkin and scab of beasts. The nitre it selfe is laid vp and piled in heaps, where it hardeneth and continueth a long time. But admirable is the nature of the lake *Ascanius*, and of certaine fountaines about *Chalcis*, where the water aboue, and which floweth vppermost, is fresh and potable, but all beneath and vnder it toward the bottome is nitrous. The lightest of the Nitre and the finest is reputed alwaies the best; and therefore the some and froth thereof is better than any other part. And yet for some vses the grosse and foule substance is very good, and namely,

A for the setting of any colour vpon cloth, and especially the purple die. As touching the vertues of nitre it selfe, & how it is imploied many wayes, I wil write in place conuenient. But to returne againe to our nitre pits, and their boiling houses, there be of them very faire and goodly in *Egypt*. In old time, they were wont to be about *Naucratis* and *Memphis* only, but those at *Memphis* were nothing so good as the other: for there, the nitre lying vpon heapes, groweth to the hardnes of a stone; insomuch, as by this means, you shal see mountaines thereof like rockes. Of this nitre they vse to make certain vessels to vse in the house: and many times they melt it with sulphur, & boyle it ouer the coles for to giue a tincture vnto the said vessels: look also when they would keep any * thing long, they vse this stone-nitre. Moreover, there be in *Egypt* other nitre pits also, out of which there issueth a reddish kind of nitre, resembling the color of the earth from which it sweateth and oofeth out. As for the some of nitre (which is commended for the best of all) the antient writers were of opinion, that it could not be made but when the dew fell: at what time as the nitre pits were (if I may so say) great bellied and full of nitre within, but not ready to be deliuered thereof: and therefore if they be neare (as it were) to their time, there can no such froth be gathered, notwithstanding the dew do fall. Others there be of this minde, that the said vppermost coat or crust aloft, is ingendred by reason of the fermentation of the sayd nitre: but the modern Physicians of late daies haue thought and taught, That * *Aphro-nitrum* is gathered in *Asia*, and found within certain soft and gritty caues distilling out of rocks: [These caues because they be vaulted and arched ouer head, the inhabitants call * *Cochlacas*] which afterwards they doe drie in the Sun, and the best is thought that of *Lydia*. The true marke to know good sal-petre, is to be very light in hand, exceeding brittle, & easie to crumble; inclining also much to the colour of purple: this is brought from thence to vs in trochichs. As for the *Egyptian* *Aphro-nitre* or *Sal-petre*, it comes in vessels wel pitched, because it should not melt and resolute into water. Those vessels also before named, ought to be thoroughly dried & dressed in the Sun. As for nitre, the best is chosen by these marks; namely, if it bee passing fine & cleere, but withall, spongius & very ful as it were of pipes and holes. Many do sophisticat it in *Egypt* with quicklime; but this deceit may be easily found by the tast: for the good and true sal-nitre will soone melt and dissolue at the tongues end, whereas the other that is not right, pricketh and biteth in the mouth: moreover, if it haue a sprinkling of lime among, it carrieth a strong smell with it. When it is calcined in some earthen pot, it ought to be well couered with a lid, lest it leap or fly out; otherwise, in the fire it selfe, it sparkleth not nor leape forth: neither groweth any thing els in those places where sal-nitre is ingendred, whereas in salt-pits grasse commeth vp. As for the Sea, what a number of liuing creatures breedeth it? and what plenty of reike and weeds besides? And not only by this argument appeareth it, that there is more acrimonie and sharpnesse in sal-nitre than in salt, but also herein, That no shooes will abide the nitre pits, but presently fret and weare; for otherwise wholsome they be and soveraign for the eies: neither was it euer seen, that any men who handled these pits of nitre, and wrought therein, were euer blind. Moreover, this commodity they haue, That if a man come thither hauing a fore or vlcere vpon him, the same will soone be healed vp and skinned cleane: but if one chance to bee wounded or hurt there, long it will be ere he be cured thereof. Salnitre prouoketh sweat, if the body be anointed with it and oile together; and it maketh the skin soft and tender. That which is called *Chalastrum*, serueth in lieu of salt, in making bread, whereas the *Egyptian* nitre is vsed with radishes, for it maketh them more tender. As for cates and meats, if they bee powdred withall, they will look white and be worse for it: whereas all woorts either for pot or sallad, will seeme the greener.

To come now vnto physick and the medicinable vertues of salnitre: hot it is of temperature, and doth extenuate, biting besides and astrigent: a great drier it is, & doth exulcerat. In regard of which qualities, imploied it is in those accidents which require either drawing to the exterior parts, or to be dissolued and resolued: such also as need some gentle mordication, or would be lightly extenuated, as meazils, small pocks, wheals, and pimples. Some for this purpose, first make it red hot in the fire, and then quench it with some astrigent wine: which done, they beat and reduce it to powder, and therewith rub and chaufe the body in the baines, without any addition of oyle to it: mixt with the powder of dried flour-de-lis, & incorporat in green oile oliue, it represseth immoderat sweats: a liniment made therewith & figs together, doth extenuate the films in the eies; and the asperity of the eie-lids it doth subtiliate: the same operation hath it besides,

* As dead boe dies.

* This is our Sil-petre.

* Some reade *Cochlacas*.

if it be sodden in wine cuit to the consumption of the one halfe: and so is it good for the spots G that arise in the eies. The decoction of nitre boiled within the rind of a pomegranat in wine cut- it, cure the fore nails and the raggednesse thereof: and reduced into an ointment with honey, it cures the eie-sight: a collution made thereof, sodden in wine with pepper, ease the tooth-ach if the mouth and gums be washed therewith: so doth the decoction thereof with leeks. Burn or calcine nitre into powder, it maketh an excellent dentifrice for blacke teeth, and reduceth them again to their naturall whitenesse: annoint the head with nitre & Terra Samia incorporat together in oile, it killeth the lice and nits that breed therein: dissolved in wine, and poured into the ears that run attyr, it cureth them: dropt into them with vineger, it ease the ringing & ringing therein. A liniment made of nitre and fullers earth, of each a like weight, incorporat with vineger, taketh away the foule morphew, if the skin be annointed therewith: mixed with rosin, or with raifons of white grapes stamped stones and all, it draweth vncoms and fellons to an head, and breaks them: reduced into an ointment with swines greafe, it preserueth the genitoirs from inflammation, & cureth them: good likewise for the meafils and small pocks which break out in all parts of the body: put rosin thereto, and incorporat them both in a liniment with vineger, it healeth the biting of a mad dog, so it be taken betimes at the beginning: and in this manner, it cureth also the sores occasioned by the sting of serpents, eating vlcers, which consume to the bone: such likewise as be corrosiue and apt for putrefaction, so it be mixed with quick-lime and tempered with vineger. Stamp nitre with figs, and bring it into the form of a cataplasme or liniment, it doth much good for the dropsie: the ventosities causing wringings and painful gripes of the belly, it discusseth, if the decoction thereof be drunk, namely, when to the weight of one dram, it is sodden with rue, dill, or cumin. Annoint their bodies all ouer who are weary, with nitre, oile, and vineger, you shal see how effectually it is to refresh them and driue away their lassitude. Rub and chaufe both hands and feet, with nitre & oile wrought together, is singular good against quaking and shiuering cold: giuen with vineger, especially in a swee, to those who are painted with the jaundise, it represteth the itch that troubleth them: if a man be poisoned with taking venomous mushrooms, he shall find means to auoid the danger thereof by drinking nitre in oxycrat or vineger & water mingled together. Hath one swallowed down the hurtfull fly Buprestis? let him take a draught of sal-nitre in water, it wil saue him, for it causes vomit: to those that haue drunk buls blood, it is vsually giuen with the spice Laser: incorporat with honey and K cow milk, it healeth the breaking out and the exulcerations in the face. Torriste nitre vntill it begin to look blacke, beat it then to powder and cast the same vpon a raw place that is burnt, it wil take out the fire and skin it vp again: for the pain of the belly and the kidnies, for the stiffness and starkness of the lims, the griuance also of the sinews, it serueth well in a clystere: lay it to the tongue with bread, it is souveraigne for the palsie or resolution of the sinews: it helps those that be short-winded, if they take it in a Ptsan, or with husked barley. The floure of nitre incorporat in Galbanum, and the rosin called terpine, of each an equal weight, and reduced into a lochoch, so as the patient swallow down the quantity of a Bean at once, cures an old cough * Burn or calcine nitre, temper it afterwards with liquid pitch or tar, and giue it to drink, it cureth the squinancy. The floure of nitre incorporat with the oile Cyprinum, makes a pleasant L. liniment to annoint the body withal in the Sun, for the gout or any paine of joints: drunk in wine it doth exterminat and driue away for euer, the jaundise, it scattereth and discusseth ventosities, it stoppeth bleeding at the nose, if the patient receiue into the nostrils the vapour of it out of boiling water: mixed well with alume, it riddeth away an itch: foment or bath the arme pits duly every day therewith in water, it correcteth the ranke smell thereof. Make a liniment or cerot of nitre and wax tempered together, it healeth the vlcers occasioned by fleame: after which maner it is good also for the sinews. Being injected by a clystere, it helpeth the flux of the belly, proceeding from a feeble stomack. Many Physitians haue giuen direction to annoint the body all ouer with sal-nitre and oile, before the cold fits of agues: which ointment serueth likewise for the leprosie, and the vnseemly spots or freckles that blemish the skin. To sit in a tub of nitre within M the baine, & therewith to bath the body, is a souveraigne thing for those that haue the gout, be in consumption, and either draw backward with the crampe, or stretched and plucked so strait and stiffe therewith, that they seeme all of one entire piece. Sal-nitre, if it bee boyled together with sulphur, turneth to be as hard as a stone.

Coquitur, &
distillat.

CHAP

CHAP. XI.

¶ The nature of Spunges.

Many sorts there be of Spunges, according as I haue shewed already more amply in my treatise of water-beasts, and those especially of the Sea, and their seuerall natures: howbeit some writers distinguish them after another manner, into male and female: for some of them they haue thought to be of the male sex, to wit, those which haue smaller pipes or concauities, and those growing thicker and more compact, whereby they sucke vp more moisture; and these, our delicat and dainty people, die in colours, and otherwhile giue them a purple tincture. Others they count of the female sex, namely such as haue bigger pipes, & the same running throughout one continuity without interruption. Of the male kind, some be harder than others, which they call Tragos; the pipes whereof are the finest, and stand thickest together. There is an artificiall deuise to make spunges look white; to wit, if the softest and tendrest of them be taken while they be fresh in summer time, and so bathed & soked wel in the some of salt: after which they ought to be laid abroad in the moon-shine, to receiue the thick dew or hoary frosts (if any fall) with their bellies vpward into the aire, I meane that part whereby they cleaue fast to rocks or sand where they grew, that thereby they may take their whitening. That spunges haue life, yea and a sensible life, I haue proued heretofore; for there is found of their blood settled within them. Some writers report, that they haue the sense of hearing, which directs them to draw in their bodies at any sound or noisemade, and therewith to squeeze out plenty of water which they contained within; neither can they easily be pulled from their rocks, and therefore must be cut away; whereby they are seen to shed a deale of blood, or that which resemblith blood very neer. Many do prefer the Spunges growing in places exposed to the North-wind, before any other: neither doe any hold and maintaine longer in any place their owne breath, as Physicians doe hold; who affirme, that for this regard they be good for our bodies, namely, if wee entermingle their breath with ours by application: for which purpose, the fresher taken and the moister they be, the better they are thought: but this their operation is lesse perceived, in case they be wet in hot water, and so applied: likewise if they be soked in any vnctuous liquor, or bee laid vpon any part of the body annointed. This also is obserued by them, that the thickest of them, to wit, such D as haue the least pipes, sticke not so hard to a place as others. As touching the softest and finest spunges, called Penicilli, if they be applied vnto the eies after they haue bene soaked in honied wine, they do allay and bring down any swelling in them. The same are abstersiue and singular good to clarifie and cleanse the eies that be giuen to bleerednesse: but those (I say) ought to be of the finest and softest kind. For to stay the violent flux of rheumaticke humors into the eies, there is nothing better than to apply spunges of any sort with oxycrat, that is to say, vinegre and water: but with vinegre alone actually hot, they be singular for the head-ach: and otherwise, any sponge that is fresh gotten, doth discusse, mollifie, & mitigat. Old spunges do conglutinat and foulder any wounds. There is a generall vse of all spunges, to wipe and mundifie any place, to foment and bath withall: to keep off the aire also and to couer it after fomentation, vntill another E medicine be made ready for to be laid on fresh. Moreover, they be desiccative, & therefore if they be applied to rheumatick and moist vlcers, and namely in old folke, they dry vp the superfluous humors that find a way thither: neither is there any thing so fit for to foment a fracture or green wound, as spunges. Also, when any part of the body is cut off or dismembred, what is so handsome to suck and soke away the blood quickly, (that the cure may be thoroughly seen, & the order thereof) as a sponge? Furthermore, spunges themselves serue to be laid to wounds, sometime drie and sometime dewed or sprinkled with vinegre, one while wet in wine, another while moistened with cold water, and all to defend them from inflammation: but if they be bathed in raine water, and so applied to members new cut, they will not suffer them to swell and impositumat. They are besides laid vsually to the found parts, where no skin is broken, if there be any hidden F and secret humor that runs vnder the place, and puts it to paine and trouble, such as needeth to be discusse and resolved: also to impostumes, if they be first annointed with boyled hony. In like manner, for the paine of the joints they are proper to be applied, one while wet in vinegre with salt, another while dipped in vinegre and water: and if the gout be hot, they would be laid to soked in water only. The same spunges ought for the dissolving of hard callosities, to be wet with

Co 2

fale

salt water: & against the sting or prick of scorpions, with vinegre. In the cure of wounds, sponges may be vsed in stead of vnwashted greasie wooll, somtimes applied with wine and oile, and somtimes also with the said wooll: this only is the difference, That such wooll doth mollifie, whereas sponges do restrain and smite back: and yet a facultie they haue, to fetch out and sucke away the filthy excrements, attyr, and quitter, that gather in fores and wounds. They may be bound about the body of those that haue a drop sicke, either drie, or else wet in warme water or vinegre; according as need requireth, either to goe gently to worke, or to couer and dry the skin.ouer and besides, good it is to apply sponges to those accidents and infirmities of the body which require euaperation; namely, if they be well foked and thoroughly wet in hot water, and then pressed and strained between two tables or bords. After which manner, they are good to be laid to the stomack; and in a feauer, against extremitie of heat. For those that be troubled with the oppilation or hardnes of the spleen, there is not a more effectual remedy, than to apply sponges to the place affected, wet in oxycrat or vinegre & water together: like as for shingles and *S. Anthonies* euill, with vinegre only. But in this application of them, consideration must be had that they couer the found parts also round about as well as the other. Sponges wet in vinegre and cold water, staunch any flux of bloud. If there be any place of the skin blacke and blew, vpon a fresh or new stripe, lay thereto sponges well drenched in salt water, changing them often one after another, and it shall recouer the naturall colour againe: in which order, they bring down the swelling of the coles, and allay their paine. Being hacked and cut small, they serue to good purpose for to be laid to the biting of mad dogs; so that eftsoones and euer and anon they bewet and refreshed with vinegre, cold water, or hony good store, one with another. The sponges of Africke or Barbarie being burnt or calcined, doe make soueraigne ashes for to be drunke with iuice of vnset leeks in cold water (so there be put vnto a draught thereof, a quantitie of salt) by such as cast or reach bloud vward at the mouth. The same ashes reduced into a liniment, either with oile or vinegre, and so applied as a frontall to the forehead, driue away tertian agues. These African sponges haue this peculiar qualitie, to discusse any tumors, if they be applied to them well foked in oxycrat or water and vinegre mixed together. The ashes of any sponges whatsoeuer, burnt together with pitch, staunch the bleeding of any wound: and yet some there be who in this case burn those only with pitch which are of a grosse and loose making, and not so compact as the rest. Moreouer, for the accidents of the eies, sponges are many times burnt and calcined, in an earthen pot vnbacked, and the ashes which come thereof, do much good also vnto the pilling and asperitie of the eie lids, the excrescence of flesh, and whatsoeuer in those parts needeth astriction, or otherwise to be vnited, fowdred or incarnat: and for these effects, it is much better to wash the said ashes. Furthermore, sponges, in friction and rubbing of crasse bodies, may well stand in stead of currying combs, and course linnen cloaths: besides, they serue right handsomely and fitly, to couer and defend the head against the extreame heat of the Sun. Moreouer, the ignorance of our Physitians, is the cause that all sponges be reduced to two only kinds, to wit, vnder the name of African, which be of more tough and firme substance; and the Rhodiacke, which are softer, and therefore meet for fomentations. At this day the tendrest and most delicate sponges are found about the walls of the citie Antiphellus. And yet *Trogus* writeth, that about Lycia, the softest sponges called *Penicilli*, do grow in the deep sea, and namely in those places, from whence other sponges beforetime had been plucked and taken away. Finally, *Polybius* doth report, that if sponges be hung about the neck or feeling of a bed ouer sicke persons, they shall take the better rest and repose all night for it. Now is it time for me to returne vnto Beasts of the Sea, and other creatures liuing and bred in the waters.

THE

THE XXXII. BOOKE OF THE HISTORIE OF NATURE,

WRITTEN BY C. PLINIUS
SECVNDVS.

The Proem.

¶ Medicines taken from liuing creatures of the Sea.

Having so far proceeded in the discourse of Natures historie, that I am now arrived at the very height of her forces, and come into a world of Examples, I cannot chuse but in the first place consider the power of her operations, and the infiniteness of her secrets which offer themselves before our eies in the Sea: for in no part else of this vniuersall Frame, is it possible to obserue the like majestie of Nature: in so much as we need not seeke any further, nay we ought not to make more search into her diuinitie, considering there cannot be found any thing equall or like vnto this one Element, wherein she hath surmounted and gone beyond her owne selfe in a wonderfull number of respects. For first and foremost, Is there any thing more violent than the Sea, and namely, when it is troubled with bloustring winds, whirlpuffs, stormes, and tempests? Or wherein hath the wit of man become more employed (seeke out all parts of the whole world) than in seconding the waves and billowes of the Sea, by saile and oare? Finally, Is there ought more admirable, than the innarrable force of the reciprocal sides of the Sea, ebbing and flowing as it doth, whereby it keepeth a current also, as it were the streame of some great river?

CHAP. I.

¶ Of the fish *Echeneis*, and her wonderfull propertie. Of the Crampe-fish *Torpedo*, and the Sea-hare. The wonders of the Red sea.

The currant of the Sea is great, the tide much, the winds vehement and forcible; and more than that, ores and sails withall to helpe forward the rest, are mighty and powerful: and yet there is one little sillie fish, named *Echeneis* that checketh, scorneth and arresteth them all: let the winds blow as much as they will, rage the stormes and tempests what they can, yet this little fish commandeth, their fury, restraineth their puissance, and mauge all their force as great as it is, compelleth ships to stand still: A thing, which no cables, be they neuer so big and strong, no ankers, how massie and weightie soeuer they be, sticke they also as fast and vnmouable as they will, can performe. Shee bridleth the violence, and rameth the greatest rage of this vniuersall world, and that without any paine that she putteth her selfe vnto, without any holding and putting backe, or by any other meanes, saue only by cleauing and sticking fast to a vessell: in such sort, as this one small and poore fish, is sufficient to resist and withstand so great power both of sea and nauie, yea and to stop the passage of a ship, doe they all what they can possible to the contrary. What should our fleets & armadoes at sea, make such terrors in their decks and forecastles? what should they fortifie their ships in warlike maner, to fight from them vpon the sea, as it were from mure and rampier on firme land? See the vanity of man! alas, how foolish are we to make all this ado: when one little fish, not about halfe a foot long, is able to arrest and stay perforce.

perforce, yea and hold as prisoners our goodly tall and proud ships, so well armed in the beake-head with yron pikes and brassen tines, so offensive and dangerous to bouge and pierce any enemye ship which they do encounter. Certes, it is reported, that in the nauall battell before Actium, wherein *Antonius* and *Cleopater* the queene were defeated by *Augustus*, one of these fishes staied the admirall ship wherein *M. Antonius* was at what time as he made all the hast & means he could deuise with help of ores, to encourage his people from ship to ship, and could not preuaile, till he was forced to abandon the said admirall and go into another galley. Meane-while the armada of *Augustus Caesar* seeing this disorder, charged with great violence, and soone inuaded the fleet of *Antonius*. Of late daies also, and within our remembrance, the like happened to the roial ship of the Emperour *Caius Caligula*, at what time as he rowed back and made saile from *Astura* to *Antium*, when and where, this little fish detained his ship, and (as it fell out afterward) presaged an vnfortunat euent thereby: for this was the last time that euer this Emperour made his returne to Rome: and no sooner was he arriued, but his owne souldiers in a mutinie fell vpon him, and stabbed him to death. And yet it was not long ere the cause of this wonderful stay of his ship was knowne: for so soon as euer the vessel (and a galliace it was, furnished with fise banks of ores to a side) was perceiued alone in the fleet to stand still, presently a number of tall fellows leapt out of their ships into the sea, to search about the said galley, what the reason might be that it stirred not; and found one of these fishes sticken fast to the very helme: which being reported vnto *Caius Caligula*, he fumed and fared as an Emperour, taking great indignation that so small a thing as it, should hold him back perforce, and checke the strength of all his mariners, notwithstanding there were no fewer than foure hundred lusty men in his galley that laboured at the oere all that euer they could to the contrary. But this prince (as it is for certaine known) was most astonied at this, namely, That the fish sticking onely to the ship, should hold it fast; and the same being brought into the ship and there laid, not worke the like effect. They who at that time and afterward saw the fish, say, it resembled for all the world a snail of the greatest making: but as touching the forme and sundry kindes thereof, many haue written diuersly, whose opinions I haue set downe in my treatise of liuing creatures belonging to the waters, and namely in the particular discourse of this fish. Neither do I doubt but all the sort of fishes are able to doe as much: for this wee are to beleue, that Pourcellans also be of the same vertue, since it was well knowne by a notorious example, that one of them did the like by a ship sent from *Periander* to the cape of *Gnidos*: in regard whereof, the inhabitants of *Gnidos* doe honour and consecrate the said Pourcellane within their temple of *Venus*. Some of our Latine writers do call the said fish that thus staieth a ship, by the name of *Remora*.

As touching the medicinale properties of the said stay-ship *Echeneis* or *Remora* (call it whether you will) a wondrous matter it is to see the varietie of Greek writers: for some of them (as I haue shewed before) do hold, that if a woman haue it fastened either about her neck, arme, or otherwise, she shall go out her full time if she were with child: also, that it will reduce her matrice into the right place, if it were too loose and ready to hang out of her body. Others againe report the contrary, namely, That if it be kept in salt and bound to any part of a woman great with child and in paine of hard trauell, it will cause her to haue present deliuerance; for which vertue, they call it by another name **Odinolion*. Well, howeuer it be, considering that mighty puissance which this fish is well known to haue in staying ships, who wil euer make doubt hereafter of any power in Nature her selfe, or of the effectual operation in Physicke, which she hath giuen to many things that come vp by themselves. But say we had no such euidence by the example of this *Echeneis*, the Cramp-fish *Torpedo*, found and taken likewise in the same sea, were sufficient alone to proue the might of Nature in her workes, if there were nothing else to shew the same: for able she is to benum and mortifie the arms of the lustiest & strongest fishers that be; yea and to bind their legs as it were, how swift and nimble soeuer they are otherwise in running: and how euen by touching only the end of a pole, or any part of an angle rod, which they hold in their hands, although they stand aloft and a great way from her. Now if we cannot will nor chuse, but must needs confesse by the euident instance of this one fish, that there is something in nature so penetrent and powerfull, that the very smell only or breath and aire proceeding from it, is able thus to affect, or infect rather the principall lims and members of our bodies, what is it that we are not to hope for and expect from the vertue of all other creatures that Nature (through her bounty) hath endued with medicinale power for the remedy of diseases?

And

And in very truth, no lesse admirable be the properties which are respected of the sea-Hare: for to some a very poyson it is, taken inwardly either in meat or drinke: to others againe, the onely aspect and sight thereof is as venomous. For if a woman great with child chance but to see the female only of this kind, she shall sensibly therupon feelee a sickle wambling in her stomacke, she shall presently fall to vomiting, and anon to vntimely labour, and the deliuerie of an abortiue fruit. But what is the remedy? Let her weare about her arme in bracelets, any part of the male, which ordinarily for this purpose is kept dry and hardened in salt, these shall passe these dangerous accidents. The same fish is hurtfull also in the sea, if it be touched only. Neither is there any liuing creature that feeds vpon this fish, but it dieth thereon, vnlesse it be the sea Barbell onely: al the harme that this fish catches by eating of it is this, that the flesh is more tender by that means, and nothing so fast as it was before; besides, the meat is more vnpleasant, & not so much set by in the market, nor bought vp by Caters for the kitchen. If man or woman chance to be infected by eating of the sea-Hare, they presently smell and sent of the said fish; and this is the first signe and argument to proue that they be impoisoned thereby; howbeit, they die not immediately but may continue so many daies as the said Hare liued after it came out of the sea. And therefore (according as *Licinius Macer* hath left in writing) this poyson hath no set and prefinir time wherein it killeth any body. As touching the sea-Hares among the Indians, it is constantly affirmed, that taken they cannot be aliue; and that by way of counterchange, a man is their poyson: for if he do no more but touch one of them with his finger in the sea, it will forthwith die: And it is said withall, that far bigger he is there than in other seas: like as all other beasts whatsoever. King *Iuba* in those booke which he wrote to *C. Caesar*, sonne to *Augustus* the Emperour, as touching the historie of Arabia, saith, That their limpins, muskles and cockles, are so big in those seas, that one of their shels will contain a measure of three hemines. Also that there haue been known Whales six hundred foot long, and carrying a breadth of three hundred and sixtie foot, to haue shot themselves out of the sea into the great riuers of Arabia: the fat of which Whales, (like as the grease of all other sea-fishes there) is much set by and sought after by merchants, who in all those quarters vse it for to annoint their traueiling cammels, for to driue away the Breefe or Gad Bee from them, which indeed cannot abide the smell of that oile.

CHAP. II.

The naturall wit, docilitie, and gentlenesse of some fishes. Also where they be so tractable, that they will take meat at a mans hand. Finally, in what part of the World fishes giue answer by way of Oracle.

Wonderfull in my conceit is the wit and subtiltie of some fishes, if all bee true which *Ouid* the Poet hath reported of them, in that booke of his which he intituled *Halieuticon*: For first and formost he saith, That the Goldenie *Scarus* perceiuing himselfe to be taken in a weire, or enclosed within a wicker-net or leape, neuer striueth to get out againe with the head forward, or to thrust his muffle betweene the oisiers, for feare he should be caught by the head: but turning his taile vnto them, keepeth such a flapping therewith, that he makes himselfe way by that means, and so breakes forth of prison backward. Now, in case whiles he strugleth and laboureth thus to get out, another Goldenie that is without happen to espie him thus a prisoner, the same will take hold with his mouth of his fellowes taile, and helpe to get him forth out of the said net, which he endeauoures to break through. Also that the sea pike *Lupus*, when he seeth that hee is compassed about with nets, maketh a furrow with his taile into the sands, wherein he coucheth and lieth close, that when the fishers draw their nets vnto them, they may glide and passe ouer him. As for the Lampreis, knowing what a smooth, round, and slipperie back they haue, they make no more adoe, but seeing themselves within the net, get between the very meshes, which with their much winding and wrigling they will wrest wider and wider still, vntill they be gotten through and escaped.

The Pulpe fish or Pourcuttill, maketh at the very fishhooks which hee searcheth after, and those he biteth not at, but claspeth hard and gripeth round about with his clees and armes that he hath: and neuer letteth he his hold goe, vntill hee hath gnawne and eaten off the bait cleane, vnlesse before he haue done, he perceiue that he is like to be drawne vp out of the water by the angle;

angle. The Mullet also knoweth that the bait hath a hook within it, neither is he ignorant that it is laid for to entrap and catch him; howbeit, so greedie he is thereof by nature, that he neuer linneth beating it with his taile, vntill he hath shaken off the meat from the hook. The Pike is not so wary and prouident in forecast, as to keep himselfe from the danger of the hooke: but of great strength and force he is, when he bethinketh himself and repenteth that he was so foolish as to be caught: for no sooner hangs he by the hooke, but he runneth and girdeth with it in his mouth too and fro, forcing and wresting his wound so wide, vntill the said hooke which had fast hold on him before, be fallen out of his mouth againe.

The Lampreies deuoure the hooke, yea, they gobble in and swallow more than so, vntill they come to the very lines, which they set their sharpe teeth vnto, and neuer rest vntill they haue fretted and gnawne them asunder. And *Pytheas* is mine Authour, who writeth thus of them besides, That if they find themselves to be once vpon the hooke, they turne their bodies and writh sides, as knowing the same to be armed with trenchant and keene edged fins like with their backs, as knowing the same to be armed with trenchant and keene edged fins like kniues, & so with their very sharp chine & fins cut the lines atwo. *Licinius Macer* writes of Lampries, that they be all of the female sex onely, and doe conceiue by serpents engendering with them, as I haue heretofore obserued: which is the cause, that fishes lure them with hissing like vnto serpents, and by that meanes call them forth of their holes and catch them. Hee saith moreover, That they will feede fat with milk: and if a man giue them a good knock with a cud-gill, they will not die thereupon: rap them onely with a Fennell stalke or some such wand, you shall see them dead forthwith. And verily it is held for certaine, that their life lieth in the taile: which if it be smitten, they are very soone gone and bereft of vitall breath: strike them vpon the head, you shall hardly and with much adoe kill them.

There is a fish called a Rafoir: looke whatsoeuer toucheth it, senteth presently of yron.

Confessed it is and knowne for certaine, that the Lompe, Paddle, or sea- Owle, a fish called in Latine *Orbis*, of all others hath the roughest and hardest body. Shaped round it is without scales: a man that looketh vpon it, would say it were all head.

Trebius Niger mine authour affirmeth, That so often as the sea Kite is seene to lance himselfe and flie without the water, it threateneth tempests.

The Sword-fish, called in Greeke *Xiphias*, that is to say in Latine *Gladius*, i. a sword, hath a beake or bill sharpe pointed, wherewith hee will driue through the sides and planks of a ship, and bouge them so, that they shall sinke withall. The experience wherof is seene in the ocean, & the neere vnto a place in Mauritania called Gorta, which is not farre from the riuer *Lixos*. And the foresaid writer *Trebius Niger* reporteth, That the sea-cats or Cuttle fishes, called *Loligines*, will flie out of the sea, and settle vpon ships in such multitudes, that they force them vnder water and so drowne them.

The Emperour *Cesar* had many faire houses of pleasure in the country, where he kept fishes that would ordinarily come to hand and take meat. Our ancestors made no such maruell thereat, namely, that they should be so gentle & tractable in small stewes and fish-ponds where they are kept to feed: but they haue written the like of fishes in great lakes and standing pooles: And namely, about *Florus*, a castle in Sicilie, not farre from *Syracusa*: likewise, in a well or fountaine of *Iupiter Labradium*, there be yeels will take meat at ones hand, & these wear ear-rings also about them. Semblably, in *Chios* neere vnto the chappell of the ancients or elders called *Veterum Delubrum*: as also in a certaine spring of *Mesopotamia*, called *Cabura*, whereof I haue already written. As for the fishes which keep about *Myra* in *Lycia*, within the wel or fountain of *Apollo*, called *Curius*, they will shew themselves of purpose to giue presage & foreknowledge of things to come: and the manner is, to call them to the top of the water with three whistles, of a fife or such like pipe. The order is among those that come to be resoled by them in some future euents, to cast peeces of flesh to them: if they snatch the same & swim away therewith, it is a lucky and fortunat signe, presaging a good issue of their affaires about which they come; but in case they reject the same, & flurt the meat from them with their taile, that is an ominous token, and they sheweth some vnhappie euent to follow. About *Hierapolis*, a citie in *Syria*, the fish within the lake or poole of *Venus*, obey the voice of the wardens or sextons who haue the keeping of her chappell there; and orderly they come at their call, garnished with their ornaments of gold about them: they will abide to be scratched and clawed, they will wag their tails like a dog in a fawning and flattering maner; nay, they will gape with their mouths wide open, and suffer them

A to thrust their hands or fingers into them. At *Stabianum* neere to the rocke or cape of *Hercules*, the blacke-tailed ruffles or sea-breames, which the Greekes name *Melanuri*, if a man cast crums of bread into the sea to them, they will catch the same, and scud away wishall: throw them any other meat or bait with a hooke in it, they will not once come neer therto. Neither are these to be reckoned among the least wonders and in the last place, namely, That about the Island *Pele* and the citie *Clazomenæ*, all the fish that is, tasteth bitter: Contrariwise, those that keep about the rock *Scylla* in *Sicilie* be sweeter, as also at *Leptis* in *Affrick*, *Euboea*, and *Dyrrhachium*. Again some are so salt, that they may well be taken for salt fish that hath lien in brine or pickle, to wit, neer the Islands *Cephalenia*, *Ampelos*, and *Paros*: likewise about the rockes and clifles of *Delos*: and yet in the Bay or hauen of the said Island, their meat is sweet ynough. This difference B in the tast of fish, proceedeth no doubt from the diuersitie of their food. Moreover, *Apion* saith, That the greatest of all other fishes is the Mole-bout, which the Latines call *Porcus*, the Lacedæmonians *Orthagoriscos*; and that when he is taken, he will grunt like an Hog, whereupon it should seeme he tooke the name *Porcus*. But as touching the foresaid accident of the variety in the tast of fish, how some be sweet, others salt, that it should be a naturall thing (and therefore the more to be marvelled at) appropriat to certaine places, it may appeare by this instance, which fitly proueth the same: For take the salt fish of *Italie*, what kind soeuer you will, for certaine it is knowne, That at *Beneuentum* they may be made fresh againe, as if they had neuer bene salted.

C That sea-fish hath been vsed at *Rome* from time to time, and euer since the very foundation of the citie, it may appeare by the testimony of *Cassius Hemina*: which I will set downe word for word as touching that point, in this very place. King *Numa* (quoth hee) ordained, That fishes without scales should not be bought vp by *Caters* for the furnishing of any solemne funerall feast. By which inhibition his policie and purpose was, that the great dinners, as well publike as priuat; the feastiuall suppers also which were kept at the shrines of the gods, should not be so costly and chargeable: for scarce also least the caters who made prouision for such sumptuous feasts, sparing for no cost, nor sticking at the price were it neuer so high, might forestall the markets and buy the same vp beforehand.

As touching *Corall*, we (here at *Rome*) set not more by the Indian orient pearles (whereof I haue written at large in place conuenient) nor esteem them at a greater price than those Indians do our *Corall*. And verily, if we deeme aright, it is the opinion and perswasion of people only, that setteth the price of these and such like things. True it is verily, that there is *Corall* bred in the red sea, but blacker it is than that which we haue: likewise in the Persian gulfes, & that is named *Iace*. Howbeit, the best simply is that which is found in the gulfes of *Marfiles* in *France*, about the Islands *Stœchades*: as also in the narrow seas of *Sicily*, toward *Helia* and *Drepanum*. There is also therof growing at *Grauiſca*, & just before *Naples* in *Campaine*. But the reddest of all other, soft & tender withall, and therefore most commodious, is engendred about *Erythræ* in *Barbary*. *Corall* resembles a bush or shrub in forme, & of it selfe within the water, is of color Greene. The berries therof vnder the water be white and soft: no sooner be they taken forth, but presently they wax hard and turne red: much like both in shape and in bignesse to the grains or fruit of the gentle garden *Cornel* tree. It is said that this plant whiles it grows and is aliue, if a man touch it neuer so little, becomes as hard immediatly as a stone. The fishers therefore to preuent that inconuenience (as knowing the nature therof) either pluck it vp with their nets, or cut it with some sharpe edged yron tooles: which is the cause that it is commonly called **Curalium*, as some make interpretation of the word. The reddest *Corall* is taken to be the best: the same also branched most, is nor rough and ragged vnder the hand to feele to, or stone-hard: so- E like likewise it is and masse, not void and hollow. The berries or beads which it beareth, is of no lesse account & price with the men of *India*, than the *Indian* pearles with our costly dames here. And verily among them, their *Wisards*, *Southsaiers*, *Priests*, & *Prophets*, haue a religious opinion of them, and attribute great holinesse to the vse thereof: as being perswaded, that whoeuer F weare them, shall be secured against all perils and dangers whatsoeuer; and therefore a speciall reckoning they make of them, as wel in regard of beautie as deuotion. Before that it was known in what estimation *Corall* was with the *Indians*, the *Frenchmen* adorned & set out their swords, targuets, shields, morrions, and head peeces therewith: But since time that there was a vent into *India* of this commoditie so vendible, great scarcitie there is of it, and hardly shall a man meet

with

*I shall write some

(as it were) in
the sea.

with any Corall, even in that part of the world where it growes naturally. The branches of Corall hang about the neckes of infants and young children, are thought to be a sufficient pre-
 servative against all wither and forcerie. Calcined by fire, and so reduced into ashes or pou-
 der and given to drinke in water, it helpeth those who are troubled with the wringing paines of
 the belly, the griefe of the bladder, and the disease of the stone. The like effect it hath if it be
 drunk in wine, or if the patient have a feaver upon him, in water for to procure sleep. This would
 be noted, that Corall doth withstand the power of fire, and long it is before it be burned and
 reduced into ashes: But surely a singular medicine it is, so prepared and vsed, inasmuch as (by re-
 duced into ashes) if a man keepe to it still and continue it long, the same will consume the hardnesse and
 schirrositie of the spleen. The powder of Corall is soueraign for such as reach and cast vpon
 at the mouth. The ashes enter into many mixtures and medicines for the eyes: for astringent
 they be, and cooling withall. Hollow vlcers and fistulae they incarnate and fill vp againe with
 new flesh. Skars and cicatrices they do extenuate.

If I should speak of the repugnance and contrariety in Nature (which the Greekes call an-
 tipathie) found in many creatures, there is not to be seen in the whole world any thing more ve-
 nomous and aduersive to plants than the Puffins or Forke fish of the sea, called *Pastinaca*: for as I
 heretofore noted, it hath a pricke in the tail, which is able to kill any trees that be pierced or
 wounded withall. And yet a concurrent and enemy this hath, which doth persecute & plague
 it, and namely the Lamprey called *Galeos*; so eager is it and greedy of the venome and poyson
 of that fish. There be other fishes also which it pursueth, but those Puffins especially: and no
 Weazill hunteth more after serpents. In summe, whosoever be hurt or wounded by the said
 Puffin, this *Galeos* is a present remedy; so is the Barbe also, and the gum Lafer or Benjoin.

CHAP. III.

¶ Of certaine creatures which liue as well upon the land as the sea. Of *Castoreum*,
 or the generators of a Beuer: the medicinable vertues thereof, and
 other properties observed therein.

The power and majesty of Nature is very conspicuous and visible, even in those creatures
 also which liue indifferently on land and in the water: and namely in the Beuers, which
 commonly the physicians call *Castores*, like as their stones also *Castorea*. Some hold, that
 these Beuers when they be neer driuen and pressed by hunters, and at the point to be taken, bite
 off their owne stones. But *Sextus*, who hath written most exactly in Physicke, denieth it flatly.
 He saith moreover, that these cods be small, knit short and trussed vp, so as they stick close vnto
 the chine bone, and cannot possibly be taken from the beast but the life goes away withall. By his
 saying also they are sophisticated, and the kidnies of the Beuer which are big, be obtruded and
 foisted to vs many times in stead of their stones, which indeed are neuer found but very little &
 slender. Furthermore he affirmeth, That they be not the right stones of a Beuer when they are
 seene without a twofold burse or skin, which no living creature hath besides. In these two bags
 there is found (saith he) a certain oleous liquor, which ordinarily is kept & preserved with salt:
 And therefore among other marks to know false and sophisticat *Castoreum*, is this, If you see a
 paire of cods, hanging (as it were) knit together by one string in one bag. And yet the best may
 be falsified by the fraud and cunning of such as put gum thereto with salt *Ammoniack*, because
 the true Beuers stones ought to beare the colour of *Ammoniack*; to be enclosed also within
 their seuerall tunicles; and to lie in a certaine liquor resembling cerous hony, standing much
 vpon wax; to haue a strong and rank smell, a bitter, hot and fiery tast; and withall, apt to crumble
 between the fingers. The best *Castoreum* & most effectually, is brought out of *Pontus* and *Gala-*
tia: next to it is that of *Affrick* or *Barbarie*. The vertue of *Castoreum* is to prouoke sneezing, if a
 man hold it to his nose and smell thereto. If the head be annointed with *Castoreum* incorporat
 with oile of roses and *Harstrang*, it will procure sleep: so will it do alone by it selfe given in wa-
 ter to drinke: in which respect, proper it is for the frensie. And yet the perfume or vapor there-
 of will raise those that lie in a sleepe lethargie: like a suffumigation* or pessarie put vp into the
 natural parts of women, is soueraign for the rising of the mother, in which fit they lie as it were
 in a trance and out of the world. *Castoreum* given to the weight of two drams with *Penitroyall*
 in water to drink, moueth womens monthly sicknes, and forceth the afterbirth to com away. It

examinationes
et subsidii.
 We practise
 the contrary.

helpeth those that haue the dizziness or swimming of the braine; bee drawne backward with
 cramps, tremble and shake; are plucked with spasmes and convulsions, diseased in their signers;
 troubled with the *Sciatica*, sick of a weak and feeble stomacke that keepeth nothing which it
 takes, and lie bed-ridden of the palsey, if they be annointed thoroughly therewith in parts conueni-
 ent. Or if *Castoreum* be reduced into powder, and together with the seed of *Agnus Castus*, be
 incorporat with vinegar or oile of rose, and so reduced to the consistence of hony, which being ta-
 ken as an electuarie, is singular not only for the former maladies, but also for the falling sicknes:
 and if the same be given in drink, it dissueth ventosities, appeaseth the wrings and torments of
 the belly, yea, and represseth the malice of any poisons. But in this case of poisons it ought to
 be prepared, mixed, and vsed diuersly, according to the sundry kinds thereof: for against the ve-
 nome of scorpions it would be drunk in meere wine. To withstand the danger of the *Phalangia*
 and such venomous spiders, it ought to be given in honied wine especially, if the intention bee
 to cast vp the said poysons by vomit, or with *Rue*, if the drift and purpose be to hold and retain
 all still. To prevent the perill of the Lizards or venomous wormes *Chalcidica*, it should be ta-
 ken in Myrtle wine. Against the sting of the horned serpent *Ceraastes*, or the fierie vermine *Pre-*
ster, with *Panax* or *Rue* in wine. But generally for all other serpents, the only liquor to receive it
 in, is wine. Two drams at a time is thought to be a sufficient dose of *Castor* it selfe, in any of these
 compositions, but of other drugs that are put thereto, there ought to be a proportion of the half;
 to wit, one dram. Moreover, a peculiar vertue it hath, if it be drunk in vinegar, to resist the veno-
 mous gum *Ixias*, growing vpon the plant *Chamaeleon*: but soueraigne it is for the poyson
 of the herb *Aconitum* or *Libard* base, in milk or faire water. Against white *Ellebores* it is good to
 be taken with mead or honied water and sal-nitre. Also, if it be puluerized and incorporate with
 oile, a soueraigne remedy it is to ease the tooth-ach, if it be dropped or poured into the eare of
 the same side where the griefe is: but better it were to temper it with the juice of Poppy for pain
 of the ears. Mix *Castoreum* with the best hony of *Attica*, and bring it into an eie-salue, it is pas-
 sing good for to cleare the sight. Given in vinegar, it staieth and keepeth downe the yex or hic-
 quet. Furthermore, the vrine of a Beuer is a good counterpoyson: and therefore it goeth to the
 making of Antidotes and preseruatiues. But the best way of keeping it (as some think) is in the
 owne bladder.

CHAP. IIII.

¶ Of the Tortoise. The medicines taken from many fishes, and diuers observations
 to them pertaining.

SEmblably, Tortoises liue in two places, and haunt both land and waters. Their effectual pro-
 perties besides are such as deserue like honour, as well in regard of their manifold vses in
 sumptuous buildings (whereby they carry a great price) as of their sundry vertues and ope-
 rations which Nature hath giuen them: now of these Tortoises there be many kinds, to wit, land
 Tortoises, and sea Tortoises. Tortoises found in muddy waters & marraies: Tortoises also that
 keep in fresh riuer water; and these last named, some Greeke writers call *Emydes*. The flesh of
 land Tortoises serueth well in perfumes & suffumigations, for so it is as good as a countercharm
 to put by and repell all forceries and enchantments: a singular counterpoyson also to resist any
 venome whatsoever. Great store of Tortoises be found in *Affricke*: where they vse to cut away
 the head and feet, and then employ the rest of the body as a soueraigne remedy against all poy-
 sons. If their flesh be eaten together with the broth wherein they are sodden, it is held to be very
 good for to dissuise and scatter the wens called the kings euil, & to dissipat or resolu the hard-
 nesse of the swelled spleene: likewise to cure the falling sicknes, and to driue away the fits there-
 of. The blood of Tortoises clarifieth the eyesight & dispatcheth the cataraacts, if they be anoi-
 nted therewith. Many incorporate the said blood in meale, and keep them reduced into the forme
 of pills, which when need requirerh, they giue in wine as a present help for the poyson of all ser-
 pents, spiders, and such like, yea, and the venome of toads. The gall of Tortoises mixt with *Ar-*
ticke hony, serueth to cure the fiery rednesse of the eyes, if they be annointed therewith: The
 same is good to be dropt into the wounds inflicted by the prick of scorpions. The ashes of the
 Tortoise sheli incorporat with wine and oile and so wrought into a salve, heals the chaps & vl-
 cers of the feet. The scales scraped lightly from the vpper part of the shell giuen in drink, coole
 the

the heat of lust. And I maruell the more hereat, because the powder of the whole shell indeed bath the name to heat the appetite and desire to ventry. As touching their vrin, I hold it impossible to meet with the same, vnlesse it be found in their bladder when they be cut in twaine. And yet the Magicians hold this to be one of the most rare things in the world, and that which worketh wonders, saying it is right soueraigne for the biting or stinging of the Aspis, howbeit, much more effectually (say they) if punaises be mixed with it. Tortoise eggs dryed and hardened, are good to be applied to the wens called the kings euill; to any exulcerations, caused either by extreme cold or burning: The same being soft, are singular to be supped off in the paine of the stomacke.

The flesh of sea Tortoises, mixed and incorporat with the flesh of frogs, is a souverain remedy against the venome of Salamanders: neither is there any thing more contrary in nature to the Salamander, than is the Tortoise. The blood of the sea Tortoise serueth to recouer haire in the places naked and bare, by occasion of the disease called Alopecia: it riddeth away likewise the skales and dandruffe, yea, and healeth all the scalds of the head: but the same must dry vpon the head, and be washed off at leisure by little and little. If it be dropped into the eares with breaste-milk, it easeth their paine. If it be chewed or eaten, tempered with the fine floure of wheat, it cureth the falling sicknes. But for the better preparing and ordering of this blood in these cases, it ought to be mingled in 3 hemines of vineger, one hemine of wine put thereto, with an addition also of Barly meale, and the same tempered with vineger: of which composition the patient is to take and swallow down the quantity of a bean every day, morning and euening; and after some daies past, in the euening only this blood is likewise singular to be dropt into the mouths of those that be fallen of the epilepsie or falling sicknes, so the fit be but smal, for which purpose they must be forced to gape. In case of cramps & convulsions, the same is to be clysterized with Castoreum. Whosoeuer rubbeth their teeth with Tortoise blood, and vse so to do a whole yeare together, shal be freed from the pain therof for euer. If it be mixed with barly groats, and giuen to them that draw their winde short, it discusseth the cause of that difficulty; yea, helpeth such as cannot breath but sitting vpright. The gall of Tortoises cleareth the eyesight, it doth subtilize the cicatrices and films that grow in the eyes: the inflammation of the tonsils it represseth, assuageth the squinancy, and helpeth all the accidents of the mouth: and more particularly, a property it hath to heale the cankerous and corrosiue sores there breeding: as also to cure the inflammation of the genitoirs. The same conueied vp into the nostrills, fetcheth those again to themselves who are in a fit of the falling sicknesse, and setteth them vpright vpon their feet. And with the slough of a serpent incorporat in vineger, and dropt into the ears that run, it is an excellent medicine to scoure them. Some put a Bœufes gall among, together with the broth of the Tortoise flesh sodden, and an addition of a snakes slough in equall quantity; but first they seeth the said Tortoise a long while in wine. Moreouer, the gall of Tortoises mixed with hony, amendeth all the imperfections incident to the eies, if they bee annoiued therewith: yea, if it were a cataract, the gall of a sea Tortoise tempered with the blood of a riuier Tortoise and womans milk, riddeth and scoureth it away. The said gall is very proper to giue a yellow die or colour to womens haire. Against the poison of Salamanders, sufficient it is to drinke the broth or decoction of a Tortoise.

As touching those kind of Tortoises that liue and breed in mud and moorie waters, which I reckoned to be the third kind: broad they be and flat in the backe as well as vpon the brest: neither doth their shell arise arch-wise in manner of a vault: these are il-favored to see to, and yet as loueleffe as they be, they are not without some medicinable vertues and remedies: for take 3 of them and throw them into a fire made of Vine twigs, or their cuttings; when their shells or co-uers begin to diuide in funder and part one from another, pull them hastily out of the fire, pluck the flesh out of their shells, feeth them in a gallon of water, with a little quantity of salt put thereto; thus let them boyle vntill a third part of the liquor be consumed: This broth or decoction if it be drunken, is thought to be soveraign for those that be troubled either with the palse, gout, or paine of joints. The gall of these Tortoises purgeth also phlegmaticke humours and corrupt bloud out of the body. And after that this medicine hath don his part, and set the belly in a loofenesse, a draught of cold water knitteth it againe, and staeth all.

To come now vnto the fourth kind of Tortoises which keepe in fresh riuers, they affoord an excellent remedy for to rid away a quartane ague, in this manner prepared and vsed : first take certaine

A certain tortoise, diuide one piece from another & take out the fat within, stamp the same with the herb called houleek and Lincseed, incorporate all into an ointment, let the patients be anointed therewith before the fit commeth, all ouer the body saue the head only, and when they be well lapped with cloathes about them, giue them some hot drink: This (I say) is thought to be a foueraigne medicine against the said ague. But a tortoise to be applied for this purpose, ought to be taken at the full of the moone, because there may be more fat found in her. Many the sick body must not be anointed (men say) at any time but two daies after. The blood of tortoises which are of this fourth kinde, if it be dropped on the head by way of embrochation, appeaseth the head-ach that vseth to return and come often by fits: the same also applied vnto the kings euill cureth it. Some are of opinion, that the better to let tortoises blood, and according to art, (as requirit it is in such cases of physick) they ought to be laid along with their bellies upward, and so their heads to be cut off with a brasen knife: and then they giue order to receiue the blood in a new earthen vessel neuer occupied before: which blood is excellent to anoint the shingles, or any kind of *S. Ambrosies* fire: likewise the running scalls of the head, and alswerts. The same Authors doe promise and warrant, That with the dung of all sorts of Tortoises, the bites called *Pani* may be discussed and resolued. And although it be incredible and not to be spoken, yet some there be who haue written, That any thip maketh way more slowly at Sea, that carrieth within it the right foot of a Tortoise. And thus much shall suffice as touching Tortoises.

And now from henceforth as touching the fishes and other water creatures, I meane to discourse of them and their medicinable properties, according to euerie disease which they seru for. And yet I am not ignorant, that many a one will be desirous to know all at once, the vertues of each living creature, which indeed maketh them to seem more admirable a great deal. Howbeit this course that I meane to take, I hold to be more expedient and profitable to this life; namely, to set downe receipts and remedies digested by order, of each disease and malady: considering that one thing may be good for this Patient, and another for that; and some medicines are sooner found and gotten than others.

CHAP. V.

¶ Sundry medicines and receipts taken from those living creatures which conuerse in waters, and the same digested orderly into diseases. And in the first place, such as be appropriat to poysons and venomous beasts.

Heretofore haue I written of venomous honey, and the countie wherein such is gathered and made: now if any be poisoned therewith, good it is to eat the fish called Arata, *i. a*

Guilt-head. Or say one be gluttered with pure hony, or haue taken a surfet thereof, being of all other most dangerous, whereby the appetite is cleangon, and the stomack oppressed with crudities: for to preuent farther danger, *Pelops* ordained for a speciall antidote or defenfatue the meat of tortoises boiled, after the head, feet, and taile were cut away. But *Apelles* in this case attribureth as much to *Scincus*. Now what this *Scincus* is I haue declared heretofore. Shewed also I haue oftentimes in many places, how venomous the monthly fleurs of women are, but yet (as hath bin said already) the fish called a Barble is a singular remedy against the poison thereof: like as, both applied outwardly in a liniment, and taken inwardly as meat, it is a soweraigne thing for the pricke of the Puffin or Forkish, of Scorpions as well of the land as the sea, and of the malicious spiders Phalangia. The ashes of a Barble fresh taken and calcined, is a generall counterpoison; but more particularly it helpeth those who haue eaten deadly Mushrooms. Also it is said, That if the fish called a Sea-star, wel besmeared and anointed all ouer with the bloud of a Fox, be fastned to the lintell, or hanged to the brazen nail or ring of a dore, it will put by all charmes, forceries, and witchcrafts, that none shall come into the house, or if any doe, yet they shall not worke any harme. As for the pricke or sting of sea-dragons and scorpions, a cataplaine of Sea-stars flesh applied thereto healeth them: so it doth also the venomous bit of spiders. In sum, the broth of their decoction is thought to be a soweraigne remedie against all

Pp manner

manner of poisons; whether it be that a man haue taken it by the mouth, or be stung and bitten G by any venomous beast.

As touching fishes kept in salt, they are not without their medicinable vertues: for to eat salt fish is very good for them who are stricken with serpents, or otherwise bitten or stung by any venomous beast, so they drink to it estoons pure wine of the grape, and withal be sure to cast vp again by vomit toward euening their foresaid meat which they did eat that day. The same salt fish more peculiarly serueth for them who haue bin hurt and wounded with the venomous Lizard * Chalcis, the horned serpent Ceraustes, or the venomous horn-fretters called Sepes: being otherwise singular to heale those who haue bin smitten with the serpent Elops, or bitten with the thirsty tooth of the worrne Diplas: but if a man be pricked by the Scorpion, good it is for him to feed fully of saltfish, howbeit in no wise to vomit the same vp again, but rather to indure the drinnesse & thirst occasioned thereby: and many hold, that it is a proper remedy to apply to the sore a cataplasme made of the foresaid saltfish. Verily against the biting of Crocodils there is not thought to be a more present and effectual remedy, than it. But to grow vnto particulars, Sprouts salted haue a special propertie to heal the biting of the beetle or venomous fly Prester: also in case a man be bitten with a mad dog, it is very good to lay salt fish vnto the sore; yea although the wound were not cauterised with a red hot iron, nor the patients body emptied by a clystire, this cataplasme alone of saltfish is thought sufficient to cure it: the same soaked in vinegar serues also to be laid vnto the place that is hurt with a sea dragon. Of the same operation and effect is a * square piece or canton of the fish Tuny salted and condired. And since I haue named the sea-Dragon, this would be noted, That himself outwardly applied, is a remedie for the venom inflicted by the prick or fin of his ridge bone, wherewith his manner is to strike: yea & his very brains also, if you take nothing els, are as effectual. The decoction of sea frogs sodden in wine and vinegar, is a souerain drink for all poisons, but especially for the venome of the hedge toad and salamander. As for the frogs of riuers and fresh waters, if a man either eat the flesh or drink the broth wherein they were sodden, he shal find it very good against the poison of the sea-hare, or the sting of the serpents abouenamed; but more particularly against the prick of scorpions they would be boiled in wine. Moreouer, Democritus saith, That if a man take out the tongue of a sea frog aliue, so that no other part thereof stick therto, & after he hath let the frog go again into the water, apply the said tongue vnto the left pap of a woman while she sleepest, in the very place where the heart beateh, she shall answer truly and directly in her sleepest, to any interrogatorie or question that is put vnto her. But the magitions tell more wonders than so of the frog, which if they be true, certes frogs were more commodious & profitable to a Commonwealth, than all the positiue written lawes that we haue. For they would make vs beleue, That if the husband take a frog and spit her (as it were) a length vpon a reed, so as it go in at the skut or mature behinde, and come forth againe at the mouth, and then pricke the said Reed or broch in the mensuall bloud of his wife, she shall neuer haue minde afterwards to entertaine any adulterers, but dereft and loath that naughty kinde of life. Certaine it is, That if froggs flesh be put within a net, or that a hooke be baited therewith, Purple fishes about all others will come flocking thither. Moreouer, it is commonly said, That a Frog hath a double liuer, the which ought to be layd before Ants, and looke which of the two lobes or flaps thereof they make vnto, and seeme to gnaw, the same is a most singular antidote against all poysons whatsoever.

Some frogs there be that liue only among bushes and in hedges, which thereupon we call in * Our Toads. Latine by the name of * Rubeta; and the Greeks term them Phrynos: the biggest they are of all other, with two knubs bearing out in their front like horns, and full of poison they be. They that write of these toads, striue a-vie, who shal write most wonders of them: for some say, that if one of them be brought into a place of concourse where people are in great number assembled, they shall be all hushed and not a word among them. They affirme also, that there is one little bone in their right side, which if it be thrown into a pan of seething water, the vessel will coole presently, and boile no more vntill it be taken forth again. Now this bone (say they) is found by this means: if a man take one of these venomous frogs or toads, and cast it into a nest of Ants, for to be eaten and deuoured by them, and looke when they haue gnawed away the flesh to the very bones, each bone one after another is to be put into a kettle seething vpon the fire, and so it

A it will soon be known which is the bone, by the effect aforesaid. There is another such like bone (by their saying) in the left side, cast it into the water that hath done seething, it will seeme to boile and waulme again presently: this bone (forsooth) is called Apocynon: and why so? because ywis, there is not a thing more powerfull to appeale and repress the violence and furie of curst dogs than it. They report moreouer, that it inciteth vnto wanton loue; and yet nathelesse if a cup of drinke be spiced therewith, it will breed debate and quarrels among those that drinke thereof: also, whoeuer carrieth it about him, shall be prouoked to fleshly lust: and contrariwise, if the bone in the right side be likewise vsed, it will coole as much, and take downe the pride of flesh and heat of concupiscence. Others there be who are of opinion, that if it bee but worne about one, either hanging to the necke, or fastened vnto any other part of the body, infolded within a little piece of a new lambs skin, it will cure a quartane ague, or any other feuer besides. The same also represseth the affection of loue. Moreouer, they beare vs in hand, that the milt of these toads is a counterpoison against their owne venome: but the heart (say they) is much more effectual.

There is a certaine kind of serpent or Snake haunting the water, called in Latine Coluber; the fat and gall of which Serpent, if they haue about them who vse to hunt after Crocodiles, it is wonderfull (say they) how they be armed and defended against them, for they will not attempt to turne againe vpon the hunters and giue any assault: and yet of greater effect and force they shall finde it, in case there be incorporat withall, the pond-weed or water-speeke called Potamogiton.

C The riuer Crefishes, if they be taken fresh, stamped and giuen in water to drinke, are soueraine against all poisons: so is their ashes also a counterpoison; but more particularly against the sting or pricke of Scorpions, if it be drunke in asses milke; or for default thereof, in goats milke, or any other whatsoeuer: but then the patient ought to drinke wine vpon it. And verily, so aduerse and contrary are they vnto Scorpions, that if they be punned with Basill into a certaine composition, it will kill them, if the same be but laid vpon them. Of the same force they are against the sting or biting of any other venomous beast besides, and more especially of the pernicious hardi(hrew Seytale, of snakes, sea-hares, and hedge-toads. Many there be who vse to saue the ashes of Crefishes calcined, as a soueraine remedy for all such as be in danger to fall into the symptome of fearfulness to drink, incident to those that are bitten by mad-dogs: some D adde thereto the herbe Gentian, and giue both together in wine to drink: but if the said symptome of Hydrophobie haue surprized them already, then the said ashes or powder ought to be reduced (by the meanes of wine) into trofches or pills, which they prescribe vnto their patients for to be swallowed downe. The Magitians proceed farther and affirme, that if a man take ten Crefishes and tie them all together with a good bunch or handfull of basill, all the Scorpions that be thereabout, will assemble together to that one place: and they giue order, that if a man be hurt already with a scorpion, there should be a cataplasme made of them, or at leastwayes of their ashes mixed with Basill, and so applied to the place affected. The sea-crabs are nothing so good of operation in all these causes, as the Land-crabs or Crefishes aforesaid, according as Thrasillus mine Authour doth report. Howbeit, hee sayth neuerthelesse, that there are no such enemies to serpents, as Crabs; and he affirmeth moreouer, That if swine be stung or hurt by serpents, they helpe and cure themselves by feeding vpon sea-Crabs onely, and seeke for no other helpe or remedie. Hee addeth furthermore and auoucheth, that serpents are ill at ease, yea and much tormented with paine when the Sunne is in the signe of the crab, called commonly Cancer.

To come now to the riuer shell-snails: most certaine it is, that their flesh, whether it be raw or boyled, is singular good to resist the venome of scorpions inflicted by their pricke or sting: and some there be, who for to haue them in a readinesse to serue in those cases, keep them in salt: and they ordaine them to be applied vnto the very sore it seife, occasioned by their foresaid sting.

F As for the [blacke] fishes named Coracini, they are peculiar and appropriate vnto the riuer Nilus: howsoeuer my determination and purpose is to deliuer medicines profitable and beneficiall to all parts of the earth in general. Their flesh is good to be applied vnto the sores caused by scorpions.

The Sea-swine or Porpus, bath prickly fins vpon his back, and those are counted amongst other venomous things that the sea yeeldeth, putting them to much paine that are wounded or hurt thereby: but what help therfore? surely the very muddy slime that gathereth about the body of the same fish, is the onely remedy.

The Sea-calfe, otherwise named a Seale, hath a certaine greace, wherewith it is good to anoint the face or visage of those, whoby reason that they are bitten with a mad dog, are afraid to drink and cannot away with water: but it will worke the better, if there be mingled therewith the marrow of an Hyena, the oile of the Mastich tree and wax, that all may be reduced into a liniment.

As for the biting of a Lamprey, there is not a better thing to heal it than the ashes of a lampreys head. The Puffin likewise or Fork-fish, cureth the wound that himselfe inflicted; namely, if the place be annointed with his own ashes, tempered with vineger, or mixt with the ashes of any other fish. If a man would make meat of this fish, there ought to be taken out of the backe whatsoeuer is there found like to saffron: likewise the head all and whole would be taken away: and yet to maintain and keep the tast thereof, the same must be washed but a little and no more than all shell fishes, for otherwise all the pleasantnesse in the eating would be cleane gone.

The mischieuous venome of the sea-hare, [called otherwise Imbrago] is quenched cleane and mortified, by taking the flesh of the sea-Horse any way in drinke.

*Named after
ward Opossum
psum.

Against the poison of deadly dwale, the meat of sea-urchins is soueraigne: & whoeuer haue drunk the dangerous juice of * Carpasum, find much ease and help especially by supping their decoction. To conclude, the broth of sea-crabs likewise taken, is thought to be effectual against the foresaid dwale named Dorycnium.

CHAP. VI.

¶ Of oysters and Purple shell-fishes: of Sea-musse, or Reits: and the remedies which they afford.

Moreouer, Oysters haue a speciall vertue to resist the venome of the sea-hare. And albeit I haue written already of oysters, yet me thinks I cannot speak sufficiently of them, seeing that for these many yerres they haue bin held for the principal dish & daintiest meat that can be serued vp to the table. This fish loueth to haue fresh water, & joiet to be in those coasts where most riuers do run into the sea: which is the reason, few of them are found in the deep, called therupon Pelagia; and those thriue not, but are in comparision very small. Howbeit, they breed and ingender otherwhiles among rocks, & in such holes which want the recourse of sweet waters; as for example, about Grynna and Myrina. They wax big and full according to the encrease of the Moon, as I haue shewed already in my treatise of creatures liuing in waters: but principally about the spring prime, when they be full of a certain humour or moisture like vnto milk; and in those shallow places where the sun pearceth with his beams to the very bottom of the water. And this seemeth to be the reason, that in other coasts and parts of the sea, they bee found far lesse: for shade hindreth their growth, and for want of the cheerfull sight of the sunne, they haue lesse appetite to meat & feed not: moreover, this is to be noted, that oysters differ one from another in colour. In Spaine they be reddish, whereas in Sclauonia they be brown and dusky: but about the cape Circeij in Italy, their shell and flesh both, be blacke. In what coast or countrey soeuer they be found, the best and principall those are held to be, which be massie and compact; not glib and slippery without, with their owne humour and moisture: and rather bee they chosen which are thicke, than broad and flat: such also as bee taken neither in muddy nor yet in sandie places, but vpon the sound and firme ground in the bottome; hauing their white meat ruffed vp short and round, and not flaggie as flesh: the same not jagged and fringed about in the edges with smal strings, but lying all close vnited together as it were couched within the belly. They that be more expert and practised in the choice of oysters, adde one marke more to chuse them by, namely, if there be a purple thread or string that compasseth them about the edges: and by this signe they know the oysters of the best kind and race, from others, and call them by a proper name Calliblephara. Oysters delight (as I may so say) to trauell into strange quarters, to be transported from their naturall seat into other vnknown waters. Thus the oysters bred about Brindis, and remoued from thence to the lake Auernus; and beeing there fed, are suppo-

posed by that means to keep still their own natieue juice and humidity, and besides to gain nouriture by the moisture of Lucrinus. Thus much as touching the substance and body of Oysters: it remaineth now to speake of those parts and tractes where the best oysters are to be had; to the end that such coasts may not be defrauded of the honour due and appertaining vnto them. But of this point speake I will by the tongue of another, and alledge his speech who is thought to haue written hereof with best iudgement of any man in our time. These therefore bee the verie words of Mutianus, which I will put downe as followes: The oysters (quoth he) of Cyzicum taken about the straights of Callipolis, be the fairest of all other, and bigger than those which are fed or bred in the lake Lucrinus, sweeter than those of Brittain, more pleasant in the mouth than the Edulian, quicker in tast than those of Leptis, fuller than the Lucensian, drier than those of Coryphanta, more tender than the Istrian, and last of all, whiter than the oyster of Circeij: and yet there haue not bin found any oysters either more sweet or tender than these last named. The Historiographers who wrote of Alexanders voiaiges and exploits, haue left in writing, that within the Indian sea there be oysters found a foot long euery way. Moreover, there is among vs a certain Nomenclator or Controller belonging to one of our prodigall and wastfull spendthrifts here at Rome, who haue giuen a proper name to certain oysters, and termed them Tridacna: his desire was by that significant name, to expresse thus much, That they were so big as that they would make three good bits or mouths-full a piece.

Now proceed I will to their medicinable vertues, & before I go any further, in this very place set down how far forth they serue in physick. First and formost, they be the only meat to comfort and refresh a decayed stomack: they recouer an appetite that was cleane gone. But see the practise of our delicat wantons! to coole oysters forsooth, they must needs whelm & couer them all ouer with snow; which is as much as to bring the tops of mountaines and bottom of the Sea together, and make a confused medley of all. This good moreover do oysters, that they gently loose the belly, and make a body soluble: seeth the same with honied wine, they cure the Tisicne, which is an inordinat and bootlesse desire to the stoole without doing any thing, especially if the tiwil (which is the place affected) be not exulcerat: oysters likewise so prepared, cleanse and mundifie the vlcers of the bladder: eat them in their shel with their water, as they came clofed and shut from the sea, you shall find them wondrous good for any rheumes or distillations. The ashes of an oyster shell calcined, and incorporat with honey, be singular for the paine of the vula, and assuage the inflammation of the tonsils: semblably, they repress the swelling kernels that rise vnder the ears, assuage the biles and botches called Pani, mortifie the hard tumours of womens breasts, and heal the fores or scalls of the head, if they be applied accordingly with water: and in the same order prepared, they rid away wrinkles, and make womens skin to lie smooth and euen. These ashes are a soueraigne powder to be cast vpon any place that is raw, by reason of a burne or scalding: and the same is commended for an excellent dentifrice to cleanse & whiten the teeth withall: temper the said ashes with vineger, it killeth the itch, and healeth angrie wheales; the small pocks also and meazils. Oysters punned raw and reduced into a cataplasme, heale the kings euill and kibed heels, if they be applied accordingly.

Moreover, the Shell-fishes called Purples, are very good against poison.

As for the reits Kilpe, Tangle, & such like sea-weeds, Nicander saith, they are as good as treacle. Sundry sorts there be of these reits, going vnder the name of Alga, as I haue already declared: some are long leaved, some large; others of a reddish colour, and some haue curled and jagged leaves: the best simply of all others, be they of the Island Creta, which grow near the ground vpon rocks; and namely for to dye wooll & woollen cloth; for they set so sure a colour, as neuer will shed or be washed off afterwards. Nicander giueth direction, to take the said treacle in wine

CHAP. VII.

¶ Medicines against the shedding of haire. For to colour the haire of the head. Also against the accidents of the eares, teeth, and visage.

If by occasion of some infirmity the haire be fallen off or grow very thin, the ashes of the fish called the Sea-horse, mingled with sal-nitre and swines grease, or applied simply with vineger, replenish the bare places with new haire, and cause it to come vp thick again: and for to apply such medicines for this purpose, the powder of a cuttle bone prepareth the skinne well beforehand.

Maris marini hand. Also the ashes of the sea-Tortoise incorporat with oile of a sea-vrchin likewise burnt and calcined flesh and all together as also the gall of a scorpion, be appropriat medicines to recover haire that was lost. In like maner take the ashes of 3 frogs burnt together aloue in an earthen pot, meddle them with hony, it is a good medicine to cause haire to grow: but the operation will be the better, in case the same be tempered with liquid pitch or tar. If one bee disposed to colour the haire of the head black, let him take horse-leeches which haue putrified and been resolved together in some grosse red wine for the space of 60 daies, he shall find this to be an excellent medicine. Others there be who giue order, to put as many horse-leeches as a sextar will hold, in two sextars of vineger, and let them putrifie within a vessell of lead as many daies together, and when they be reduced into the form of a liniment, to annoint the haire in the sunshine for the same purpose. And *Sornatius* attributeth so much power vnto this composition, that vnlesse they that haue the annointing of the haire with it hold oile in their mouths all the while, their teeth also (by his saying) who haue the doing of it, wil turn black. The ashes of Burrets or Purples shels incorporat in hony, serue passing well in a liniment to heale scald heads: and the powder of the foresaid fish shels (although they be not burnt and calcined) tempered with water, is as good for the head-ach. Of the same operation is Castoreum, incorporat with Harstrang in oile rosat. The fat or grease of all fishes whatsoever, as well those of the sea as riuers, beeing dissolved in oile and tempered in honey, is soueraigne for to cleare the eyes: and of the like effect is Castoreum applied with hony. The gal of the fish Callionymus, healeth the cicatrices or scars that ouergrow the skin about them: and the same eateth & consumeth the excrecence of superfluous flesh in the corners of the eies. And verily there is not a fish that hath more gall than it, as testifieth *Menander* the Poet in his comedies: the same fish is otherwise called **V-ranoscopus*, by reason of the eies which he hath in the vppermost part of his head. Semblably the gall of the black fish *Coracinus* quickneth the eie-sight. Also the gall of the reddish sea-scorpions, mixt with old wine or the best hony of Athens, serueth to discusse the filmes of the eies like to breed a cataract: and thrice must the eies be annointed therewith, letting a day goe euer betweene. The same cure serueth likewise to take away the pearle in the eie. As for Burrets, it is commonly said, that if one do feed ordinarily vpon them, hee shall sensibly feeble his eies to decay and wax dim thereby. The sea-hare it selfe verily is venomous; but the ashes keep the disorderly and hurtfull haire of the eie-lids from growing any more, if they be once pluckt vp by the roots: and for this purpose, the least of this kind are the best. In like manner, the little Scallops kept in salt, and stamp together with the rosine or oile of cedar: the small frogs likewise which vsually they call *Diopetes* and *Calamitæ*, haue the like effect to hinder the coming vp of hairs in the eielids, after they be once pulled vp; in case their bloud be tempered with the gum of the vine-tree, and therewith the edges of the said eie-lids be annointed. The swelling and rednesse of the eies is by nothing better delaid and discussed, than by a liniment made of a cuttle bone puluerized and mixt with womans milk. And in very truth, the said cuttle bone simply by it selfe, cureth the asperity and roughnesse of the said eie-lids. But to worke this cure, the chirurgeon vseth to turne vp the said eie-lids, and to apply therto the medicine, which he suffereth not to stay there long, but taketh it away within awhile: he annointeth the place also with oile rosat, and ouer night laieth thereto white-bread crums [with breist milke] for to assuage the paine. The selfe same shell or couer of the cuttle-fish beaten to powder and brought into a liniment with vineger, cureth those who can see neuer a whit towards night. The ashes of the sayd cuttle-bone draw forth the scales or films which grow in the eies: the same incorporat with hony, heale the skars of the eies, but tempered with salt or brasse-ore, of each one dram, they rid away the pin and web growing in the eie: the same help horses of the haw that offendeth their eies. Some say moreover, that the little bones within the cuttle, if they be stamped to powder with vineger, taketh away the accidents of the eies called *Epinyctides*. The Magitians giue direction to burne the same with vipers skins and frogs, and to spice the drink with the ashes that come thereof, assuring those who vse to drink the same, that they shall haue a very cleare sight. [A fish there is named *Ichthyocolla*, which hath a glewfish skin, and the very glue that is made thereof, is likewise called *Ichthyocolla*. The same glue taketh away the night-foes, commonly named in Greeke *Epinyctides*. Some affirm, That the said glue *Ichthyocolla* is made of the belly and not of the skin of the said fish, like as Buls glue. This fish glue is thought to be best that

* Looking
vp to heauen

A is brought out of Pontus: the same also is white without any veines, strings, or scales; and verie quickly melteth and resolueth. Now the same ought first to be cut or shred small, and then to lie infused or in steep a whole day and a night in water or vineger, which done, to be panned and beaten with the pebbles found about the sea-shore, that the same may the sooner mele and dissolve. This glue thus ordered, is held to be soueraigne for the head-ach; and a good thing to enter into those medicines or compositions which are deuised to smoothe the skin & rid away the wrinkles. Take the right eie of a frog, lap it within a piece of selfe russet cloth (such as is made of black wooll as it came in the fleece from the sheep) and hang it about the neck, it cureth the right eie, if it be inflamed or bleared. And if the left eie be so affected, do the like by the contrary eie of the said frog, &c. Now, if it were possible to pluck out these eies as the frog is ingendering, it would heale also the white cicatrices or scars in the eie, if it were hung about the necke of the patient in like sort within an egge-shell. The rest of the frogs flesh applied to the eie, sucketh out and consumeth the bloud that is congealed vnder the tunicles of the eie, and lies there black and blew. They affirme moreover, That the eies of a crab or craifish being hanged about the neck, are a soueraigne remedy for bleared eies.

A little frog there is, delighting to liue most among grasse & in * reed plots: mute the same is and neuer croaketh, green also of colour: if kine or oxen chance to swallow one of them down with their grasse, it causeth them to swell in the belly, as if they were dew blown. And yet (they say) that if the slime or moisture wherewith their bodies be charged outwardly, be scraped off with the edge of some penknife, it clearerth the sight, if the eies be annointed therewith. As for the flesh it selfe, they lay it vpon the eies for to mitigat their pain. Furthermore, some there are who take 15 frogs, pricketh them with a rish, & draw the same through them, that they may hang thereto; which done, they put them in a new earthen pot: and the humour or moisture that passeth from them in this manner, they temper with the juice or liquor which in manner of a gum issueth out of the white wine Brionie, wherewith they keep the eielids from hauing any haire growing vpon them. But first they pluck vp those disorderly haire which grew there to offend and hurt the eies: & with a fine needle point drop the foresaid liquor into the very places where the haire were fetched out by the roots. *Megetes* the Chyrurgian deuised another depilatory for to hinder the growing of hairs, made of frogs which he killed in vineger, and permitted them therein to putrifie and resolve into moisture: and for this purpose his manner was to take many fresh frogs, euen as they were ingendered in any rain that fel during the Autumne. The same depilatory effect, the ashes of Horse-leeches are supposed to haue, if they be reduced into a liniment with vineger, and vsed accordingly: now must they be burnt and calcined in a new earthen vessel that neuer before was occupied. And of the like operation is the liuer of the sea-fish *Tænia*, if the same be dried, and thereof the weight of foure deniers Romane incorporate in oile of Cedar to the forme of a liniment, for to annoint the haire of the eie-lids by the space of nine moneths together.

The fresh gall of a Ray or Skeat, yea, and the same preserved and kept long in old wine, is an excellent medicine for the eares: so is the gal likewise of the fish * *Bancus*, which some call *Myxon*: also of *Callionymus* the fish aforesaid, if it be dropt into the eares with oile rosat: semblably Castoreum with the juice of Poppie. There be also in the sea certaine creepers ingendered, called *Pedunculi*, i. sea-lice, which being stamped and tempered with vineger, they giue counsell to drop into the eares. Also a lock of wooll died in the bloud of the purple shell-fish *Conchylium*, of it selfe alone is a very good thing to be applied to the eares: howbeit, some doe wet the same in vineger and salniter mixed together. But the soueraigne remedy in the opinion of most Physitians for any grievance and infirmity of the eares, is this, namely, *Recipe* of the best fauce or pickle called *Garum Sociorum* that may be gotten, one cyath, of hony one cyath and an halfe, of vineger one cyath, seeth them all together gently ouer a soft fire in a new pot, eftsoo skimming it in the boiling with a feather, and when it hath left casting vp a scum and is sufficiently purified, take it from the fire: and of this decoction warm drop into the pained eares. If the eares be swelled withall, they ordain and prescribe to mitigat & assuage the same first, with the juice of Coriander. The fat of frogs dropt into the eares, allaieth their paine presently. The juice or decoction of craifishes incorporat with fine Barly meale, is a singular and most effectual salve to heale the wounds of the eares. As for swellings and inflammations rising behind the eares, there is not a better thing to cure them, than to apply therto the ashes of Burrets shels tempered with hony,

* *Calamitæ*

* *ganchi*, some
reade *Bacobi*.

hony, or of the Purples Conchylia, with honied wine.

If the teeth ake, the ready means to assuage them, is to scarifie the gums and let them bloud with the sharp bones of the sea-dragon: and withall, to make a collution with the brains of the sea dogfish boiled in oile and faued for the purpose, to wash the mouth and teeth therewith once in a yere. Likewise in the pain of the teeth, found it is most souveraigne to scarifie the gums with the prickly bone or fin of the Puffin or Forkfish, vntill they bleed againe. The same also being puluerized, brought into a liniment with white Ellebore, and applied to the teeth, causeth them to fall out of the head without any great paine. Moreouer, the ashes of salt fish burnt in a new earthen vessell, and mixt with the poudre of the marble stone, is reckoned among the remedies for the teeth. In like maner the quadrants or square cantons of the old Tuny fish, burnt to a cole in a new earthen pan, and afterward beaten to poudre, are thought to be good for the tooth-ach.

Of the like operation and effect (they say) be the pricks and fins of all kindes of salt fish, if they be first burnt to a coale, then puluerized, and therewith the teeth well rubbed. Furthermore, to make a collution to wash the teeth withall, and to hold the liquor in the mouth, some seeth frogs in vineger, with this proportion, that to euery frog they take one hemine of vineger. But because many a mans stomack lothed & abhorred such a medicin, *Salustius Dionysius* found the means to hang many of them by the hinder legs ouer the vessell or pan of seething vineger, that out of their mouth there might fall the humor within their bodies into the said vineger. But to those who had good stomacks & were of stronger complexions, he prescribed to eat the very frogs broth & all wherein they were sodden. And in very truth, many are of this opinion, that if the grinders and great jaw teeth do ake, this is a speciall medicine for them, but in case they be loose in the head, then the best way to confirm and set them fast, is a collution with the vineger aforesaid. And for this purpose some there be, who after they haue cut off the feet of 2 frogs, lay their bodies to infuse and steep in one hemine of wine, and so aduise their patients to wash their vnsteady teeth with the said infusion. Others apply them whole as they be, legs and al outwardly to the chawes, and keep them fast thereto. Whereas some again seeth ten of them in 3 sextars of vineger, vntill a third part of the liquor be consumed, and with this decoction thinke to fasten the teeth sure that shake in their sockets. Moreouer, others you shall haue who take the hearts of 36 frogs, and bake or boile them in one sextar of old oile vnder a pan or ouen of brasse; the graue or liquor whereof they poured into the eare of that side where the cheek or jaw doth ake: whereas many others besides seeth the liuer of a frog, and when they haue stamped and incorporat it with hony, put it into the hollow teeth, or apply it thereto. But all these medicines abovesayd you must thinke to be more effectually, if they be made of sea-frogs. Now if the teeth bee worne eaten and stinke withall, they giue order to dry a hundred of them in an ouen all night long: afterwards to put vnto them as much salt in proportion as they come to in weight, and therewith to rub the said faulty teeth. There is a kind of serpent or water-snake called in Latine Coluber, and of the Greeks Enhydri: diuers there be, who with foure of the vpper teeth of this serpent, scarifie the gums of the vpper chaw, in case the teeth therein do ake: and semblably with foure of the nether teeth, if the other bee in paine: and yet some there bee who content themselves with the eye-rooth onely. They vse also the ashes of Sea-crabs, and no maruell: for the ashes of Burrets is a dentifrice well knowne for to keepe the teeth cleane, and make them neat and white.

The fat of a sea-Casse or Seale taketh away the foule terrors called Lichenes, and the filthy leprosie: so do the ashes of Lampreys, if the same be incorporat with hony to the weight of 3 oboli. The liuer also of the Puffin boiled in oile. Finally, the ashes of a sea Horse and a Dolphin mixt with water, so that the part affected be well rubbed withall vntill it blister. Now, when it is thus exulcerat, it must be followed with that manner of cure which is appropriat thereto, and namely, vntill it be healed and skinned againe. Some take the liuer of a Dolphin, and fry or torrefie it in an earthen pan, vntill there come from it a kind of greafe in manner of oile, & therewith annoint the patients in the cases abovesaid.

If women desire to be rid of the foule freckles, spots, and morpew that do injury vnto their beautie, if they would looke young, and haue their skin plump and void of all riuels, let them take the ashes of Burrets and purple shells calcined, incorporat the same with honey into the form of a liniment: within one weeks space if they ply it with annointing, they shal see the effect thereof; namely, the skin cleare and neat, euen and smooth without wrinkles, & the cheekes

not

not hollow, but faire and full. Mary vpon the 8 day they must not forget to foment and bath the place with the white of an egge wel beaten. Among the kinds of Burrets called Murices, are to be ranged those shell-fishes which the Greeks some call Colycia, others Corythia, shaped in the shell like to the rest in manner of a turbant, but that they be far lesse, howbeit more effectually: for that besides the other properties abouenamed, this speciall gift they haue, to maintaine a sweet breath. As for the fish or glue called Ichthyocolla, it hath vertue to lay the skin euen without riuels, and to make it rise and appear firm, but then it ought to boile in water the space of 4 houres, afterwards to be stamped, strained, and wrought to the liquid consistencie of hony and no more. Thus prepared, it must be put vp into a new vessell neuer occupied, & there kept. When time serues to vse it, to euery 4 drams weight thereof proportion two of brimstone, of Orchanet as much, of litharge of siluer 8 drams: put them all together, and stampe them, with some sprinkling of water among. Herewith let the face bee annointed, and after foure houres wash it off againe. For the spots and pimples in the face, called Lentils, as also for all other deformities, the ashes of Curtill bones are thought singular, if the skin be rubbed therewith: and the same consume the excrescence of proud and rank flesh, like as they dry vp any moist and rheumaticke vlcers.

CHAP. VIII.

¶ *Diners receipts, set downe disorderly one with another, for sundry maladies.*

One Frog boiled in five hemines of sea-water, is singular to cause the scurfe of the mange or wild scab to fall off: but sodden so long it must be, vntill the decoction bee risen to the height of hony.

There is ingendred in the sea also that which is called Halcyoneum, made as some thinke of the nests of the birds Halcyones and Ceyces: but as others suppose, of the filthy some of the sea thickened and indurated: and according to the opinion of some, it proceedeth from the muddie slime or a certaine hoary dry scum or froth of the sea. Foure kinds there bee of it. The first of an ash colour, thick and massie, of a quick and hot smell. The second is soft and more mild, favouring in manner like to sea weeds. The third resembleth the whiter kinde of chequer worke in marquettry. The fourth is more hollow and fuller of holes in maner of a pumish stone, & in that respect resembleth a rotten sponge, inclining much to the colour of purple: and this is simply the best, called also by the name of Halcyoneum Milesium; yet in this kind the whiter that it is the worse it is to be liked. The property of them all in generality, is to exulcerat and mundifie. Vsed they are being torrifed, euen without any oile. Wonderfull is their operation, if they bee tempered with Lupines, and the weight of two oboli in sulphur, for to take away the wilde scab or leprosie, the foule terrors Lichenes, and the pimples or spots of the skin called Lentils. Halcyoneum also is commonly emploied about the scars or thick filmes appearing in the eyes. Andreas the Physitian vsed much the ashes of a sea-crab incorporat with oile in curing the leprosie. *Astalus* occupied as vsually the fat of a fresh Tuny, new taken, for the healing of vlcers. The pickle of Lampreies, together with the ashes of their heads calcined, and brought into a liniment with hony, healeth the kings euill. And many are of opinion, that to prick the wenches named the Kings euill aforesaid, with the small bone or pricke that sticketh in the taile of that sea fish which is called *Rana marina*, with this gage and rule of the hand that it wound not deep, is very good for that disease: but the same must be done euery day vntill they bee thoroughly cured and whole. Of the same operation is the sharp prick in a Puffen: of the sea-hare also applied to them, so as neither the one nor the other be suffered to lie long to the place, but bee soone renewed. Also the shelly skin of the sea-Urchin stamped to poudre and brought into a liniment with vineger: as also the ashes of the sea Scolopendre incorporat with honey: and the riuier crai-fish either puluerized or calcined, and the dust or ashes thereof likewise tempered with honey, are good to be applied to the same disease. Wonderfull effectually be the bones also of the curtill fish beaten to poudre, and with old swines greafe brought into the form of a liniment: and in this manner they apply this medicine to the tumors behind the eares: like as the liuers of the sea fish Scarus. Moreouer, the sheards of such earthen vessels wherein salt fish was poudred & kept, beaten to poudre, & tempered with old swines greafe: the ashes also of Burrets shells incorporat in oile, serue in right good stead for the swellings behinde the eares, and the tumors or wenches called

¶ The Frenchmen terme it *Diable de mer*, i. the diuell of the sea.

¶ *Exusta, not Rusta, according to Galen.*

called the kings euill. The stiffe cricke in the neck is mollified and made pliable againe, so as it G
may turne which way a man would haue it, with drinking of one dram weight of those creepers
or insects which be called sea-lice; and yet some take for the same Castoreum in honied wine,
adding thereto a little pepper, and drinke this composition in the broth of frogs boiled in oyle
and salt. After which manner, many Physitians cureth the crampe that draweth the neck back-
ward: the generall conuulsion also that stretcheth the body so, as if it were of one piece: and o-
ther particular spasmes and cramps of any part, so there be some pepper put thereto. The ashes
of salt Cackerels heads burnt and reduced into a liament with honey, discusse and resolueth the
Squinancy cleane, like a, the broth of frogs boiled in vinegar; and the sayd broth is singular al-
so for the inflammation of the tonsils. The Creisfishes of the riuer dried and beaten to powder, H
then put into water (so as there be to euery one a hemine of water) make a good liquor to garga-
rize withall for the squinancy. The same also drunke in wine or hot water, worke the like effect.
The sauce made of Maquerels called Garum, put with a spoon vnder the uvula, and there held a
while, putteth it vp, and reduces it again to the right place. The fish * Silurus eaten at the table
either fresh or powdered, helpeth the voice much. The barbels kept vntill they be dried, & then
puluerized, prouoke vomit, if a cup of drinke be spiced with the powder. If a man or woman be
short winded, there is not a medicine again so good to helpe that difficulty of breath, as to drinke
whiles they be fasting, Castoreum, with a little quantity of Ammoniack in honied vinegar. The
same potion taken likewise with honied vinegar hot, allaieth the conuulsion of the stomack pro-
ceeding from excessiue yexing or hiccups. Item, it is said, that Frogs boiled in some broth be-
tween two platters after the manner of fishes, are good, for a cough: and beeing hanged by the
heeles, after that their saluation and humidity is dropt from them into a pan or platter vnder-
neath, they are to be rid of their garbage, & when the same is flung away, they ought to be kept
and preferred for the purpose aforesaid. There is a little Frog that vseth to climb trees, & from
thence crieth and croaketh: if a man spit into the mouth of one of them, & then let her go again,
it is thought hee shall bee deliuered by that meanes from the cough. To conclude, many giue
counsell for the cough that bringeth vp bloud withall, to drinke in hot water the flesh of a raw
perwinckle well punned.

CHAP. IX.

¶ Proper receipts for the accidents of the Liver and the Sides : for the infirmities also of the Stomack and Belly. Besides other medicines huddled together confusedly.

MAny vse to suffocate and kill in wine a sea Scorpion, and to drink thereof for the paine of the liuer. For the same purpose many are wont to take in honied wine and water of each a like quantity, the flesh of the long muskles or shell fishes: or if they haue a feuer, in honied water. In case of pleurisie or paine of the sides, the flesh of the sea horse roasted, eates the same: so doth the fish Tethea, which resemblesh an Oyster, taken as meat. I the pickle of the fish Silurus injected by way of clystire allaieth the paine of the sciatica. To the like effect there are giuen for 15 daies together, Cockles, or Muskles, to the weight of 3 oboli infused in two sextars of wine. The broth of Silurus softneth the belly: like as the crampefish Torpedo, eaten as meat. The * sea-wort is like to that of the garden, hurtful to the stomach, but most easily it purges the belly. In regard of the acrimony that it hath, they vse to seeth it with some fat flesh. The broth of any fish whatsoever is laxatiue: the same prouokes vrine, especially if it be made of wine. The best fish broth comes from the Sea Scorpions, and those which they call Iulides: of stonefishes also that keep about rocks, and haue no rank or strong taste; and such must be sodden with dill, parsley, coriander, and leeks, putting thereto oile and salt. The Squares also or cantons of the Tunie, that haue bin old kept, are purgatiue, for particularly they euacuate crude and waterish humors, besides flegme and choler. The shell-fishes also named Myaces, haue a quality purgatiue: as touching whose nature I purpose to write fully in this very place. They gather together by heaps after the manner of Butrets; they liue in places giuen to breed reits and sea mosse; most delicate and pleasant meat they be in Autumne, & especially in those coasts where good store of fresh water is intermingled in the sea, which is the reason that those of Ægypt bee most commendable: as winter grows on, they begin to gather a kind of bitteresse, & a red colour besides. The

*Olive mariner: haply he meaneth *Brassica marina*, i. *olustanella*, yet it is nothing like to our Colewort

A The broth of these fishes hath the name to euacuat both the belly & bladder, to scour & mundifie the guts, to open any obstructions whatsoever, to purge the reins, to take down the rankness of blood and fat. In which regards they be soverain for the dropsy, for the monthly termes of women, the jaundie, all gouts and dileases of the joints whatsoever, and ventosities. Singular they are holden to be for to cleanse the humors either cholerick or phlegmatick, which annoy and stuffe the lights, or which ingender obstructions about the liuer: likewise to cure infirmities of the spleen, and all rheums or descent of humors to any place. Only they be hurtfull to the throat, and make a man to lose his voice, this is all the harm they do. The vlcers that corrode, and be full of filthy matter, and require mundification, they heal: so do they all cankerous sores. Being calcined after the order of Burrets, they cure the biting both of dog and man, if their ashes be incorporat in hony: and so they cleanse the leprosie, and rid away the pimples or spots in the skin called Lentils, Their ashes * taken in drinke, haue a vertue to discusse the dimnesse and mistinesse of the eie-sight, to cure the accidents of the gums and teeth; and besides, to drie vp the small pocks and such like breaking out of wheals by occasion of flegm. Moreover, they are as good as a counterpoison against the iuice of the deadly Dwale called Dorycnium, or of Carpasum, which is commonly named Opocarpasum. Besides, this would be noted, that they grow all to be of two kinds of them; the one * Mituli [*i. Limpins*] which haue a raste of salt, & cary a strong fauor; the other * Mysæ, which differ from the other in roundnesse: lesse also they be a good deal, and hairy: and as their shels be thinner, so their flesh is more firm and hard. The said Limpins also, as well as Burrets, yeeld ashes when they be calcined, which haue a caustick quality, whereby they serue properly to mundifie the skin from leprosie, lentils, and other pimples and ifsauored spots. The same being washed after the maner of lead, be singular for to subtiliat the thick eie lids, to scatter and discusse the pearls in eies, to dissipat the cloudy & misty dimnesse, to cleanse filthy vlcers in any part of the body, and namely the puthes and blisters that arise in the head. As touching the flesh that they haue, it serueth in a cataplasme to be laid vnto the biting of mad dogs. The Palours also do soften and mollifie the belly: so doth Castoreum, being drunk to the weight of two drams in honied water. They that would haue this medicine more quick in operation, and to work thoroughly, put thereto of the garden cucumber root dried one dram, & of salt-petre two drams. As for the fishes named Tetheæ, they are singular against the wringing torments [and gripings] of the belly and all ventosities. These fishes be found ordinarily about the rocks of the sea, sucking the leaues of Keits and such like weeds, more like indeed to Mushrooms and Puffes, than to fishes. But the same haue a special propertie to cure the Tinefme and the accidents of the kidnies.

* *Potius*, rather

Squilla.
* *Muskles*.
* *Haply Coc-*
cles.

Moreover, there grows in the sea a kind of Wormwood, which some call Seriphium, and principally towards * Taposiris in Egypt, the which is more smal and slender than that of the land: it loofeth the belly, killeth the worms in the guts, and expelleth them. The Cuttil fish also is laxative: and ordinarily giuen it is to be eaten, after it hath bin sodden with oile, salt, and meal. Salt Cackerels likewise prouoke vnto the stoole, in case they be reduced into a liniment with blurs gall, and therewith the nauil anointed. Generally, the broth of fish stewed betweene two platters with Lettuce, dispatcheth those sharp and fretting humors which are the cause of the Tinefm. Crafishes of the riuier stamped and drunk in water, stop a lask, and be diureticall. But yet in wine they moue appetite to the siege. Take away their feet and armes whereby they crawl, then pun and incorporat the reft of their body with Myrrh, they driue out the stone. But this proportion must be obserued, that to euery dram weight of them there be put three oboli of Myrrh.

* Таблица 2:

To appease the painfull passion called Iliaca, to allay and resolve ventosities also and inflammations, there is not a better thing than to take in 4 cyaths of mead or honied wine hot, Castoreum, with carot and parsl seed, as much as may be comprehended with 3 fingers. The same is singular to allay the wrings and torments of the belly, with vineger & wine mixt together. The fishes named Erythini eaten as meat, stay the loosnesse of the belly. For to cure the dysenterie or bloody flux, seeth frogs with the sea onion commonly named Squilla, and thereof make certain trochisks to be given to the patient in that case. The same effect hath their gall or heart stamped and incorporate with honey, as *Niceratus* myne author doth testifie. Eat salt fish with Pepper, so as you abstain from all flesh besides, if you would be cured of the jaundise. Lay the fish named a Sole to the region of the spleene, it doth cure the oppilation and hardnesse thereof.

of:

of: so doeth the cramp-fish Torpedo: and a Turbet in like manner, being applied alive; but afterward you must let it keepe againe into the sea. A sea scorpion killed in wine healeth the infirmities of the bladder; is breaketh and expelleth the stone. The same effect hath the stone which is found in the tail of a sea scorpion, if it be drunk to the weight of one obolus: the liuer also of the water-snake Enhydriis, and the ashes likewise of those kind of Mulletts called Blennij, if they be taken with Rue. Moreouer, there be found also in the head of the fish Banchus, certain little stones as it were, which if they be drunke in water, are soueraigne for them which be troubled with the gravel and the stone. And it is commonly said, That the sea fish called a Nettle taken with the gravel and the stone. And it is commonly said, That the sea fish called a Nettle taken in wine, is very good therefore: like as another named in Latine Pulmo Marinus, boiled in water. The eggs of spawne that the Cuttill fish doth cast be diureticall, and prouoke vrine, whereby also they cleanse the kidnies from the phlegmatick humors there gathered. Riuer crabs or crabs fishes stamped and taken in asses milke especially, doe cure ruptures and inward convulsions. And as for sea Vrchins, if they be stamped prickes and all, and so drunke in Wine, they expell stone and gravel: but to euery Vrchin there must be taken one hemine of Wine, and the Patient ought to drinke it continually vntill he find help: and otherwise their meat is good to be eaten ordinarily for this purpose. To feed also vpon Cockles and Scalops is wholesome for to scour the bladder. Of these shell-fishes those of the male sex be called by some Donaces, by others Auli, whereas the female are named Onyches. The male do prouoke vrine, but the female are the sweeter in tast, and of one colour. The eggs or spawne also of the Cuttill fish moue vrine, as the hath bin said before, and purge the reins. For that rupture wherein the guts fall downe into the cods, it is said, That the sea Hare punned and applied to the place in form of a cataplasme with hony, is singular to reduce them vp into their place. The liuer also of the water-snake or adder, called otherwise Hydrus or Enhydriis, beaten to powder and put in drinke, helpeth those that be giuen to breed the stone and gravel. The pickle that comes of the fish Silurus salted, infused or injected by a clistre into the guts, so that the belly were before emptied from the grosse excrements, cureth the Sciatica. The ashes of Barbles and Mulletts heads calcined, heale and skin vp the galls and frets of the fundament. Now the manner of burning or calcining them is in an earthen pot: and reduced they ought to be into a liniment with hony, before the place be there-with anointed. The ashes also of Cackerels burnt do cure and close vp againe the chaps in the seat: which also are good for the swelling piles and bigs in those parts: Like as the ashes of the tyong Tunies heads salted, called Pelamides: or the Squares named Cybia, with hony. If the tyong will be slipped down and ready to hang out of the body, apply thereto the cramp fish Torpedo, it presently reduceth it and staieth it vp. The ashes of craiffishes brought into a liniment with oile and wax, healeth the chaps and fissures in those parts: so doth the fine powder of the Sea-crab dried and puluerised. The pickle also of the fishes Coracini discusseth and resolueth the biles called Pani. The same effect work the ashes of the garbidge and scales of the shadow-like Sciatha. The sea Scorpion also boiled in wine, so that the said biles or impostumes be fomented therewith: But the hard and shell-like skins of sea Vrchins being wel stamped, and with water brought into a liniment, keepe the said biles downe and repercusse them in the beginning. The ashes likewise of Murrets or Purple fishes serue both waies, whether it be needfull to discusse them in the beginning, or to ripen them, and after they be brought to maturation, for to break them and let them forth. Some physitians for this intent compound a medicine or ointment in this maner: *Recipe* of wax and flax 20 drams, of litharge of siluer forty drams, of Burrets ashes ten drams, of old oile one hemin, *fiat unguentum*. The very fishes alone by themselves, salted, foddren, and so applied, serue in this case. Craiffishes of the riuers punned into a cataplasme and applied vnto the secrete parts, resolute & discusse the puihes that there arise: so do the ashes of Cackerels heads: their flesh also boiled and laid to the place affected. In like manner, the ashes of Perches heads salted and reduced into a salve with honey. The ashes of yong Tunies heads, whiles they are Pelamides, or the rough skin of the fish called * Squatina, burnt. This is the skin which, as I said before, is proper to polish wood and make smooth any workes made thereof: whereby you may see, that euen the sea also doth afford instruments to fit the Joiners and Carpenters hand. The small fishes named Smarides applied vnto the puihes of the sayd priuy parts in the forme of a liniment, do much good. As also the ashes of Burrets or Purples shells incorporate with honey: and the same would be more effectuell, in case that the Fishes bee burned whole, shell, fish and all. Salt fish foddren in honey, and applied, serueth particu-

* Some take it for a Sole, others for a Skate.

larly to extinguish the heat of carbuncles & botches in the said secrete parts. If one of the cods hang down flaggung vnseemely lower than his fellow, some would haue it annointed with the troth that cometh from shell-snails or periwinkles. The flesh of the sea horse roasted, helpeth them that cannot hold their vrine, in case they vse ordinarily to eat therof: likewise the little fish called Ophidion, so like vnto a Congre, if it be taken with a Lillie root. The small fishes found in the bellies of the greater who haue deuoured and swallowed them down, taken forth & burned to ashes, are good in this infirmity to be drunk in water. The ashes of shell-snails, meat and all, burnt, are prescribed by some physitians to be giuen in Signine wine against incontineney of vrine, but principally of Barbary snails. For the gout in the feet, & the diseases of other ioints, the oile wherein a frog was boiled, is soueraigne: so are the guts of the said frog, and the ashes of a toad incorporat with old oile: some put thereto the ashes of all the three kinds of barley, of each an equal weight. And they giue direction to rub also the goutie feet, with a Sea-hare: also to be shod with the skins of Beuers, especially those which are bred in Pontus: like as to wear shoes made of Seals skin: the fat of which fish, is likewise very good. Also the sea-mosse or reits called Bryon, like to lettuce, but that the leaues be more riueled, and grow to no stalke; whereof I haue written heretofore: of a styprick and astringent nature it is; no maruell therefore, if being applied vnto the gout, it mitigat the fury and violence thereof. Moreouer, the common sea-weeds named Alga, of which also I haue treated already; but this caution there would be in the application thereof, That it be not dry. The sea fish called Pulmo-Marinus, cureth the kibes in the heels: the ashes also of the sea-crab, tempered with oile: yea, and the riuer-crabs or Creiffishes burnt and calcined to ashes, if the same be incorporat with oile: like as the fat of the fish Silurus. Moreouer, if other ioints be diseased, it were very good for the easement of their grieffe, effsoons to lay thereto frogs, fresh and new taken: may the best way, by the direction of Physitians, is to split them through, and so to apply them warme. The broth of Limpins, Mussels, cockles, and Wilkes, is very nutritiue, and maketh them fat that vse it. Those that be subject to the falling sicknesse, vse ordinarily (as hath bin said before) to drinke the rennet of the Seale or Seacalf, either with mares milke or asses milk, or els with the juice of the pomgranat: and some are wont to take it in oxymell or honied vinegar: and yet there be others that swallow the same downe by it selfe in forme of pills. And for the same purpose, Castoreum is usually giue vnto such patients fasting, to be drunke in 3 cyaths of honied vinegar or oxymell afore said: but those that effsoons be surprized with the fits, and oftentimes fall thereof, find wonderfull much good by this clistre following: Take of Castoreum two drams, of honey and oile one sextar, and of water as much. But say that one be presently in a fit, the ready meanes to raise him and set him vpright vpon his feet again, is to present vnto his nostrils Castoreum with vinegar, for to smell vnto. The liuer also of the fish named the Sea-cat or Weazill, is giuen in like case: euen as the blood either of Sea-mice or Tortoises.

CHAP. X.

¶ Remedies for feuers of all sorts: also for diuers other infirmities.

THE liuer of a Dolphin eaten before the accesse, cureth all those agues which be not continually, but returne by fits and keep their course. Oile rosat wherein the fishes called Seahorses were suffocated and killed, is singular good to annoint those that be sicke of such agues as come with a cold fit: and the very fish it selfe is most effectuell to rid away the same, in case it be hanged about the necke, or to the arme of the patient. Semblably, the little stones which are found in a Haddocks head at the full of the moone, if they be taken forth and hung about the patient, lapped handfomly in a little linnen bag, serue to drive away such feuers. Moreouer, it is said, that the longest tooth in the head of a riuer Fish called Pagrus, tied to one of the hairs of the patients head, so as he do not see the party who fastened or hung it therto, in 5 daies space will doe the deed: as also the oile wherein a frog hath bene boyled in some carrefour or croffe street turning three waies, cureth those who are sicke of a quartane ague, if they be all ouer annointed therewith; provided alwaies, that the flesh be first throwne away. And yet some ordaine, that they should be strangled or stifled in oile, and then the bodies hung priuily about some part of the patient without his knowledge, and that he be afterwards well rubbed and annointed with the foresaid oile. If one carry about him the heart of a frog either hanging by his necke

But the hollow fores commonly knowne by the name of Fistuloes, are enlarged, kept open, yea G and brought to drines, with tents made of saltfish conueied into them within fine linnen rags: and within a day or two at most, they will rid away all the callositie, together with the dead and putrid flesh within the fores, yea and repress the eating and corrosiue humor in them, if they be wrought into the forme of a salve or emplaster, and so applied. To mundifie vlcers, there is not a fitter thing than stockfish made into a tent with fine lint of rags, and so put into the fore. Of the same effect are the ashes of the sea-vrchins skin. The pieces of the fish Coracinus salted, discusse and resolueth the horapostems named carbuncles, if they be applied: so doe the ashes of the Barble salted and calcined. Some vse the ashes of the head of the said fish onely with hony, or els the very flesh of Coracinus. The ashes of murets tempered with oyle, delay & take down any swelling. The gall likewise of the Sea-scorpion, taketh off the roufe of sores, and bringeth skars that ouergrow the flesh vnto the leuell of the other skin. The liuer of the fish Glanus, causeth werts to fall off, if they be rubbed withall. Also, the ashes of Cackerell heads do the like, if they be tempered with garlick: but for the thyme werts particularly, they vse them raw: the gall likewise of the reddish sea scorpion, and the small sea fish Smarides, punned and brought into a liniment do the like. The grosse pickle sauce called Alex, if it be made through hot, cures the raggednesse of nails: the ashes also which come of Cackerell heads, do extenuat and make them fine. The fish Glauciscus eaten in the own broth, causeth women to haue store of milke: so doe the small fishes called Smarides, taken with ptisan or barley gruell, or els boiled with fennell: and in case they haue sore breasts the ashes of Burrets or Purple shells incorporat with honey, doe heale effectually. A liniment made of Sea-crabs or fresh-water Creiffishes, takes away the offensive haire: that grow about womens nipples or breast heads: the fleshy substance also of the Burrets applied to them, work the same effect. A liniment made of the fish called a Skate, will not suffer womens paps to grow big. A candle-wicke or match made of lint, and greased al ouer with the oyle or fat of a dolphin, and so set a burning, yeeldeth a smoake which will raise women againe, lying as it were in a trance and dead vpon a fit of the mother: the same do Macquerels putrified in vinegre. The ashes either of Pearch or Cackerell heads tempered and incorporat with salt, fauerie and oyle, serue for all the accidents of the matrice, and more particularly in a perfume, bring down the after-birth. Semblably, the fat of a Seale or Sea-calf, conueighed by meanes of fire in a perfume vp into the nostrils of a woman lying halfe dead vpon the rising and suffocation of the matrice, bringeth her to her selfe againe: so doth it also, if with the rennet of the same Seale, it be put vp in wooll after the manner of a pessarie, into the priue parts. The ashes of the Sea-fish called Pulmo, applied conueniently to the region of the matrice, and kept fast thereto, purgeth women passing well of their monethly fleurs: of the same operation are Sea-vrchins stamped alieue, and drunk in some sweet wine: but the riuier Creiffishes likewise punned and taken in wine, do contrariwise stay the immoderat flux thereof. Likewise it is said, that a suffumigation of the fish Silurus, especially that which breedeth in Africa, causeth women to haue more speedie and easie deliuerance in childbirth: as also, that Crabfishes drinke in water, doe stop the excessiue ouerflowing of their monethly terms; whereas with *hyssop they set them a going and purge them away. Say that the infant sticke in the birth, and by reason of painful labour be in danger of suffocation, let the mother drinke the same in like manner, there will present help ensue. Women with child vse also either to eat them fresh, or drink them dried, that they may go out their full time, and not slip an abortiue fruit. Hippocrates vseth the same, and prescribeth vnto women for the bringing down of their sicknesse, and likewise to thrust out the infant dead in their wombs, to drinke them in honied wine with fine dock roots, stamped together with rue and foot: and in very truth, foddren with sorrel or docks and parley, they force womens months to come downe speedily, if the broth be drunke; and withall, bring plentie of milke into nurres breasts. If women haue an ague, and the same accompanied with head-ach & much twinkling or inordinat palpitation of the eies, it is thought they shall find much good by drinking them in some hard and austere wine. Castoreum taken inwardly in honied wine, is singular to helpe forward womens monethly purgation: the same being held to their nostrils with vinegre and pitch to smell vnto; or put vp beneath in manner of a suppositorie, after it is reduced into the forme of trochitques, helpeth them when by rising of the mother they are in danger of strangulation. For to bring away the after-birth, it auaileth much also for women to drinke the said Castoreum with Panaces in foure cyaths of wine: as also it is certaine, that who-

*Hyssop, other-
wise Oxypp,
is the tried
greace of vn-
washed wooll.

A Souer take the weight of three Oboli thereof, shall auoid the danger that may come to them by extremitie of cold. Moreouer, if a woman great with child chance to goe ouer a place where lieth Castoreum, or to step ouer the Beuer it selfe (which is the beast that beareth it) she shall be deliuered before her time; yea she shall be in great danger vpon her deliuerance, if the same be but born ouer her where she lieth. A wonderfull thing it is that I read of the crampfish Torpedo, namely, That if it be taken while the moone is in the signe Libra, and be kept for three daies together abroad in the open aire; so often afterwards as it is brought into the rounce where a woman is in trauell of childbirth, she shall haue easie and speedie deliuerance. In this busines also it is thought expedient, that the prick which a Puffin or Forkfish hath in the taile, be applied and tied fast to the nauell of a woman; provided alwaies, that if it be taken forth of the fish alieue, and then the same fish be let goe againe and throwne into the sea. I read in some writers of that which they call Ostracium, to be the same that others name Onyx; but call it what you will, a suffumigation made thereof, is of wonderfull effect to ease the pain and grieve of the matrice. I find, that it hath the smell of Castoreum, and if it be burnt together therewith in a perfume, the more good will ensue: as also that the ashes thereof calcined, heale all inueterat vlcers, and such as are morimals and come any ordinary cure. And verily, the same authors doe report, that for carbuncles, cancers, and such vntoward sores, as arise sometimes about the priuities of women, the most present & assured remedy that is to heale them, is the female Sea-crab, stamped after the full of the moone with the finest powder of salt, called the flour thereof, and water together, and so reduced into the forme of a salve or liniment. The bloud, gall, and liuer C of the fish Tunie, ether taken fresh or old kept, be all of them depilatories, for they fetch away hair and hinder it from growing: the liuer therof punned, and together with the rosin or oyle of cedar incorporat and kept in a leaden box, hath the same effect. This was the deuise that the famous midwife Salpe had for boies, to make them beardless and appeare alwaies young, and to set them out the better for sale. Of the same operation is the fish called Pulmo Marinus, the Sea-hare likewise, I meane the bloud and gall of them both: and as for the said Sea-hare, being but stifled & killed in oyle, it is as effectual. The ashes of the Sea-crab and Scolopendre both, the Sea-nettle (a fish so called) incorporat with vinegre squillitick, the brains of the crampfish Torpedo tempered with alume, be all depilatories, if the place be anointed therewith the morrow after the moon is at the full. The bloody moisture that comes from the little frog, which I D describer heretofore in the cure belonging to eies, is the strongest depilatorie that is, and worketh most effectually, in case the part be dressed therewith while it is fresh and new: and the frog it selfe dried and stamped, and anon after boiled in three hemins of vinegre till one of them be consumed, or in oyle after the same manner in some brazen pan, is a sure medicine to take away haire, and hinder the coming vp of it againe. In the same measure of liquor, some put fiftene frogs, and make thereof an excellent depilatorie, like as I haue said already among the remedies appropriat to the eies. Moreouer, horsleeches torrified in some earthen pan, and brought into a liniment with oyle, worke the same effect in the hairs: the very perfume or smoke which they cast as they be burnt or torrified, killeth Punaifes, if they either flie or be brought into the aire thereof. Furthermore, diuers haue bene knowne to vse Castoreum and hony in a liniment for E many daies together, as a notable depilatorie. But in vsing any depilatorie whatsoeuer, this one point is generally to be obserued, That the haire be first pulled vp by the roots, in any place, where they would not haue them to grow.

To come now vnto the gumbs of children, and their breeding of teeth: the ashes of dolphins teeth mixed with hony, is a souerain medicine: yea, or if you do but touch their gumbs with a dolphins tooth all whole as it is, the effect thereof is admirable: the same hanged about their necks, or tied to any part of the body, riddeth them of sodain frights, wherunto infants are much given. Of the same effect is the tooth also of a dogfish. As for the vlcers or sores incident to their eares, or any other part of their body, the broth of riuier creiffishes thickned with barley meal, heales them. For other diseases also of breaking out, a liniment made of them and oyle F incorporat together in a mortar, is singular good, if they be anointed all ouer therewith. Touching the hot distemperatures and inflammations of the head, wherto little babes be much subiect, a sponge actually cold applied to the place, and oftentimes wet, is a good meane to cure the same: but a frog turned inside outward hath no fellow, if it be bound fast vnto the head: for they say, that it may be found all drie vpon the head with drawing the heat so forcibly to it.

A Barbledrowned in wine, or the fish called a Rocher, or also two Eeles, likewise the fish named the Sea-grape putrified in wine, do infuse this vertue into the foresaid wine, That whosoever drinke thereof, shall haue no mind afterwards to any wine besides, but fall into a dislike and loathing thereof.

The stay-ship Echeneis, the skin of a Sea-horse forehead, especially toward the left side, wrapped within a little linnen cloth, and so hanged about one; or the gall of a liue Crampe-fish, applied vnto the genital members in manner of a liniment, be all means to coole the wanton lust of the flesh: contrariwise, the flesh of riuer Creffishes powdred and kept in salt, giuen in wine to drinke, do stir and prouoke the appetite vnto venerie. Moreouer, to feed vpon the fishes called Erythrines ordinarily at the table: to hang about the necke the liuer of the frog called Diope-tes or Calamita, within a little piece of a cranes skin; or the jaw tooth of a Crocodile fastened to any arme; either els the Sea-horse, or the sinewes of a Toad, bound to the right arme, incite greatly to wantonnesse and lecherie. Put a toad within a piece of a sheeps skin newly flaid, and let one weare it tied fast about him, he shall forget all loue and amitie for euer.

The broth of frogs boiled in water, do extenuat the scurvie thicke rouse in the farcins or mangé of horses, and make way that they may be bathed and anointed: and verily it is credibly affirmed, that if they be cured after this manner, the scab will neuer returne againe. The expert midwife *Salpe* affirmeth for certain, That doggs will not barke, if there be giuen vnto them in a morcell of bread or gobbet of flesh, a liue frog.

In this discourse of Warer, and the things concerning it, somewhat ought to be said as touching Calamochnus, which otherwise in Latine is named Adarca: it groweth about small canes or reeds, and is engendered of the froth of sea water and fresh water together, where they both meet and are intermingled: a causticke qualitie it hath; in regard whereof, it entrench into the compositions called Acopa, which serue for lassitude, and those that are benumbed with cold. It is employed also in taking away the pimples or spots in womens faces like to lentils.

As for Reeds and Canes, this is their very proper place also, wherein they should be treated of. And to begin with that reed or cane called Phragmitis, which is so good for mounds & hedges; the root thereof Greene gathered and punned, is singular for dislocations, and the paine of the backebone, if the place affected be annointed with it, incorporat in vinegre. But the rind of the Cypryan cane, which also is named Donax, burnt into ashes, is singular for to recouer haire againe where it was shed by occasion of sicknesse, and to heale old vlcers. The leaues also serue very well to draw forth any spills, pricks, or arrow heads that sticketh within the flesh, yea and to extinguish *S. Anthonies* fire. As for the floure or downe of their carkins, if it chance to enter into the eares, it causeth deafenesse. The blacke liquor resembling inke, which is found in the cuttle-fish, is of that force, that if it be put to the oile of a lamp burning (*Anaxilaus* saith) it will cuttle-drown and put out the former cleare light, and make all those in the room to looke like black-mores or *Aethiopians*. The hedge frog, otherwise called a toad, boiled in water and giuen to swine among other drasse to drinke, cureth all their diseases: and of the same effect are the ashes of any other frogs besides. Rub a piece of wood with the fish called Pulmo Marinus, it will seem as though it were on a light fire; in so much as a staffe so rubbed or besmeared with it, may serue in stead of a torch to giue light before one.

CHAP. XI.

¶ That there be of fishes and other creatures living in the Sea, one hundred seventie and six severall and distinct kinds.

HAuing thus treated before sufficiently of the natures and properties of Fishes, and such creatures as the water doth yeeld; it remaineth now for a final conclusion, to present vnder one view, all those fishes name by name, which are engendered and nourished not only in those mediterranean and inland arms of the sea, which for many a mile take vp a great part of the continent and firme land, but also in that vast and wide ocean without the main, bounded as it were limited only by the compasse and circumference of the heauen: and those, namely as many as be knowne, may be reduced all into 176 kinds: a thing which cannot be done either in the beasts of the land or foules of the aire. For how is it possible to decipher & particularize the wild beasts and foules of India & *Aethyopia*, of the desarts, and of *Scythia*, which we are not

come

A come to the knowledge of, seeing we haue found so many different sorts in men, of whom wee haue some notice and intelligence: to say nothing of *Ta probane*, and other Islands lying within the Ocean, whereof so many fabulous reports are deliuered: certes, there is no man but hee prize all sorts of creatures which the earth & aire do yeeld. Howbeit, those that are bred in the Ocean, as huge and vast as it is, may be comprehended vnder a certaine number: a wonderfull matter that we should be better acquainted with those, considering how Nature hath plunged and hidden them in the deepe gulfs of the maine sea!

To begin then with the greatest monsters and beasts that this vnruely Element of the water doth breed: we find therein the sea-Trees, Whirlepooles, greater Whales, Priests, Tritons [*i. sea Pipes*], Rams, and smaller Whales accompanying the bigger. Besides, other Rams that resemble the ordinary shape of fishes; Dolphins, and the sea Calues or Seales, whereof the Poët *Homer* writeth so much. Furthermore, the sea Tortoises, which serue for roioir, wantonnesse, and excessse: the Beuers, which are so much in request among Physicians. As for the Otters, albeit a kind of Beuers they are, yet because I neuer heard that they came into the salt water, I make no great reckoning of them; for my purpose is to rehearse those only which inhabit or haunt the sea: moreouer, the sea Dogs: the Curriers, Pofts, or Lacquies of the sea: the horned fishes: the Swordfish or Emperour of the sea, and the Sawfish.ouer and besides, those which liue indifferently in the sea, the land, & the riuer, to wit, the water Horses and the Crocodiles: others againe that ordinarily keepe in the sea, and yet come vp into the riuers, but neuer land, to wit, the Tunnies, as well the growne Thunnies, as the yonger sort, Thunnides or Pelamides. The Siliuri, the blacke Coracini, and Perches. As touching those that neuer came forth of the sea, the Sturgeon fish Box, Baris, Banchus, Barrachus, and Belone, with all the kind of those which wee call Needle fishes, and also Balanus. The sea Raven Corvus, and Cytharus: all the sorts of the Chrombi: the Carpe, Chalcis, and Cobio: Callarius of the Cods kind, but that it is lesse: Corbatica, a fish resembling Lizards: of which and of the young Tunie Pelamis (both bred in Mæotis) being chopped and cut into pieces & so salted, are made those Quadrants or Square rands, called Cybia. For this you must vnderstand, that the Tunie is called Pelamis, when after 40 daies he returneth out of Pontus or the Euxine sea into Mæotis: whereas the said smal Pelamis taketh the name of Cordylus, when it goes first forth of the said great lough or lake Mæotis, and enters into the sea before named. Moreouer, in this said meer Mæotis be these fishes be- tides, to wit, Cantharus, Callionymus, otherwise named Vranoscopus, and Cinædi, which bee the only fishes that be all ouer yellow; Cnide, which we in Latin call Vrtica, the Nettle, al the sorts of Crabs, the gaping smal Cockles and Muskles, whether they be the rough Chamæ-trachæ, the smooth Cnamæ-leoi, or the Chamæ-peloridae: which be of diuers kinds distinct from another, both in forme of roundnesse, and variety of colours: as also the Cockles named Chamæ-glycimerides, which be bigger than the former Pelorides, together with those that the Greekes call Colycia or Corophya. Moreouer, sundry sorts of other shell fish, and among them those that engender and beare pearles, and thereof be called Mother-pearls. The wilkes also and winckles which resemble shell-shailes: of which kind are the Pentadaetyles, Melicembales, and the prickly Echinophoræ, whose shells serue to sound or wind withal.ouer & besides these shell fishes, are those winkles of a round forme, the shells whereof are much vsed to lade vp oyle. Furthermore, the sea Cucumber and Cynopus, the sea Craffish Cammarus, Cynoflexia, and the sea Dragon. As for that which is named Dracunculus, some are of opinion, That it differeth from the foresaid Draco, and like it is to the Chough-fish Gracculus, sharpe pricks it hath in the gills, and those pointing toward the taile: like as the sea Scorpion, which thereby woundeth and hurte those that would seem to take it vp in their hands. There is besides the Erythinus, the stay-ship Echeneis, and the sea Vrchin. The black Elephants also, which be the black kind of the Lizards, hauing foure feet, and those clouen & two-forked; besides two arms with two joints apiece, and each of them armed with a little forked cleve, and closing in manner of teeth. Then haue you the fish called Faber or Zeus, that is, the Goldfish or Doree. All the sorts of Glaucifus, the Glanis, the Gonger, or Conger, the Hearing or Pilchard Gerries, Galeos, and *Garus, *Which some take for the Pike eel, Also

* Which are a
kind of oysters

Also the coast Crabfish called Hippeus, or Sea-horseman Hippuros; the sea Swallow fish, Halieupomus, or Pulmo Marinus; the sea-lights, heart-fish, the liuer of the sea, and Helacathenes. All the sorts of the sea-Lizards: the flying Calamari: the Locusts and Lanternes of the sea, Lyparis, Lamyrus, the sea Hare and sea Lions, which haue cleies or armes in maner of Crabfishes, but in other respects resembling Locusts. The Barble, the Merling or Whiting (among stone-fishes well esteemed) and the Mullet: the black taile Perch (which some take for a Ruffe, others for a sea Bream:) the Cackerell, the Meryx, the Lamprey, the little Muske, the Limpin, the Myfcus, and the Burret. The seven-eye Oculata, the Ele-pout Ophidion, the Oistre, the * eares of the sea called Otia, & Orcynus. This fish of the Tunie kind named Pelamides is the biggest, and neuer returneth again into Mæotis, like vnto a Triton; & the meat thereof is the better for age. The Lompe, Paddle, or sea Owle, and the grunting Molebout: moreover, the fish Phager, the Mole or Lepo counted among stonefishes, and the Pelamis, the greatest of which kind is called Apolectus, and harder it is than the Triton, also the sea-god Phorcus, and Phritharus: the Plaice or Hallbut, & the Puffin: all the kinds of Pulpes or Pourcuttills. The greatest Scallops also, and those which during Summer be blackest, whereof the best sort be those which are taken about Mytlenæ, Tyndaris, Salona, Altinum, Antium, and the Island Pharos neere to Alexandria in Ægypt. Also the little Scallops, the Purples, & the sea Perches, named Percides: the Nacres and their hunters, called Pinnothere. Ouer and besides, the fish called Skate, which some will haue to be Rhina in Greek, & named by vs in Latine, Squatus, and the birt or Turbot: the Guilthead Scarus, which at this day is thought to be a principal fish: the Sole, the Sargus, the Shrimp, and the Sarda, for so they call the long Pelamis when he comes out of the Ocean. The Maquerel or Scomber, the Stockfish, the Sparus, Scorpæna, Scorpions, Sciadeus, Sciæna, the Scolopendra, the serpent fish Smyrus, the Scepines, the shel-fish pointed like a Turbant, Strombus: & Solen, otherwise called Aulus, Donax, Onyx, or Dactylus, all shel-fishes made like kniues: the aff-house oyster Spondilus, and the shel-fish Smarides, the Star, and the Sponge. Then follow the noble stonefish Turdus, and the Thomus Thurianus, sold in pieces or rands cut forth, which fish some call Xiphia, or the Sword-fish. The Theffa, Torpedo or Crampfish, and Tethea. Triton also, which is reckoned among the greater kind of the Pelamides, whereof are made thre square taile-pieces of the Tunie, called Vrea Cybia. Last of all, the Vrenæ, the sea Grape or the Empeurour with a sword, called Xiphias. And here I thinke it not amisse to annex the names of diuerse fishes set downe by the Poet *Ouid*, which are not to be found in any other Authour: But haply those breed in the great sea of Pontus, in which realme he began that booke *De Ponto*, in his later daies. In the first place he nameth * Bopgyrus, which liueth among the rockes: the red Orphus, and the blacke Rhacinus, the painted and streaked Mormyræ, and the golden coloured Chryfos. Moreover, the little Teragus, and Labrus with the faire & pleasant raile. Likewise the Epodes, which are of the broad or flat kind, named Lati. All these be notable fishes: but ouer and besides, he reports the speciall properties and nature of some: as namely that the Chaune doth conceiue of it selfe without a male: that the Glaucus neuer is to be seene in Summer: that Pompilus alwaies accompanieth the ships vnder saile: and Chronius buildeth a nest in the very water. He saith moreover, That Helops is a stranger to vs in this part of the world, and not known in our seas: whereby it is euident that they be deceived who take it for the Sturgeon Acipenser, and yet many reckon this Elops to haue the daintiest tast, and to be the most delicate meat of all fishes. There are ouer and besides other fishes, named as yet by no writer, to wit, that which in Latinewe call Sudis, the Greekes Sphyræna, which (as it should seeme by the name) hath a snout or muffle resembling a sharpe stake or spit, and may for quantitie be counted among the biggest: a rare fish, but of no base and bastard kind. There be also of the Nacres those which are called Pernæ, taken and gathered in exceeding great plenty about the Islands of Pontus: their manner is to stand or sticke fast planted vpon the sea sand, and made they are in fashion of the long shanke of a wine; they gape alwaies toward the coast which is cleare; and neuer doe they hunt for their food, but they yawne at least a foot wide. Teeth there be growing round about the edges of a shell, and those stand thicke together, and when they M shut or close their shels, the foresaid teeth run one betweene another in manner of a combe. In stead of a callostic within, they haue a great lump of flesh. As for the fish Hyæna, I my selfe haue seen one of them taken in the Island Ænaria, which vsed to put forth and draw in his head at his pleasure.

Thus

A Thus much of Fishes worth the naming. For besides these, I am not ignorant that there be other base excrements that the sea voideth and purgeth, which I hold to be very vnfit and not worthy to be ranged among Fishes and liuing creatures, but rather to be reckoned as Kilpes, Reike, and other sea weeds.

THE XXXIII. BOOKE OF THE HISTORIE OF NATURE, WRITTEN BY C. PLINIVS SECVNDVS.

C Of Mettals and Minerals, and their natures.

The Proem.

D **N**ow is it time to enter into the discourse of the Mettals and Minerals, the very riches and precious treasure of the World, which men so curiously and carefully seeke after, as that they sticke not to search into the very bowels of the earth by all the means they can deuise: for some you shall haue (to enrich themselves) for to dig into the ground for mines of gold and siluer, base metall Electrum, Copper and Brasse: others againe vpon a desire of daintie delights and brauerie, to lay for gems and precious stones, for such Minerals (I say) which may serue partly to adorne their fingers, and partly to set out the walls of sumptuous buildings with costly colours, rich marble, and porphyries. Lastly, there bee many, who maintaine rash quarrels, and audacious bloudie murders. In summe there is not a vaine in the whole earth but wee prie and search into it: we follow it also so farre as it goeth. Thus hauing undermined the poore ground, wee lye and goe aloft vpon it, as ouer hollow vaults and arches vnder our feet: and yet we would seeme to wonder, that otherwhiles she cleaueth asunder into wide and gaping chinkes, or else trembleth and quaketh againe: and wee will not see how these be apparant signes of the wrath of this our blessed mother, which we bring and force from her, to expresse the indignation that she taketh for this wrong and misusage. We descend into her entrails: we goe downe as far as to the seat and habitation of the infernall spirits, and all to meet with rich treasure: as if the earth were not fruitfull ynough and beneficiall vnto vs in the upper part thereof, where she permiteth vs to walke and tread vpon her. Howbeit, in all this paines that wee take to ransacke the mines thereof, the least matter of all other is to seeke for any thing that concerneth Physick and the regimēt of our health: For among so many masters as there be of mines, where is there one that would be at such expence of digging, in regard of any medicines. And yet I must needs say, that as the earth otherwise is no niggard, but bounteous and liberall, readie also and easily entreated to bring forth all things good and profitable for vs: so in this behalfe she hath furnished vs sufficiently with whole some drougs and medicinal things that shee hath hidden aboue and fit for our hand, without need of digging deepe for the matter. But these things shee drine and send vs to the duell in hell (as it were) into the bottome, those be they that presse vs downe, grow at all. In such sort, as to consider the thing aright, and not to captiue our spirits to such base matters, How farre I thinke we, will conscious minded men pierce and enter into earth? or when will they make

at:

an end of these mines, hollowing the ground as they doe in all ages from time to time, and making it void G
and emptye? Oh how innocent a life, how happy and blessed, nay, how pleasant a life might we lead, if we
conetted nothing else but that which is about the ground: and in one word, if we stood contented with that
which is ready at hand and euen about vs. But now, not sufficed with the gold which we fetch out of the
mines, we must seeke for the greene earth *Borras* also, which lieth hard by, yea, and giue it a name respectiue
vnto gold, whereby it might be thought more deare and pretious. For why? we thought not the inuention
and finding out of gold alone to be enough for to infect and corrupt our hearts, vnlesse we made great ac-
count also of that vile and base minerall, which is the very ordure of gold and no better. Men vpon a co-
netous mind would needs seeke for siluer, and not satisfied therewith, thought good withall to find out Mine-
rall vermilion, deuising meanes how to vse that kind of red earth. Oh the monstrous inuentions of mans
wit! What a number of waies haue we found to enhance the price and value of euery thing! for painters H
of the one side with their artificiall painting and enameling: the grauers on the other side with their cu-
rious cutting and chasing, haue made both gold and siluer the dearer by their workmanship: such is the
audacitie of man, that hee hath learned to counterfet Nature, yea, and is so bold as to challenge her in her
workes. And wherein is the art and cunning of these artificers so much scene, as in the workmanship
of such pourtraires vpon their gold and siluer plate, which might incite and prouoke men to all kind of vi-
ces: for in proceesse of time we tooke pleasure to haue our drinking boles and goblets engrauen all ouer with
those workes which represent lust and wantonnesse: and our delight was to drinke out of such beastly cups
which might put vs in mind of sinfull and filthy lecherie: but afterwards these cups also were cast aside
and laid away, men began to make but bafe account of them; gold and siluer was so plentifull and common,
that we had too much thereof. What did we then? Forsooth we digged into the same earth for *Cassidonic* I
and *Cryfall*, and we loued to haue our cups and other vessels of such brittle minerals; and the more preci-
ous we held them, as they were more subiect to breaking: so as now adaiies hee is thought to haue his house
most richly furnished, who hath his cupboards best stored with this ticklish ware: and the most glorious
shew that we can make of excessse and superfluitie, is this, To haue that which the least knocke may breake,
and being once broken, the pieces thereof might be worth nothing. Neither is this all, for stay we cannot
here, we are not yet at cost enough, vnlesse we may drinke out of a deale of precious stones. Our cups other-
wise chased, engraues, and embossed in gold, must be set out with *hemerauls* besides: to maintaine drun-
kennesse, to make a quarrell to carouse and quasse, we must hold in our hand and set to our mouth the riches
of *Indi*. So as, to conclude, our golden plate comes behind pretious stones and pearles, and we count it but
an accessarie and dependant, which may be spared.

CHAP. I.

¶ When mines of gold grew first into request. The beginning of gold rings. The quantitie
of gold in treasure among our ancestors in old time. Of the Cavallerie and
Gentrie of the Romanes. The priuledge of wearing
golden Rings.

H that the vse of gold were cleane gone: Would God it could possibly
be quite abolished among men, setting them as it doth into such a cursed
and excessiue thirst after it, if I may vie the words of most renowned writ-
ters: a thing that the best men haue alwaies reproched and railed at, and the
onely meanes found out for the ruine and ouerthrow of mankind. What
a blessed world was that, and much more happier than this wherein wee
liue, at what time as in all the dealings betweene men, there was no coine
handled, but their whole trafficke stood vpon bartering and exchanging

ware for ware, and one commoditie for another, according as the practise was in the time of the
Troiane war, as *Homer* (a writer of good credit) doth testifie. And in that manner (as I take it)
began first the commerce of negotiation among men for the maintenance of their society and
liuing together: for so he reporteth, That some bought that which they stood in need of, for
Bœufes hides, others, for yron or such commodities as they had gotten in bootie from their e-
nemies. And yet I must needs say, that euen *Homer* himself esteemed gold of great price, as may
appear by the æstimate that he made thereof in comparison of brasse, when he saith, That *Glauc-*
cus exchanged his golden armour, worth 100 * oxen, for the [brasse] harness of *Diomedes*,
which

etymologia
etymologia

A which was valued but at nine *Bœufs*: according to which manner practised in those daies, euen
at Rome also (as may appeare by the old records) there were no other penalties and fines impo-
unded that name passed all the amercements that were leuiued. Well, a bad example and prefi-
dent gaue he vnto the world, who first deuised to wear rings vpon the fingers: but who he was
the reports that go of *Prometheus*, I hold them all but fabulous tales: and yet in all the antient
pictures and portraitures of him, he is to be seen by a generall consent of antiquity, with a ring
of yron: howbeit, I suppose that they represented thereby his bonds and his imprisonment, ra-
ther than any custome that he had to wear a ring as an ornament vpon his finger. And verily
B concerning the ring of K. * *Midas*, which if the collet were turned about toward the palm of the
hand, caused them to go inuisible that so wore it: is there any man (thinke you) that judgeth it
not more fabulous than the other of *Prometheus*? But to come more particularly vnto gold, the
greatest credit and authority that it got, was by wearing it in rings vpon the fingers, and those
only and altogether vpon the left hand. And yet this was no fashion at first among the Romans,
whose manner was to vse no other but of yron, to shew that they were good fouldiers, skilfull
and expert in feats of arms. Whether the antient kings of Rome were wont to haue gold rings
vpon their fingers, I am not able to say for certaine. Sure it is, that the statue of king *Romulus* in
the Capitoll hath none. Neither is there any to be seen in the other statues of the Roman kings,
saue only of *Numa*, and *Servius Tullius*; no nor in that of *Lucius Brutus*: Whereat I maruel much,
and especially at the two *Tarquines* kings of Rome, considering that they were descended of the
Greeks, from whence came vp the first vse of these gold rings, how soeuer yet at this day in
Lacedæmon there be none wore but of yron. Howbeit, this is recorded and known for a truth,
That *Tarquinius Priscus*, the first of all the *Tarquins*, honoured a sonne of his with a brooch or ta-
blet of gold pendant at his neck, for that whiles he was vnder 16 yeares of age, and as yet in his
Prætexta, hee had killed an enemy in plain fight. And thereupon was taken vp the manner first,
(which also continued afterward) to hang that * ornament about the necks of those gentlemen
sonnes who were men at armes and serued in the wars on horse-backe, in token of knighthood
and cheualrie: whereas other mens sonnes wore a riband onely. And therefore great *maruell* I
haue at the statue of the said prince king *Tarquine*, surnamed *Priscus*, that it should be without a
D ring on his finger. And yet besides all this, I read, that there hath been some variance and diffe-
rence in old time about the naming of rings: The Greekes imposed a name deriued from the
finger, and called it *Dactylus*. The Latines here with vs in old time named it *Vngulus*: but af-
terwards, as well we as the Greekes termed it *Symbolum*. Certes, long it was first (as appeareth
evidently by the Chronicles) ere the very Senators of Rome had rings of gold. For plaine it is,
that the State allowed and gaue rings only to certain especial lieutenants when they were to go
in embassage to forein nations: and in mine opinion, it was for their credit and countenance,
for that the most honorable personages in strange countries were distinguished from others by
that ornament. And verily, no person (of what degree soeuer) was wont to wear rings, but such
as had received them first from the common-wealth vpon that occasion: & so it serued them or-
E dinarily in triumph, as a token and testimoniall of their vertue and valour. For otherwise, he that
triumphed in Rome, although there was a Tuscan coronet al decked with spangles of gold, born
vp behind and held ouer his head, had no better than a ring of yron vpon his finger, no more than
the slave at his back, who haply carried the said Tuscan chaplet. For certainly in that manner tri-
umphed *C. Marius* ouer *K. Jugurtha*: and as the Chronicles do shew, receiued not a golden ring,
nor tooke vpon him to wear it before his third Consulship. And euen those also who from the
State had golden rings giuen them, in regard of embassage aforesaid, neuer vsed them but when
they came abroad into open place, for within doores they might wear none but of yron: which is
the reason, that euen at this day the wedding ring which the bridegroom sendeth as a token * of
espousals to his bride, is of yron simply without * any stone set in it. Neither, so farre as I can
F finde by reading, were there any golden rings in vse and request about the time of the Troiane
war: for sure I am, that the Poet *Homer* maketh no mention of them at all, who otherwise spea-
keth of the brauery and rich attire of those times. And when he talketh of writing tabletts, sent
ordinarily in stead of letters missiue, when he writeth of cloths and apparels bestowed in chests
and coffers, when he telleth vs of vessels, as well gold as siluer plate, he saith they were all bound
and

and trussed fast with some sure knot, and not sealed vp with any mark of a ring as the order is in these daies. Moreouer, when he reporteth of any challenge made by the enemy to single fight, and sheweth how the captains fel to cast their feuerall lots for the choise of them which should performe the combat, this was neuer done by the signet of rings, but by some other especiall marks that euery one made. Also, when he taketh occasion to speak of the workmanship of the gods, he rehearseth buckles, clasps, and buttons of gold, other jewels and ornaments also belonging to the attire of women, as eare-rings and such like of their making, which at the beginning were commonly made, but he speaketh not one word of golden rings. And verily in my conceit whoeuer began first to weare these rings, did it couertly by little and little, putting them vpon the fingers of the left hand, the better to hide them, as if they were ashamed to haue them openly seene: whereas if they might haue auowed the honouring of their fingers by that ornament, they should haue shewed them at the first vpon the right hand. Now if any man object and say, that the wearing them on the right hand might be some impeachment to a soldier for vsing his offensive weapon which he beareth in that hand; I alledge again, that the hinderance was more in the left hand, which serueth to hold and manage the targuet or buckler defensiuely. I read in the same Poet *Homer* aforesaid, that men vsed to plait & bind vp the tresses of their haire with gold: and therefore I wot not well whether men or women first began the manner of such braiding the locks of the haire.

As touching gold laid vp for treasure, little was there of it at Rome for a long time; for surely, when the city was taken & sacked by the Gauls, and that the Romans were to buy & redeem their peace for a sum of money, there could not be made in all Rome aboue one thousand pound weight of gold. Neither am I ignorant, that in the third Consulship of *Cn. Pompeius* there was embezeled and stolne 2000 pound weight of gold out of the throne or shrine of *Iupiter* within the Capitoll, which had bin there bestowed and laid vp by **Camillus*: whereupon many men haue thought, that there was 2000 pound weight of gold gathered for the ransom of the city. But surely looke what ouerplus and surcrease there was aboue the foresaid weight of one thousand pound, it was of the very booty and pillage of the French, and taken out of the temples and chappels in that part of the city whereof they were masters. Moreouer, that the Gauls themselves were wont to goe to the wars brauely set out and enriched with gold, it appeareth by this one example of *Torquatus*, who slew a Gaule in combat, and tooke from him a massie collar of gold. Apparent it is therefore, that all the gold, as well that of the Gauls, as that which came from the temples abouesaid, amounted to the said sum, and no higher: to the light and knowledge whereof we come by means of reuelation from *Augurie*, which gaue vs to vnderstand, that *Iupiter Capitolinus* had rendered againe the foresaid sum in duple proportions. And hereby the way there cometh to my remembrance another thing, not impertinent to this place: considering I am to treat againe of rings: when the sexton or keeper of this cell was apprehended, and the question demanded, What was become of the treasure aforesaid of 2000 pound which *Iupiter* had in custody, and which now was out of the way and gone? Hee tooke the stone that was in the collar of his ring which he ware, crackt it between his teeth, and presently dyed thereupon: whereby the truth was not bewraied and reuealed, as touching the theefe that robbed the said treasure. Wel, reckon the most that can be, surely there was not aboue 2000 pound weight of gold to be had in Rome, when the city was lost, which was in the 364 yere after the first foundation thereof, at what time (as appeareth by the rolls of the Subsidie booke) there were in Rome to the number of 152580 free citizens. And what was 2000 pound in proportion to such a multitude of people. Three hundred and seuen yeres after, when the temple of the Capitoll was on fire, all the gold to be found therein, as also in all the other chappels and shrines arose to thirteen thousand pound weight, which *C. Marius* the yonger seized vpon and conueied away to the city *Prænestæ*. And all the same was recovered againe and brought backe againe by *Sylla* his enemy, who vnder that title carried it in triumph, besides seuen thousand pound weight of siluer, which he raised out of the spoile of *Marius*. And yet neuertheless, the day before hee had caused to be carried in a pompe of triumph fiftene thousand pound weight of gold, and one hundred and fiftene thousand pound of siluer, which came of the rest of the pillage gotten by that victorie of his.

But to returne againe vnto our discourse of gold rings: I doe not read that they were ordinarily vied, before the daies of *Cn. Flavius* the sonne of *Annus*: This *Flavius* beeing otherwise a

A man of mean and base parentage, as whose grandfire by the father side had bin no better than a slave infranchised: howbeit hauing a pregnant wit of his own, he brought vp daily vnder a good schoolmaster *Appius Claudius* surnamed the Blind (whom he serued as his Scribe, Clerke, or Secretary) he grew into inward credit and fauor with his master, that for his better aduancement he opened vnto him the whole course of dayes pleadable and not pleadable, exhorting and persuading him withal, to publish that secret and myserie to the view & knowledge of the whole city: which the said *Flavius* (after much conference and consultation had with *Appius*) did, and effected accordingly: wherupon he became so gracious with the whole body of the people (who were alwaies before wont to hang euery day vpon the lips of some few of the chief & principal Senators, for to haue the information and knowledge of the said daies) that in the end a bill promulged by him, passed by generall assent of them all, for to be created *Edile Curule* together with *Annicius* of *Prænestæ* (who not many years before had bin a professed enemy, and borne armes against the Romanes) without any regard had in this election, either of *C. Petilius*, or *Domitius*, who were nobly born, & had two Coff. to their fathers, who notwithstanding stood for the said dignitie and honorable place. Nay more, This *Flavius* had a speciall grace besides granted, To be at the same time one of the Tribunes also or Prouosts of the *Communitie*. At which indignitie the Senat took such disdaine, and chafed so for despight and anger, that as we read in the antient Annals and Chronicles of our city, there was not one Senator of them all but laid away his golden rings and gaue vp his place. Many are of opinion (although they be farre deceiued) that the knights and men of arms also did the semblable, and left off their rings the same time.

C And this likewise goeth currant and is generally receiued, That they cast aside the caparisons and trappings of their bard horses; for these be the two badges or markes which cause them to be called Equites, as one would say, knights, men of arms, or horsmen. True it is besides, that in some annals we find it recorded, that it was the nobility only of Rome that gaue ouer their gold rings, and not generally the whole body of the Senat. Wel, how soeuer it was, this hapned when *P. Sempronius Longus* and *L. Sulpitius* were Consuls. But *Flavius* abouesaid, seeing what trouble and discontentment was risen hereupon throughout the city, vowed to erect and build a temple in the honor of *Concord*, if he could reconcile the estate of the Senat, and the order of the gentlemen againe to the common people. And seeing that he could not be furnished with money out of the common treasure of the city, for defraying of charges requisite to this piece of work, he made means to haue certaine extreme vsurers condemned to pay good round sums of money: & with these fines a little chappell he caused to be made all of brasse, and reared it in the place appointed for Embassadors out of strange countries to wait and giue attendance in, called *Græco-stasis*, the which was at the head of the publique grand place or hal of assemblies called *Comitium*: where in a table of brasse he rooke order there should be cut and engrauen the verities of the dedication of the said temple, which was 104 yeres after the temple in the Capitoll was dedicated, and in the 448 yere from the foundation of the city. This is the first and most antient euidence that may be collected out of all the antiquities of Rome now extant, as touching the vsage and wearing of Rings. Another testimony we haue thereof in the second Punicke War; which implieth, that rings in those daies were vsed more ordinarily, as well by commons, as gentlemen and Nobles: for otherwise, if they had not bin so vsually worn as well by one as another, *Annibal* could neuer haue sent to Carthage those three Modij of rings, which were pluckt from the fingers of those Romans who were slain in the battell of Cannæ. Moreouer, the Chronicles beare witnesse, that the great quarrell betweene *Cæpio* and *Drusus* (from which arose the sociall war of the Marrians, and the ruin of the state) grew by occasion of a ring sold in portsale, which both of them would haue had, the one as well as the other. Neither at that time verily did all Senators weare gold rings; for known it hath bin within the remembrance of our grandfathers, that many of them (and such as beare the Pretorship) in their old age, and to their very dying day, neuer wore any other rings but of iron. The same doth *Fenestella* report of *Calpurnius*; and of *Manilius* also, who was Lieutenant vnder *Caius Marius* in the war against King *Tugurtha*. And many other historians affirme the like of *L. Fufidius*, him I meane vnto whom *Scæurus* dedicated that Booke which he compiled of his Life. There is a whole house or family at Rome of *Quinij*, wherein (by antient custome and order) there was neuer any known, so much as the very women, to weare any gold about them. And euen at this day, the greater part of those nations and people who liue vnder the empire of Rome, know not what these rings mean. All the coun-

tries of the East throughout, and Egypt generally, at this time content themselves with simple writings and bare scripts, without any seale or signe manuel set vnto them. But so far off are we in these daies from keeping vs to the plain hoop rings of our ancestors, that as in all things els, so in them also we loue to change and alter euery day, so giuen we are to excesse and superfluitie: for now, many ^{men} haue curiously set in their rings, pretious stones of excellent beautie: for now, many ^{men} haue curiously set in their rings, pretious stones of excellent beautie and most exquisite brightnesse; and vnto their fingers be charged and laden again with the riches and reuenues of a good lordship, they are not adorned and decked to their mind. But I purpose more fully to speake hereof in my treatise of gems and pretious stones. Others again will haue in their rings and stones sundry figures and portraictures as they list themselves engrauen, that as there be some rings costly for the matter, so others again should be as pretious for the workmanship. Yee shall haue many of these wantons and delicate persons make conscience (forsooth) to cut and engrauie some of their pretious stones, for hurting them; and (to shew that their rings serue for somewhat else than to seale and signe withall) doe set the said stones whole and entire as they be. And diuers there are who will not enclose the stone with gold on the inside of the coler which is hidden with the finger, to the end (forsooth) that it may touch the naked skin and be seene through. And such an opinion they haue of these stones, that gold is worth nothing in comparison of many thousands of them now in vse and request. Contrariwise, many there are who will haue no stone at all in their rings, but make them all of massiue gold, and therewith do seale: a deuise that came vp in the time of *Claudianus Caesar* the Emperour. Furthermore, in these our daies some slaues set iron within a collar of gold, in stead of a stone; and others again hauing their rings of iron, yet they adorn and set them out with the most pure and fine gold that may be had. This licence (no doubt) and libertie of wearing rings in this order, began first in Samothrace, as may appeare by the name of such rings: The manner was in old time to weare rings but vpon one finger onely, and namely that which is the fourth or next to the little finger, as we may see in the statues of *Numa* and *Seruius Tullius*, Kings of Rome: but afterward they began to honour the fore-finger which is next vnto the thumbe, with a ring, according to the manner which we see in the images of the gods: and in proceesse of time they took pleasure to weare them vpon the least finger of all: and it is said, that in France and Brittain they vsed them vpon the middle finger. But this finger now adayes is excepted onely and spared, whereas all the rest be sped and charged with them; yea and euery joint by themselves must haue some lesser rings and gemmalls to fit them. Some will haue the little finger laden with 3 rings; others content themselves with one and no more vpon it, wherewith they vse to seale vp the signet that is to signe ordinarily, for this signe manuel (I may tell you) the manner was to lay vp a safe among other rare and pretious things: this might not come abroad euery day, as beeing a jewell that deserved not to be misused by handling commonly, but to be taken forth out of the cabinet or secret closet neuer but when need required: so that whosoever weareth one ring and no more vpon the least finger, hee giueth the world to vnderstand, that he hath a secret cabinet at home stored with some speciall things more costly and pretious than ordinarie. Now, as some there be that take a pride and pleasure to haue heavy rings vpon their fingers, and to make a shew how massiue and weighy they are; so others againe are so fine and delicat, as they thinke it a paine to weare more than one. Some hold it good, for sauing of the stone or collet (if the Ring should chance to fall) to haue the round hoope or compasse thereof wrought hollow or enchaused within, yea and the same filled vp with some lighter matter than is gold, that it may fall the softer. You shall haue many that vse to carry poysen hidden within the collet vnder the stone, like as *Demosthenes* did, that renowned Prince of Greeke Orators; so as their rings serue for no other vse or purpose but to carry their owne death about them. Finally, the greatest mischiefs that are practised by our mighty men in these daies, are for the most part performed by the meanes of rings and signets. O the innocence of the old world! what a heauenly life led men in those daies, when as there was no vse at all of seale and signet? But now we are faine to seale vp our ambries and hogtheads with our signets, for feare we be robbed and beguiled of our meat and drinke. This is the good that cometh of our legions and troupes of slaues, which we must haue waiting and following at our heeles: this commoditie we haue by our traine and retinue of strangers that wee keepe in our houses: inso much as wee are driven to haue our ^{Nomenclatores} Controllers and * Remembrancers to tell vs the names of our Seruants and people

A people about vs, they are so many. It was otherwise ywis by our ancestors and fore-fathers daies, who had no more but one yeoman or groome apiece, and those of the lineage and name of their Lords and Masters: as may appeare by the ordinary names of * *Marci-pores*, and *Luci-pores*: and these had all their viduals and diet ordinarily at their masters board. And therefore there was no great need to keep safely any thing vnder lock and key from such household seruitors: whereas now adayes the cater goeth to the market to provide cates and viands for to be stolen and carried away as soon as they come home, and no remedy there is against it: (for no seale will serue to make sure either such lurchers themselves for filching, or keep the very locks and keies safe and whole that lead to the prouision. And why? an easie matter it is to plucke the rings from their lord and masters fingers that are oppressed with dead sleep, or when they lie adying. And verily we hold in these daies a seale to be the best assurance in contracts that may be: but I wot not how long it is since that custom first came vp. And yet if we consider the fashions and manners of strange Nations, we may peradventure find how these signets came into such credit and authoritie: and namely by the History of *Polycrates* the Tyrant or King of the Isle Samos: who hauing cast into the sea a ring which he loued and esteemed aboue all other jewells, met with the same againe by meanes of a fish which was taken, in the belly whereof the said ring was found. Now this king was put to death, about the two hundred and thirtieth yeare after the foundation of our citie. Howbeit, the ordinarie vse of these signets (as I suppose by all reason and likelihood) began together with vsurie: for prooffe whereof, marke how still at this day, vpon any stipulation and bargain paroll made, off goes the ring presently to confirme and seale the same.

C The which custome no doubt came from old time, when there was no earnest nor gods-pennie more ready at hand than a signet. So as we may conclude assuredly and affirme, That amongst vs here at Rome, when the vse of money and coyne was taken vp, soone after came the wearing of rings in place. But as touching the deuise and inuention of mony, I will write anone more at large.

And now to return againe to my discourse of rings: after they began once to bee in any request, there were none at Rome vnder the degree of a knight or gentleman that carried rings on their fingers; inso much, as a man might know a gentleman from a commoner by his ring, like as a Senator was distinguished from the Gentlemen, wearing rings, by his coat embroidered with broad gards and studs of purple. Howbeit, long it was before this distinction was obserued: for I find that the publicke criers were ordinarily such coats likewise embroidered, as Senators do: as appeareth by the father of *L. Atilius Stilo*, surnamed vpon that occasion *Praconimus*, because his father had bin a publicke Crier. Certes, these rings certified the middle degree, inserted between the Commons and the Nobles: and that name which in times past horses of seruice gaue to men of armes and * gentlemen of Rome; the same now adays sheweth men of worth, and those who are of such and such reuenues. But long it is not since this disorder and confusion begun. For when as *Augustus Caesar* late Emperour of happy memory, ordained decuries of Iudges in criminal matters, the greater part of them consisted of those who wore no other rings but of yron: and those were simply called Iudges, and not Knights or Men of armes: for this name continued still appropriat to the troupes of those gentlemen, who serued vpon horses allowed by the Senat. Moreover, at the first there were no more but foure decuries of Iudges, and hardly might there be found in each of those decuries, a bare thousand: for as yet those of our prouinces might not be admitted to this estate to sit and iudge vpon criminal causes: and euen at this day precisely obserued it hath bin, That none but antient citizens might be Iudges: for neuer any that came newly to their free burgeoisie, were taken into this order and degree.

CHAP. II.

¶ Of the Decuries or Chamber of Iudges vpon record at Rome. How often the name and title of the Romane Cavallerie changed. The gifts and rewards represented vnto valiant souldiers for their braue seruice. And at what time Coronets of gold were seene.

THE chamber of the foresaid iudges consisted of diuers estates and degrees, distinguished all by severall names: for first and foremost, there were of them called *Tribuni æris*, as it were

R r 2

Generall

* the pages or

Equires.

Generall receiuers or Treasurers: secondly, *Selecæi*, chosen from among the Senators: and last of all, those who simply were named Iudices or Iudges, taken from among the knights or men of armes.ouer and besides these, they had others called *Nongenti*, choice men selected from out of all the estates, who had the keeping of those chests or caskets wherein were put the voices of the people in their solemn elections. And by reason of a proud humor in men, chusing themselves names to their owne liking, great diuisions and factions arose in this house and chamber of the foresaid Iudges; whiles one would needs be called *Nongentus*; another *Selecus*, and a third gloried in the title of Tribune or Receiuer. But at length, in the ninth yere of the reigne of the Emperor *Tiberius Caesar*, the whole estate of the gentrie or cauallerie of Rome, was reduced to an vniformitie; and an order was set downe whereby it was knowne who might weare rings, and who might not? which fell out to be in that yere when *C. Asinius Pollio*, and *C. Annius Vetus* were Consuls together, and in the 775 yere after the foundation of Rome city. And verily this vniforme regularity was occasioned by a trifling cause to speak of, and whereat wee may well maruell: and thus stood the case: *C. Sulpitius Galba* desirous in his youth to win some credit with the foresaid Emperour *Tiberius*; and namely, by deuising meanes how to bring *Tavern*, Cooks shops, and victualing houses in danger of the law, and to forfeit penalties; pleaded against them, and complained before the Senat, That those who were the vndertakers and Tenants: were of the foresaid *Taverns*, &c. and made their gaine thereby, had no other meanes to beare themselves out, nor plea to defend their faults and disorders, but their rings. The Senat taking knowledge hereof, ordained an act, That none from that time forward might bee allowed to weare the said rings, vnlesse he were free borne, and that both himselfe, his father, and grandfire by the fathers side were afflicked in the Censors booke 400000 sesterces; and by vertue of the law *Iulia* as touching the publike Theatre, had right to sit and behold the plaies in the first and foremost 14 ranks or seats for knights appointed. Howbeit afterwards, euery man labored and made means one with another, to be allowed to weare this ornament of a ring. Now in regard of these disorders and variances aboue rehearsed, prince *Caius Caligula* the Emperour, adjoynd to the former foure, a fifth Decurie. And shortly after, mengrew to that height and pride in this behalfe of wearing rings, and the company so furcresed, that whereas in *Augustus Caesars* dayes there could not be found knights and Gentlemen sufficient throughout all Rome to furnish those Decuries, by this time they could not be contained all within the Chamber of Iudges or Decuries abouesaid: insomuch as now adaies, no sooner are there any slaues manumised and affranchised, but presently (by their good will) they must be at their rings. A thing that neuer before was knowne in Rome: for aforesetime when a man spake of the iron ring, he was vnderstood presently to point at the Gentlemen and Iudges before named: but the said ornament or badge became so commonly to be taken vp, by one as well as another, that a gentleman of Rome (*Flavius Proculus* by name) indited 400 at once before *Claudius Caesar* Censor for the time being, and declared against them for this abuse and offence. See what inconuenience infused vpon the act of rings! for whiles thereby a distinction was made between that degree & other free-born citizens, straight waies base slaues leapt in, and were so bold as to take that ornament vpon them. And hereby the way, it is to be noted, that the two *Gracchi*, *Tiberius*, and *Caius*, brethren, vpon a certain desire and inbred affection that they had to maintaine and nuzzle the people in sedition, and to beare a side alwaies against the Senat, for to currie fauour with the Commons and to do them a pleasure, deuised first to haue all them called Iudges, who by vertue of the foresaid statute or edict, might weare rings: and this he did to crosse and beare the Senat. But after the state of this sedition was quenched, and the popular authors thereof who stirred & blew the coles were murdered, the denomination of these criminal Iudges (after diuers troubles and seditions with variable and alteratiue fortune) fell in the end to the Publicans and Farmers of the reuenues of the State; and being thus deuolued vpon them, there continued: insomuch as for a good while the said Publicans made vp the third degree betweene the Senators and the Commons. Howbeit, *M. Cicero* when he was Consull re-established the Knighthood & Cauallerie of Rome in their former estate and place, and so far preuailed, that hee reconciled them againe vnto the Senat: giuing out openly, that he himselfe was come of that degree, and by that means by a certain popularity, sought to draw them all to side with him. From this time forward, the men of armes were installed as it were in the third estate of Rome, insomuch as al edicts and publick acts passed in the name of the Senat, People, and Cauallerie of the citie. And for that

* Who onely indeed were to judge causes.

that these knights or gentlemen were last incorporated into the body of the Common-weale, this is the only reason that euen now also they are written in all publicke Instruments, after the People.

As touching the name or title, attributed to this third estate or degree of Horsemen or men of Arms, it hath bin changed and altered oftentimes: for in the daies of *Romulus* and other KK. of Rome, they were called *Celeres*, afterwards *Flexumines*, and in proceesse of time *Trossuli*, by occasion that these horsmen without any aid at all of the Infanterie, had woon a towne in *Tuscane* nine miles on this side *Volfinij*, called *Trossuli*: which name continued in the Cauallerie of Rome, vntill the time of *C. Gracchus* and afterward. And verily *Iunius* (who vpon the great amitie betweene *Gracchus* and him, was surnamed *Gracchanus*) hath left these words in writing as touching this matter: concerning the degree of knights (quoth hee) those who now are called Equites, [i. Horsemen] beforetime had to name *Trossuli*: the change of which name arose vpon this; that many of these Gentlemen, ignorant in the originall and first occasion of the foresaid name *Trossuli*, and what the meaning thereof was, were ashamed so to be called. He alledgeth moreover the cause of the said name: and yet notwithstanding (quoth hee) they cannot away with the name at this day, but are so called against their wils.

To come again vnto our former discourse of gold. There be yet some other points besides to be considered therein, which cause distinction in diuers conditions of men: for our ancestors, willing at all times to honour those souldiers who had borne themselves valiantly in wars, were wont to bestow chains of gold vpon strangers and auxiliaries, such I meane as came to ayd and succour the Romans: but vnto their owne naturall citizens they gaue none other but of siluer: and true it is, that Roman citizens had bracelets giuen them ouer and aboue, which foreiners had not. They were wont also (a thing to be maruelled at) to giue vnto citizens, coronets of gold: but who he was whom they honored first with this reward, I could neuer find in any Chronicle; and yet *L. Piso* hath set downe in his Annals, the first giuer thereof: for *A. Posthumus L. Dictator* (quoth he) vpon the winning of the fortified campe of the Latines neare the Lake *Regillus*, was the first that bestowed vpon that souldier, by whose valorous seruice principally the said bold was forced, a coronet of gold; which he caused to be made of the pillage taken from the enemy. *L. Lentulus* in like manner, being Consull, gaue a crowne of gold vnto *Sergius Cornelius Merenda*, at the winning of a certaine towne within the Samnites countrey. Semblably *Piso* surnamed *Frugi*, bestowed vpon his owne sonne a Coronet of gold weighing five pound, which hee caused to bee made of his owne priuate money: and yet amongst other Legacies in his last Will and Testament, the said Coronet hee bequeathed to the State and Common-wealth of Rome.

CHAP. III.

Other vses besides of gold, as well in men as women. Of Gold in money. When Brasse, Siluer, and Gold, were first stamped and coined. Before Brasse was conuerted into stamped money, how they used it in old time. At what rate and proportion of money were assessed the best houses of Rome, at the first leuying of Subsidies. And at what time gold came into credit and request.

All the gold imploied in sacrifices to the honor of gods, was in gilding the horns of such beasts as were to be killed, and those onely of the greater sort. But in warfare among souldiers, the vse of gold grew so excessiue, that the field and campe shone againe withall, insomuch as at the voiage of *Macedony*, where the Marshalls of the field and colonels bare Armour set out with rich buckles and clasps of gold, *M. Brutus* was offended and stormed mightily at it, as appeareth by his letters found in the plaines about *Philippi*. Well done of thee, *O M. Brutus*, to find fault with such wastfull superfluitie: but why saidst thou nothing of the gold that the Roman dames in thy time wore in their shoes? And verily this enormity and abuse, I must needs impute vnto him (whosoever he was) that first deuised rings, and by that means caused gold to be esteemed a mettall of much worth: which euill precedent brought in another mischiefe as bad as it, which hath continued a long time; namely, that men also should weare about their arms, bracelets of gold next to their bare skin: which deuise and ornament of the arm

is called Dardanium, because the inuention came from the Dardanians: like as the fine golden carkanets Viriæ, we tearme Celticæ; and the necke-laces of gold Virioliæ. Celtibericæ. Oh the monstrous disorders that are crept into the world! But say that women may be allowed to weare as much gold as they will, in bracelets, in rings on euery finger and joynt, in carkanets about their necks, in earrings pendant at their ears, in staies, wreaths, & chinbands; let them haue their chains of gold as large as they list vnder their arms or crosse ouer their sides, scarce-wife, be gentlewomen and mistresses at their collars of gold, beset thicke and garnished with masse pearls pendant from their necke, beneath their waist; that in their beds also when they should sleepe they may remember what a weight of gold they carried about them: must they therefore weare gold vpon their feet, as it were to establish a third estate of women answerable to the order of knights, betwene the matrons or dames of honour in their side robes, and the wiuies of meane commoners? Yet me thinkes, we men haue more reason and regard of decencie, thus to adorne with brooches and tablets of gold, our youths and yong boies, and a fairer sight it is to see great men attended vpon to the baines by beautifull pages thus richly decked and set out, that all mens eyes may turne to behold them. But what meane I thus bitterly to inueigh against poore women; are not men also growne to such outrageous excessse in this kind, that they begin to weare vpon their fingers either Harpocrates, or other images of the Egyptian gods engrauen vpon some fine stone? But in the daies of the Emperor Claudius there was another difference and respect had, That none might carrie the pourtraiture of that prince engrauen in his signet of gold, without expresse licence giuen them by those gracious enfranchised slaues who were in place to admit vnto their lord the Emperor, whom it pleased them: which was the occasion I mities were happily cut off as soon as the Emperour Vespasian (to the comfort and joy of vs all) came once to the crowne: for by an expresse edict, he ordained, That it might be lawfull for any person whatsoever to haue the image of the Emperour in ring, brooch, or otherwise without respect. Thus much may suffice concerning rings of gold, and their vlage.

To come now to the next mischief that is crept into the world; I hold that it proceedeth from him who first caused a denier of gold to be stamped: although, to say a truth, I know not certainly who he was that deuised this coine. As for the people of Rome, sure I am that before king Pyrrhus of Epirus was by them vanquished, they had not so much as siluer money stamped and currant. Well I wot also, that in old time the manner was to weigh our brasse by the Asse, which was a pound weight, and thereupon called As Libralis; and yet at this day, Libella: like as the weight in brasse of two pound, they named Dipondius [As.] And hereupon came the custome of adjudging any fine or penaltie vnder the tearme of [Æris grauis] that is to say, of brasse Bullion or in Masse. From hence it is also, that still in reckonings and accounts whatsoever hath bin laid out or deliuered, goeth vnder the name of Expensa [id est, Expences] as a man would say, weighed forth, because in times past all payments passed by weight. The Latines likewise vse the nowne Impendia, for cost bestowed, or the charges of interest in vsurie about the principall; euen as the verbe Dependere, betokeneth (to pay) because payments ordinarily were performed by poise. Moreover, the vnder treasurers of war, or paymasters in the camp, were in ancient time named Libripendes, for weighing out vnto the souldiers their wages; and their very pay thereupon was called Stipendium, from whence commeth Stipend, a word commonly receiued. According to which manner and custome, all buyings and sellings at this day which passe with warrantise, are vsually performed by interposition of the ballance, which serueth to testifie the realitie of the contract and bargain on both parts.

Touching brasse money, Servius Tullius a king of Rome, caused it first to be coined with a stampe, for before his daies, they vsed it at Rome rude in the masse or lumpe, as Remus mine author doth testifie. And what was the marke imprinted thereupon? euen a sheepe, which in Latine they call Pecus: and from thence proceedeth the word Pecunia, that signifieth money. And note here by the way, that during the reigne of that king, the best man in all Rome was vallew to be worth in goods not about 120000 Asses in brasse: and at this rate were assailed the principall houses of the city in the kings booke: and this was counted the first Classis.

Afterwards, in the 485 yere from the foundation of the city, when Q. Ogulnius and C. Fabius were Consuls, five yeares before the first Punicke warre, they began to stampe siluer money at Rome, and three severall pieces were coined. At what time ordained it was, That the Denarius

* Called also Sigalion.

* He speaketh as I take it for Denarius was a siluer piece: but he meaneth any piece of coine.

A or Denier should goe for tenne Asses or pounds of brasse money; the halfe Denier, Quinarius, should be currant for five; and the Sesterce reckoned worth two and a halfe. Now, for as much as during the first Punicke war against the Carthaginians, the city was growne much behind hand and farre indebted, so as they were not able to goe through the charges which they were to defray, agreed it was and ordained to raise the worth of the brassen money by diminishing the poise: whereas therfore the Asse weighed a pound of twelue ounces, they made the Asse of two ounces: By which deuise, the Commonwealth gained five parts in six; and the Fiscus or city chamber by that means was soone acquit of all debts. But if you would know what was the marke of this new brassen Asse: of the one side it was stamped with a two faced Ianus, on the other side with the beake-head of a ship, armed with brassen pikes. Other smaller pieces there were, according B to that proportion, to wit, Trientes, the third part of an Asse; and Quadrantes the fourth; which had the print of punts or small boats vpon them. As for the piece Quadrans, it was before time called Triuncis, because it weighed three ounces. Howbeit in processe of time, when Annibal pressed hard vpon the city, and put them to an exigent for money to maintaine the wars against him, driuen they were to their shifts and forced (when Q. Fabius was Dictator) to bring downe the foresaid Asse of two ounces vnto one. Yea, and enacted it was, That the siluer denier, which went before time for ten Asses, should be worth * sixteene; the halfe Denier or Quinare, eight; and the Sesterce foure: and by this means the State gained the one halfe full. And yet I must except the money paid to souldiers for their wages: for a Denier vnto them was neuer reckoned about ten Asses. As for the siluer Deniers, stamped they were with the pourtraiture of cohes C drawne with two horses or foure horses, whereupon they were called Bigari and Quadrigati. Within a while after there passed an act promulged by Papyrius, by vertue whereof the Asses weighed not aboute halfe an ounce. Then came Livius Drusus in place, who being one of the Prouosts or Tribunes of the commons, brought in base money, and delaid the siluer with one eight part of brasse. Touching that piece of coine, which now is called Victoriatus, stamped it was by an Act propoed by Claudius, for before his time, those pieces of money were brought out of Sclauonia, and reckoned as merchandise: and stamped it is with the image of Victorie, of which it tooke that name.

Concerning gold coined into money, it came vp threescore and two yeres after the stamping of siluer pieces: and a scripture of gold was taxed and valued at twenty sesterces, which ariseth D in euery pound according to the worth of sesterces as they were rated in those daies, to nine hundred sesterces. But afterwards it was thought good to cast and stampe pieces of gold, after the proportion of fiftie to a pound: And those, the Emperors by little and little diminished still in poise, till at length Nero brought them downe to the lowest, and caused them to be coined after the rate of five and fiftie pieces to the pound. In summe, the very source and originall of all auarice proceedeth from this money and coine, deuised first by lone and vsurie, and continued still by such idle persons that put forth their money to worke for them, whiles they sit still, and find the sweetnes of the gaine comming in so easily. But this greedy desire of hauing more still, is growne after an outrageous manner to be excessiue, and no more to be named couetousnesse, but rather insatiable hunger after gold: in so much as Septimulcius, an inward and familiar friend E of C. Gracchus, forgat all bonds of amitie, and hauing cut off his friends head, vpon promise to haue the weight of it in gold, brought the same vnto Opimius: howbeit, he poured molten lead into the mouth thereof to make it more heauie, and so together with this parricide and vnnatural murder, couened also & beguiled the Commonweale. But to speak no more of any particular citizen of Rome, the whole name of the Romanes hath bene infamous among forraigne nations for auarice and corruption in this kind: as may appeare by the conceit that king Mithridates had of them, who caused Aquilins (a Generall of theirs, whose hap was to fall into his hands) for to drinke molten gold. See what couetousnesse brings home with it in the end.

Now when I behold and consider no more but these strange names of our vessell in plate, which are newly deuised in Greeke from time to time, according as the siluer is either double or F parcell gilt, or the gold enclosed and bound within worke, I am ashamed of it; and the rather, for that in regard of these deuised names and daintie toies, such plate as well of beaten gold, as gilded only, should be so vendible and sell so deare: especially knowing as we do full well, the good order that Spartacus held in his campe, expressely commanding that no man should haue any plate of gold or siluer. A great reproch to vs Romans, that our fugitiues & banished persons should

* And therefore they were called Ratiis of Rates.

* Ordinarily the Romane siluer Denier had the letter X stamped vpon it, but these Deniers had XPI. V. S.

should shew a more nobler spirit than we our felues. *Messala* the great Oratour hath left in writing, That *M. Antonius* vsed to discharge all the ordure and filthy excrements of the body into vessels of gold; yea, and allowed *Cleopatra* likewise to do the same by her monthly superfluities, most shamefully. Noted it was among forreine Nations for excessive licentiousnesse, and that in the highest degree, that *K. Philip* of Macedony was neuer wont to go to bed and sleepe without a standing cup of gold vnder his pillow also, That *Agnon Teius* (a great captain vnder *Alexander the Great*) was giuen to such wastfull prodigality, as to fasten his shooes and pantophles with buckles of gold. But *Antony* aboue named, to the contumelie and contempt of * Nature, abused gold, and imploied it to the basest seruice that is: an act (as much as any other) deseruing pro- scription and outlawing indeed.

* Which had giuen vs gold for vessels of honour.

* For in al they were to pay 10000 talents: reck on a talent at 60 pounds, which is the lesse Article, * *Folia*, I think rather *folies*, i. bathing vessels.

* Some say 75.

But among diuers things besides, I wonder much at this, That the people of Rome, vpon the conquest of so many Nations, imposed vpon them a tribute to be paid alwaies in siluer, & neuer made mention of gold: as for example, when Carthage was subdued, & *Annibal* vanquished, the Carthaginians were inioined for 50 yeres together to make payement yerely of * [12000] pound of siluer only, and no gold at all. Neither can it be thought that there was little gold at that time to be had abroad in the world; for *Midus* and *Crasus* both, were posselt of infinit sums of gold, besides the golden plate and vessell, and other gold which he found ready wrought: and of gold, besides the golden plate and vessell, and other gold which he found ready wrought: and among the rest, certain * leaues, a Plane and a vine-tree, both of beaten gold. In the pillage also of this victory, he gaue away 500000 talents of siluer, and one standing cup that he tooke from *Semiramis*, that weighed 15 talents. And *Varro* mine Author saith, That the poise of the Egyptian talent ariseth to * 80 pound. Besides, there had reigned before time ouer the Colchians, *Silauces*, and one *Eubopes*: who hauing newly broken vp a piece of ground in the Samnians country, is reported to haue gotten out thereof great store of siluer and gold: notwithstanding that the whole kingdome is renowned for the golden fleeces there. And verily this prince had the arched and embowed rouses of his pallace made of siluer and gold: the beames and the pillars also sustaining the said building, yea, the jambes, posts, principals, and standards, all of the same metall; namely, after he had vanquished *Sesofres* K. of Egypt, so proud a prince, that (as *Chronicles* make mention) he was wont euery yere to haue one or other (as the lot fell out) of those kings who were his tributaries and did homage to him, for to draw in his charriot like horses, when he was disposed to ride in triumph. These and such like things haue bin thought K fabulous tales: but haue not our Romans done semblable acts, which the age and posterity hereafter wil think incredible? *Casir* afterwards Dictatour, was the first that in his Edileship, when hee exhibited a solemne memoriall in the honour of his father departed, did furnish the whole Cirque and shew-place, with all things meet for such a solemnity, of cleane siluer; in so much as the chasing stauces and bore-speares were of siluer, wherewith the wild beasts were assaulted: a spectacle neuer scene before. And not long after, *C. Antonius* set forth his plaies (when he was Edile) vpon a stage or scaffold of siluer: after whose example, diuers free cities and townes of the empire haue don the like. Semblably, *L. Murana* and *C. Caligula* the Emperor, erected a frame or pageant to go and rife vp of it selfe with vices, supporting images and jewels in the place of publick pastimes, which was thought to haue in it 124000 pound of siluer. *Claudius Casir* who succeeded Emperor after him, when he rode in triumph for the conquest of Brittain, among other crownes of beaten gold, shewed two that were principall, the one of 7 pound weight, which high Spaine had giuen to him; the other weighing 9 pounds, sent vnto him as a Present from that part of Gaule which is called *Comata*: as appeared by the inscriptions and titles which they bare. *Nero* his successeur, to shew vnto *Tyridates* king of Armenia what abundance of treasure he had, kept the great Theatre of *Pompeius* for one whole day covered all ouer with gold. But what was that furniture in comparison of his golden house, which tooke vp a great part of the city, and seemed (as it were) to be compassed about. In that yere when *Sex. Iulius*, and *Lucius Aurelius* were Consuls (which fell out to be 7 yeres before the third Punicke warre) there was found in the treasury or chamber of Rome, * 700026 pound weight of gold, in Masse or Ingots; M of siluer likewise in Bullion, 92000 pound weight; besides the coine and ready money, which amounted to 375000 Sesterces. The yere wherein *Sex. Iulius* and *L. Marcus* were Consuls, the wit, in the beginning of the sociall warre against the Marcians and other Romane allies, the treasure of Rome arose to 846 pounds of gold in Bullion. *C. Casir* at his first entrance into the

* According to *Budens*.

A the city of Rome, when the ciuill war between him and *Pompey* was begun, took out of the citie chamber 15000 wedges or ingots of gold, 35000 lumps or masses of siluer, and in ready money 40000 Sesterces. And to say a truth, neuer was the city of Rome wealthier than at this time. Moreover, *Amplius Paulus*, after he had defeated and vanquished *Perseus* the Macedonian King, brought into the Treasurie of the Citie a bootie of 3000 pound of gold in weight. After which time the common people of Rome had neuer any tributes or taxes leuiued of them by the State.

* According to *Budens*.

Moreover, this is to be obserued, That after the ouerthrow and destruction of Carthage, the beames began first to be guiled within the temple of the Capitoll, whiles *Lu. Mummius* was Cenfor. And now adaies you shall not see any good house of a priuat man, but it is laid thicke and covered ouer with gold. Nay, the brauery of men hath not staied so, but they haue proceeded to the arched and embowed routs, to the walls likewise of their houses, which we may see euery where as wel and thoroughly guiled as the siluer plate vpon their cupbours. And yet *Catulus* was diuersly thought of in the age wherein he liued, because he was the first that gilded the brazen tiles of the Capitoll.

Touching the first inuentors, as well of gold, as also of all other mettals to speake of, I haue already written in my seuenth booke. As for the estimation of this metall, that it should be chiefe as it is, I suppose it proceedeth not from the colour, for siluer hath a brighter lustre, more like to the day, and in this respect more agreeable to the ensignes of war than that of gold, because it glittereth and shineth farther off: and hereby is their error manifestly conuincied, who commend the colour of gold, in this regard, that it resembleth the starres: for well it is knowne that their colour is not reputed richest, either in precious stones or in many things besides. Neither is gold preferred before other mettals, because the matter is more weighty or pliable than the rest; for lead surmounteth it, both in the one and the other. But I hold, that the reputation which it hath, commeth from hence, That it alone of all things in the world, loseth nothing in the fire: for say that a house be burnt wherein gold is, yet it wasteth not: and looke what gold is committed to the funerall flames, it consurneth not with the dead body, but is found all againe among the ashes. Nay, the oftener it hath bin in the fire, the better it is, and the more refined: in such sort, that the best gold which they call *Oryzum*, is knowne by this, if it be of the same deep red colour that the fire is wherein it is tried. And a principal argument this is of fine gold, if it hardly be kindled & set on fire red hot. Moreover, this is wonderful in the nature of * gold: that in a fire made of light straw or chaff, it wil most quickly become red hot and melt; put the same among the hottest burning coles that can be of wood, vnneath or hardly wil it yeeld to the heat thereof and resolute: as also for the purifying thereof, it ought to be melted with lead. A greater reason there is besides that maketh gold so precious: for that with vse or handling there is little of it lost and wasted; whereas siluer, brass, and lead, if you draw any lines therewith, colour as they go and leaue somewhat behind: they soile their hands also who occupie the same with the substance and matter that sheddeth from them.ouer and besides, there is not a metall will be driuen out broader with the hammer, or diuide easily into more parcels than gold, in so much as euery ounce of it may be reduced into 750 leaues, or more, and each one of them foure fingers large euery way. The thickest gold soile beareth the name at this day of *Prænestium*, for that the Image of Fortune at *Prænest* is aboue all other most richly guiled. The next thereto in goodnesse is the soile or leafe of gold named *Quæstoria*. In Spaine they vse to call by the name of *Strigiles*, the small pieces of that fine gold which is found naturally alone aboue all the rest either compact in some masse, or in manner of sand or grauell; whereas all other parcels of gold taken out of the Mines, need to be fined and brought to their perfection by the meanes of fire. But this gold that I speake of, is gold presently at the first, and no sooner is found, but the matter thereof by and by is consummat and accomplished. Lo how gold is found in the owne nature pure and perfect! As for the other manner of finding and fining gold, whereof I meane to speake anon, it is forced (as it were) and vpon constraint. But aboue all other properties to commend the goodnesse of gold, this especially is to be obserued, That there is no rust nor canker, no nor any filth besides breeding of it selfe therein, which is able either to corrupt the goodnesse, or diminish the weight and substance thereof. What should I say how firme it continueth and dureable against salt and vineger, scorning all their iniuries: and yet otherwise their moisture is able to eat into any other mettals, yea, and to consume and tame all things else

* This haply may be true in ore, for otherwise in fined gold it is not so: & the finer that it is, the stronger fire it asketh to be melted by.

*or rather cor-

A Conduits, and those are to be paved by degrees one vnder another. Besides, there is a kinde of shrub or bush, named Vlex, like to Rosemarie, but that it is more rough and prickly, and the same is there planted because it is apt to catch and hold whatsoever pieces of gold do passe beside. The sides moreover of these canals or trenches, are kept in with planks and boards, and the same borne vpon arches pendant through steep places, that by this means the canale may haue passage and void away at length out of the land into the sea.

Lowhat a worke it is to search out and meet with gold I and verily by this means Spaine is grown mightily in wealth, and full of treasure. In the former work also of sinking pits for gold, an infinit deale of labour there is to lade out the water that riseth vpon the workemen, for feare it choke vp the pits, for to preuent which inconuenience, they deriue it by other drains. As touching the gold gotten by cleauing and opening mountains (which kind of work I called Artu-
B gia) it needeth no trying by the bloome-smithie, for fine it is naturally & pure of it selfe: and found there be whole lumps and masses of this kind, and in this manner. In pits likewise we shal haue such pieces, weying otherwhiles ten pounds and more. These grosse and massie pieces of gold, the Spaniards call Palacra or Palacranca: but if they be but small, they haue a pretie name for them, and that is Baluces. But to come again to the shrub or plant Vlex, whereof I spake before, after it is once dried, they burn it, and the ashes that come thereof, they wash ouer turfs of greene grasse, that the substance of gold may rest and settle therupon. Some writers haue reported, that the countries of Asturia, Gallæcia, and Lusitania, were wont to yeeld euery yere 20000 pound weight of good gold gotten after this sort: yet so, as they all doe attribute the greatest proportion thereof to Asturia: and there is not any part of the world comparable to it either for
C so great fertility of mines, or so long continuance, holding out as they do so many ages. As for Italy, our antient Senat in old time thought good to haue it spared, and they made an Act, forbidding expressly to break any ground for mines: otherwise there is not, I dare be bold to say, a land more plentifull in gold and other mettals. And here there commeth to my remembrance an Act of the Censors extant vpon record, as touching the gold mine of Ictimulus, a towne in the territory or countrey of Vercelles; which Act contained an inhibition, that the publicanes who ferm'd that mine of the city, should not keepe aboute fise thousand pioners together at worke there.

Moreouer, there is one deuise to make artificiall gold, to wit, of Orpiment, a minerall digged out of the ground in Syria, where it lyeth very ebbe, and the painters vse it much: in colour it resembleth gold, but brittle it is in substance like as glasse stones. And verily *Caligula* the Emperour (a couetous prince and greedy of gold) was in great hope to extract gold out of this minerall, and thereupon caused a huge masse thereof to bee boiled, melted, and calcined: and in truth he made therof most excellent gold, but in so small a quantity, that it would not quit for the cost & pains about it; in somuch, as he lost by the bargain: yet his auarice was such, as he would needs make the experiment, notwithstanding that orpiment it selfe was worth foureene deniers the pound: but he sped so bad, that no man afterwards would go about to try the like conclusion.

Gold vntried is of a diuers touch; & generally there is not any but it hath siluer in it more or lesse: for in some places, the gold ore hath a tenth part in weight of siluer, in others a ninth, and there is again that hath a mixture of the eight part. In one gold mine within France, called Albicrarente, there is found in gold the 36 part of siluer, and no more: such mettall is not elſwhere found to my knowledge, and therefore it passeth all other whatſoeuer.

There is a base kind of pale and whitish gold, which hath in it a fifth part of siluer: and whosoever this is found, they call it Electrum. Such mettall lieth commonly in trenches and pits minerrall, and namely with that gold which I called before Canaliense. Moreover, there is an artificiall Electrum made, namely, by intermingling gold with siluer according to the naturall mixture, but if it exceed that proportion of one part to fve, it wil not abide the hammer and the anuill. This white gold also hath bin of great account, time out of mind, as may appeare by the testimony of the Poet *Homer*, who writeth, that the pallace of prince *Menelaus* glittered with gold, electrum, siluer, and yvorie. At *Lindos* (a city within the Island of the *Rhodians*) there is the temple of *Minerua*, wherein Lady *Helena* did dedicate vnto that goddesse a cup made of Electrum: and as the story saith moreover, it was framed and wrought just to the proportion & bignesse of one of her own paps. This property hath Electrum naturally, To shine by candle-light more cleare and bright than siluer. This singulartie and proper vertue it hath besides (if it

be naturall) to discover and shew any poison: for be there poison in a cup of this mettall, a man shall see therein certain semicircles resembling rainbows, & perceiue besides the liquor to keep a hissing and sparkling noise as the fire doth; which 2 signs do certainly giue warning of poison.

As touching statues of gold: it is said, that the first image that euer was knowne to be solid and massie, was that of the goddesse Diana surnamed *Anaitis*, which stood within a temple dedicated to her, which in my Cosmography I haue signified vnder that name, and this was before any brassen statue of that making. This temple in those parts was accounted in regard of the diuine power of this goddesse, most holy and sacred; and such a kind of Image they call *Holophraton*. Howbeit, as religious as the church was, *Antonie* in his voiage into Parthia, spoiled it, and carried away the said Image. And here I cannot forget to put downe a pretty speech, which (by report) an old gentleman and souldier of Bononie deliuered to *Augustus Caesar*, at what time as he was entertained as a guest and supped with the said Emperour at his owne table: for beeing asked by *Augustus*, whether it was true, that the man who first violated this goddesse, died blind, lame, and bereaued of all his limps: he answered, Yea sir, that it is; and that me thinks you should know best, for euen now a leg of his you haue at supper, and *all your wealth besides is come to you by that faccage.

* For *Augustus Caesar* desired *Antonie*, & was mightily enticed by the spoils of him. * And yet other writers say, that *Al Grece* erected that image to honor him withall.

The first man that * caused his owne statue to be made of gold, and the same solid & massie, was *Gorgias Leontinus* the great Orator and Rhetorician, which (to immortalize his owne name) he set vp in the temple at Delphos; and this was about the 70 Olympias: whereby we may see what wealth and gain was gotten in those daies by teaching Oratory and the Art of Rhetorick.

But to come at length vnto the medicinable vertues of gold: certes, diuers waies effectually it is in the cure of many diseases: for first of all, foueraign it is for green wounds, if it be outwardly applied: and if yong children weare it about them, lesse harme shal they haue by any sorcery, witchcraft, or enchantments, that be brought into the house, or practised where they are: howbeit, gold it selfe if it be carried ouer one, is thought to be mischieuous and hurtfull: for in that sort it doth harme also to hens that coue and sit, or ewes that are great with lambe and ready to yeane. But what is the remedy to preuent this mischiefe? marry take the same gold that is thus brought in place to do a shrewd turn, wash it well, and with that water besprinkle them that you would cure. Moreover, gold may be torrifed once with cornes of salt taken to the triple weight thereof; and a second time with two parts of salt, and one of the stone which they call *Schistis*: by this manner of preparing, all the venomous and hurtfull quality that is therein, it doth transfuse into the other things that be calcined or burnt therewith (which must be done vpon an earthen vessell) and it selfe continueth pure and incorrupt still. Now the rest of the ashes separated from the gold, saued in an earthen pot, and incorporat with water into the forme of a liniment, healeth the foule tetter that appeareth in the face: it cureth the same disease also, if the face be rubbed with the said ashes and beane floure together, but then it must be afterwards washed off. These ashes thus prepared, cure the hollow vlcers called fistuloes, and also the hæmorrhoids: but in case you put thereto the * floure of salnitre, it healeth corrupt and putrified vlcers, & such as stink again: the same being boiled in hony with *Nigella Romana*, doth gently loofe the belly, if the naual be anointed therewith. To conclude, *M. Varro* saith, that gold wil cause werts to fall off.

CHAP. V.

¶ Of *Borras*, and the six medicinable properties that it hath: the wonderfull Nature thereof in sodring one mettall with another, and in bringing all mettals to their perfection.

Chryfocolla, called otherwife *Borax*, or green earth, is found in those pits and mines that are digged for gold: and a humor it is at the first, running along the veine of gold, which as it thickneth and groweth muddy, congealeth at length by the extreame cold of winter to the hardnesse of a pumish stone. Howbeit, the best kind of *Borax* we haue known by experience to be ingendered in mines of brasse; and the next to it for goodnes, in those of siluer: otherwhiles also men meet withal in leaden mines, but the same is not so good as that which the gold mines doe yeeld. Moreover, there may be an artificiall *Borras* made in all the said mettall mines, but far inferior to that which is naturall; namely, by letting water gently to run among their veines all winter long vntill the month of Iune: the which water, in Iune & Iuly wil grow to be dry and prooue

A prooue *Borras*; whereby a man may perceiue plainly, that *Borras* is nothing els but a putrified vein of mettall. But this Minerall, if it be of the own kind, differeth from this other which is made by art of man, especially in hardnesse, for much harder it is, and called the yellow *Borax*, or in Latine *Lutea*; and yet it may be brought to that colour by artificiall means, namely by dying with an herb called likewise * *Lutea*: for of this nature it is, that it will take color & drink it in, as well as linnen or woollen. But for to dresse and prepare it for the purpose; first, they pin it in a mortar, then they let it passe through a fine seer, afterwards it is ground or beaten againe, & so it is seerced a second time through a finer seer; whatsoeuer passeth not through, but remaineth behind, must be punned once more in a mortar, & so ground into a small powder: and euer as they haue reduced any into powder, they put it into sundry pots or cruets: then they let the same to lie enufed and soked in vinegre, till the hardnes therein be wholly resolued, which done, to the mortar it goeth againe, where it must be thoroughly stamped for altogether, and so when it is well washed out of one trey or boll into another, they let it dry: after it is thus prepared they giue it a colour with the herb *Lutea* (before said) and alum de plume: and thus you see it must be painted and died first, before it selfe serue to paint or die withall. And herein it skilleth much how pliable & apt it is to receiue the said color; for vnlesse it haue willingly taken a deep tincture, they vse to put thereto *Schyttanum* and *Turbystum*, for so they call two drugs which serue to make it take a color the better. This *Borax* thus died, our painters vse to call *Orobiris*: and two kinds they make thereof, to wit, *Lutea*, the yellow, which they keep for the powder or colour * *Lomuntum*; the other liquid, namely when the said grains or pellets be resolued into a kind of moisture, like drops of sweat. This *Borax* of both sorts, is made in the Isle *Cypros*. The principall and best of all other comes from *Armenia*: in a second degree, from *Macedonia*; but the greatest quantity therof is in *Spain*. The excellent *Borax* is known by this mark especially, If it resemble perfectly in colour the deep and full green that is in the blade of corn wel liking. In our time, & namely in the daies of the Emperour *Nero*, the floore of the grand-cirque or shew-place at *Rome*, was seene paved all ouer with greene *Borax*, at what time as he exhibited goodly fights and pastimes to the people; and namely, when he meant himselfe to run a race with chariots, and took pleasure to driue his horses vpon a ground sutable to the colour of the cloth or liuerie that he * wore himself at that time: and in truth, a world of workemen he brought thither to lay the said paving. All the sorts of *Borax* may be reduced into three distinct kinds: to wit, the rough, valued at seuen denarij a pound; the meane, which is worth fise; and the poudred *Borax*, called also the grasse-green *Borax*, which costeth not about three deniers the pound. As for the sandie or poudred *Borax*, the painters before they vse it, lay the first ground vnderneath it, of vitrioll and * *Parætanium*, and then the *Borax* aloft: for these things take it passing well, & besides giue a pleasant lustre to the color. This *Parætanium* (for that it is most fattie & vnctious by nature, & for the smoothnes besides most apt to sticke too and take hold) ought to be laid first, vpon which must follow a course of the vitrioll ouer it, for feare least the whitenes of the foresaid *Parætanium* do pall the greenesse of the *Borax*, which is to make the third coat. As for the *Borax* called *Lutea*, some thinke it tooke that name of the herbe *Lutea*; which also, if it be mixed and tempered with azure or blew, maketh a greene, which many do lay and paint withall in stead of *Borax*; which as it is the cheapest greene of all other, so is it a most deceitfull colour.

* Sometime it is to be weld or yellows.

* *Lomuntum*, See the beginning of the next booke.

* For some were called *L'assina* that ran for the pitte, i. Green-kins.

* A kind of chalkie earth, or clay, growing neare the sea shore.

E *Borax* doth not onely serue painters, but is much vsed also by Physicians; and namely, to mundifie wounds and vlcers, if it be made into a salve with wax and oile: and dry as it is of it selfe in powder, it hath a desiccative qualitie, and doth conglutinat and sodder very well: being mixed with hony into an electuarie, they giue it inwardly vnto those that haue the squinancie, and cannot draw their wind but sitting vpright, and so it prouoketh vomit. Moreover, it entreteth into many collyries or cie-salues, especially to consume and discusse the cicatrices and filmes growing within the cis: it goeth also to the making of green plasters, such as be applied either to mitigat paine, or to heale the skin. And verily this *Borax* not artificially died, thus employed in Physick, the Physicians call *Acefin*; and is not that which men name *Orobiris*, and which F receiueeth a tincture from mans hand.

Furthermore, there is a *Borax* or *Chryfocolla*, that goldsmiths occupie especially about sodring their gold: & of this kind al the rest take the name also of *Chryfocolla*. This is altogether artificiall, and is made of Cyprian *Verdegri* or rust of brasse, the vrin of a yong lad, and salnitre, tempered all together & incorporat in a brassen mortar, stamped with a pestill of the same met-

* Whereupon it took the name *Chryfocolla*, i. Gold-glasse, or Gold-glaze.

tall. Our countrymen in Latin call this Borax Santerna: with it they vse to fodder that gold especially which standeth much vpon siluer, and is therefore called Argentofum. This kind of gold may be known thus: namely, if it will look bright and cleare vpon the putting of Santerna to it: whereas contrariwise if it hold much vpon brasse (and such gold is named Aërosum) it will haue no lustre at all, but looke dim and dusky vpon the laying of Borax vpon it, and besides will hardly be sodred. But to fodder such gold, there is a proper glue or fodder made, with an addition of gold and the seuenth part of siluer to the rest abouenamed, and all the same stamped and vnited together. And since I am entred into the feat of sodring, it were very meet and conuenient to annex vnto this present discourse, all things els concerning it, that we may vnder one view behold the admirable works of Nature in this kind. The fodder of gold then is Borax, which I haue shewed already. Iron is sodred with the stiffe potters cley Argilla. Brasse ore or Chalmine called Cadmia, serues to vnite and knit pieces of brasse together in masse. Alume is good to hold plates of brasse one to another. Rosin doth fodder lead, and besides is the proper cement of marble: but black lead will join well, by the means of the white: and one piece of tin with another, with the helpe of oile. In like manner, tin will hold vser with a fodder of brasse file-dust, and siluer, with tin. Both brasse or copper, & also yron ore, melt best with an yron made of Pinewood, as also with the Papyr reed in Egypt: but contrariwise gold soone it melts with a fire of chaffe and huls. Quicklime will catch an heat and burne, if water be cast vpon it, and so doth the * Thracian stone: but the same oile doth quench. Fire is most of all extinguished and put out with vinegre, with birdlime, and the white of an egg. No kind of right earth will burn light or flame. Finally, charcole which hath bene once one fire, then quenched and afterwards set a burning againe, is of more force and giueth a greater heat, than that which commeth new from the earth.

CHAP. VI.

¶ Of Siluer, Quick-siluer naturall, Stibium, or Alabastrum. The drosse or refuse of siluer, and litharge of siluer.

IT followeth by good order to write in the next place, of siluer mines, from whence proceedeth the second rage that hath set men a madding: where first and formost this is to be noted, that there is but one means to find siluer, and that is in pits sunke of purpose for it: neither is there any shew at all of siluer to giue light thereof, and to put vs in hope of finding: no sparkes shining, like as there be in gold mines which direct vs to it. The earth that engendreth the veine of siluer, is in one place reddish, in another of a dead ash color. But this is a generall rule, that it is not possible to melt and trie our siluer ore, but either with lead, or the veine and ore of lead. This minerall or metall they call * Galena, found for the most part neer to the veins and mines of siluer. Now by the means of fire, when these are melted together, part of the siluer ore setteth downeward and turneth to be lead, the pure siluer floteth aloft, like as oile vpon water. In all our prouinces, yea and parts of the world to speake of, there be mines of siluer to be found: howbeit the fairest be in Spaine, and yeeld the finest and most beautifull siluer: and the same also like as gold, is engendred in a barraine soile otherwise and fruitlesse, and euen within mountains: look also where one vein is discouered, there is another alwaies found not farre off: which is a rule obserued not in mines of siluer only, but also in all others of what metalls soeuer, and hereupon it seemeth that the Greekes doe call them * Metalla. And verily, strange it is and wonderfull, that the mines of siluer in Spaine which were so long agoe begun by Anniball, should continue still as they do, and retaine the names of those Carthaginians who first found, discouered and brought them to light: of which, one named then Bebelo, & so called at this day, yeelded vnto Anniball daily 300 pound weight; which mine euen at that time had gone vnder the ground and hollowed the mountain a good mile and a halfe: and all that way the Aquitans at this day standing in water, lade the same vp, labouring night and day by the candle or lampe-light, euery man in his turne, and during the burning of a certaine measure of oile, in such wise as they diuert the water from thence, and make a good big riuer thereof, to passe and run another way. A veine of siluer which lieth but ebb within the ground, and is there discouered, the miners call Crudaria, as it were a raw vein. In old time those that digged for siluer, if they met once with allum, were wont to giue ouer their worke and seeke no farther: but of late daies it happened, that vnder alume there was found a veine of white brasse or laton, which fed mens hopes still,

* Some take this for Tin-glasse.

* Which some take for pit-cole, or sea-cole rather, such as commeth from Newcastle by sea: or rather a kind of yeast.

* or, Molybdaena.

* quasi vñ z'ma, one after another.

A and cause them now to sink lower, and neuer rest so far as they can dig. And yet there is a damp or vapor breathing out of siluer mines, hurtfull to all liuing creatures, and to dogs especially. Moreover, this point is well to be marked, that gold and siluer both, the softer that they be and tender, the better they are esteemed: and siluer being white as it is, most men maruell how it commeth to passe, that if one rule paper or any thing therewith, it will draw black lines & fully as it doth.

Furthermore, within these veins and mines abouesaid, there is a certaine stone found which yeelds from it an humor continually, & the same continues alwaies liquid: men call it * Quick-siluer (howbeit being the bane and poison of all things whatsoeuer, it might be called Death-siluer well enough) so penetrant is this liquor, that there is no vessel in the world but it will ear and breake through it, piercing and passing on stil, consuming and waisting as it goes: it supports any thing that is cast into it, and wil not suffer it to settle downward, but swim aloft, vnlesse it be gold only, that is the only thing which it loveth to draw vnto it and embrace: very proper it is therefore to refine gold; for if gold and it be put together into earthen pots, and after often shaking be poured out of one into another, it mightily purifies the gold & casts forth all the filthy excrements thereof; and when it hath rid away all the impurities and grosse refuse, it selfe ought then to be separated from the gold: for which purpose poured forth the one & the other ought to be, vpon certaine skinned leather well tewed and dressed vntill they be soft, through which the quick-siluer may passe: and then shall you see it stand in drops vpon the other side like sweat sent out by the pores of our skin, leauing the gold pure and fine behind it: and verily the affinitie betwixt gold & quick-siluer is so great, that if any vessels or pieces of brasse are to be gilded, rub the same ouer first with quick-siluer before the gold soile be laid on, it will hold the same most surely: many this one difcommodity there is in it, that if the leaues of gold be either single or very thin, the whitenesse of the quick-siluer will appeare through, and make the gilding more pale and wan: wherefore our cunning goldsmiths who would make their Chapmen to pay for their plate as double gilt, when it is indeed but thin laid and single, and so picke their purses, set a rich and deep colour vpon their work for the time, by laying vnder the gold in stead of quick-siluer naturall, the white of an egg, and then vpon it artificial quick-siluer named Hydragryum, whereof I purpose to write in place conuenient. And to say a truth, the right quick-siluer which is of the own kind, is not commonly found in great plenty.

D Ouer and besides, within the same mines and among the veins of siluer, there is found a minerall, which to speake properly is a stone concrete of a certain scum or some, white and shining, howbeit not transparent, which is called by some Stimmi, by others * Stibium, Alabastrum, or Larbason: and hereof there be two kinds, the male and the female; but the female Antimony or Stibium is the better esteemed: for the male is more rude, rough, and rugged, & yet for all that not foweighty, bright and radiant; besides that, it is more charged with sand: whereas the female contrariwise shineth and glittereth plentifully, being also brittle & tender, apt to cleaue easily into plates or flakes, and not to breake into lumps and gobbets.

Touching the vertues of Stibium pertinent vnto physick, astringent it is and refrigerant, but a principal and peculiar medicine to be employed about the eyes; for therupon it was that most men called it Platyophthalmion, for that being put into those ointments that are to * beautifie the eyes of women, (named thereupon Calliblephara) it seemes to extend the compasse of the eyes, and make them appeare open, faire, and * large withall. Antimonie puluerised and incorporat with the powder of frankincense, by the means of gum withall, staith the flux of humors into the eyes, and healeth the fretting and exulcerations incident thereto: being otherwise a proper medicine to staunch the blood that gusheth or issueth from the braine. But for to stop the bleeding of any fresh wound, the powder of Antimony alone is thought to be more effectual: all if the place be strewed withal: which also is a singular thing to heal the old bitings of dogs. It cureth moreover any burn occasioned by fire, in case it be tempered in some conuenient suet and wax, with Litharge of siluer, and Ceruse or White lead, and so reduced into a salue. But for to prepare Antimonie aright, it ought to be well lured all ouer with a certain kinde of paste made of Cow-dung, and then dunged and calcined in an ouen; which beeing done, to bee quenched with Womans milke, and then stamped and brayed very well in a mortar, putting thereto raine water also among, and euer and anon the troubled water ought to be transfused into a vessel of brasse, and clarified therein together with Sal-nitre. As for that which settled in

* or Life siluer.

* We call it, Antimonium.

* And therefore Jon called it, *Antimonium* *quintessentia*, when he reckons vp the deuices that *Quintessentia* had to paint and trim her selfe.

* Which was caused a grace in old time, as may appeare by Homer, who giueth vnto *Quintessentia* the Epithet of *beaute*, (*id est*) broad eyed, as is a Cow or Heifer.

the bottome of the mortar, is held to be the droffe and dregs thereof, standing most vpon lead, and is throwne away as good for nothing: but the pot or vessell whereinto the troubled water afore said was poured, after it is well couered and stopp'd with a linnen cloth, must be suffred to stand all night to take a setling; and the next morrow that which floteth aloft is to be poured out by little and little, and the rest of the liquor to be soked forth with sponges, and separated from the Antimonie. Now, that which resteth in the bottome is taken to be the floure of Antimonie, and so called; which they lay forth in the Sun a drying, couered with a fine linnen cloth, that it should not be ouermuch dried: which done, they beat this fine floure againe in a mortar, and so reduce it into trochiskes. But in this operation of preparing antimonie, about all things regard would be had in the burning thereof, that it be not ouermuch calcined, and so turne into lead. Some in the burning of antimonie vse not dung, as is before said, but rather lap the same about with some grease or tallow: others, after it is well beat and punned, streine it with water through a threefold linnen cloth, & cast away the dregs remaining behind: but the liquor that passed through, they poure out of one vessell into another, and the residue alwaies they gather and saue, which they mix in the composition of plaisters and eie-salues, or collyries.

As touching the droffe or refuse in siluer, the Greeks call it Helcysma: the nature thereof is restrigent & refrigeratiue: it entreteth into plaistres like as lead ore doth (which is named Molybdæna, and whereof I intend to write in my treatise of lead) especially those that are made to heale cicatrice, and skin. Also being injected by way of clistere with oile of myrtles, it cureth teneffms and dysenteries. It is vsed much also in those lenitiue and vntuous plaistres named Linpate, and serueth likewise for the excrecence of proud flesh in vlcers, & for those exulcerations which come of rubbing and fretting, or the running sores and scalls in the head.

Within the mettall mines afore said there is ingendred another mineral, known by the name of Spuma argenti, [i.e. the some of siluer] commonly called litharge, & three sorts there be found of it. The best litharge, of gold, which they call Chrystitis: the second, of siluer, named Argyritis; and a third of lead, which is Molybditis: and many times all these kinds to distinct in color, are found in one and the same lump or puffed loaf of litharge. The best litharge is brought out of the region Attica: the next in goodnesse comes from Spain. Litharge of gold, named Chrystitis, is made of the very mine and vein of siluer, Argyritis, of siluer it selfe; and Molybditis, of the lead which is melted with the siluer: as wee may see at Puteoli, where great store of it is made, and of that place took the name Puteolana. All the sorts of them are made, after that the mettall or matter appropriat vnto them, is thoroughly melted and tried; for it runneth downe from the vpper pan into that vnderneath, out of which it is taken vp with iron broches; and to the end that it might be of a small weight, some wind it about the broch in the very flame of the furnace; and as it may appeare by the very name, it is no other thing but the scum of the ore, or mettall boiling and melting ouer the furnace: from droffe it differeth as much as scum or froth aboue, may from dregges or lees beneath: and as the one is an excrement cast vp from a matter while it is purging it selfe, so the other is the refuse or grounds thereof after it is purged and settled. Howbeit many there bee who make but two kindes of this some or litharge; the one

* or rather,
Peumene

* Spuma argen-
* or rather,
Stercoris.

* Rumpuntur.

* Sterefitis, as it were solid and massiue; the other * Peumene, as one would say, puffed vp and full of wind. As for the third named Molybdæna, they reckon as a thing by it selfe, to be treated of in the discourse or chapter of lead. Now the litharge abovesaid ought for the vse that it is employed about, for to be prepared in this manner: first the lumps afore said are to be broken into small pieces as big as Hæfel nuts, and set ouer the fire againe: thus when it is once red hot by the blast of bellows, to the end that the coles and cinders might be separated one from another, there is wine or vinegar cast vpon it, both to wash, & also withall to quench the same. Now if it be Argyritis, to the end it may look the whiter, they vse to break it to the bignes of beans, and giue order to seeth it in water within an earthen pot, putting thereto wheat and barley lap-ped within pieces of new linnen cloth, and suffer them to boil therewith till they burst: which done, for six daies together they put it in mortars, washing it thrice euery day in cold water, and in the end with hot, and so at length put to euery pound of the said Litharge, the weight of one Obolus of Sal-gem. The last day of all they put it vp into a pot or vessell of lead. Some there be who seeth it with blanched beans and husked barley, and after that dry it in the sun: others think it better to seeth it with beans and white wool, vntill such time as it colour the wool no more black: then they put thereto Sal-gem, changing estoones the water, and dry it for the space of forty

A forty daies together in the hottest season of the Summer. There be againe who think it best to seeth it in water within a swines belly, and when they haue taken it forth, rub it wel with sal-nitre, and pun it in mortars, as before, with salt. Ye shall haue them that neuer bestow seething of it, but only beat it with salt, and then put water thereto and wash it. Well thus prepared as is before said, it serueth for collyries and eie-salues; in a liniment also, to take away the foule cicatrices or scars, the pimples and specks likewise that mar the beauty of women, yea & our dames wash the haire of their head withall, to make it clean and pure. And in very truth, Litharge is of power to dry, mollifie, coole, and attemper; to clenfe also, to incarnate vlcers, and to assuage or mitigate any tumors. Being reduced into the vnguent or plaisters afore said, and namely with an addition of rue, myrtles, and vineger, it is singular for S. Antonies fire. Semblably, being incorporated with oile of myrtles and wax into a ceror, it healeth kided heeles.

CHAP. VII.

Of Vermilion; and of what estimation it was among the old Romans: the first inuention thereof. Of Cinnabaris, the vse thereof in Pictures and in Physicke. The sundry sorts of Minium or Vermilion: and how it is to be ordered to serue painters.

C There is found also in siluer mines a mineral called Minium, i. Vermilion, which is a colour at this day of great price and estimation, like as it was in old time: for the ancient Romans made exceeding great account of it, not only for pictures, but also for diuers sacred & holy vses. And verily *Perrius* alledgeth and rehearseth many authors, whose credit ought not to be disproued, who affirm, That the maner was in times past to paint the very face of *Iupiters* image on high and festiual daies with Vermilion: as also, that the valiant captains who rode in triumphant maner into Rome, had in former times their bodies coloured all ouer therewith: after which manner (they say) noble *Camillus* entred the city in triumph. And euen to this day, according to that ancient and religious custom, ordinary it is, to colour all the vnguent that are vsed in a festiual supper at a solemne triumph, with Vermilion. And no one thing doe the Censors giue charge and order for to be done, at their entrance into office, before the painting of *Iupiters* visage with Minium. The cause and motiue that should induce our ancestors to this ceremony I maruel much at, and canot imagin what it should be: True it is and well known, that in these daies the *Aethiopians* in generall set much store by this colour, and haue it in great request, in so much as not onely the Princes and great Lords of those countries haue their bodies stained throughout therewith, but also the images of their gods are painted with no other colour: in which regard I am moued to discourse more curiously and at large of all particulars that may concerne it.

* To shew the bloody battle is they had fought, and what carnage of their Enemies they had made: for with out much effusion and drawing of their blood they might not triumph.

Theophrastus saith, that 90 years before *Praxibulus* was established chiefe ruler of the Athenians (which falls out iust vpon the 249 yere after the foundation of our city of Rome) *Callias* the Athenian was the first that deuised the vse of Vermilion, and brought the liely colour thereof into name: for, finding a kinde of red earth or sandy grit in the mines of siluer, and hoping that by circulation there might be gold extracted out of it, he tried what he could do by fire, and so by that means brought it vnto that fresh and pleasant hue that it hath: which was the first original of Vermilion. Hee saith moreover, That euen in those daies there was found Minium in Spain, but the same was hard and full of gritty sand. Likewise among the Colchis, in a certaine rock inaccessible, by reason whereof the people of the country were much afraid by shooting at it, to shake and driue it down: howbeit the same was but a bastard Minium. But the best simply (saith he) was gotten in the territorie of the Cilbians, somewhat higher in the country than *Elphesus* in sum, That the said Minium or Vermilion is a certaine sandy earth of a deepe scarlet colour, which was prepared in this order: first they pun and beat it into powder, and then washed it being thus puluerified. Afterwards, that which settled in the bottome they washed a second time. In which artificiall handling of Minium this difference there is, that some make perfect Vermilion of it with the first washing: others thinke the Vermilion of that making to be too pale and weake in colour, and therefore hold that of the second washing to be best. And verily

I won.

* Such are called by Homer, *μυνηρ*.

I wonder not that this colour was so highly esteemed: for euen before time during the state of Q Troy, the red earth called Rubrica was in great request, as appeareth by the testimony of Homer, who being otherwise spary enough in speaking of pictures & colours, yet commends the ships * painted therewith. The Greeks call our Minium by the name of Miltos, and yet some terme it Cinnabari: and hereof arose the error occasioned by the Indian name Cinnabari. For so the Indians call the bloody substance of a dragon, crushed and squeezed with the weight of the Elephants lying vpon them ready to die, to wit, when the said dragons are full with sucking out the Elephants blood before: and now their owne and it are mingled together, according as I haue shewed before in the story of those beasts. And verily there is not a color besides, which expressed the lively colour of blood in pictures so properly as Minium. As for that other Cinnabaris of India, it is most wholsom to be put into antidots, preseruatiues, and countrepoysons, yea H and other souerain medicines to be taken inwardly. But our physicians (belecue me) for that by an error Minium or vermilion is called Cinnabaris, vse in stead of Sanguis draconis, the said Minium, which in very truth is no better than a meere poison, as I will shew anon. Wel, in old time they vsed to draw those pictures and pourtrails which consist of one single colour, and be called Monochromata, with this colour Cinnabaris. They painted also with the Minium of Ephesus, but they gaue it ouer in proesse of time, because such colors were so costly, & required such pains ere they were prepared and made perfect. Besides, both the one and the other were thought to be ouer-quick and stinging in hand; and therefore they betook themselves to the red earth Rubrica and Sinapis, of which colours I will speake more in their proper places. But to returne again to Cinnabaris or Sangdragon, it is sophisticated and corrupted either with Goats I blood, or else with the fruit of Scruoites punned. But the true Cinnabaris or Sangdragon is worth fifty Sesterces by the pound. As for Minium or Vermilion aforesaid, K *K. Iuba* saith, that it groweth plentifully also in Carmania. And *Hermogenes* affirmeth, that *Aethiopia* likewise is not without good store of it. But from neither of those two countries is it brought vnto vs, nor (to say a truth) out of any other place but Spain. The best and most excellent is that which comes out of the territory of Sisapone in the Realm of Granada or Boetia a part of Spain, euen from a Mine of Vermilion there, which payeth a great custome, and yeelds much reuenue to the people of Rome: and there is nothing looked to more streightly for feare of fraud and imposture; for lawfull it is not there to dresse and refine it, but vncocted and crude is it brought to Rome in the masse as it lay within the vein, sealed by the sworn masters of the mine, which yeelds one K a yeare with another 10000 pound weight or much thereabout. At Rome it is washed, and a price there is set vpon it by an expresse Act, namely, That it should not be sold aboue seuentie deniers the pound. But many wayes is it sophisticated, whereby the societie and fellowship of the Publicanes, who had the ordering of it at Rome, robbed the Commonweale, and gained themselves. For a second kind there is of Minium, found almost in euerie mine of siluer & lead, the which is made of a certain stone intermingled in the veins of those mettals after the same is burnt; and not of that red stone which yeeldeth forth the humor that I named before Quicke-siluer: for this stone may it selfe by boiling be brought to siluer, but of other red pieces of earth found together with the said true Vermilion, which are knowne to be barraine and void of the right Vermilion, onely by the leaden hue which they haue: for vnlesse it be in the furnace they L neuer wax red, and then being fully burnt and calcined, they are beaten to powder. This is that Minium of a second sort, and much inferiour vnto those naturall powders and sands of the true Minium, notwithstanding very few there bee that know it. Well, this is that Minium where- with the true Vermilion is sophisticated in the Worke-houses and shops of those Publicanes, whose Companie and Fellowship had the ordering of it; like as it is corrupted also with Scy-ricum. Buphow this colour Scyricum is made I will in due place write hereafter: Certes our painters, to giue the better lustre vnto Minium, yea and to saue charges, haue deuised to lay the first ground vnder it of this Scyricum. Besides this, they haue another cast to gain (or scale rather) by Minium; for by reason that it sticketh to their pensils euer and anon, they wash it off M when they be full: this fetleth down to the bottom of the water, where it remaines, and the painters take it for their auails; but they were as good pick their masters purse who setteth them aworke. But if a man would know the true and sincere Vermilion indeed, it ought to haue the rich and fresh colour of skarlet. As for the brightnesse that is in the second sort, if a wall bee painted therewith, the naturall moisture and dankenesse that commeth from thence will abate the

A the lustre soon. And yet this Minium is taken to be but a kind of rust in mettals, either siluer or lead, as they lie in the mines. Moreouer, the minerall Vermilion found naturally in the foresaid Minium mines of Sisapona, haue no siluer mixed therewith, boyle and trie it in the fire as much as you will. Also the way to find true Minium from false, is by the means of gold: for touch the sophisticated Minium with a piece of gold red hot, it will wax blacke, whereas the true Minium keepeth colour still. [Whereby the way note, That I read it may be falsified with Quicklime:] And after the same maner, if there be no gold at hand to trie it by, you shal soon see the prooffe and find the falsehood by a plate of yron red hot, and vsed accordingly. Furthermore this hath bene obserued, That the shining beams either of Sun or Moone, do much hurt to the lustre of Vermillion, or any thing painted therewith. But what meanes to preuent this inconuenience? B Euen to vernish the wall after the colour is dried vpon it in this manner: Take white Punicke wax, melt it with oyle, and while it is hot, wash the said painting all ouer with pensils or fine brushes of bristles, wet in the said vernish. But when this vermish is laid on, it must be well chafed & heat again with red hot coales made of Gall-nuts held close to it, that the wall may sweat and frie again: which done, it ought afterwards to be rubbed ouer well with cerecloths, and last of all, with cleane linnen cloths, that it may shine again and be likke as statues of marble be. Moreouer, the workemen that are employed in their shops about the making of Vermillion, doe bind vnto their faces in manner of Maskes, large bladders, that they may take and deliuer their wind at libertie, and yet not be in danger of drawing in with their breath that pernicious and deadly powder, which is no better than poyson: yet so, as they may see out of the said C masks neuer thelesse.

To conclude, Vermillion is vsed much in limming the titles and inscriptions of roles and books, it setteth forth the letters also, and maketh them more faire and beautifull which are written in tables ouer sepulchres, be they enriched otherwise either with gold or marble stone.

CHAP. VIII.

¶ Of quicksiluer artificiall, called Hydragryum. Of gilding siluer. Of Touch-stones for to trie the diuerse kinds of siluer.

S O inuentiue is the wit of man, that there hath bene deuised in the world a means to make an artificiall Quick siluer in stead of the true and naturall, and that out of the second kind of Minium which before I called Secundarium. I should erewhile haue spoken therof in the chapter of the right Quicksiluer, but deferred it I haue no further than to this present place. First therefore this is to be vnderstood, that made it is two maner of waies, somtimes of the Minium aforesaid punned with vinegre in morters, and with pestles all of brasse; otherwhiles it is drawn by fire: for they put secundarie Vermilion in an earthen pot well luted all ouer with cley, vpon which is there set a pan of yron, & the same couered ouer the head with another pot, well cemented, vnder which earthen pot abouenamed, there ought to be a good fire made, & the same kept continually with blowing: and thus by circulation there wil appeare a dew or sweat in the vppermost vessel proceeding from the vapors resolved, which being wiped off, will in substance E shew liquid as water and in color resemble siluer: The same liquor is easie to diuide into drops, and as apt again by the lubricitie thereof, to run into an humor. This quicksiluer being by the iudgement of all men a rank poyson, I suppose, that al things reported of Minium as medicinale, be dangerous remedies, vnlesse haply that by inunction of the head or belly, it staies all flux of blood; with this caution and charge notwithstanding, that it neither perce and enter into the inward noble parts, nor touch the wound: for otherwise my conceit is, that it ought not to be used. I see that now adaies siluer only, and in maner nothing els, is gilded by the means of this artificiall Quicksiluer: whereas gold soile should be laid also after the same maner vpon vessels, or any workmanship of brasse: but (as I haue before said) the deceit & fraud that is euery where in the world, which makes men so wittie as they be, hath deuised other means of gilding, and F those of lesse dispence & charge than with any Quicksiluer, according as I haue before declared I canot thus write as I do so much of gold and siluer, but me thinks I must of necessity speak of the stone which they call in Latin * *Coricula*, which in times past was not vsually found in any place but in the riuer Tmolus, as saith *Theophrastus*: but in these daies we find it euery where: some call it Heraclius, others Lydius. Now these stones all the sort of them are but small, not

* i. The touch-stone.

exce-

exceeding foure inches in length, and two in bredth. That part or side which lies about toward G the Sunne when it is found, is thought better for touch, than the other which lieth to the earth. By means of these touchstones, our cunning and expert mine-masters, if they touch any ore of these mettals, which with a pickax or foile they haue gotten forth of the veine in the mine, will tell you by and by how much gold there is in it, how much siluer or brasse, and they will not misse a scruple: a wonderful experiment and the same infallible.

As touching siluer, two degrees there be of it, different in goodnesse, which may be knowne and discerned in this maner: For lay a piece of siluer ore vpon a scilife, plate, or fire pan of yron red hot, if it continue white still, it is very good, if the same become reddish, go it may for good too in a lower degree; but in case it looke blacke, there is no goodnes at all in it. Howbeit, there is some deceit also in this triall and experiment: which may crosse a man in his iudgement: for H let the said scilife or plate lie a time in a mans vrine, be the ore neuer so base that is laid thereupon when it is burning red hot, it will seeme to take a white colour for the time, and deceiue him that shall see it. To conclude, there is another pretty prooffe of siluer fine, if it be brought and burnished, and that is by breathing vpon it: for if the breath be seene thereupon presently as a sweat, and the same passe away incontinently as a cloud, it is a signe of perfect siluer.

CHAP. IX.

¶ Of mirroirs or looking glasses. And of the Egyptian siluer.

AN opinion it was sometime generally receiued and beleued, That no plates might be dri- I uen by the hammer, nor mirroirs made, but of the best and purest siluer: And euen this experiment is falsified and corrupted by deceit. But surely a wonderful thing in Nature this is of these mirroirs of siluer, that they should represent so perfectly the image of any thing that is before them, as they do: which must needs be (as all men confesse) by the reuerberation of the aire from the solid body of the mirroir, which being beaten backe againe from it, bringeth therewith the said image expressed therein. The same reuerberation is the cause that such looking glasses as by much vliage are polished and made subtile, doe in that sort gently driue backe the image represented within them, that it seemes infinitely big in proportion of the body it selfe: such difference there is in them, & so materiall it is, whether they reuerberate and reflect the aire, or receiue and entertaine it. Moreouer, there be drinking cups so framed and fashioned with a K number of mirroirs within, that if there do but one look within them, he shall imagine that he saw a multitude of people, euen as many images as there be mirroirs. There are deuised looking glasses also, which will represent monstrous shapes; and such be those mirroirs that are dedicated in the temple at Smyrna: but this comes by reason that the matter wherof they be made, is in that sort fashioned. For it skilleth much whether mirroirs be hollow, either in manner of a drinking pot, or of a Threidian buckler: whether the middle part lie low and inward, or rise and beare out with a bellie: whether they be set crosse and ouerthwart, or stand bias, whether they hang with their heads bending backward, or bolt vpright: For according as the matter which receiueth the image, is disposed to this or that fashion, or set one way or other, so it turneth the shadowes backe againe: for verily the said image represented in a mirroir, is nothing els L but the brightnesse and clearenesse of the matter which receiueth the same, returned and beaten backe againe. But to go through in this place with all things concerning such looking glasses, and the best known in old time vnto our ancestors, came from Brindis, and those consisted of tin and brasse tempered together. But when siluer mirroirs came in place, those went downe, and these were preferred before them. The first that made them of siluer, was Praxiteles in the daies of Pompey the great. Of late, men had this opinion of siluer mirroirs, That they would represent an image more liuely and truly, in case their backe part were laid ouer with gold.

But to return againe to siluer, the Egyptians vse a deuise to paint it, to the end that they would drinke more deuoutly, seeing their god Anubis painted within their pots. And in truth they rest contented with painting their plate, and neuer graue or chase any pieces. This deuise is growne M into such credit by the precedent receiued from thence, that the statues of siluer caried in a shew at triumphs, be nought set by, vnlesse they be also enamelled & painted black: & wonderfull it is how much more precious they are thought to be when the native brightnes thereof, is thus hid and the light quite put out or blindfolded. The manner of making this black siluer, is thus: They

A They take of siluer and sulphur vif as much of the one as the other, of Cyprian brasse or latton plates (which brasse they call Coronarium) as thin as may be, a third part: these they mix together and melt them in an earthen pot well luted all ouer with cley: and boile they must so long, vntill the lid of the pot doth rise vp and flie open of it selfe. Moreouer, siluer will look black with the yolke of an egge roasted hard and well beaten with vineger and Tripoli.

To come now vnto those that counterfeit money. Antonius whiles hee was one of the three vsurping Triumvirs, mixed yron with the Roman siluer denier. He tempered it also with the brassen coine, and so sent abroad false and counterfeit money. Others there be that make money too light (namely, vnder the lawful proportion) which is, to coin and stamp for euery pound weight of siluer 84 deniers. This enormity grew to this passe, that M. Gracidianus published a law, by B vertue whereof there was an act instituted and ordained for the prooffe and allowance of siluer deniers, what touch and what poise they should haue: by which act of his hee so pleased the Commons of Rome, that there was not a street throughout all the city, but they erected a siluer statue, pourtraied all whole in a gowne in the fauor and honour of M. Gracidianus. But strange it is, and a man would not think it, that this art and cunning deuised for the detecting of falshood and forgerie, is the only means to teach deceit and wickednesse, for many a man will giue too too much for false money: yea, and many siluer deniers for one counterfeit, well and cleanly made: to take forsooth a pattern thereby, and learne to deceiue others.

CHAP. V.

C ¶ Of excessive summes of money in mens hands. Who they were in old time that were thought richest. And when here began largesses at Rome, and money to be scattered and cast abroad to the people.

IN old time men knew no number about 100000: and therefore at this day also in stead of a million we multiply the said number by ten, and say thus in Latine, *Decies centina millia*. A hundred thousand ten times told, and so forward, * repeating alwaies a hundred thousand to the numerall aduerbe, as the sums doth amount. Vsuries, interests, and coined money haue been the cause of these multiplications: and by that occasion also came debts to be called euen vnto

D this age, by the name of *As alienum*. And thereof arose the proud name of *Diuites*, i. Rich, for great monied men were so called. Yet take this withall, That the first man that euer was knowne by that surname * *Diues*, brought a shilling to nine pence in the end, proued Baquerout, & de- feated his creditours. As for M. Crassus, one of that same house, and who gaue the same armes, would commonly say, That no man was to be counted rich, and worthie of that title *Diues*, vnlesse he were able to dispend by the yeare as much in reuenues as would maintaine a legion of fouldiers. And verily his owne lands were esteemed worth *Bis milles sesterium*, that is to say, Two hundred millions of sesterces, Roman: & setting aside *Sylla*, he was the richest Roman that euer was knowne. And yet such was his auarice, that hee could not content himselfe with that

E wealthy estate, but vpon a hungry desire to haue all the gold of the Parthians, would needes undertake a * voyage against them. And albeit by his inestimable wealth he vsurped the title & ad- dition of *Optimus* i. The best, in his time, yet (for me thinks it doth me good to prosecute stil, and inueigh against this insatiable desire of hauing more) we haue known many after him, & those otherwise of base condition, and no better than slaves newly enfranchised, to haue growne vnto greater wealth; and namely three at one time, to wit, during the Empire of *Claudius Caesar*; and those were *Pallas*, *Callistas*, and *Narcissus*, late bondslaves all to the said Emperor. But to let these men passe, as if they were lords still of worldly wealth: in that yeare wherein C. *Asinius Gallus* & C. *Marcus Censorinus* were Consuls of Rome, died C. *Cacilius Claudius*, who signified by his last will and testament, bearing date the 6 day before the Calends of February, the yere about writ- ten, That albeit he had sustained exceeding great losses during the troubles of the ciuil war, yet F he should leaue behind him at the houre of his death, of slaves belonging to his retinue foure thousand one hundred and sixteen; in oxen, three thousand and six hundred yoke; of other cattell 257000 head, and in ready coine, H. S. D C. i. three score millions of sesterces Roman. And besides, he set out for defraying of his funerall charges, * eleuen thousand sesterces, and gaue or- der expressly, to be entered so sumptuously. But what of all this? Set case these and such like

* To wittwen- tie times, or a hundred times, a hundred thousand, &c.

* i. Crassus.

* In which ex- pedition he was taken prisoner by *Servius*, lieutenant general for the king of Par- thia: who strake off his head, and poured gold melted into his mouth to stifle his hu- ger after it.

* H. S. X. i. which if you read by the numerall aduerbe (un- decies) a mean- eth to the said sum a hundred times told.

men gathered together innumerable fums of mony, and an infinit masse of goods, yet they shall come nothing neare to the wealth of *K. Ptolomeus*, who according to the testimony of *M. Varro*, (at what time as *Pompey* the great warred about Iury) maintained 8000 horsemen in pay continually with his own priuat purse: kept an ordinary table within his court of a thousand persons, and those had every man his own cup of gold to drink out of, and at each course and change of meats that came in, new plate was serued vp still to the boord. These guests of his sared so highly, that a man would haue said they had bin franke-fed. But how far short was this mighty and sumptuous prince think ye (for I wil say no more now of kings) in comparison of one *Pythius* a Bithynian, who sent to *Darius* the king a Present of a Plane-tree, all entire of beaten gold, and withall, that famous gold Vine, so much renowned by all writers: feasted the whole army of that mighty monarch, and those were * 788000 men: promising ouer and aboue five moneths H pay for them all, and corne for so long to serue the whole campe, if of five sons that he had of his owne, the king would spare him but one to beare him company in his old age, and not prest him forth to serue in the wars. Certes, a man that heareth thus much of this *Pythius*, might compare him with that rich *Crasus* king of Lydia. But what folly and madnesse in the diuels name is this, to hunger and thirst so much in this life after that, which either is common to base slaues, and may fall vnto them, or els wherof kings themselves can find no end? And thus much of gathering good and heaping riches together.

To come now to the scattering thereof, I finde in the Chronicles, That in the yeare wherein *Sp. Posthumius*, and *Qu. Martius* were Consuls, they began at Rome to make largesses, and to sling money abroad to the common people. And at that time such plenty of coine therewas stirring at Rome, that the City bestowed by a generall contribution vpon *Lu. Scipio*, as much as bare out his charges in exhibiting the solemne games and plaies vnto the people. As for that purse which was made for the funerals of *Agrippa Menenius*, wherein euery man put his sextant, i. the sixt part of an As, I take it to haue been no Largeffe, but a beneuolence to testifie how the people honoured *Agrippa*, and a supply of meere necessitie, considering how poore the man died.

CHAP. XI.

¶ Of the superfluitie and frugality both, of men in times past, touching plate and siluer vessels. Of beds and tables of siluer. Also when there were deuised chargers and platters of Siluer to be made of huge capacity beyond all measure.

THE world is giuen to so much inconstancy as touching siluer plate, that a wonder it is to see the nature of men how variable they be in the fashion and making of such vessel: for no workmanship wil please them long. One while we must haue our plate out of *Furnius* his shop; another while we will be furnished from *Clodius*: and againe in a new fit, none wil content vs but of *Gratius* his making (for our cupboords of plate & tables, forsooth, must beare the name of such and such Goldsmiths shops.) Moreouer, when the toy takes vs in the head, al our delight is in chased and embossed plate, or els so carued, engrauen, and deep cut in, as it is rough againe in the hand, wrought in imagery or floure-work, as if the painter had drawne them. And now a daies we are growne to this passe, that our dishes are set vpon the table borne vp with feet and supporters to sustaine the viands and meat therein, but in any wise their sides must be pared very neere; for herein I may tell you lieth a great matter, and the more that the sides and edges hath lost by the file, the richer is the plate esteemed to be.

As touching the vessell seruing in the kitchen: did *Calvus* the noble Oratour complaine in his time that it was of siluer? Why, wee in these dayes doe more than so, for wee haue deuised that our coaches should bee all siluer, and these curiously wrought and engrauen. And within the remembrance of man, euen in this age, *Poppaea* the Emperesse, wife to *Nero* the Emperour, was knowne to cause her Ferrers ordinarily to shooc her coach-horses and other palfreys for her saddle (such especially as shee set store by, and counted more daintie than the rest) with cleane gold. To what excesse and prodigalitie is the world now grown to? *Scipio Africanus* the second of that name when hee dyed, left no more vnto his Heire in Siluer Plate and Coine than two and thirte pound weight: and yet this worthie Knight, when hee rode in triumph for the conquest

A quest of the Carthaginians shewed in that solemne pompe, and brought into the chamber of Rome as much treasure as amounted to * foure thousand foure hundred and seuentie pounds weight of siluer, a thousand times old. This was all the treasure in siluer that the whole state of Carthage was able to make in those daies; Carthage (I say) that great and proud city which pretended a title to the Empire of the world, and maintained the same against Rome: and yet see! in this age there is as much laid out in our cupboords of plate, and furniture of our tables. The same *Africanus* afterwards, vpon the winning and final ruine of Numantia, gaue among his souldiers in a triumph, 17000 pound weight of siluer: O braue souldiers, and worthy so noble a captain, who stood contented with such a reward. A brother of this *Scipio*, surnamed *Allobrogus*, was the first knowne to haue in plate, one thousand pound weight: but *Lucius Drusus*, while he was but Tribune or Prouost of the commonalty, had in siluer vessell as much as weighed eleuen thousand pounds. Now if I should tell you that the Romane Censors vpon a time disgraced, yea and degraded an antient captain and one who in his time had rode in triumph, only for that he had in plate five pound weight, it would be taken in these daies for a meere tale and vaine fable: as also that *Catus Calpurnius* in his Consulship, was found sitting at dinner serued with earthen vessell of potters worke, when the Embassadors of the *Aetolians* came vnto him: that he refused also siluer plate presented to him for the furniture of his boord, and to his dying day had neuer in siluer more than two drinking cups, which *Lucius Paulus* his wiues father bestowed vpon him after the defeiture of *K. Perseus*, in regard of his valiant seruice, we hold it now for no lesse than an vntruth and incredible. And here I call to minde a merry conceited speech that I haue read in the chronicles, of certain Carthaginian Embassadors, who said, that no men in the world had more good fellowship in their houses, and liued more friendly together, than the Romanes, for why? when they feasted one another (say they) the same * siluer plate went round about amongst them all from one to another without change. But howfoeuer this frugality whereof I speak may seeme strange and fabulous to the world wherein we liue, certes wee all know this to be true and no fable, that *Pompeius Paulinus* (the son of a Roman knight or man of armes borne at Arles) was not only banished out of the country and nation where his father was borne, but confined also to the marches of most sauage and barbarous people, and exposed to their cruelty, only for this, That he had in his campe (to the euil example of the army) as much siluer plate as weighed 12 pounds. But long ago it is since the fashion came vp at Rome, that our dames had their beds couered all ouer with siluer, yea, and some dining rooms with tables laid with the same: which inuention came first (as it is reported) from *Cornelius Pollio*, a gentleman or knight of Rome, who deuised to garnish his boords with siluer, not couering them full and whole throughout with plates thereof, nor after the manner of Deliacke workmanship, but onely by parcels, and according to the Punicke or Carthaginian fashion. The same *Pollio* made beds and tables of gold: but not long after, those siluer beds and boords came to the order of those in the Isle Delos. But all this sumptuositie was punished sufficiently and expiat by the ciuill warre of *Sylla*: for a little before those troubles, this excesse and these superfluities came vp: as also about the same time, men fel to make great chargers & platters of siluer, weighing one hundred pound a piece; of which there were at Rome (as it is well knowne) when the said warre beganne, to the number of five hundred and aboue: which was the cause that many a man fell into the danger of proscription and confiscation, for that their rich plate set their enemies teeth on water; who for the loue and desire thereof, practised by all cunning meanes their vtter vndoing. Certes our Historians heretofore, who attributed this cursed and unhappie ciuill warre betwene *Sylla* and *Marius*, vnto such superfluities and vices of those times which reigned so rife, might be ashamed and blush to say so; for our age hath been more hardy, and hath proceeded farther without any such feare of punishment from aboue. No longer since than in the daies of *Claudius* the Emperour, *Drusillanus* a slave of his surnamed *Rotundus* (the Seneschol or Treasurer vnder him in high Spaine) had a siluer charger of five hundred pound weight (for the working whereof, there was a forge framed beforehand of set purpose:) and the same was accompanied and attended with eight more of a smaller size, weighing 50 pound a piece. Now would I gladly know (if it might please you) how many of his fellowes (such slaues as him selfe) there must be to carry the said vessell and serue it vp to the table: or what guests they mought bee who were to be serued with such huge plate? *Cornelius Nepos* writeth, that before the victorie of the sayd *Sylla* hee defeated *Marius*, two dining tables and no more there were throughout Rome, all of siluer.

T t

Fence/ella

* This was spoken by way of jest, & signified: for that al their vessell being plate of potters clay & no better, seemed alwaies the same: whereas in siluer plate, men were delighted with diuersitie of workmanship, and vaine of fashion.

* Quater million, quadrigena septuagena milia pondo: which is foure millions four hundred & 70 thousand pound weight. An incredible sum, considering that which presently followeth: and therefore I suppose: this place in Pliny is corrupted.

Fenestella saith, that in his time (and he died the last yere of the reigne of *Tiberius Caesar* the Emperor) men began at Rome to bestow siluer vpon their cupboords and side livery tables: & even then also (by his saying) Tortoise worke came in request and was much vsed. Howbeit, somewhat before his daies, he writeth, that those cupboords were of wood, round and solid of one entire piece, and not much bigger than the tables whereupon men eat their meat: but when hee was a young boy, they were foure square, and of many peeces joyned together; and then they began to be covered ouer with thin boords or painels, either of maple or citron wood. Soone after, they were set to lay siluer plates vpon them at the corners only, and along the joints where the planks were set together: but by the time that he was come to be a well grown yong man, they were at their drinking mazors or round-bottomed dishes like balances, whereupon they were called *Statera*: also at those platters, which in old time were named *Magides*. Howbeit, men rested not contented to haue furnished themselves with plenty of siluer in their plaine plate and about their houses, vnlesse the curious workmanship also thereof were more costly than the metall and matter it selfe. But lest this superfluity should be imputed vnto vs in these daies, be it knowne, that such curiosity was crept into the world long ago: for *C. Gracchus* had in the gold-smiths hand 5000 sesterces certain vessels of siluer called *Dolphins*, which cost him at the gold-smiths hand 5000 sesterces a pound: an exceeding price for the fashion and workmanship, considering *L. Crassus* the Orator had two pots artificially engrauen by the hand of *Mentor* that cunning workman, the fashion and making whereof cost * 100 sesterces a pound: and yet he confessed and protested, that hee was abashed to see them, and durst not for shame bring them abroad. Moreouer, knowne it is, that he had in his cabinet pieces of plate, which to be bought and sold were worth euery pound 6000 sesterces. Briefly, the conquest and reducing of Asia vnder our Empire, was the first occasion that brought into Italy such wastfull excess: for *L. Scipio* shewed in triumph of siluer plate, intailed and ingrauen, 400 thousand and 50 pounds weight, besides vessels of gold amounting to the weight of 100 thousand pound: and this was in the yere from the foundation of Rome, 565. But the free * donation and bestowing of the said Asia vpon the city of Rome (which fell vnto the Romans by the death of *K. Attalus*, who in his last will and testament ordained them his full heires) did most hurt vnto our state: and this succession which our Antients injoyed by vertue of that gift, did greater damage to the integrity of manners, and brought more corruption into our city, than the former victory atchieued by force of armes: for from that time forward men grew to be shamelesse, and without regard of modesty euery mans fingers itched to be tempering with the treasure of *K. Attalus*, and to buy the same at any price, sold in open port-sale to them that would giue most: which hapned in the 626 yere after the foundation of the city: for in 56 yerres (which was the meane space between the foresaid subduing of Asia and this feoffment of *K. Attalus*) our city was well nuzzled and trained not onely in the admiration of such puissant forrein kings and princes, but also in some affectionate loue to their wealth and riches. About which middle time between, & namely in the 608 yere, reckoning from the first founding of Rome, when Achaia was likewise brought vnder our obedience and subjection, this victory also was a mighty means to bring vs also out of al good order, and to set vs forward to imbrace superfluities and to ouerthrow al honesty and vertue: for now were brought in the stately statues and proud painted tables, that we should want no inticing delights, but that all the pride and pleasure of the world might be found at Rome. Finally, the ruin of Carthage, was the rising of superfluities with vs, as if the Destinies had so appointed, that at one & the same time we should haue both wil to imbrace vice, & also power & liberty withal to perform sin: so that in regard of our times and the enormities thereof, we may iustifie, yea and honor any of our ancestors who seemed before to offend in this behalfe: for, as it is said, *C. Marius* after he had defeated the *Cimbrians*, contented himselfe to drink in a wooden godet and tankard, after the example of father *Bacchus*: *C. Marius* I say, who of a good husbandman in the country about Arpinum, & of a common and ordinary souldier, came to be a braue captaine and commander in the field.

CHAP. XII.

¶ Of Statues and Images of Siluer: of the workmanship in grauing Siluer, and of other things pertinent thereto.

Men commonly haue thought, that the first statues of siluer seene in Rome, were made in the honour of the Emperour *Augustus*, by way of courting and flatterie to winne his grace and

A and fauour, as those times did require: but it is altogether vntrue; for before his daies, we finde that *Pompey* the Great when he rode in triumph, caused the siluer statue of *K. Pharnaces* (the first) [of that name] that euer reigned in the realme of Pontus to be carried in a solemne shew: like as the image also of *Mithridates* his father, besides chariots as well of gold as of siluer.

Moreover, it falleth out sometimes, that siluer is vsed in stead of gold also vpon some vrgent cause and iust occasion: as we may see by our proud & sumptuous dames, that are but commoners and artizans wiues, who are forced to make themselves carquans and such ornaments for their shooes, of siluer, because the rigour of the statute provided in that case, will not permit them to weare the same of gold. And I my selfe, as I remember, haue seen *Aurelius Fuscus* (a gentleman of Rome, who being put beside his place, and hauing lost the dignity of a man of arms, by reason of a notable calumnniation framed against him, when as young gentlemen sons vsed to accompany him because he had the name of a braue souldier) weare his rings of siluer. But to what purpose do I collect these examples, seeing our soldiers make no reckoning of yvorie, but the hilts of these swords and the hafts of their daggers, bee garnished with siluer, damasked and ingrauen; their scabbards and sheaths bee set out with siluer chapes, and their sword-girdles, bangers, and bawdricks, gingle again with thin plates of siluer. And do we not see how our yong boies are * kept in and restrained with siluer, during the time that they be vnder mans age? how our fine dames vse to wash and bath in siluer, disdaining and setting light before any other bathing vessels in the baines, in so much as the same metall and matter which we are serued with at the table, is employed also in shamefull and vnclenly vses. Oh that *Fabritius* were alive now again to behold these things! if hee saw our women bathing together with men in one and the same baine, and those pained (as it were) vnder foot with siluer for smooth and slipperie that they cannot hold their feet: *Fabritius* I say, who forbade expressly, that any warriours and Generall captains should haue in plate more than one drinking boll or goblet, and a saltellar: if hee saw siluer (which was wont to be giuen in presents and rewards to braue men and valiant captains) thus to be melted and broken to serue for these purposes, what would he say? but What a world is this! we passe not for *Fabritius*, nay, we are ashamed of him and his frugality.

But to leaue these abuses and complaints: one thing I wonder much at, that among so many excellent artizans as haue been, there is not one who took any pleasure to graue in gold, nor became renowned thereby; whereas many are famous for their workmanship in siluer: howbeit, *Mentor* (of whom I spake erewhile) excelled them all in this kinde: and yet I doe not find, that euer he made in all, about eight peeces that were curiously and exquisitely wrought, and those (as it is said) be all lost. And no maruell, for why? the temple of *Diana* at Ephesus lieth along: the Capitoll of Rome likewise, and all within it, hath perished by fire. Howbeit, *Varro* hath left in writing, that among his antiquities, one brazen image he had of *Mentors* hand-worke. Next to him, the world had *Acragas*, *Boethus*, and *Mys*, in great admiration for their excellent skill: and at this day there be extant, peeces of all their workmanship, to be seen in the Isle of the Rhodians: for in the temple of *Minerva* which is at Lindus a city in that Island, there is one statue of the said goddesse, of *Boethus* his making: within the temple of god *Bacchus* in the very city it selfe of Rhodes, there are certain cups wrought by *Acragas*, wherein bee ingrauen the religious Priestresses called *Bacchæ*, and the Centaurs. Within the same Church, are the pourtraicts of *Silennus*, and the pretty *Cupids*, expressed liuely in imagerie, by *Mys*. Moreover, *Acragas* pourtraied the resemblance of chaces or hunting, in certain pots, most artificially; for which he became very famous. After these, there are to be ranged in another degree, *Calamis* and *Antipater*, together with *Stratonicius*, who wrought within a broad-mouthed cup, one of the Satyres found asleep; but with such dexterity and so liuely, that he is judged and said to haue couched and fitted him to the cup, rather than barely ingrauen him. Then followes *Tauriscus* of Cyzicum: semblably *Arifmus* and *Eunicius*, both Mityleneans, are highly commended: as also *Hecateus* and *Praxiteles*, who flourished about the time of *Pompey* the Great. *Pofidonius* also of Ephesus, and *Ledus* the Stratiat, who was in great name for ingrauing of bartells and armed men at the point to joyne skirmish. Likewise *Zopirus*, who made two singular cups; in the one, hee represented the honourable Court of the *Areopagites*; in the other, the trial and judgement of *Orestes*: which were esteemed worth twelue talents. In another age liued *Pytheas*, a singular Artificer, whose workmanship was so rare and exquisite, that euery two ounces of his siluer plate, was sold commonly for twentie thousand sesterces: and verily a broad goblet or stand-

* I could see this done more plainly: but in some respect of care mind & care, I am willing enough to leaue it as it is in English, as I found it in Latine.

ding piece there was of his making, with a deuise appendant to it, for to be set too and taken off by a vice, and the same resembled *Ulixes* and *Diomedes*, stealing the Palladium out of the temple of *Minerva* in Troy. The same workman deuised to set into little cups, prettie images or mannikins resembling cookes, which he termed *Magiriscia*, but so finely & delicatly wrought they were, that the patterns of them could not be taken out in any mould, without hurting and spoiling; so subiect were they to any outward injuries in the handling. Furthermore, *Tecus* was famous in his time, for his dexterity and light hand in shallow imboosing. Well, in as great request as these artificers were in times past, yet this cunning decayed all on a sudden, and grew so far out of vse, that nothing now commendeth such pieces of work, but only antiquity: in which regard, how neare soeuer they be worne with continuall handling, insomuch as the shapes and proportions of the imagerie ingrauen cannot be discerned, yet great store is set by any such antique plate wherefoeuer it is to be had.

Ouer and besides, it is to be noted, that siluer will rust in medicinable waters, such as stand vpon some especiall mine; yea, the salt aire breathing from them, is able to infect it: as wee may see in the Mediterranean parts of Spaine far remote from the sea.

Also, in mines of gold & siluer, there are ingendred certain mineral colours seruing for painters, to wit, * Sil and Azur. As for Sil, to speake properly, it is a kind of muddy slime: the best of this kind is called *Atticum*: and every pound of it is worth 32 deniers. The next in goodnesse is hard as stone or marble, and carieth hardly halfe the price of the other named *Atticum*: there is a third sort, of a fast & compact substance, which because it is brought out of the Island *Scyros*, some call *Scyricum*: and yet of late verily, we haue it out of *Achaia* also, and this is the Sil that painters vse for their shadows: this is sold after two festerces the pound. As for the Sil which commeth out of France, called the Bright Sil, it is sold in euery pound two asses lesse than that of *Achaia*. This Sil, and the first called *Atticum*, painters vse to giue a lustre and light withall: but the second kinde, which standeth vpon marble, is not imploied but in tablements and chapters of pillars, for that the marble grit within it, doth withstand the bitternesse of the lime. This Sil is digged likewise out of certain hils not past 20 miles from the city of Rome: afterwards, they burne it, and by that means do sophisticate and sell it for the fast or flat kinde named *Pressum*: but that it is not true and natural, but caleined, appeareth evidently by the bitternesse that it hath, and for that it is resolu'd into powder.

CHAP. XIII.

¶ Of * Sil, * Caruleum, Nestorianum, and Calum. Also that all these kindes keep not the same price euery yeare.

Polygnotus and *Mycon* were the first Painters who wrought with Sil or Ochre, but they vsed onely that of Athens in their pictures. The age insuing, imploied it much in giuing light vnto their colours, but that of *Scyros* and *Lydia* for shadows. As for the Lydian ochre, it was commonly bought at *Sardis*, the capitall city of *Lydia*, but now it is growne out of all remembrance.

As touching *Caruleum* or Azur, it is a certaine sandy grit or powder: of which, in old time there were knowne 3 kinds: to wit, the Egyptian, most commended aboue the rest: the Scythian which is easie to be dissolued and tempered, and in the grinding turneth into foure colours: namely, the Azur, which is of a pallet colour, called therefore the whiter; the blacker Azur of a deeper blew, there is the Azur also of a grosser substance, and the fourth of a finer. The Cyprian Azur is preferred before that of *Scythia*. Ouer and aboue those Azures before-named, wee haue some from *Puteoli* and *Spaine*, where they be artificiall, and they haue taken to making it, of a kind of sand. All the sorts of these Azurs, receiue first a dye, and are boiled with a certain hearbe appropriat to it, called *Oad*, the colour and juice whereof Azur is apt to drinke in and receiue. As for all the preparation and making of it otherwise, it is the same that belongeth to *Chrysocolia* or *Borax*. Of Azur there is made that powder which wee call in Latine *Lomentum*, for which purpose it must be first punned, puluerized, and washed; and this is whiter indeed than the Azur it selfe: sold it is after three and twentie deniers the pound, whereas Azur may be bought for eightene. Herewith they vse to paint walls that be ouercast with plasters, for lime it will nor abide. Of late daies there is a kinde of Azur growne into request, called *Nestorianum*,

num, taking that name of him who first deuised it: made it is of the lightest part of the Egyptian Azur, and it costeth 40 deniers the pound. Of the same vse also is the Azur of *Puteoli*, saue only in windows; and this some call *Cælon*. It is not long, since another kind of Azur or blew named *Indico*, began to be brought ouer vnto vs out of India, which is prized at 17 deniers the pound. It serueth painters wel for the lines called *Incisura*, that is to say, for to diuide shadows from lights in their workes. To conclude, there is another kinde of *Lomentum* or blew powder of the basest account of all other; some call it *Tritum*, and it is not esteemed worth aboue six asses the pound.

But to try the right and perfect Azur indeed, the best experiment is to see whether it will flame vpon a burning cole. As for the false and sophisticat Azur, it is thus made: they take the floures of violets dried, and boile them in water: the juice they presse forth through a linnen cloth, and mix the same with the chaulky earth called *Eretria*, vntill such time as it be well incorporat with it.

To proceed vnto the medicinable vertues of Azur: It is holden to be a great clenfer, & therefore it mundifieth vlcers: in which regard, it entreth into plasters: as also into potentiall cauterics. As touching Ochre or Sil, it is exceeding hard to be reduced into powder: and this also serueth in Physicke, for it hath a mild kind of mordacity: astringent it is besides & incarnatiue, in which respect, soueraigne to heale vlcers: but before that it will doe any good, it ought to be burnt and calcined vpon an earthen pan.

To conclude with the prices of all those things named heretofore: how soeuer hitherto I haue set them downe, yet I am not ignorant, how they vary according to the place; yea, and alter in manner euery yeare: and well I wot, that as shipping and nauigation speeds well or ill, as the Merchant buyeth cheap or deare, the price may rise and fall. Againe, it falleth out, that sometime one rich munger or other, buying vp a commodity, and bringing it wholly into his owne hands for to haue the Monopoly of it, raiseth the market, and inhaunceth the price: for I remember well, how in the daies of *Nero* late Emperour, all the spicers, druggers, and Apothecaries, preferred a Bill of complaint vnto the Consuls, against one *Demetrius* a regrater. Yet notwithstanding, I thought it necessarie to put downe the prices of things as they are ordinarie valued at Rome one yeare with another, to shew in some sort (by a generall æstimat) the worth of such wares and commodities whereof I haue written.

The Proem.

CHAP. I.

¶ *The Mines of Brasse.*

IT is now time to go in hand with Mines of Brasse, a mettall esteemed most of all other next to Gold and Siluer, in regard of the vses about which it is employed: nay, if I should say truly, preferred it is (especially that which is called the laton of Corinth) in diuers respects before siluer, yea, and gold it selfe: for brasse (I may tell you) is of great authority in the campe, and carrieth no small stroke among souldiers in regard of their pay, which (as I haue said before) was weighed them out in brasse: and hereupon their wages-money is vsually called by the name of *Ara militum*. From this mettall likewise, the generall Receiuers and Treasurers take their title of credit and place: for at Rome they be called *Tribuni ærarij*, as a man would say, The Tribunes or Officers to the chamber of brasse coine, that is indeed, of the Treasury: hereof also is the Chamber of the city K or Treasury it selfe, called *Ærarium*: finally, those that be deeply indebted to any man, are in Latine named *Obærati*, as it were charged and pressed with the heavy burden of brasse, i. debt. Moreouer, I haue shewed already (for the greater credit and authority of this mettall) for how many yeres together the people of Rome vied no other mony but brasen coine. And otherwise, as may appeare by antient records and histories, the credit of brasse took root at the beginning, and hath bin in authority euer since Rome was Rome: an euident prooffe whereof we haue from K. *Numa*, who founded and erected a third society or confraternity of brasse-founders. As touching the ore or veine of brasse, digged it is out of the mine in manner aforesaid, but it is tryed, & brought to perfection by fire. Made also it is of the Chalamine stone, named otherwise Cadmia. The best mines of brasse that yeeld the excellent mettall, are now in Asia; howsoeuer in old time Campaine in Italy carried the name. And euen at this day, the brasse digged out of the mines within the territory of the Bergomats in the farthest part of Italy, is in great request: and as it is said, there are good mines thereof discovered lately in Germany, a Prouince vnder the Roman Empire.

CHAP. II.

¶ *Diuers kinds of Brasse: and namely, the Brasse of Corinth, of the Isles of Delos and Egeina.*

IN the Island of Cyprus, where first were found mines of brasse, the same is made of another M stone also besides Cadmia, which they name Chalcitis: but this * Cyprian brasse sel soon to beare a low price, by reason of a better kind which other countries did yeeld; and principally the laton called Orichalcum, which for a long time was counted the best and held in greatest admiration. Howbeit, this kind of brasse hath not bin gotten for these many yeres, as if the earth were

A were not in heart, and had giuen ouer bearing of it. Next to this Aurichalcum, the most reckoning was made of the brasse Sallustianum, within the tract or quarter of the Centrones among the Alps: neither held these mines out any long time; but after it, succeeded the Livian brasse, discovered in France. These two kinds last mentioned, take name both of the lords and masters of the mines wherein they were digged: the former of one *Sallustius*, a great friend and fauorite of *Augustus Caesar* the Emperor: the other of the Empreffe *Livia* his wife: and this mine also quickly failed. And verily of this Liuiian brasse very little or none there is to be had. But now adiaies all the name goes of the Marian brasse, which also is called Cordubense: and to say a truth setting aside the aboue-named Liuiian brasse, there is not any will take the yellow tincture of the Cadmia or Chalamine stone better, or commeth so neer in goodnesse to the latton Orichalcum; **B** as if a man would say that a piece of coin stamped of it, were a sesterces, or at leastwise a double As, to the Cyprian piece, which is but a single As. And thus much concerning the degrees in goodnesse and credit, of those kinds of brasse which be naturall.

There be other sorts of brasse mettall, which stand vpon an artificiall mixture and temperature, whereof I purpose to write in more ample manner in place conuenient, after I haue shewed aboue all other things the excellencie of this mettall in generalitie, thus tempered. In old time there was a mixt mettall made of brasse, gold and siluer, melt and confused all together, whereof were made singular pieces of worke: and albeit the mettall was rich and precious, yet euermore the workmanship was the dearer and went beyond it. But now, it is hard to say, whether is worfe of the two, the matter or the art that is seen in it? But certes, I cannot but maruell much how it commeth to passe, That these brasen workes, hauing alwaies bin from time to time so dear, and growing so infinitely as they do stil in price to be bought & sold, yet the magnificence and credit of this art is so much decayed & vtterly gone? But I take this verily to be the cause, that in times past artificers wrought for to win glory and fame; & now, as all things els, for gain and lucre only. Certes, in old time the feat of casting mettall was counted so magnificent, that the Poets ascribed it to some of the principal gods, as a mystery befitting their diuine workmanship; in so much, as the great lords and noble princes of the world sought to win an immortal name by this means: and yet I say for all that, the manner of tempering and casting this precious Mascellin, this compound mettall I mean of gold, siluer, and brasse, is so far grown out of practise and knowledge, that for these many yeres past Fortune her selfe hath had no power either to retain or to restore the antient art belonging thereto. But setting aside the glorious Mascellin of old time, the Corinthian brasse mettall was most highly commended: and the same mixture happened euen by meere chance and fortune, when the city Corinth was woon, sacked and burnt to the ground: and wonderful it is how the minds of many great men was affected to this compound mettall, and how they stood vpon the hauing thereof, in so much as (by report) there was no other cause in the world why *Perres*, whom *Cicero* had caused to bee condemned, was together with him proscribed, outlawed, and banished by *Antonie*, but only this, For that he vaunted that he had as goodly vessels and pieces of Corinth mettall as himselfe, and would not part with any of them to *Antonie*: howbeit, in my conceit, most part of those men who delight thus in this Corinth Mascellin, in a certain singularity by themselves, because they would seem to know more than their fellows, make semblance rather of a special insight and skill that they haue therein, than know indeed any thing by it of such exquisite stuffe. And this will I shew and declare to you in few words: the city of Corinth was won and destroyed in the 156 Olympias, and the third yere thereof, which fell out to be in the 608 yeare by our computation at Rome: now long before this time, those great masters and imageurs, so famous for mettall-founding and casting of Images were dead and gon; and yet all the pieces of their making, these men forsooth at this day will needs haue to be of Corinthian medley, and so they call them. And therefore to disprove this erroneous opinion of theirs, I purpose as I proceed in this my discourse, to range all the notable artificers that antiquity hath knowne in this kind, according to the several ages wherein they liued & flourished in the world. For easie it will be to calculate and collect the yeres from the foundation of our city, by the former comparison of them with the Olympiades. All the vessels then which our delicats haue, those I mean that would seem to be more fine in their houses than their neighbors, are only of the Corinth mettall and no better, which they cast, partly into pots and pans and such like kitchin vessell for to seeth meat in, partly into candlesticks, chafers, chamber pots, and such like homely and base vessels, without any regard of cleanness and

* As if he would say, this mettall is so much better than the Cyprian brasse & copper, as the Sesterce and Dupondius, is of more value than As: i. i. duple, or duple and halfe.

and neat seruice. But this Corinthian mettall may be reduced well into three principall kinds, G
to wit, the white, which commeth nearest in brightnesse to siluer, as standing most indeed vpon
the mixture of siluer: the second yellowish, according to the nature and colour of gold, which
beareth the chiefe stroke in it: and a third of an equall medley and temperature, wherein a man
shall not perceiue any one mettall predominant. Ouer and besides, these 3 sorts of Corinthian
brasse, there is another kind of Mascellin, as touching the mixture whereof precisely, we are not
able to yeeld any reason: for although there be found Images and statues thereof made, wherein
we may see the handy worke of man, yet it should seem that Fortune in some sort hath giuen
the temperature thereto: and that dainty and precious colour that it hath, is a deep red, much
resembling that of the liuer, and therefore they call it commonly Hepatizon. Short it commeth
far of the Corinthian mettall, but out-goeth a great way the brasse either of Ægina or Delos, H
which two mettalls for a long time were thought to be the chiefe. And in very truth, for antient
glory and name the Deliake brasse may challenge the first place: for thither, as to a mart or fair,
there was great resort of chapmen from all parts of the world; & specially of those artificers who
were curious in making of table feet, trestles, and bed-steads: and indeed the finest workmanship
at first was seen herein, and thereby artificers came to be innobled. But in proceffe of time they
went farther, euen to cast the images of gods, the personages also of men for statues, yea, & the
solid forms and pourtraits of beasts and other such liuing creatures. After this brasse of Delos,
the most account was made of that which came from Ægina: an Island this is without any mine
at al of brasse in it, howbeit, much renowned for the excellent mettall-founders therein, in regard
of the singular temperature that they gaue vnto their brasse. The brasen Oxe which standeth in
the beast market at Rome was brought from thence. And this may serue for a paterne of the Æ-
ginetick brasse: but the image of *Iupiter*, erected within the chappel of *Iupiter*, surnamed Thun-
dring, in the Capitoll, is the true paterne, testifying what kind of brasse that of Delos was. And,
as *Myron* was wont to cast the mettall of Ægina in all his works, so *Polyeetus* vied ordinarily that
of Delos for this purpose; and these two were rare Imageurs, liuing at one time, and prentises at
the Art together: but they indeauoured to surpass one the other in diuers mettalls which they
occupied.

CHAP. III.

¶ Of Candle-sticks and Ornaments belonging to Temples, made of Brasse.

IN old time the Island Ægina was in especial name for the workmanship only of the branches,
sockers, & heads of candle-sticks; like as Tarentum, for the shanke, shaft, & body supporting
the same: and therefore that candle-sticke was counted rich indeed, when both these places
seemed to concur to the making and workmanship therof: for such a candle-stick some haue not
bin ashamed to giue as much money as the salarie and yearly pension of a Tribune militarie or
Colonell, commeth to: and yet you see, an implement or moueable it is, that hath but a vile
& base name, for called it is in Latine Candelabrum, of sticking a candle in it. But wil you know
who was so foolish as to bestow so much vpon a candle-stick, and what a tale belongeth therun-
to, for to mend the hard bargain: thus stood the case; it was a jolly dame in Rome, named *Gegania* L
who made this wife match. And when she had so done, she must needs forsooth make a feast to
shew this candle-stick to her guests, which cost her 50000 sesterces. Now *Cleippus*, the founder
or Brasier that sold it her, was mishapen and bunch-backed. And order was taken by the comman-
dement of **Theon* a publick crier of Rome, that he should in the midst of supper be brought
into the place stark naked as euer he was borne (and as foule and ill-fauoured a fellow he was o-
therwise as a man should lightly see) vnder a colour to make sport and to set the company in a
laughing, but indeed to mocke *Gegania* the Mistresse of the house. But what followed therupon
The woman cast a faspie to him by and by, and in that heat of loue, or lust rather, admitted him
anon to her bed, and after let him into her will, and made him her heire. This crooke-backed
squire seeing himselfe exceedingly enrich by this double bargain, adored the said candlestick M
no lesse than a god, as the only cause of his rising, and all the wealth he had: and thus by his oc-
casion, one tale more goeth currant abroad in the world, of Corinthian vessels. And yet after-
wards (as it were to punish his Mistresse for that light behaviour of hers) he caused a stately and
magnificent sepulchre to be made for her, whereby the infamy and shame of *Gegania*, might be

A eternized and continue fresh in remembrance with all posterity. But to return again to Corin-
thian Brasse and the vessels made thereof, although it be well knowne, that there are no Candle-
sticks indeed made of that Mascellin, yet there goeth a great name of them, as if they aboue all
other things were certainly cast of that mettall: and the reason is, because that *Mummius*, as in
the heat of his victorie he sacked and destroyed Corinth, so withall hee dispersed the brasse by
parcels and piece-meale, and sent it away into many other townes and cities of Greece.

Moreover, this is to be noted, That in old time it was an ordinary thing to make of brasse, the
sides, lintels, sills, and leaues of great dores belonging to temples. I read also in Chronicles, that
Cn. Octavius, who defeated *K. Persus* in fight at sea, and rode in triumph for that naual victorie,
caused the double gallerie, which standeth neere vnto the Cirque of *Flaminius*, to be erected;
B which was called the Corinthian gallerie, for that the chapters of the pillars were of brasse.
Furthermore, the Annals do testifie, that it was thought good, That the rouse of the chappel of
Vesta, should be alwaies covered ouer with Brasse, after the manner of Saracossian work. Likewise
M. Agrippa made all the chapters of the pillars, standing in the temple *Pantheon*, of Syracusan
brasse, which remaine at this day to be scene. And not onely publick places and buildings were
thus beautified and adorned, but great mens priuat houses also were enriched by this mettall:
for it appeareth vpon record, That *Sp. Carvilius*, one of the Treasurers of Rome, amongst other
criminal imputations that he objected to *Camillus*, challenged him for this, That the dores of
his dwelling house were plated and garnished with brasse & copper. Moreover, as *L. Piso* report-
eth in his Chronicle, *Cneus Manlius* after his conquest of Asia, was the first that in the triumph
C wherein he rode in the yeare after the foundation of Rome 568, he made a shew of three-sided
tables, cup-bourds, and bours, supported by one foot all of brasse. And *Valerius Antias* verily
doth write, That *L. Crassus*, heire to that great Orator *L. Crassus*, made sale of many such brasen
tables, which fell vnto him by right of inheritance. Semblably, I find in the histories, That in
old time they were wont to make many large basons, supported with a frame of 3 feet, known by
the name of Delphick basons, for that they were commonly dedicated to *Apollo*, the patron or
god of Delphos, for to receiue the gifts and oblations offered to him. In those daies also the
lamp-branches hanging aloft in churches, spreading out their arms abroad and carrying lights
like trees bearing fruit were vsually made of brasse: and such a one is to be seen in the temple of
Apollo within the Palatine hill at Rome: which being found by *Alexander* the great in the sac-
D cage of Thebes, the said prince dedicated to the god *Apollo* at Cyme, a towne in Æolia. To con-
clude, this art of founding and casting brasse proceeded farther and passed on, vntil it was com-
monly practised in making the idols and images of the gods.

CHAP. IIII.

¶ At what time the first brasen Image was cast at Rome. The first originall and begin-
ning of statues, and the honour that belonged to statues. Also the diuers
kinds and fashions of them.

E The first Image of brasse that euer was made at Rome, I finde to be consecrated to *Ceres*, &c.
raised it was out of the goods of *Sp. Cassius*, who aspiring to be a king, was therefore slaine
by his owne father. But this honor continued not long proper to the gods, but passed from
them vnto the statues of men also and their portraictures, and that after sundry sorts. In ancient
time the manner was to vernish their images and statues of brasse, with * Bitumen: more mar-
uel it is therefore, that afterwards men should take such pleasure to guild them as they did: this
invention, whether it came from Rome or no, I know not: but if it did, surely it was no antique
deuise, nor of any long continuance there. Certes, the manner was not in old time to expresse
the liuely similitude of men in brasse, vnlesse they were such worthy persons as by some notable
and famous acts deferred to be immortalized, as namely, for winning the prizes at any of the
F foure sacred and solemn games holden in Greece, and principally at those of Olympia, where it
was an ordinary thing to see the statues of those erected and dedicated, who had atchieued any
victory there. But in case any one were so happy as to obtain victory at those solemnities, 3 se-
ueral times, his statue in brasse was so liuely & perfectly cast, that it resembled his person full &
whole, according to the proportion of euery member, joint and muskle of the body, yea, euen to
the

* or as some
say, with a kind
of Amber.

the haire of the head and beard. And such kind of complete images, the Greeks vse to call Icones, i. personages. The manner of the Athenians was to honour men of singular vertue and valour, by representing their personages in brasse: but I am not sure whether those Athenians were the first that brought vp that manner or no: true it is, that long ago they caused statues of *Harmodius* and *Aristogiton*, to be made of brasse at the charges of the state, and to be erected in publick place, for that they had the courage and heart to kill *Pisistratus*, who tyrannized ouer them: and this fell out just in that very year wherein the kings were also deposed at Rome, and expelled the city for euer. And in proesse of time this manner was taken vp in all parts of the world: so plausible to the nature of man, is the ambitious desire to perpetuate their memorie by such monuments, inso much as there is not a good towne within our prouinces, but they haue begun already to beautifie their market places with many such ornaments of brassen statues & images; together with titles, honours, and dignities ingrauen at the bases or pied-stal therof, for the better continuance of mens memoriall, that the posterity might be informed by such inscriptions, as well as by their tombs and sepulchers. And at length the ambition of men proceeded so far, that as well their priuat houses within, as the base courts and porches without, were so beset with images, that a man would take them for some publicke places within a city: and all this arose from the deuote courtesie of vassalls, in token of homage and honour done to those their patrons and lords, whom they acknowledged to be the protectors and maintainers of their life and liberty.

CHAP. V.

¶ Of brassen statues in long robes, and diuers other sorts of Images. Whose statues were first erected vpon pillars. When they were set vp first in publicke, and at the common charges. Finally, which were the first in Rome.

IN ancient time all the images and statues erected to the honour of any men, were in their gowns and robes. Men delighted also to haue them otherwhiles all naked, resting vpon their spears which they held in their hands: this pattern came from the Greeks, resembling the manner of their yong men, which in that sort dia exercise naked in their publick wrestling places, thereupon called *Gymasia*: and such images are named *Achilles*. And verily, the Greekish fashion it is, to hide no part of the body, but to shew all: whereas the Romanes contrariwise (like souldiers and military men) vsed to make their statues armed with a cuirace or brest plate only, leauing the rest of the body discouered and bare. And *Iulius Caesar* verily the Dictator, was well content that his image should be set vp in the Forum or common place at Rome, armed with an habergeon or coat of male. As for such statues which represented in habit the priests of *Pan*, called *Luperci* (i. all discouered but their priuities) it is an inuention new come vp, and as lately deuised as those which be pourtraied in clokes or mantles. *Mancius* appointed that his image should be erected in that habit and manner, that is to say, bound and vnarmed, as he was deliuered prisoner to the Numantines his enemies. As touching the statue of *L. Afcus*, a famous Poet, I will report vnto you what writers haue recorded, namely, That being himselfe a very little man and low of stature, he caused his image to be made exceeding big and tall, and so to be set vp within the temple of the Muses at Rome. As for the statues represented on horse-backe; in great name and request they were among the Romans: but no doubt they had their precedent from the Greeks. At first they honoured such horsemen only in this sort, who had won the price in the race at those solemn & sacred games which were held in Greece, and those horse-runners they called *Celeres*: howbeit, afterwards the like honor obtained they, who had born themselves best at the running of chariots, whether they were drawn with 2 horses or four. And from hence came the manner with vs of our valiant captains and victorious generalls, to haue their statues made riding triumphant in their chariots. Howbeit, long it was first ere this fashion came to be taken vp: and before the daies of *Augustus Caesar*, late Emperour of famous memory, there had not been knowne any such images at Rome riding in chariots either drawne with six steeds, or Elephants, as now there be. The manner also of riding in coches with 2 horses about the cirque or shew place (which vually they did who had bin lords Pretors of Rome) represented in their pourtraitures, is not ancient.

Con-

A Concerning statues erected vpon columns or pillars, they be of greater antiquity, as may appeare by that of *C. Metius*, who vanquished the ancient Latines that invaded the territory of Rome: vnto which nation, the people of Rome was wont by vertue of the league, to allow the third part of the bootie and pillage gotten in the wars: during the Consulship of which *C. Metius*, vpon the victory atchieued of the Antiat, the city of Rome ordained, that the beak-heads with their brassen tines, which were taken from them in a conflict at sea, should be fastened vnto the pulpit of publicke pleas and Orations, which thereupon was euer after called *Rostra*: and this fortuneth in the 416 year after the foundation of Rome. The like statue vpon a column was set vp for the honour of *C. Duillius*, who first defeated the Carthaginians by sea, and for that natural victorie entered Rome in triumph: the same remaineth at this day to be seen in the Forum or grand place of the city. Semblably, *P. Minutius* obtained the same honour, who being Puruei- or generall of corne for the city in time of a dearth, behaued himselfe so well in that office, that his statue of brasse was erected vpon a pillar without the gate of Rome called *Trigemina*: and that by an vniuersall contribution of the people, who gaue voluntarily toward the charges thereof, euery man to the value of an ounce of brasse coine. And I wot not whether I may boldly say that he was the first man who receiued that honour at the peoples hands: for before time I am well assured that the Senat only granted such rewards for mens good seruice. Certes, these were braue and honourable memorialls, had they not begun vpon occasion of some trifling matters to speake of. For such a statue was that of *Afcus Nauus* the Augur or Soothsayer, which stood before the entrie of the Curia or Councell-chamber of Rome: the base or foot of which pillar was burnt, at what time as the said Curia or Senat-house caught a light fire, at the funerals of *P. Clodius*. The like image was set vp (by authoritie from the State) in the publicke place of elections at Rome, called *Comitium*, to the honor of *Hermodorus* the Ephesian, who translated out of Greeke into Latine the lawes of the 12 tables, which the ten Decemvirs had gathered and set down for the publicke benefit of the city. As for the statue of *Horatius Cocles*, which remaineth to this day, there was another reason of it, and the same of greater credit and importance: for that he alone sustaining the charge and brunt of *K. Porcinaes* army, made good the wooden bridge ouer Tybre at Rome, and caused the enemies perforce to abandon the place. As touching the Statues of the Prophetesses *Sibylla*, three of them there be neare vnto the *Rostra*, before said, but of a lesse making, whereat I nothing maruell: the one was repaired by *Sex. Pacuvius Taurus*, one of the *Aediles* of the Commons; the other two by *M. Messala*. And I assure you I would haue taken these Images and that of *Afcus Nauus* to haue beene the most antique of all others, as being set vp in the daies of *K. Tarquinius Priscus*, but that I see the statues of the former kings within the Capitoll.

CHAP. VI.

¶ Statues without gowne or robe at all. Of other Statues, Which was the first statue on horse-backe. When and whereupon all the Images, as well publicke as priuat were demolished and put downe. What women they were at Rome who were honoured with brassen statues: and which were the first statues erected publickely at Rome by strangers.

AMONG the said Statues of Roman kings, that of *Romulus* is without any coat or cassocke at all; like as that also of *Camillus*, which standeth at the pulpit *Rostra*. As for the Image of *Q. Martius Tremellius*, which was erected before the temple of *Castor* and *Pollux*, the same was in a gowne, and sitting vpon horse-backe: this noble knight had vanquished the Samnites twice: and by the winning of *Anagnia*, a city not far from Rome, procured thereby an easment vnto the people, from paying tribute vnto the state for the maintenance of the wars. In the ranke of the most antique monuments of Rome, I may range the statues of *Tullius Clatius*, *L. Roscius*, *Sp. Nautius*, and *C. Fulcinius*, which stand about the Pulpit *Rostra*: and these were the foure Roman Embassadors, who against all law of Nations, were during their embassage murdered by the Fidenatians. For this was an ordinary custome with the Romanes, to honour those in this manner, who in the seruice of the Commonwealth were vniustly killed: as may appear likewise by *P. Iunius*, and *T. Cornucanius*, who by *Tenuca* the queene of the Illyrians were put to death, notwithstanding

*i. Therewelfsh part of their As.

withstanding they came in embassage to her. And here I cannot ouerpasse one point noted in the Annals, that the measure of the statues erected in the common place at Rome, was set down precisely to be three foot in height: whereby it may appeare, that this proportion and scantling in those daies was thought to be honorable. Neither wil I conceale from you & omit the memorable example of C. * *Ostius*, who for one word speaking lost his life: this man being sent as Embassadour vnto king *Antiochus*, and hauing deliuered his message vnto him according to his charge and Commission, when hee saw that the king made no haite to giue him his dispatch presently, but said hee would make him an answer another day; made no more adoe, but with a wand or rod that he had in his hand, drew a circle about the king, and compelled him by force to giue him his answer before he stirred his foot without that compasse. But this cost him his life: and for that he was killed thus in his Embassage, the Senat of Rome ordained, That his statue should be erected in the most conspicuous place of the city, and that was in the publick pulpit for Pleas and Orations, the Rostra before named. I read in the Chronicles, that the Senat made a decree, that *Taracia Calia*, or, as some say, *Suffetia*, a Votary or Vestall Nun, should haue her image made of brasse, and this speciall prerogative besides, that she might set it vp in what place she would her self: which addition or branch of the decree implieth no lesse honor than the grant it selfe of a Statue to a woman. What her desert might be, in consideration whereof she was thus honoured, I will set downe word for word, as I finde it written in the Chronicles, namely, *For that she had conferred fr ankely vpon the people of Rome, a piece of meadow ground lying vnder the Riuer Tybre, which was her owne Free-land.* I finde moreouer vpon record, That the Statues of *Pythagoras* and *Alcibiades* were set vp in the cornered nouke of the Comitium at Rome, & that by direction from the Oracle of *Apollo Pythius*, vnto which the Senate sent of purpose to know the issue of the Samnites warre, which was then in hand: from whence they had this answer, that if they looked to speed well in their affaires, they should take order to erect two statues of brasse in the most frequented place of the city of Rome, the one in the honour of the most valiant man, and the other in the honour of the wisest person of all the Greekish Nation: which Images remained there vntill such time as *Sylla* the Dictatour built his stately hall or pallace in the same place: But I maruell very much, that those sage fathers (the Senatours of Rome at that time being), preferred either for wisdom *Pythagoras* before *Socrates* (considering that the said *Socrates* by the very same Oracle of *Apollo*, was judged the wisest man, not of Greeks onely but of all others in the world;) or in regard of valour, *Alcibiades*, before so many hardie Captaines in Greece: but most of all I muse, that in both respects, as well of wisdom as vertue, they set any one before *Themistocles*. Now if a man be desirous to know the reason of these Columns and Pillars, which supported those Statues aforesaid, it was to signifie, That such persons were now aduanced and lifted vp above all other mortall men: which also is meant by the triumphant Arches, a new inuention, and deuised but of late daies: yet both it, and all other such honourable testimonies, began first with the Greekes. But amongst many and sundry statues which they granted and allowed vnto such as they affected and liked of, I suppose, there was neuer man had more than *Phalerius Demetrius* at Athens: for the Athenians honoured him with three hundred and threescore: and yet soone after they brake them all to peeces, euen before one full yeare went ouer their heads, that is to say, a few daies more than there were Images. Moreover, all the tribes or wards of Rome set vp a statue in euery street of the city (as I haue said before) in the honor of *Marius Gratidianus*, and those they ouerthrew euery one, against the comming in of *Scylla*.

As touching statues and Images on foot, I doubt not but they haue bene for a long time greatly esteemed at Rome. Howbeit those on horse-backe were very antient: and that which more is, this honour they did communicate also vnto women as well as men; as may appeare yet at this day by the statue of *Clatia* sitting on horse-backe, as if shee could not haue bene honored sufficiently by making her statue in the habit of a Damosell or Ladie of Rome in a side gowne. And yet neither the Chaste dame *Lucretia*, nor the valiant *Brutus* (who chafed the kings and all their race out of Rome, and for whose sake and in whose quarrell the said *Clatia* was deliuered as a Hostage among others) neuer attained vnto that honour. And I doe verily beleeue, that this Statue of hers, and that of *Horatius Coclus*, were the first that publique authoritie ordayned: for before time King *Tarquinius Priscus* caused both his owne Statue and also *Sibylla* to be made, like as the other kings before him and after, as may be presumed by all likelihood

* Others say
Popilius.

* Strabo saith
that they desired
to be melted
them, yea, and
flung them in
to draughts
and priues.

likelihood and probabilitie. And yet *Piso* saith, that the other damosells and young gentlewomen her fellow hostages, after they were set free and sent home safe againe by king *Porfena* (for the honour that he meant vnto *Clatia* in consideration onely of her rare and singular vertue) caused the said statue or image of hers to be cast in brasse, and erected. But *Annus Facialis* (another antiquarie or herald at armes of Rome) reporteth this storie otherwise; for he writeth, That the statue of a woman sitting on horse-backe (which standeth ouer-against the temple of *Iupiter Stator*, and hard at the gate or entry of king *Tarquinius* the Proud his Pallace) was of ladie *Valeria*, daughter vnto *Valerius* the Consul, surnamed *Publicola*: who saith moreouer, that shee it was alone who escaped from her fellowes, and swam ouer the riuer *Tiberis*; whereas the rest of the virgins which had been sent as pledges vnto king *Porfena*, were mured all, by the secret traines and indirect meanes of *Tarquinius* the Proud.

L. Piso moreouer hath left in writing, that in the yeare when *M. Emilius* and *C. Popilius* the second time were Consuls, the Censors for the time being (*P. Cornelius Scipio* and *M. Popilius*) caused all the images and statues of those who had been head magistrates, that stood about the Forum of Rome, to be taken downe; permitting those onely to stand which had bene erected and set vp either by grant from the people, or warrant and decree of the Senat. As for that statue which *Sp. Cassius* (him I meane who ambitiously sought to be a king) caused to be erected for his owne selfe before the church of the goddesse *Tellus*, the Censors not onely pulled it downe, but also took order that it should be melted. And this (no doubt) did those wise and prouident fathers, to cut off all means euen in such things as these, that might feed the ambitious spirit of men. There be yet extant certaine declamations of *Cato*, who being Censor, cried out against the vain-glorie and pride of certaine Romane Ladies who suffered their own images to be set vp in the prouinces abroad: yet with all his exclamations, he could not repress their ambition, but that their statues must be erected euen in Rome also: as for example, *Corndia*, the daughter of the former *Scipio Africanus*, and mother to the two *Gracchi*, whose statue was made sitting: and this singularitie it had besides from all others, That her shooes were pourtraied open and loose without any strings or latches at all. This image of hers was set vp in the great gallery or publick walking-place of *Metellus*, but now it is to be seen among the stately workes and buildings of *Octavia*.

Moreover, (by allowance and permission of the state) there haue been statues set vp in Rome in publicke place, by strangers: as namely, for *C. Aelius* a Tribune or Prouost of the commons, for that he published and enacted a law, That *Stennius Statilius* a Lucan, who twice had invaded and ouer-run in hostile manner, the Territory of Thurium, should be reputed as an enemy vnto the Romanes: In regard of which demerit, the Thurines honoured the said *Aelius* with a statue of brasse, and represented to him a coronet of gold. The same Thurines also caused another statue to be made in the honour of *Fabricius*, for raising the siege that inuested and beleaguered their citie. By occasion of which succour and reliefe giuen vnto strangers and aliens, it came to passe in proceesse of time, that forrein states and cities shrouded themselves ordinarily vnder the protection of some great men at Rome; and in deuotion to them, honoured such as their lords and masters, by statues and all other means, euen as their bounden vassals. At length, there grew such disorder and confusion of these statues, that we had them pell mell at Rome without any choise or regard at all: insomuch as it this day, they are no fewer than three statues of *Annibal* to be seene at Rome, in three seuerall places of that citie, within the walls whereof he was the onely enemy euer knowne to haue launced his iavelin.

CHAP. VII.

¶ Of the Brasse-founders in old time. The inestimable prices of molten Images. Of the most renowned Colosses and gyant-like Images in Rome.

That the art of Founderie or casting mettals for Images hath been very antique, practised also and professen in Italie as well as in other countries time out of mind, may be evidently proued by the statue of *Hercules*, which *K. Evander* consecrated to the honour of him, in that very place (by folks saying) which now is the beast market in Rome. This image is called at this day, *Hercules triumphalis*, and at euery triumph is richly clad in triumphant habit. The image likewise of *Ianus* with two faces, dedicated by *K. Numa*, testified no lesse, and honoured

he is no lesse than a god, as by whom the times of war and peace be distinctly knowne. Moreover, the fingers of his hand are in that sort fashioned and formed, as they represent the number of 365, which are the daies of the whole yere; by which notification of the yere, he sheweth sufficiently, that he is the god and patron of time and ages. The images also which are knowne commonly by the name of Thulcanica, which are so dispersed abroad in all parts of the world, who will ever doubt but that they were commonly made in Tuscan? I would haue thought verily, that these Thulcanica had bene the images of the gods, and no other, but that *Meiodorus Scepheus* who for the immortall hatred that he bare against the Romans had his * surname giuen him, reproches the Romanes among other imputations, That they had forced and sacked the towne Volfinij, for the loue of two thousand pretty images in brasse which were therein. Considering then, that the inuention of making such molten images hath been so antique in Italie, I cannot chuse but much maruaile, that the idols and images of the gods in times past dedicated in churches and chappels, were either of wood or potters earth, rather than of brasse, vntill the conquest of Asia; from whence to say a truth, first arose and proceeded all our excesse and superfluitie. As touching the first deuise and originall of casting by moulds and forming the liuely similitudes of any thing expressly to the patterne, I shall haue fitter and better occasion to write thereof in my treatise of the art of Pottery, which the Greeks call *Plastice*; for of more antiquity I take it to be than this feat of Foundrie: & yet this craft and cunning so flourished in times past, and brought forth such excellent pieces of worke, and for number so infinit, that if I should put down the greater part of them, it would require many volumes; for, to comprehend them all, what man is able? During the time that *M. Scavrus* was *Aedile*, there were three thousand molten images shewed vpon the stage when he exhibited his plaies, notwithstanding this theatre of his was made not to continue any time, but to serue for the present. *Mummus*, after the conquest of Achaia, brought in with him so many of these images, that hee filled the citie therewith, and no corner was free; and yet when he departed this life & died, he left not behind him a competent portion for to bestow his daughter in marriage. And this I write not to accuse and condemne so braue a man, but rather to excuse and commend him: for how can I otherwise doe? The two *Luculli* stored Rome with a number of these images. *Mutianus* (a man who of late daies had been twice Consul) reporteth, That there be yet within Rhodes three thousand such images: and verily it is thought, that in Athens, Olympia, and Delphi, there remaine no fewer to be seen. What man liuing is able to particularize them all? and say a man should come to the perfect knowledge of them, what good can he reape thereby, or what vse may he make thereof? Howbeit, one would take some delight and pleasure lightly to touch the principall pieces of workmanship in this kind, and namely those that be of marke and note for some special singularitie about the rest; as also to name therewith the renowned artificers in times past, who wrought euery one of them a number of pieces, the exquisite and curious workmanship wherof, no man is able to vnfold and vtter as they deserue, since that *Lysippus* (by report) made in his time six hundred and ten, so full of art, so excellent and perfect all, as there is not one of them but sufficient it were to immortalize his name. And how was it knowne that hee made such a number just? It appeared plaine after his decease by a coffer that he had, wherein he treasured vp his gold, and which was then broken open by his heire: for the manner of *Lysippus* was, whensoever he tooke money for the workmanship of any piece that went out of his hands, to lay by in the said coffer one * denier of gold; and so by the number of those deniers it was knowne, how many pieces of worke he made. Incredible it is to what height of perfection this art grew vnto, first by the successe of the art, which was so vendible and high prized; afterwards, by the audaciousnesse of the artificer, who ventured to make so huge and monstrous works.

What good speed this art had, may appear by an example which I will set downe, of an image, deuised to expresse the likenesse neither of god nor man: and a dogg it was in brasse, which many a man hath seene in our time in a chappell of *Iuno* within the Capitoll temple, before it was burnt now last by the * *Vitellians*: This dogg was made licking his owne wound; but how artificially it was wrought, and how liuely it expresse the proportion & feature of a dog indeed, to the wonder of all those that beholding it could not discern the same from a liuing creature, is apparant not only by this, That it was thought worthy to stand in that place and to be dedicated to that goddesse, but also by the strange manner of charge laid vpon them that had the keeping and custodie thereof: for no reall caution of money was thought sufficient to

* It doth not appear what it was, but by all likelihood *quintus metellus*.

* It should seeme that the Greeks had a piece in gold answerable in weight vnto the Romane *Denarius* in silver, which was a dram Attick: and this cometh next vnto our French crowne.

* i. Those that sided with *Vitellius*.

A be pledged and pawned for the warrantise, or to counteruaile the worth thereof: Order therefore was giuen by the state, and the same obserued from time to time, that the sextons or wardens of the said chappell should performe the safety and forth-comming of it vnder paine of death.

As touching the bold and venturous pieces of worke that haue been performed and finished by this art, we haue an infinite number of such examples: for we see what huge and gyant-like images they haue deuised to make in brasse, resembling high towers more like that personages, and such they called *Colossi*. Of this kind is the image of *Apollo* within the Capitoll, transported by *M. Lucullus* out of Apollonia, a city within the kingdome of Pontus, which in height was thirtie cubits, and cost a hundred and fifty talents the making. Such another is that of *Iupiter* within *Mars* field, dedicated by *Claudius Caesar* the Emperour, which because it standeth so neere vnto *Pompeys* theatre, men commonly call *Iupiter Pompeianus*, and full as big he is as *Apollo* abouenamed. Like vnto these, is the colosse or stately image [of *Hercules*] at Tarentum, the handiwork of the said *Lysippus*, but he is forty cubits high: and miraculous is the deuise of this colosse, if it be true which is commonly reported thereof, namely, that a man may moue and stirre it easily with his hand, so truly ballanced it stands and equally counterpoised by Geometry; and yet no wind, no storme or tempest, is able to shake it. Certes, it is said, that the workman himselfe *Lysippus*, provided well for this danger, in that a pretty way off he reared a colunne or pillar of stone full opposit to the winds mouth, for to breake the force and rage thereof, from that side where it was like to blow and beat most vpon the colosse: and verily so huge it was to weld, and so hard to bee removed, that *Fabius* surnamed *Verrucosus*, durst not meddle with it, but was forced to let it alone & leaue it behind him; notwithstanding be brought with him from thence another *Hercules*, which now standeth within the Capitoll. But the Colosse of the Sun which stood at Rhodes, and was wrought by *Chares* of Lyndus, apprentice to the abouenamed *Lysippus*, was aboue all others most admirable; for it carried seuentie cubits in height: well, as mighty an image as it was, it stood not on end aboue threescore yeares and six; for in an earthquake that then happened, it was ouerthrowne: but lying as it doth along, a wonderfull and prodigious thing it is to view and behold: for first and foremost, the thumbs of the hand and great toes of the foot are so big, as few men are able to fadome one of them about: the fingers and toes are bigger than the most part of other whole statues and images: and looke where any of the members or lims were broken with the fall, a man that saw them would say they were broad holes and huge caues in the ground: for within these fractures and breaches, you shall see monstrous big stones, which the workemen at the first rearing and setting of it had couched artificially within, for to strengthen the colosse, that standing firme and vpright so ballasted, it might checke the violence of wind and weather. Twelve yeares (they say) *Chares* was in making of it before he could fully finish it, & the bare workmanship cost three hundred talents: This money was raised out of *K. Demetrius* his prouision which he had set by for that purpose, & paid from time to time by his officers, for that he would not himselfe endure to stay so long for the workmanship thereof. Other images there are besides of the nature of colosses in the same citie of Rhodes to the number of one hundred, lesser indeed than the foresaid colosse of the Sun, yet there is not one of them, but for the bignesse were sufficient to giue a name to the place and ennoble it, wherefoeuer it should stand.ouer and aboue, there be in the said citie fise other gyant-like images or colosses representing some gods, and those of an huge bignesse, which were of *Bryaxes* his making. Thus much of workemen strangers.

And to come somewhat nearer home: we Italians also haue practised to make such colosses, for surely we may see (and go no further than to the librarie belonging to the temple of *Augustus Caesar* here in Rome) a Tuscan colosse made for *Apollo*, and the same is fiftie foot high from the great toe vprward: but the bignesse thereof is not so much as the matter and workmanship: for hard it is to say, whether is more admirable, the beautifull feature of the body, or the exquisite temperature of the mettall. Moreover, *Sp. Carvilius* long agoe made the great image of *Iupiter* which standeth in the Capitoll hill, after the Samnites were vanquished in that dangerous war, wherein they bound themselves by a sacred lay and oth to fight it out to the last man, vnder paine of death to as many as seemed to turne backe or once recule; to the making whereof, he tooke the brassen cuiraces, grieues, and morions of the enemies that lay dead and slaine vpon the ground: which is so exceeding bigg and large, that hee may very plainly and euidently bee discovered and seene from the other *Iupiter* in Latium, called therefore *Latarius*.

* *Fellus* saith 105 foot: whereby it appeareth that a cubit was one foot & a halfe. *Chares* the workman engraved vnder it this Hypogram in Latin: *hic est colossus Iovis aedificatus a Rege Xipre miles armatus a Antiocho*.

The powder & dust which the filme made in the workmanship & polishing of this colosse, *Caracallus* himselfe cast again, and thereof made his own image and pourtraiture, and the same standeth (as you may see) at the foot of the other. Within the said Capitoll, there be two brasen heads worthy of admiration, which *P. Lentulus* when he was Consul thought good to dedicate to that place. The one was made by *Chares* the foresaid founder, the other wrought by *Decius*. But this of *Decius* his making compared with the other, commeth so farre short, that one would not take it to be the doing of an artificer that was his crafts-master, but rather of some bungler, prentice, or learner. But to speake indeed of a great image, and that which surpasseth in bignes all the rest of that kinde, looke but vpon the huge and prodigious colosse of *Mercurie*, which was about it, and within our remembrance, made in France at Auvergne: ten yeares hee *Zenodorus* in our age and the workmanship came to foure hundred thousand sesterces. Now when hee had made sufficient prooffe of his Art there, *Nero* the Emperour sent for him to come to Rome, where he cast indeed and finished a colosse a hundred and ten foot long, to the similitude and likenesse of the said Emperour, according as it was first appointed, and as he began it: but the said prince being dead and his head laid, dedicated is was to the honour and worship of the Sun, in detestation of that most wicked monster, whose vngodly acts the city condemned and abhorred. Certes, I my selfe haue been in that workhouse of *Zenodorus*, where I beheld and considered not onely that great master-patterne in cley of the said colosse, but also another consisting of very small pieces, as branches, which serued as it were for moulds, and the first indution to the worke, as the assay and prooffe thereof. Surely the workmanship of this one statue or colosse, shewed plainly, that the true science & skil of founderie or casting brasie into forms, was cleane decayed and gone; considering that *Nero* was ready and willing to giue siluer and gold enough for the doing thereof artificially and with expedition. *Zenodorus* also himselfe was not thought inferiour to any workman in old time, either for counterfeiting a similitude, or grauing the same: for during the time that he made the statue before said in Auvergne, he counterfeited two drinking cups grauen and chased by the hand of *Calamis*, but belonging to *Vibius Arvatus* (the president and gouernor at the same time, of that prouince) which he had receiued of *Cassius Syllanus* his vnkle by the mothers side, tutor and schoolemaster somtime to *Casus Germanicus*: which prince notwithstanding that he loued them wel, yet hee bestowed them freely vpon his said instructor *Cassius*, whom he loued better: and *Zenodorus* did it so well, that hardly there could be discerned any difference in the workmanship. But to conclude, the more consummat and accomplished that *Zenodorus* was for his skill and cunning, the more euidently it appeareth, that the true Art of founderie was in his time cleane lost, and out of knowledge and practise.

CHAP. VIII.

¶ Of 366 excellent pieces of worke in Brasie, and as many cunning artificers in that kind.

The images and wrought pieces of Brasie, commonly called Corinthian works, many men take such pleasure & delight in, that they loue to carry the same with them whither soeuer they goe. As *Hortensius* the famous orator, who would neuer be without the counterfeite of *Sphinx*, which hee had from *Verres* his client, at what time as he was in trouble and called into question, for his extortions and oppressions in Sicilie: in which triall of *Verres*, wherein *Cicero* was his aduersarie and accuser, vpon occasion that *Hortensius* who pleaded at the barre against him in the behalfe of *Verres*, among other crosse words that passed betwene, happened to say, That he understood no parables and riddles, and therefore willed him to speake more plainly; *Cicero* made answer readily againe, that by good reason he should be well acquainted with riddles, seeing he had a *Sphinx* at home in his house. Likewise, *Nero* the Emperour had a great fancie to a piece or counterfeite of an Amazon, (wherof I meane to write more hereafter) which by his good will he would neuer be without. And *C. Cestius*, somewhat before *Nero*, a man that in his time had bin Consul, was so addicted to a little image that he had, that it went with him in the campe, yea and he would haue it about him in the very conflict and battell with his enemies. Moreover, *K. Alexander* the Great had four statues or images (by report) which ordinarily were wont and none but they, to support his tent when he lay abroad and kept the field: wherof twain stand now before the temple of *Mars* called the Reuenger, & other 2 before the *Palatium*.

As

As touching images, statues, and counterfeits of a lesser size, there are an infinite number of artificers who are ennobled & renowned by them: yet to begin with the image of *Iupiter* made at Olympia, *Phidias* the Athenian (about all other) was of great name therefore, and wrought it was of yvorie & gold together: howbeit many other pieces of brasie there were of his making, which greatly commended the workman; he flourished in the 83 Olympias, and about the yere (after our computation at Rome) 300. And at the same time there liued those concurrents of his who endeauoured to match him, to wit, *Alcamenes*, *Critias*, *Nesicles*, and *Hegias*. After these, and namely in the 87 Olympias, there succeeded and had their time, *Agelades*, *Callon*, *Polycleus*, *Phrynon*, *Gorgias*, *Lason*, *Myron*, *Pythagoras*, *Scopas*, and *Pericles*: of which, *Polycleus* brought vp diuers braue and worthy apprentices, and by name, *Argisus*, *Asipodorus*, *Alexis*, *Aristides*, *Phrynon*, *Pyron*, *Athenodorus*, *Dameas* of Clitorea, & *Myron* the Lycian. In the 95 Olympias there flourished *Nauces*, *Dinomides*, *Canochus*, and *Patrocles*. In the 102 Olympias there came in place, *Polycles*, *Cephalodorus*, *Ececharis*, and *Hypatodorus*. In the 104 liued *Lysippus*, at what time also *K. Alexander* the Great flourished: likewise *Lysistratus* and his brother *Sthenis*, *Euphronides*, *Softratus*, *Ion*, and *Silanius*: of which *Silanius* this is wonderful, that hauing no master at all to teach and instruct him in the art, yet he became himselfe so excellent, that he brought vp vnder him, *Zeuxis* and *Ladys*. In the 120 Olympias, *Eutychides*, *Euthykrates*, *Labippus*, *Sephestodorus*, *Tymarchus*, and *Pyromachus* were famous artificers for the time. Then lay the art asleepe and as it were dead for a while, vntill such time as about the 155 Olympias it seemed to reuiue and awaken again; & then there arose *Antheus*, *Callistratus*, *Polycles*, *Athenaus*, *Callixenus*, *Pythocles*, *Pythias*, and *Timocles*, indifferent good workemen, but nothing comparable to the other before named. Thus hauing ranged the most famous Artificers distinctly according to their seuerall Ages, I will runne ouer them againe, as many I meane as excell the rest: and yet how soeuer I make haste, I will not ouerpasse the multitude of others, but interlard (as it were) and disperse them among, as occasion shall be offered.

In the first place this is to be vnderstood, that the principal and singular of all these founders came in question (notwithstanding they liued in sundry ages) which of them should be esteemed chiefly, by reason of diuers Amasons wrought by their hands: for when these images should be dedicated in the temple of *Diana* in Ephesus, it was thought good to make choise of one that should be deemed & approued best, by the iudgment of those workmen who then liued & were present: for plaine it was, that the image whom they all iudged to be next and second to their own, the same was simply best, and so to be reputed. This principal Amason hapned to be of *Polycleus* his making: in a second degree was the Amason made by *Phidias*: that of *Ctesilas* was counted the third, of *Cydon* the fourth, & in a fifth place was reckned the workmanship of *Phragmon*. As for *Phidias*, besides the *Iupiter Olympius* of his making, (wherin no man seeketh to come neere vnto him) he made likewise *Minerva* of iuorie at Athens, which standeth there in the temple *Parthenon*. But ouer and aboue the foresaid Amason, there was of his workmanship *Minerva* in brasie, so faire and beautifull, that of her beauty she tooke the surname [*Kallimorphos*]. Of his doing was the image called ** Cliduchos*, and another of *Minerva*, which *Amilius Paulus* dedicated at Rome in the temple of *Fortuna huiusce diei*. Of the daies of Fortune. Also two other statues or images portraied in clokes or mantles, were his handiwork, which *Catulus* set vp in the same temple: likewise another after the maner of a colossus or gyant all naked. In sum, he was deemed and that iustly, to haue bin the first that deuised and taught the skil of chasing & embossing. As for *Polycleus* the Sicyonian, who learned his cunning vnder *Agelades*, hee it was that made in brasie *Diadumenus* an effeminate yong man looking wantonly, with a diadem or wreath about his head, a piece of work of great account, & much spoke of, for that it cost 100 talents: and of his making was *Doryphorus*, a yong boy with a manly countenance, hauing a speare in his hand. Moreover, he made that which workmen call Canon, that is to say, one absolute piece of worke, from whence artificers do fetch their draughts, simetries, and proportions, as from a perfect patterne or rule which guideth and directeth them in their worke: so as wee may well and truly iudge, that *Polycleus* alone reduced the skill of Founderie and imagerie into an Art and method, as may appeare both by that Canon, and by other workes which passed through his hands. Of his workmanship was the brasen image, representing one scraping and rubbing himselfe in the bath or hot-house: as also another all naked, and ** challenging to the dice*. Item, two boyes both naked playing at dice, which thereupon be called *Astragalizontes*. And these re-

* *Kallimorphos*, i. *Claviger*, i. *key-bearer*.

* *Tale incensum*, i. *incensum*, i. *incensum*.

main to be seen in the court or portall belonging to the house of *Titus* the Emperour, which is so exquisite a piece of worke, that many doe iudge there cannot be set another to it more absolute and perfect: also he it was which wrought the image of *Mercury* which is at *Lysimachia*. of *Hercules* at Rome, and namely how hee heaved and held vp *Anteus* from the ground between heauen and earth: and the counterfeits of *Artemon*, that effeminate and wanton person, who because hee was ordinarily carried in a Litter, men called *Poryphoritos*. This *Polyclitus* was iudged to haue brought this art of Imagery to a consummat perfection; the feat also of ingrauing & imbossing he was thought to practise and promote, like as *Phidias* before him opened the way to it & gaue instructions. This proper and special gift he had besides about all other, to deuise how Images might stand vpon one leg: and yet *Varro* saith, that all the images of his making be four square, and all in manner after one pattern.

To come vnto *Myro*, born he was at *Eleuthera*, and an apprentice likewise to *Agelades*: the piece of worke that brought him into name and made him famous, was an heifer of brasse; by reason for that diuers Poets haue in their verses highly praised it, and spread the singularity of it abroad: for so it falls out otherwhiles, that many men are commended by the wit of others, more than by their own. Other pieces of work there were of his besides, to wit, a dog, a coit, a caffer (or one hurling a stone or weight of lead) *Perseus* [killing *Medusa*] sawyers called *Pristæ*, a Satyre wondrous at a pipe or flute, and the goddesse *Minerva*: moreover, the Delphick *Pentathli*, & the *Pancratiastra*: furthermore, that image of *Hercules* which standeth in the temple that *Pompey* erected neere the greatest cirque or shew-place, is the handiwork of *Myro*. Besides (as it appeares rected neere the greatest cirque or shew-place, is the handiwork of *Myro*. Besides (as it appeares by the poesie of *Erinna* the Poetresse) hee it was that made the tombe or monument in brasse of a poore graff,opper and a locust; the image likewise of *Apollo*, which (after that *Antonius* the Triumvir had wrongfully taken from the *Ephesians*) *Augustus Caesar* restored againe vnto them, being warned so to do by a vision appearing vnto him in his sleep, was of *Myro* his making. This workman seems to haue bin the first that wrought not his images after one sort, but altered his work after many fashions, as being fuller of inuention, and giuen more to deuise in his art, more curious also and precise in his symetries and proportions, than *Polyclitus*: and yet as exquisite as he was, he went no farther than to the outward linements of the body and members thereof; as for the inward affections of the mind he did not expresse in any of his work: the haire also as well of head, beard, as share, he left after a grosse manner, & wrought them no finer than the rude and vnexpert workmen in old time had either done or taught. No maruel therefore if *Pythagoras* K of the Imageur of Rhegium in Italy went beyond him in this feat, and namely in that piece of worke of his which resembled a wrestler or *Pancratiastra*, which was dedicated in the temple of *Apollo* at Delphos. He came short also of *Leontius*, who expressed liuely in brasse, *Astylus* the famous runner in a race; which image is shewed for a rare piece of work in *Olympia*: also the boy *Libys*, which is to be seen in the same place, holding in his hand a little table, and withall carrying apples, stark naked. He made also the pourtraiture of one that seemed lame and to halt, vpon an vicer, but the same is so liuely and naturally done, that as many as behold the same seeme to haue a compassion and fellow-feeling with him of some pain and grienance of his fore; and this piece of work a man may see at *Syracusa*. Furthermore, the said *Leontius* cast in brasse one *Apollo* playing vpon his harpe: as also another *Apollo*, and the serpent killed with his arrowes; which I image he surnamed *Dicaeus*, i. lust: for that when the city of *Thebes* was won by *Alexander* the Great, the gold which he hid in the bosome thereof when hee fled, was found there safe and not diminished, when the enemy was gon and he returned. Hee was the first that in his images expressed the sinues and veines lying vnder the skinne: hee it was also that couched and layd the haire of the forehead more handiomerly, yea and wrought the same farre more finely than any before him.

* or rather *Parrasius*, of *Paros*.
* *Hierofte* dict.
Now besides *Pythagoras* before mentioned, there was another a * Samian both, who by occupation was at the beginning a painter: of his handiwork are those 7 images halfe naked, which are to be seen in the Temple of * This daies *Fortune* at Rome; and one resembling an old man: all highly commended for singular art. This *Pythagoras* was so like vnto the other about named, M especially in face and countenance, that hardly (by report) one of them could be knowne from the other. As touching *Softratus*, it is said he was apprentice to *Pythagoras* of Rhegium, and his sisters son besides. As for *Lysippus* of *Sicyone*, *Durus* saith, That he learned the art by himselfe, and neuer was taught by other. But *Tullius* affirmeth, That hee was an Apprentice vnto it, and

A hauing bin at first by occupation a poore tinker or a plain braiser and coppersmith at the most, he began to take heart vnto him and to proceed further, by a speech or answer that *Eupompus* the painter gaue him: for when he seemed to ask this painters counsell, what pattern and whom he were best to follow of all those workmen that were gon before him? hee shewed vnto him a multitude of people, and said withall, That he should do best to imitate Nature her self, and no one artificer: and that was it (quoth he) which I meant by the former demonstration of so many men. And verily, so excellent a workman he proued in the end, that he left behind him the most pieces of any man (as I haue said before) and those of all sorts, and fullest of art and good workmanship: and among the rest, the image of a man, currying, rubbing, and scraping the sweat and filth off his own body, which *M. Agrippa* caused to be set before his own baine: and the Emperour *Tiberius Caesar* took to great pleasure in it, that notwithstanding at his first comming to the crown he knew well enough how to command and temper his own affections, yet he could not now rule himselfe, but would needs haue the said image to be removed from thence, vnto his own bed-chamber, and another to be set in the place of it: wherat the common people (see their contumacie and frowardnesse) were so much offended and displeased, that they rested not with open mouth to exclaim vpon him in all their theatres, when they met there together, and cried to haue their *Apoxyomenos* set again in the own place: inso much as the Emperour was content so to do, notwithstanding he loued it so well. This *Lysippus* also won great credit and commendation by another image that he made, representing a woman piping or playing vpon the flute, and drunken withall: also by a kennell of hounds, together with the huntman and all belonging to the game. But about all, he got the greatest name for making in brasse a chariot drawne with foure steeds, together with the image of the Sun, so much honored among the *Rhodians*. The personage of King *Alexander* the Great hee likewise expressed in brasse, and many images he made of him, beginning at the very childhood of the said Prince: and verily the Emperour *Nero* was so greatly enamoured vpon one image of *Alexander*, that hee commanded it to be gilded all ouer; but afterwards, seeing that the more cost was bestowed vpon it by laying on gold, the lesse was the art seen of the first workman, so that it lost all the beauty and grace that it had by that means, he caused the gold to be taken off againe: and verily the said image thus vngilded as it was, seemed far more pretious than it was whilest it stood so enriched with gold, notwithstanding all the hacks, cuts, gashes, and rases all ouer the body wherein the gold did sticke, remained still, which in some sort might disfigure it. Of this mans making was the statue of *Hephestion*, a great fauorite and minion of *Alexander* the Great; and yet some ascribed this piece of worke vnto *Polyclitus*; whereas in truth he liued almost an hundred yeres before the said *Hephestion*. He counterfeited also *Alexander* the Great how hee rode a hunting, with his hounds and all things belonging to the chace; and this Worke of his resembling hunting was thought worthy to be consecrated in the temple of *Apollo* at Delphi. At Athens he made a troupe of Satyrs. As for *Alexander* himselfe, with all his principall courtiers and friends about him, he resembled in brasse most liuely. All these pieces of his workmanship before rehearsed were transported to Rome by *Metellus*, after the subduing and conquest of Macedonia. Finally, Coaches drawne with foure horses, he made of many sorts and fashions, all in brasse. And in a word, the art of founderie and imagerie was brought to far greater perfection by this Artificer, as it was thought; for hee expressed the very haire of the head as fine and small as Nature made them. The heads to the images of his making were nothing so big in proportion to the rest of the body as they were in old time: his images shewed not so great and corpulent, but more lank, slender, and lean; as well to expresse the knitting of joints, the ribs, veins, and sinues the better, as to cause them also to seem the taller. The Symmetrie, which about all things hee obserued most precisely in all his workes, is a terme that cannot properly be expressed by a Latine word. A new deuice he had that neuer before him any practised, and that was, to make his images of a quarry and square stature, as the Antients before his time did: for an ordinary speech it is of his, That in times past men were made plain, such as they were; but he made them as they would seem to be. Finally, it seemeth, that this singular gift he had about all others in all his workes, to shew finenesse and subtiltie, which hee obserued most curiously in the smallest things that passed vnder his hand. When he died, he left behind him three sonnes, which all were his apprentices: of whom, *Lysippus* and *Bodas* were passing good Workemen, and very well regarded; but *Enthyocrates* his third sonne ouerwent his brethren. Although I must needs say, That hee

was the workman, who cast in brasse the full proportion and similitude of *Protesilaus*, and of *Pythodorus* the famous wrestler. *Alexander*, otherwise called *Paris*, was of *Euphranor* his making: The excellent art and workmanship wherof was seen in this, that it represented vnto the eie all at once, a iudge between the goddesses, the louer of *Helena*, and yet the murtherer of *Achilles*. The image of that *Minerva* at Rome, which is called *Catulliana*, came out of this mans shop: and it is the same which was dedicated and set vp beneath the Capitoll by *Quintus Lutatius Catulus*, whereupon it tooke that name. Moreouer, the image that signifieth good lucke, or happie success, carying in the right hand a boule or drinking cup, in the left an eare of corne and a Poppy head, was his handie worke. Like as the princeesse or ladie *Latona*, newly deliuered of *Apollo* and *Diana*, holding these her two babes in her armes: and this is that *Latona* which you see in the church of *Concordia* in Rome. He made besides many chariots, drawne as well with foure as two horses: as also a key-bearer or *Cliduchus*, of incomparable beautie. Semblably two other statues, resembling Vertue and Vice, both which were of an extraordinary stature and bignes, gyant-like, in manner of Colosses. He made besides a woman ministring, and yet worshiping withall. Item King *Alexander* the Great, and King *Philip* his father, riding both in chariots drawne with foure horses. *Entychides* a renowned imageur, represented the riuer *Eurotas* in brasse: and many men that saw this worke, werewont to say, That the water ran not so cleare in that riuer, as art and cunning did appeare in this workmanship. *Hegyas* the imageur made *Minerva* and King *Pyrrhus*, which be much praised for the art of the maker: likewise boies practising to ride on horsebacke: the images also of *Castor* and *Pollux*, which stand before the temple of thundring *Jupiter* in Rome. In the colonie or city *Parium*, there is an excellent statue of *Hercules*, the handy worke of *Isidorus*. *Buthyrcus* the Lycian was taught his cunning by *Myron*, who among many other pieces, befeeming the apprentice of such a master, deuised in brasse to represent a boy blowing at a fire halfe out: and he it was that cast in the same mettall the famous *Argonautes*, in that voyage to *Colchos*.

Leocras made the *Egle* that rauished *Ganymede*, and flew away with him: but so artificially, as if she knowing what a fine & dainty boy she had in charge, and to whom she caried him, clasped the child tenderly, that shee forbore with her tallons to pierce through the very cloths. The boy *Autolikos* also, winning the prize in all games and feats of actiuitie, was of his making; for whose sake *Xenophon* wrote his booke entituled *Symposion*: likewise that noble image of *Jupiter* in the Capitoll of Rome, surnamed *Thundering*, which is commended aboue all others: as also *Apollo*, with a crowne or diademe.

* i. Good health.

Lyciscus counterfeited *Lago* a boy, who in maner of a page or lacquey, seemed to be double diligent, & after a flattering and deceitfull sort performed nothing but eie-seruice. *Lycus* also made another boy blowing the coales for to maintain fire. *Menechmus* deuised to cast in brasse a calfe, turning vp the neck & head at the man that setteth his knee vpon his sides, and keeps his body down. This *Menechmus* was a singular imageur, and himself wrote a booke as concerning his own art. *Naucides* was iudged to be an excellent workman, by the making of *Mercury*, & of a discobole or coiter: as also for counterfeiting in brasse one that was a sacrificing or killing a ram. *Nancernus* woon credit by making of a wrestler, puffing & blowing for wind. *Nicerates* had the name for the curious workmanship of *Esculapius* and **Hygia*, which are to be seen at Rome within the temple of *Concord*. *Porymachus* got great reputation by a coach drawn with four steeds, & ruled by *Alcibiades* the coachman, all of his making. *Policles* was the maker of that noble piece of work that goeth vnder the name of *Hermaphroditus*. *Pyrrhus* counterfeited in brasse another *Hygia* & *Minerva*. And *Phanix* who learned his art of *Lysippus*, liuely counterfeited the famous wrestler *Epitherses*. *Stipax* the Cyprian got himselfe a name by an image resembling one *Splanchnoptes*: This was a pretty boy or page belonging to *Pericles*, surnamed *Olympius*, whom *Stipax* made frying & roasting the inwards of a beaſt at the fire, puffing and blowing therat with his mouth full of breath and wind for to make it burne. *Silantion* did cast the similitude of *Apollodorus* in brasse, who likewise was himselfe a founder and imageur, but of all other most curious and precise in his art, he neuer thought a thing of his owne making well done, and no man censured his worke so hardly as himselfe: many a time when he had finished an excellent piece of work, he would in a mistlike vnto it, path it in pieces, and neuer stood contented and satisfied with any thing when it was all done, how ful of art foeuer it was, and therefore he was surnamed *Mad*: Which furious passion of his, when *Silantion* aforeſaid would expresse, he made not the man himselfe alone of brasse, but the

A the very image of Anger and Wrath also with him, in habit of a woman.ouer and besides, the noble *Achilles* was of his making, a piece of worke well accepted and much talked of. Of his doing is *Ephistates*, teaching men how to wrestle and exercise other feats of actiuitie. As for *Strongylion*, he made one of the Amazons, which for an excellent fine and proper leg that she had, they call *Eucnemus*; and in that regard *Nero* the Emperour set so great store by this image, that it was carried ordinarily wherefoeuer he went. This artificer made likewise another braſen image resembling a faire and sweet boy, which for the singular beautie *Brutus* of *Philippo* so loued, that it was commonly called by his surname *Philippensis*.

Theodorus who made the Maze or Labyrinth at *Samos*, caused his own image to bee cast in brasse, which besides the wonderfull neere resemblance and likenesse to himselfe, was contriued so artificially besides, and so set out with other fine deuises, that he was much renowned for the workmanship, and in the sight of all men it was admirable: he carrieth yet in his right hand a file, and in his left hand he bare sometime (with three fingers) a little pretty coach, and the same with four horses at it, which was afterwards taken from the rest, and had away to *Præneste*: but both the coach, the teeme of horses, and the coachman were couched in so small a roome, that a little flie (which also he deuised to be made to the rest) couered all with her pretie wings.

Xenocrates was apprentice to *Tisicrates*, or as some say, to *Euthyocrates*; but whether of the twaine foeuer was his master, he outwent them both in the number of statues and images that he wrought, and besides compiled bookes of his owne art and workmanship.

Many artificers there were, that by imagerie delighted to counterfeit in brasse the battailes that king *Attalus* and *Eumenes* both, fought against the Galatians or Gallogreekes; and namely, *Ifigonius*, *Pyromachus*, *Stratonicus*, and *Antigonius*, and this artificer last named, composed bookes also of his own art. *Boethius*, although he was a better workman in siluer, yet one piece of worke he made in brasse, which had an excellent grace, and that was a child throttling a Goose by the necke.

Of all these pieces of antique worke which I haue reckoned vp, the most choise and singular aboue the rest, *Nero* before time had by his violent edicts and commandements caused to bee brought from all parts to Rome, and he disposed them in diuerse roomes of his golden house for to adorne and beautifie the same; but now they be consecrated by *Vespasian* the Emperour, in the temple of Peace, and in other stately buildings and edifices of his.

D Many other excellent artificers there are besides these aboue rehearsed: but they may be all ranged in one ranke, and counted for their skill and cunning equall, for a man shall not find one piece of worke of their making, that carieth any singularity aboue the rest, and namely *Ariston*, who also was wont to graue and chafe in siluer, *Callias*, *Cleſias*, *Cantharus* of *Sicyone*, *Dionysodorus* who was an apprentice trained vp vnder *Critias*, *Deliaides*, *Euphorion*, *Eunicus*, and *Hecataeus*. As touching famous engrauers in siluer, I read of *Lesbocles*, *Prodorus*, *Piſiodicus*, and *Polygnorus*, who also were most excellent and renowned painters. Likewise, of siluerſmiths or grauers in siluer, we haue *Stratonicus*, and *Scymnus*, who had for his master *Critias*.

Now will I reckon vp those worthy and famous Imageurs, who employed themselues in one and the same kind of workes. In the first place, *Apollodorus*, *Androbulus*, *Asclepiodorus*, and *Alcetas* tooke pleasure to expresse the similitudes of learned men & Philolophers. As for *Apelles*, he delighted besides to represent women at their deuotions, adoring the gods, and offering sacrifices. *Antigonius* had a grace likewise to represent one *currying and scraping his skin al ouer the body in a stoue, as also the murderers of the Tyrants abouenamed. *Antimachus* and *Athenodorus* loued to haue in their shops the statues of great ladies and noblewomen. *Aristodemus* tooke much pleasure to busie himselfe about the portraying of wrestlers, coaches with two horses set therto, and a coachman, Philolophers and great clearkes, old matrons, and king *Selenus*: There is also of his making a *Doryphorus*, resembling one of *Darius* his guard, which is a proper piece of work & a louely. As touching the *Cephiſſodori* (for two of them there were) the elder had a great dexterity in making *Mercurie* fostering prince *Bacchus* in his infancie: He made also one, preaching to the people, and casting forth his armes; but what person of quality he should be, it is not certainly knowne: the younger was wont to represent the Philolophers. *Colothus*, who joined with *Phidias* in the making of *Jupiter Olympius*: He delighted also to be doing with the images of Philolophers. So did *Cleon* and *Cenchramis*, *Calicles*, and *Cephis*. As for *Calcoſthenes*, he busied and amused himselfe in the counterfeits of Comedians, players of enterludes, and champions. *Daphippus*

* i. exerciſing
the same that
Apoſtomon:

hippus had a very good hand, in making one scraping and rubbing his body in an hot-houfe. *G Daiphron*, *Democritus*, and *Demon*, were as cunning and perfect in the personages of Philosophers and Sages, *Epigonus* would haue his hand in all those works in manner which I haue rehearsed, and laboured to imitate those artificers: but he surpassed them all in a Trumpetter of his owne devising, and a little infant, who seeing the mother slaine, made toward the dead corps, and hung about it as if it would play and be played withall, full pittiously to behold. *Eubolides* made one, as if he were counting vpon his fingers. *Mycon* his cunning was most seen in the counterfeiting of wrestlers and such as practise feats of actiuitie: and *Menogenes*, in making chariots with foure horses. *Niceratus* likewise enterprised all manner of works wherein others were best seen: and besides represented the personage of *Alcibiades*, together with his mother *Demarete*, as shee sacrificed with lampe light burning by her. *Pisicrates* shewed much skill with a chariot of two horses, H

* *Suadas*, i. Per-
suasio, or *Diana*
as some think.
Some read *Pi-
sa*, i. the god-
desse of Cere-
dulitie.

wherein he bestowed * *Pitho* sitting in the habit of a woman: The images *Mars* and *Mercurie* also, which stand at Rome in the temple of *Concordia*, be of this mans making. As for *Perillus*, there is no man commendeth him for his workmanship, but holdeth him more cruell than *Phalaris* the Tyrant, who for that he deuised a brazen Bull, to roast & frie condemned persons in, assuring the Tyrant, that after the fire was made vnder it, they would when they cried seeme to bellow like a Bull, & so rather make sport than moue compassion: but this *Perillus* was the first himselfe that gaue the handsell to the engine of his own inuention, & although this was cruelty in the Tyrant, yet surely such a workman deserued no better a reward, & justly he felt the smart of it: For why? The art and cunning foundery, which of all others is most ciuile & agreeable to our nature, and which had beene employed ordinarily in representing the personages of men and gods, this monster of men abused, and debased to this vile and vnaturall ministry of tormenting man. Would one haue euer thought, that after so many witty & worthy men who had trauelled in this science to bring it to some perfection, all their labours should turne in the end to this prooue, for to make instruments thereby of torture? And certes, there being many pieces of his workmanship, they be kept and saued for this cause onely, that as many as see the same, may detest and abhor the wicked hand that made them. But to proceed forward to other workmen in this kinde. Of *Sthenis* making are the images of *Ceres*, *Iupiter* and *Minerva*, which at Rome are within the temple of *Concord*. The same man took pleasure in counterfeiting ancient dames and matrons, weeping, praying, and offering sacrifice. *Simon* [of *Egina*] was very good at the making of a dog and an archer. *Syratonius* that famous cutter and engrauer, was neuer well K but when he pourtraied some Philosopher or other: no more than *Scopas*, both the one and the other. As for wrestlers and champions, armed men, hunters, and sacrificers, they were the onely workes that these artificers following delighted most in, to wit, *Batten*, *Eucher*, *Glaucides*, *Heliodorus*, *Hicarus*, *Lyphon*, *Lyson*, *Lcon*, *Menodorus*, *Myagrus*, *Polycrates*, *Polydorus*, *Pythocritus*, and *Protagenes* (who also was a most excellent & renowned painter, as I will hereafter shew more at large) also *Patrocles*, *Polis*, *Polidonius* born at *Ephesus*, who likewise chased and engraved in siluer most finely, *Periclimenus*, *Philon*, *Simenus*, *Timotheus*, *Theomnestus*, *Timarchides*, *Timon*, *Tisias*, and *Thrason*. But aboue all other, *Callimachus* is the workman of greatest note, in regard of a by-name giuen vnto him, and that was *Cacizotechnos*: and well he might be so called, for hee would alwaies be finding fault with his own workmanship, & neuer could see when to make an end, thinking still L that he had not bestowed art ynough vpon that he had vnder his hand. And so he brought forth little or nothing perfect in the end: A notable and memorable example to teach all men not to be ouer curious and exquisit in any thing, but to hold a measure in all. And there is a daunce of Lacedemonian women of his making: a piece of work which he went about also to amend, and when he thought to make it better, he marred it clean, so that it lost all the grace it had before. Some say, that this *Callimachus* had bin in former time a painter. And since I haue entred so far into this Treatise of statues & images, I may not passe ouer in silence, but note (as it were) by the way one thing of *Cato*, although haply it may be thought but a meere vanity: In that expedition or voiage wherein *Cyprus* was conquered and reduced vnder the dominion of Rome, hee made port-faile of all the pillage taken there, saue only one statue of *Zeno*, not for the excellencie of the matter, for it was but brasse, nor yet for the art and curious workmanship thereof, but for that it was the image of a Philosopher. In this discourse of statues and images, I must not passe by one, although it is not certainly known who was the maker of it, and this is *Hercules* in his shirt and other habit that he wore vpon the mount *Oete*: standing now at Rome neere vnto the publicke M pulpit

A pulpit called *Roftra*: Made he is (whosoever did it) with a grim, sterne, and fower countenance, and such indeed as doth bewray and feel those intollerable torments which the body sustained by that poisoned thirst [sent to him from *Deianira*.] Vpon this statue there stand 3 titles or inscriptions: the first is this; *L. Luculli Imperatoris de Manubius*, i. *L. Lucullus* Lord Generall, erected this statue out of the spoile of the enemies: the second, *Pupillus Luculli filius ex S. C. dedicauit*, i. The son of *L. Lucullus*, being orphan or ward, dedicated this, by an order or act from the Senat: the third, *T. Septimius Sabinus Aedilis Curulis, ex priuato in publicum restituit*, i. *T. Septimius Sabinus*, Aedile Curule for the time being, hath from a priuat house caused it to stand againe in publick place. This is the image of that worthy *Hercules* that fought so many battels, indured such hard conflicts and labors, and was so highly honored.

B Now is it time to return to the different kinds and sundry temperatures of brasse, from which I haue digressed: first and foremost therefore this is to be noted, That in Cyprian brasse or copper there is to be considered, one sort which is named *Coronarium*, and the other that they call *Regulare*; and both the one and the other will abide the hammer & be brought into thin plates As for the *Coronarium* or *Laron*, when it is reduced into thin leaues or plates, and then coloured or rubbed ouer with the gal of an oxe, it looketh like gold, and maketh a faire shew in those coronets that plaiers weare; whereupon it tooke the name *Coronarium*: the same, after that to euery ounce of it there be put six scruples of gold, and be reduced into a very thin foile, resemblerth the color of fire, like a rubie or carbuncle stone. As touching this brasse, it is found also in other mines of mettall, like as the pot-brasse *Caldarium*: this only is the difference, that this *Caldarium* wil melt only, for vnder the hammer it will break; whereas the other sort of copper named *Regulare*, yeeldeth to the hammer and will be drawne out, whereupon some there be who call it *Ductile*, i. battable; and such is all the kind of copper or Cyprian brasse. That also which is found in the mines of other mettalls, by art refined, differeth from the foresaid pot-mettall, for out of what mine soeuer it commeth, after that the drosse & imperfections thereof be thoroughly purged by the fire, being thus (I say) clenfed, it becommeth *Regulare* and wil abide the hammer. As for all other sorts besides the Cyprian brasse aboue named, the *Campane* brasse is counted best: like to which, there is much in other parts also of Italy, and in the prouinces: but to e-uery [hundred pound of brasse] they put 8 pound of lead: then they boile it as it were and melt it again with a soft fire, for want and scarcitie of wood and fuell. And what difference there may be in that regard, it is most of all seen in the heart of France, where it is commonly melted (for lack of other fuel) among stones made red hot: for by reason that this is a swift & scorching fire, it becommeth black and brittle withall: besides, they melt it but once: but surely to doe so oftner, maketh very much for the goodnesse thereof.

CHAP. IX.

¶ The difference in Brasse: the diuers mixtures thereof: and how Brasse should be kept.

E Moreouer, it were not amisse to note thus much also, that all kind of brasse melteth best in coldest weather. Now there is another temperature of brasse which serueth for founders, imageurs, and brazen tables, called thereupon in Latine, *Statuaria* and *Tabularis*, which is made in this manner following: first, the masse, ore, or stone as it commeth out of the mine, is melted in the bloome-smithie; and so soone as it is melted, they put thereto a third part of the brasse *Collectaneum*, that is to say, broken pieces of old vessels that haue bin vsed, and bought vp here and there. In the choice whereof, this care would be had, that for to giue vnto this temperature the kind seasoning as it were, which peculiarly it requireth, there would be gotten such pottain or old mettall which is ouerworne, and by ordinary occupying and vsing to the hand, bright-shining, and as one would say tamed, made gentle, and pliable. It would not be forgotten also, to euery 100 pound weight of the said melted ore, to mix 12 pound and a halfe of Tin. But to haue a kinde of Brasse mettall that is most tender and soft, there must bee giuen vnto it that mixture or temperature which is called *Formall*, namely, by putting thereto of ordinarie lead a tenth part, and of Tin a twentieth part; and by that means especially it taketh that colour which they call *Grecanicke*. The last temperature is that, which in Latine they call *Ollaria*, as one would say, the pot-brasse, for it taketh the name of that vessell whereto it is most employed; and

and this is by tempering with euery hundred pound weight of brasse, 3 or four pound weight of G argentine lead or tin. To Cyprian brasse or copper, if you put lead, you shall haue that deep red or purple colour which giueth the tincture to the robes that statues are pourtraied with. Moreover, this is to be noted, that the more you do scoure any vessels of brasse, the more are they subject to rust, and sooner will they gather it, than if they were neglected and not medled withall; vnlesse they be well annointed with oile. It is said, that a vernith made of tarre, is singular for to preferue and saue any brasse from rust. To conclude, brasse hath serued many a yeare ago, for the perpetuity of memorials and registers, as we may see by those brasen tables here in Rome, wherein be cut and ingrauen all our publick laws and constitutions.

CHAP. X.

¶ Of Cadmia or Brasse ore, and the medicines wherein it is usually employed.

THE mines and veins of brasse ore do many waies furnish vs with medicines: a good proofe whereof this may be, that any vlcers be soonest healed there: but the most medicinable of all minerals that belong to brasse mettall, is Cadmia [artificial.] And verily there is a kind of Cadmia made in the furnaces where siluer is fined, of a whiter colour and lesse ponderous, but nothing comparable to that which cometh from the brasse furnaces. And sundry sorts there be of Cadmia: for the very stone of which they make brasse, is called Cadmia, and as it is necessary for founders, so it is of no vse at all in Physick. Now is there a Cadmia besides which is made in the furnaces, and so called, but the reason thereof is far different: and this kinde of Cadmia commeth of the finest and thinnest part of the ore or matter in the furnace, cast vp aloft by the flame & blast, sticking to the rooffe or sides of the furnace, higher or lower according to the proportion of the lightnesse that it carrieth, more or lesse. The finest and the floure as it were of Cadmia, is found in the very mouth of the furnace, whereas the flames * do strue to get forth; the Greeks call it Capnitis, for that it is smokie and burnt, and for the exceeding leuity thereof resemble flying cinders. That which is more inward and hangeth downe from the coping and vaulted rooffe of the furnace, is the best: and in that respect, because it hangeth so as it were by clusers, they giue it the name Botrytis: heauier this is than the former, but lighter than those that follow after. As for the colour thereof, it is in two sorts: that which you see of a dead hew like ashes is the worse, whereas the red is the better; the same also is brittle and will soone crumble small: for eie-salues and collyries reputed soueraign. A third kind of Cadmia sticketh by the way, to the sides and wals of the furnace; for by reason of the heauinesse and ponderosity, it was not able to mount vp to the bending rooffe of the furnace: this the Greeks call Placitis: and well it may be so named; for a crust rather it is than a scaly substance: break it, you shall find many colours in it; and this Cadmia for to heale scabs and scurfe, as also to cicatrice or skin a sore, is better than the former. Out of this kinde, there proceed other twaine, to wit, Onychitis, which in the outside is after a sort blewish, but within, it resemblenth the flecks or spots of the onyx stone; and Ostracitis, blacke throughout, of all the rest most foule and grosse, howbeit, fittest for wounds.

Generally, that Cadmia, of what kinde soeuer, is best, which is found within the furnaces of Cyprus: this the Physitians doe burne a second time with pure coles; and when it is calcined and turned to ashes, they quench it with Amminean wine, if they meane to prepare it for plasters, but with vinegar, for scabs and scurfe. Some there be, who after it is stamped grosse, burne or calcine it in an earthen pot, then wash it well in a mortar, and afterwards dry it. *Nymphodorus* taketh the very stone or the ore as it lieth in the mine, the heaviest and most compact that may be found, which he burneth among coles; and after it is sufficiently burnt, quencheth it in wine of Chios: he beateth and punneth it then again, anon he driueth or bouldeth it through a linnen cloth, and grindeth it finer in a mortar: this done, soon after he steepeth and soketh it wel in rain water, and that which setteth in the bottom he stampeth: and this he doth, vntill such time as it be like ceruse or white lead, and wil not crash between the teeth. The same maner of preparing useth *Tollas*, but he chuseth the purest and brightest stone that he can get.

The medicinable operations of Cadmia, bee, to drie, to heale throughly, to stay fluxes, to cleanse the filthinesse in the eyes, and to scoure the pin and web, to extenuate any roughnesse; and

* *Eiusantur*, or rather *Eruantur*, i. are breathed and sent forth.

A and in one word, to worke all those effects which I shall attribute hereafter to Lead.

Furthermore, brasse it selfe may be burnt; and being so prepared, it serueth for all those purposes before named: ouer and aboue, it cureth the pearls, films, and skars in the eies: if it be incorporat with milk, it healeth the vlcers in the eies: the same likewise they vse to grinde vpon hard stones, after the manner of the Egyptian collyrie; taken as a lohoch inwardly with hony, it causeth vomit. Now as touching copper, the manner is to burn it in vnbacked earthen pans, with the like weight of brimstone; but all the breathing holes of the furnace ought to be well closed and luted vp where they must stand, vntill such time as the said pans be thoroughly baked hard: some put salt thereto: others in stead of brimstone take alumne; and there be againe, who vse neither the one nor the other, but sprinkle it well with vineger onely: when it is thus calcined, they put B it in a mortar of Thebaick marble, and then wash it in rain water. Howbeit, this first lotion of it maketh it but weak and of small effect: and therefore it had need of a second washing, in a greater quantity of water, and to be braied againe therein, and left so standing vntill it be settled: this would be reiterated often, vntill such time as it be brought to looke like vnto Minium: after that, it ought to be dried in the Sun, and saued in a brasen box.

CHAP. XI.

¶ Of the drosse or refuse of Brasse: of the skales of Brasse: of Verdegreece or Spanish greene: of Stomoma: of Verdegreece which is the rust of Brasse, and of Hieracium.

THE drosse of Brasse is washed after the same manner, but of lesse effect it is than Brasse it selfe: howbeit the floure of Brasse or verdegreece, is much vsed in Physick: and engendred it is, when Brasse is melted by much blowing, and then transferred out of the furnace into other receptacles; and there, are shaken out certain skales of miller, and this they call Elos æris. Verdegreece. Now these skales vse to fall off, when as the masses of brasse be cooled with water and be red. Likewise of the same masses, there is made that which they call Lepis; and thus the verdegreece may be sophisticated, so as the said Lepis or skales be sold for it. Now these skales come, by being driuen & smitten off from those nails which they vse to forge of the said masses and lumps of brasse, and all these most commonly are found in the Cyprian forges: therein D only is the difference; that the foresaid skales are driuen forcibly & smitten from the said pains or masses of brasse, whereas the floure of verdegreece falls off by it selfe. And yet there is a second kind of these skales more fine and subtiler than the other, to wit, driuen and smitten from the very outside and vppermost part of the brasse, and this they call * Stomoma.

Howbeit, Physitians in these daies (with reuerence to their profession and with their good leaue be it spoken) are ignorant wholly of all these things; yea, and the greater part of them bee not so much as acquainted with the terms and bare names (so far be they from the true composition of medicines;) and yet in times past, it belonged properly vnto Physitians, for to be acquainted with the terms of all simples, and to be perfect in the knowledg of them. But our physitians in this age, when they are to make any composition of simples, they haue recourse straightwaies, to their books to be directed by them, that is to say, they try experiments by the hazard of their poore patients; and there finding the names of this and that, they set downe a receipt, & for the making thereof trust the Apothecaries, as also for the ingredients; which commonly they do sophisticat and corrupt by all deceitfull meanes that possibly they can deuise; selling their emplasters and collyries that are old made, and such drugs as are past all goodnesse, seruing the bills of the Physitians with the very refuse of their shop. And thus the deceitfull wares that they haue, they rid their hands of, to the discredit of the Physitian, and danger of the sicke.

But to come againe vnto our skales, and floure of brasse or verdegreece; the manner is, first to calcine both the one and the other, either vpon earthen vessels or brasse pans; then, to wash the same, as is before said, and for the same vses. But ouer and aboue, these being prepared thus accordingly, are singular for the carnosities and excrescences within the nostrills, or the fundament: for hardnesse also of hearing, if they be blowne into those parts by meanes of a pipe: and the sores or cankers of the mouth they doe heale, by application of their powder: this powder also taketh away the inflammations and accidents of the tonsils or almonds about the throat, if it be tempered and incorporat with honey, and vsed in a collution or gargarisme. There is besides,

* *Stomoma*, nothing, but steel, therefore here doth like as in m. of this chap.

side, a scale that commeth of laton or white brasse, farre better than that which the red brasse or G copper doth yeeld.

Moreover, there is a deuife that some vse, namely, to let first the nails and panes of brasse to lie wet in the vrine of a boy: others, so soone as the scales be driuen off, bray them, and afterwards wash them in rain water; which they vse to giue for the drop sicke, to the weight of two drams in one hemine of honied wine; and besides they make a liniment with it and fioure, for to vse outwardly to the belly.

* As touching the rust * of brasse, great vse there is of it in Physick : but it commeth after many sorts; for first and foremost, it is found sticking (in manner of the floure aforesaid) vnto the stone or ore out of which brasse is tried, in such sort, as it must be * scraped from it before a man can haue it. Also it is made after an artificiall manner, by hanging certain plates of laton driuen full of holes, and hung in a pipe or barrell ouer vineger ; but the same ought to be close couered and stopped with a lid of brasse, so as the said plates do not touch the vineger : and verily, verdegreece thus made, is far better than of skales in the same wise vsed. Some there be that take vessels of white brasse or laton, and put them in earthen pans, where they suffer them to lie in vineger for ten daies together, and then scrape off the verdegreece or rust that is gathered vpon the said laton. Others there are who couer the said vessels of laton in the refuse of grapes after they be pressed (skins I meane and stones,) and after ten daies, as is aforesaid, scrape off the Verdegreece which they find vpon the brasse. There be againe, who take the fine dust which the file fetcheth from brasse, and strew the same in a vessell of vineger, stirring it with spatules or ladles oftentimes in a day, vntill it be resolued into the vineger and consumed : and yet many think it better to work and stamp the said file-dust with strong vineger in a brassen mortar, for to gather verdegreece. But the speediest way of ingendring the said rust of brasse or verdegreece, is to take the cuttings, parings, or small pieces of laton plates, such as be employed about coronets, and to put them in vineger: and you shall haue diuers, who will not sticke to sophisticated verdegreis (such especially as is brought out of Rhodes) by mixing it and the powder of marble together; others with the pumish stone puluerized, or els with gum. But the cunningest deuice that they haue to falsifie it and deceiue chapmen by, is to mingle vitrioll amongst : for all the other deceitfull tricks be soone found out by the teeth, because a man shall feele the verdegreece to crash and grate between them like grit, which hee shall not perceiue if it be sophisticate with vitrioll : howbeit, this sophistication also and fraudulent cast, may be soone detected and found out by an experiment made with a slice or fire-pan of yron made red hot in the fire : for cast vpon it the right and true verdegreece indeed, it will hold and keep the owne colour still ; but if it be corrupted with vitrioll, you shall see it turne red. You may discouer likewise the fraud abouesaid with * paper, tempered beforehand and soked in gall-nuts ; for besmeare therewith the verdegreece that is falsified, it wil quickly become black. The eie also wil soon bewray the falshood that is vsed therein, for if it be naught, a man shall perceiue it to looke with a weak green color, nothing full nor fresh. But be the verdegreece true or false, the best way is, before it be employed in Physick, after it be dried, to calcine it vpon a new earthen pan that neuer was occupied, and in the burning to turne it often with a slice or spatule, vntill such time as it be reduced into light cinders, and then after it is finely puluerized, to lay it vp for vse. Others prepare it after another sort, they put it in an earthen pot vn timer, and set the same into an ouen, where they let it stand to be calcined so long vntill the said pot of clay be well and thoroughly baked. Finally, there be, that before they vse Verdegreece, put thereto the male Frankincense, the best that can possibly be had.

The manner also is to wash verdegreece before it be occupied, after the same order as Cadmia is vsed. Being thus made & prepared as is abouesaid, it is excellent to be put into eie-salues or collyries, for by a * mordicative quality it helpeth weeping and watering eyes: in which regard, necessarie it is that it be washed first with pencils well bathed in hot water, so long vntill it haue lost that corrosiue quality.

As touching *Hieracium*, a composition it is or collyrie so called, and made in this manner: Take four ounces of *Sal Ammoniack*, of *Cyprian Verdegreace* two ounces, of shoemakers blacke, or that coppereflow which the Greekes name *Chalcanthum* as much, that is to say, two ounces, of *Myfi* or yellow *vitrioll* one ounce, and of *safran* six: let all these bee stamped together and tempered in the *vineger* of *Thafos* untill they be incorporat, and then reduce them into

A into trochiques. A singular collyrie or eyefalue this is to withstand the beginning of pearls, catarrhes, and such accidents of the eyes; to discombe also the webs that come over their sight, to leuigat the roughness of the tunicles, to dispatch the white skars, and in one word to cure all the infirmities of the cielids. As for verdegreece, that is not calcined at all, it is excellent good to be put into vulnerarie or healing plaisters: the same also is of a wonderfull operation to cure the exulcerations of the mouth or the gumbs; the lips also exulcerat it heales, being reduced into a liniment with oyle: but if you put wax thereto, it doth mundifie, and withall skin and heale perfectly. Verdegreece is proper to eat away and consume the callositie growing in a fistula, and in those infirmities which are incident to the feat or fundament, whether it be brought into a liniment with gum Hammoniack and so applied, or else in forme of a collyrie, that is to say, a B tent thrust into the hollow fistula. The same verdegreece incorporat with a third part of the true rosin called Turpentine, is souveraigne for foule leprosy and wild-fires.

С H A P. XII.

¶ Of ¹ *Scolecia*, and ² *Chalcitis*, of ³ *Myfy*, ⁴ *Sory*, and ⁵ *Chacanthum*.

Another sort there is of Brasse-rust or Verdegreece, which commonly is called Scolecia: this is made of alume, salt or salnitre, of each a like weight, stamped well together with the strongest white wine vinegre that can be gotten, in a mortar of Cyprian brasse or copper: and this must not be done but in the hottest daies of the yere, to wit, about the rising of the Dogstarre. Now must all the ingredients aforesaid be pnned and incorporat together, vntill such time as the masse become green, and that it gather and draw together in manner of *crawling wormes, whereupon it taketh the name Scolecia. But if so be, that this manner of working and making it, chance to faile and doe not well, for to amend the same, the two parts of vinegre which entred into the mixture, ought to be tempered with as much vrine of a boy vnder fourteene yeares of age. Now if you would know the medicinable effects and vertues of this kind of verdegreece, both it and the artificiaall Borax before said (which I named Santerna) be of the very same operation that the ordinary rust of brasse or verdegreece, called in Latin *Ærugo*. There is a kind of Scolecia naturall or minerrall of it selfe, without addition of any thing els whatsoeuer; whereof I purpose to speake in this place, and the same is scraped from the stone or ore of which commeth brasse. There is a stone lying in the mine which they name Chalcitis, out of which also (with burning) they excoit brasse: differ it doth from Cadmia, for Chalcitis is hewed out of the mines that lye aboue, very ebb and exposed to the aire, whereas the other is digged from vnder the ground in those mines that lie hidden. *Item*, Chalcitis (as being of a tender and soft nature) presently will crumble into pieces, so as it seemeth to be a certaine fine mosse concreat and gathered together. Also, there is another difference betweene these two Marcaffins, for that, Chalcitis containeth in it three seuerall kinds of matter, to wit, Brasse, Myfy, and Sory; of which I purpose to speak seuerally by themselves in their due place. Now this Chalcitis lies within the brasse mine in long veins: that which is of a yellowish colour like hony, full of small veins running here and there, brittle and apt to crumble, and not of a stony hardnesse, is counted the best: the fresher also and more newly gathered that it is, the more effectuaill and wholesome men take it to be; for that being long kept, it will grow into the nature of Sory. Being thus in the right nature, it hath a facultie (if it be puluerized) to consume the excrefcence of proud or dead flesh in vlcers, to staunch blood, to repress also the accidents befalling to the gumbs, uvula, and tonsils: the same put vp into the naturall parts of a woman within a locke of wooll in manner of pessarie, helpeth the infirmities of those places: but if it be tempered and incorporat with the juice of porret, it serueth to put into those plaisters which are appropriated to the vlcers and sores of the priuities or members of generation. Now if you sleepe it in vinegre, and let it lie so infused within an earthen pot well luted with beasts dung, for the space of forty daies, it will come to the colour of saffron: put then vnto it of Cadmia stone the like quantitie in weight, you shall haue that medicine which is called Pforicum. Also, if in this composition you put two parts of Chalcitis to one third part of Cadmia, & so temper them together, this foresaid medicine will be more quick & agre: but in case you would haue it yet more mordicant and stronger in operation, let the said ingredients be tempered rather with vinegre than wine. Calcine the same or torrifie it, you shall find it more effectuaill in all operations aforesaid.

1 A kind of
 veydegris or
 rust of brasse
 2 In manner of
 a worme, as
 3 *Pliny* taketh it
 4 2 The Flour of
 copper, fle,
 whereof is
 made vittroll,

 certain ore
 -hiques or
 thin cakes cal-
 led *scythia*, and
 into the
 inn of worms

* 2. The veine
or minerall,
whereof com-
meth the dus-
kish Vitrioll.

As for * Sory, that which is brought out of Ægypt is counted best, and farre better than the Cyprian, Spanish, or African: neuertheless, some hold that which commeth from Cypresse, to be more appropriat to the cure of the eies. But of what country fouer it be, the principall is that which to smell vnto is of the rankest and most stinking sauour: the same also in the bruising will grow black and be vntoous or fatty, and such lightly is hollow in manner of a sponge. A minerall this is altogether hurtfull to the stomack, and so contrary vnto the nature of it, that to some the very smell thereof is enough to ouerturne it and to cause vomit: and especially the Ægyptian Sory is of this operation. That which commeth from other nations, when it is broken or braied, shineth againe.

Touching Myfy, it is of a more hard and stony nature than Sory; but good it is for the tooth ache, if either it be held in the mouth, or a collution be made therewith to wash the teeth and gums: also it healeth the grievous and irkesome sores of the mouth, yea though they grow to be cancerous and corrosiue. The manner is to burne and calcine it vpon coles of fire as Chalcitis. Some neuertheless haue written, that Myfy is engendered by the means of a fire made with pine wood, in the hollow veins or mines of brasse ore: and they hold, that the cinders or ashes of this pine sewell, being mingled with the yellow greines or floure of the said mettall, is that which begetteth Myfy. But the truth is, of the foresaid stone or ore it is ingendered naturally: howbeit, a thing it is by it selfe gathered, distinct and separat from it apart: and the best is that which is found in the mines and forges of Cypresse. You shall know it by these signes: break it (for crumble it will) there appeare within it certain sparks shining like gold: and in the braying or stamping, it runneth into the nature of a sand or earth, like vnto Chalcitis. This Myfy is the Minerall that they put to gold ore, when it is to be tried and purified.

To come vnto the medicinable vertues thereof: being infused or powred into the eares with oile of roses, it cureth the running with matter: the same being applied in a frontal within wool to the head, easeth the ach thereof: it doth extenuat also and subtiliat the asperities of the eies, such especially as be inueterat and haue continued long: but soueraigne it is found to bee for the inflammation or swelling of the tonsils, for the squinancy, and all impostumat sores growne to suppuration. For which purpose, prepared it would be in this wise, and after this proportion: Take of it 16 drams, seeth the same in one hemin of vinegar with some addition of hony, vntil it begin to yeeld and relent; and in this manner ordred, it serueth in cases aforesaid: but when fouer need requireth to mollifie the violence thereof, and make it more mild, it were good to wet it with some sprinkling of hony. If there be a lortion or fomentation made with it in vinegar, it doth consume and eat away the hard callositie in fistuloes, and fortifieth greatly the collyries or tents to be made thereof, and put it into the concavity of the fore: it serueth also for the collyries that be eie-falues: it stancheth bloud, represseth the malice of fretting humors in corrosiue vlcers and such as do putrifie: the excrecence of proud or ranke flesh it taketh downe and consumeth: a peculiar property it hath to cure the accidents of the members of generation in men: and withall stoppeth the immoderat flux of the moneths in women.

As concerning Vitrioll, which wee call in Latine Atramentum Sutorium, i. Shoemakers blacke, the Greeks haue fitted it with a name respectiue vnto brasse, and by a neere affinity therunto call it Chalcanthum: and verily there is not a mineral throughout all the mines, of so admirable a nature as it is. There haue been found in Spaine certaine pits or standing pooles, containing a water of the nature of Vitrioll: they vsed to seeth the same, putting thereto of other fresh water a like quantitie, and poure it into certaine troughs or broad keelers of wood: ouer these vessels, there be certaine barres [of yron] or transoms ouerthwart, lying fast that they cannot stirre, at which there hang downe cords or ropes with stones at the end stretching them out-right, that they reach to the bottome of the sayd decoction within those keelers, to the end that the viscous substance of the water may gather about those cords, which you shall see sticking fast thereto in drops, congealed in manner of a glasse, and it doth represent as it were the forme of grapes; and that is Vitrioll. Being taken forth and separated from the cords aforesaid, they let it dry for the space of thirtie dayes. In colour it is blew, and carrieth with it a most pleasant and liuely lustre, so cleare, as a man would take it to be transparent glasse. Of this being infused in water, is made that blacke tincture which Curriers and Corumers occupie in colouring of their leather. This Vitrioll is ingendred many waies of the coppere-se vein within the mine, being hollowed into certaine trenches: out of the sides whereof you shall see in the midst of

Winter

A Winter when it is a frost, certaine ystickles depending, as the drops distilled and grew one to another whereupon this kind of Vitrioll they call Stalagmias, and a purer or clearer thing there is not. But look what part thereof is whitish of colour, but not transparent, and the same inclining to the wall floure or * white violet, the same they call Leucoion. There is a Vitrioll likewise made artificially in receipts and concauties (diggd of purpose in the stonie mines of Copercite) by occasion of raine water there congealed, which had been conueighed into them, and gathered a viscous slime or mud in the passage. Also there is a cast to make it in maner of salt by letting fresh water into such hollow receptacles, and permitting the same to ferment in the sun when he is at the height and full strength of his heat in the summer, vntil it be gathered and hardened as salt. And therefore some there be who make two sorts of Vitrioll, to wit, the Naturall, or Minerall, and the Artificiall: this that is made by the industry and art of man is paler than the other, and looke how much the colour is abated, so much inferior it is in goodnesse. The Cyprian Vitrioll is thought best to be imploied in Physicke. For, to expell the wormes out of the belly, it is giuen vnto the patient to the weight of one dram in honey, after the manner of an electuary. If the same be dissolved and conueyed vp into the nostrills, it purgeth the head. In like manner it purgeth the stomacke, in case it be taken in hony or honied water. The asperities of the eies, their paine, and the dimnesse or mists ouergrowing the sight, it dispatcheth and healeth the sores in the mouth. It stancheth bleeding at nose, and the immoderat running of the Hæmorrhoids. It draweth forth spels of broken bones: and tempered with the seed of Henbane, it stoppeth the course of a rheum running to the eies, if it be laid in a cloth to the forehead in manner of a frontale. Of great effect it is in plaisters, both for to mundifie wounds and to consume the excrecence of flesh in vlcers. If the Vvula be fallen, it putteth it vp againe, by touching it only with the decoction thereof. Moreover, being incorporat with line-seed, it is singular good to be applied aloft vpon plaisters, for to mitigat pain. Of this kind, that which is white is preferred before any that are of a yellowish colour like * wall-floures aforesaid. Moreover, if it be blown into the ears by the means of a pipe, it doth remedy the hardnesse of hearing. A liniment made of Vitrioll alone, healeth vp wounds, but it draweth the skar too neare together: in regard of which astringencie of Vitrioll, there hath bin an inuention deuised of late, to cast the powder of Vitrioll into the mouths of Bears and Lions when they are to be baited: for so great a knitter and binder it is, that it will draw their chaws together in manner of a muzzle, that they shal not be able to bite.

* Viola alba;

meaneth those
that resemble
Leucoion, and
which he cal-
led before by
that name.

CHAP. XIII.

¶ Of Pompholyx. Of Spodos, Antispodos, and of Diphryges. Of the Trient of Seruilius.

Here be found ouer & besides in brasse smithies or furnaces, those matters which they call Pompholyx and Spodos: and the difference of the one from another, consisteth in this, that Pompholyx requireth washing for to be prepared; Spodos neuer commeth into water or liquor. And yet some distinguish them otherwise, calling the whitest and lightest part, Pompholyx: holding opinion, that it is nothing els but the very cinders of brasse, or the Calamine stone Cadmia, whereof brasse commeth: whereas Spodos (say they) is blacker and more weightie than Pompholyx, as being scraped from the wals and sides of the furnaces, among which you shall see many times grosse sparks, yea, and otherwhiles coles intermingled. Well, this Pompholyx being tempered or foked in vinegar, smels of brasse: and if a man touch it at the tongues end, hath a horrible tast that goeth against ones stomacke. Proper it is to enter into those compositions which be ordained for the eies, for it helpeth all the infirmities incident thereto: and in one word, serueth for the same purposes that Spodos doth: herein onely lieth the difference, that Spodos is thought to be more mundificatiue, by reason that the strength of Pompholyx is delaied by the washing aforesaid. It is one of the ingredients also to those implasters which are deuised for gentle refrigeratiues and exiccatiues. And for what fouer it shal be imploied, better it is found to be, in case it were washed first with wine.

As touching Spodos, the Cyprian is most esteemed: and ingendred it is, whiles Cadmia and the brasse ore or stone be melted together in the furnace. Exceeding light it is, and apt to mount aloft with the smoake of the bloome smithie, very speedily, yea, & ready to flie out of the

sur-

furnace: and much of it sticketh to the rouse and vppermost part thereof, differing onely from foot in whitenesse. That which is not so white as the rest, signifies that the furnace was not quick ynough, and that it is not yet come to the full perfection & concoction: and this, some there be who call Pompholyx. But looke how much thereof is found of a redder colour, the same hath much acrimonie in it, and is of a more biting nature: yea, so fretting and corrosiue it is, that in the washing, if it chance to touch a mans eies, it will put out their light and make him blind. There is a kind of Spodos besides that looks yellowish like hony, wherein a man may perceiue that it standeth very much vpon brasse: but of what sort fouer it is, washing mendeth it much. First, before it be washed, they vse to cleanse it lightly with a wing or a bristle brush: & then afterwards to wash it in grosser manner, till the water be thick and muddie, rubbing it well with the fingers, vntill it haue lost all the roughnesse that it had. That which is washed in wine, is thought to be of a middle and indifferent operation. And when I say wine, you must think there is some difference therein also. For being washed in a small & mild wine, it is thought to be very good for those colleries which serue to comfort and fortifie the eies that haue been wearied and weakened with long watching: the same also thus prepared, is more effectual to heale vlcers that be matterie and run: the sores likewise in the mouth that are moist and rheumatick: and generally it serueth well to go into those salues and plaisters which are deuised against gangreenes tending to mortification. Another kind there is besides of Spodos called Laurioris, found in the furnaces where siluer is tried, but commonly it is held, & for certain affirmed, That the best

* Spodos is called Nil, whereof commeth the pretty ambiguous speech, Nil prodest oculis.

* Spodos for the eies, is that which commeth in the furnaces where gold is fined. Neither in any thing belonging to our life, is the wit & invention of man more admirable than in this. For, because we should not take the pains to search into mines & furnaces for such matters, they haue deuised means to help themselves withal in the same cases, even by the basest things: that be in stead of Spodos, which thereupon they tearme by the name of Antispodos; for so they call the ashes of the Figtree, whether it be the gentle or the wild; the ashes likewise of the Myrtle tree leaues, and the tenderest parts of the branches; as also of the wild Olive, the Quince, & the Lentiske trees. They haue a kind of Antispodos besides made of the vnripe Mulberries, that is to say, whiles they be white, dried in the Sun: like as, of the tops of the box tree or the bastard Cyprus, of brier crops, the leaues of the Terebinth or the wild vine Oenanthe floures. Finally, they vse in stead of Spodos, the ashes of strong Buls glew, or of linnen rags: which is found to be as effectual as the right Spodos. Now for to haue the said ashes for this purpose, the manner is to burne and calcine all these matters abouenamed within some vessell of cley, and to set it into the oven or furnace, where they are to be torried vntill the said vessell be thoroughly baked.

In the smithies where brasse is made and wrought, there commeth a certaine refuse or offall thereof, called Pseuma: to wit, when after the brasse ore is sufficiently melted and concocted, there be new coales put thereto, and the same set on fire and kept burning with the blast of bellows: for then of a suddaine (as it were by some extraordinary strong puffed) there are reiected and cast forth from it certain huls or chaffe (if I may so say) of brasse. Now the ground or floore to receiue this refuse as it falleth, ought to be well paved.

There is another stuffe found in the said forges or bloom-smithies, easily discerned from this Pseuma, which the Greeks (for that it is, as it were, twise burnt or concocted) call Diphryges. And this is made three manner of waies: For first they say it comes of the Marquesit stone burnt in a furnace vntill it be calcined and reduced in the red chalke Rubrica. It is engendred also of the earth or cley within a certain caue in Cyprus, first dried and soon after gently burnt in a fire round about it, maintained with small sticks put thereto by little & little. There is a third way of making it, to wit, of the grosse dregs or drosse of brasse settling downe to the battome of the furnace: in which furnace a man shall perceiue these different matters, to wit, the brasse it selfe, which being melted, runneth into pans and vessels ready for to receiue it; the refuse, called Scoria, which flies out of the furnace; the florey that floteth aloft; & the Diphryges or drosse which remaineth behind. Some yeeld another reason and making of Diphryges in this manner, namely, That there be certain round bals or pellets (as it were) of hard stones found within the mines of brasse, which together with the Marquesit or brasse ore doth not melt in the furnace, & a man shall see the brasse it selfe boile about the same: which round hard stones are vnited and soudered only, one to another by this means; but themselves resolute not nor melt perfectly, vnlesse they be translated into other furnaces: for they be the very heart (as it were) of the whole matter.

But

A But in the second triall and boiling, that which remaineth behind, is called Diphryges. Well, be it what it will, the same reason there is of it in Physicke, as of the rest of this kind found in furnaces: for by nature it is deficacitue: it consumeth besides all excrecences, & doth cleanse mightily. The triall of it is by the tongue, for if it bee good Diphryges, no sooner toucheth it the tongue, but it drieth it, and withall tasteth of brasse.

But before I depart from these brasse mines and furnaces, I cannot conceale from you one miraculous thing as touching this mettall. There is (you know) a noble family in Rome of the *Servily*, well renowned, as may appeare by the Roman Kalender and acts of record: and these haue among them a certaine piece of brasse coine called a Triens. The third part * of a Roman Asse which they do keepe and feed with siluer and gold. For eat and consume it doth both the one and the other: from whence it came first, and what the reason in nature of this property is, I know not yet. But for my warrant, I will set downe as touching this matter the very words of old *Messala*: The house (quoth he) of the *Servily* hath a certain sacred Trient, in the honor of which piece they do sacrifice yerely with great deuotion and solemnity, omitting no magnificence nor ceremonies thereto belonging. And this Trient the common speech is of them all, that it seemeth one while to grow bigger, and another while to diminish and be smaller: according to which increase or decrease, the said *Servily* take presage, That their family shall either rise to more honour, or decay in credit and reputation.

* which is our farthing.

CHAP. XIV.

¶ Of Iron, and Iron mines, and the different kindes of Iron.

I T remaineth now in the next place to discourse of the mines of yron, a mettall which we may well say is both the best and the worst implement vsed now in the world: for with the helpe of yron we break vp and ear the ground, we plant and plot our groues, we set our hortiards and range our fruitfull trees in rewes: we prune our vines, and by cutting off the superfluous branches and dead wood, we make them euery yere to look fresh and yong againe: by meanes of yron and Steele we build houses, hew quarries, and cut in stone; yea, and in one word, wee vse it to all other necessary vses of this life. Contrariwise, the same yron serueth for wars, murders, and robberies, not onely to offend and strike therewith in hand, but also to reach and kill as farre off, with diuers sorts of darts and shot, one while discharged and sent out of engines, another while lanced and flung by force of the arme; yea, and sometime let flie with wings: and this I take to be the wickedest inuention that euer was deuised by the head of man: for to the end that death may speed away the faster to a man, and surprise him more suddenly, we make it to flie as a bird in the aire, and to the arrow headed at one end with deadly yron, we set feathers at the other: whereby it is euident, that the mischief proceeding from yron, is not to be imputed to the nature of it, but to the vnhappy wit of man. For good prooffe wee had already by many experiments otherwise, that yron might be imploied and occupied, without any hurt or harme at all to mankind. And verily in those capitulations of peace, which after the expulsion of the kings, *Porfena*, king of the Tuscans tendred to the people of Rome, I find this expresse article & imposition, that they should not vse yron, but only about tillage of the ground. And as our Chronicles of greatest antiquity haue left recorded, it was not thought safe to permit writing and ingrauing letters with a style of yron. Certes, in the third Consulship of *Pompey* the great, by occasion of a tumult and commotion raised within the city of Rome for the murder committed vpon the person of *P. Clodius*, there was an edict come forth (which now is extant vpon record) after the manner of an inhibition in this form: *Ne vllum telum in vrbe esset*. That no man throughout all Rome should be seene to weare a weapon. Neuerthelesse men did not forbear and giue ouer to doe some honour vnto yron also in some other occasions of this life, tending to the entertaining of civility and humanity; for *Aristonides* the cunning artificer, minding to represent in an image the furious rage of *Athamas*, beginning now to coole and be allaiied, together with his repentance for the cruell murdering of his owne sonne *Learchus*, whom he flung headlong against the hard stones, and thereby dashed out his braines; made a temperature of brasse and yron together, to the end, that the rustie yron appearing through the bright lustre of the Brasse, might liuely expresse a blushing red in the countenance, becoming a man confused and dismayed for so vnnatural a fact. This Statue is at this day to bee seene at Thebes. Within the same Citie there is another

Image

* O Pliny, what wouldst thou say, if thou didst see & hear the Pistols, muskets, Culuerines, & Cannons in these daies.

image of *Hercules* all of hard yron or steele, which *Alcon* the famous workman made of purpose to signifie the vndaunted heart of that deified *Hercules*, who vnderwent and indured all labours and perils whatsoeuer. Here also in Rome we may see certain drinking cups of steele dedicated in the temple of *Mars* the Reuenger.

But to come vnto the nature of yron, herein appeareth still the same goodnesse of Nature, that this mettall working such mischiefe as it doth, should be reuenged of it selfe, and receiue condigne punishment by the own rust. See also the wonderful prouidence of Nature, *who maketh nothing in the world more subiect to death and corruption, than that which is most hurtfull and deadly to mankind.

As touching mines of yron ore, they are to be found almost in euery country, for there is not so much as the Island *Iliua* here within Italy, but it breedeth yron. And lightly wherefoeuer any such be, they are easily found, for the very leere of the earth, resembling the colour of ore, bewraith where they lie. And when it is found out, they burn, try, and fine it, as other veins of mettall. Onely in *Cappadocia* there is some question and doubt made, whether in the making of yron they be more beholden to the earth that yeeldeth the ore, or to the water for the preparing and ordering of it: for this is certain, that vnlesse the vein of ore be well drenched and soaked with the water of one riuer there, it will neuer yeeld yron out of the furnace. As for the kinds of yron many they are, and all distinct. The first difference ariseth from the diuersity of the soile and climats where the mines be found: for in some places, the ground & the position of the heauens do yeeld onely a soft ore, and coming nearer to the substance of lead than yron: in another, the mettall is * brittle and short, standing much vpon a veine of brasse, such as will not serue one whit for stroke and naile to bind cart-wheels withall, which tire indeed would be made of the other that is gentle and pliable. Moreouer, some kind of yron there is that serueth onely, if it be wrought in short and smal works, as namely, for nailes, studs and tackes imploied about greeues and leg-harnes: another againe, that is more apt to take rust and canker than the rest. Howbeit, all the sorts of yron ore are termed in Latine *Sctitura*, a word appropriat to this mettall & to no other, * *fringenda acie*, i. of dazling the eies, or drawing a naked sword. But the furnace it self, where the ore or yron stone is tried, maketh the greatest difference that is: for therein you shall haue to arise by much burning and fining, the purest part thereof, which in Latine is called *Nucleus ferri*, i. the kernell or heart of the yron [and it is that which we call steele] and the same also of diuers sorts: for the best is it that hardeneth the edge of any weapon or tooke: there is of it which serueth better for stithy or anuill heads, the faces of hammers, bits of mattocks, and yron crowes. But the most variety of yron commeth by the means of the water, wherein the yron red hot is eftssoons dipped and quenched for to be hardened. And verily, water onely which in some place is better, in other worse, is that which hath innobled many places for the excellent yron that commeth from them, as namely, *Bilbilis* in Spaine, and *Tarassio*, *Comus* also in Italy; for none of these places haue any yron mines of their owne, and yet there is no talk but of the yron and steele that commeth from thence. Howbeit, as many kinds of yron as there be, none shall match in goodnesse the steele that commeth from the *Ceres*: for this commoditie also, as hard ware as it is, they send and sell with their soft silks and fine furs: in a second degree of goodnesse, may be placed the *Parthian* yron. And setting aside these two countries, I know not where there be any bars or gads tempered of fine and pure steel indeed, for all the rest haue a mixtue of yron, more or lesse. And generally in this West part of the world wherein wee liue, all our steel is of a more soft and gentle temperature than that of the *Leuant*. This goodnesse of steele in some countries ariseth from the nature of the mine, as in *Austrich*: in others from the handling and temperature thereof, like as by quenching, as I said before, and namely at *Sulmo*, where the water serueth especially for that purpose: and no maruell, for we see a great difference in whetting and sharpening the edge of any instrument, between oyle whetstones that barbars vse, and the common water grind-stones: for surely the oile giueth a more fine and delicat edge. Furthermore, this is strange, that when the ore or vein is in the furnace, it yeeldeth yron liquid & cleare as water, and afterwards, being reduced into bars and gads when it is red hot, it is spongy and brittle, apt to break or resolu into flakes. And considering the difference that is betweene the nature of oile and water (as I haue said) this is to be obserued, that the finer any edge tooles bee, the manner is to quench them in oile for to harden the edge: for feare lest the water should harden them ouer much, and make the edge more ready to breake out into nickes, than to bend

* *Nihil in rebus mortalibus facient, quam qd. inf:issimum mortalitatem, the grace of this Latine cannot be so well expressed in English.*
* Which our smiths call Col far-yron.
* Some read *fringenda* (ocularis) i. of dazling the eies, which is red hot, or the bright blade of sword & other weapons, doth: but neither any copies of the author haue the word (*ocularis*) neither haue I read *fringere*, but *perfringere*, to signifie, to dazle: others vnderstand it of drawing a naked sword: & yet it is not so proper in Latine to say in that sense, *fringere aciem*, as *fringere ferrum*, or *gladium*: howbeit, I incline rather to this, for that *Pliny* a little after calls the best steele *Acies*, which word haply is the primitive, from whence *acies* also is vsed for an edge, &c. and yet it may be, that those *fringere* i. sparkling scales, flying from iron vnder the smiths hammer, & from other mettall, (which do *perfringere aciem* oculari, if any thing els) may giue occasion herof. See *huc viderint Critici*

A and turne again. But wonderfull it is about all, that mans blood should haue such a vertue in it, as to be reuenged of the yron blade that shed it, for being once embrued therein, it is giuen cure after eftssoons to rust and canker.

Concerning the load-stone, and the great concord or amity betweene yron and it, I meane to write more amply in the due place. Howbeit, for the present thus much I must needs say, that yron is the onely mettall which receiuet strength from that stone, yea, and keepeth the same a long time, in so much, as by vertue thereof, if it be once well touched & rubbed withall, it is able to take hold of other pieces of yron: and thus otherwhiles we may see a number of rings hanging together in manner of a chaine, notwithstanding they be not linked and inclosed one within another. The ignorant people seeing these rings thus rubbed with the load-stone, and cleauing one to another, call it quick-yron. Certes, any wound made by such a tooke, are more eager and angry than by another. This stone is to be found in *Biskay*, scattered here and there in smal pieces by way of bubbaton (for that is the term they vse,) but it is not that true *Magnet* or load-stone indeed, which growes in one continued rock. And I wot not whether these be so good for glasse-makers, and serueth their turn so well in melting their glasse, as the other: for no man yet hath made experiment therof. But sure I am, that if one dorub the edge, back, or blade of a knife therewith, it doth impart an attractive vertue of yron thereunto, as well as the right *Magnet*. An here I cannot chuse but acquaint you with the singular inuention of that great architect and master deuifer, of *Alexandria* in *Egypt*, *Dinocrates*, who began to make the arched rooffe of the temple of *Arfinoe* all of *Magnet* or this load-stone, to the end, that within that temple the statue of the said princeffe made of yron, might seeme to hang in the aire by nothing. But preuented he was by death before he could finish his worke, like as *K. Ptolomae* also, who ordayned that temple to be built in the honour of the said *Arfinoe* his sister.

But to returne again to our yron: of all mines that be, the vein of this mettall is largest, and spreadeth it self into most lengths euery way: as we may see in that part of *Biscay* that coasteth along the sea, and vpon which the Ocean beateh: where there is a craggy mountaine very steepe and high, which standeth all vpon a mine or veine of yron. A wonderfull thing, and in manner incredible, howbeit, most true, according as I haue shewed already in my *Cosmography*, as touching the circuit of the Ocean.

CHAP. XV.

The temper of yron. The medicinable vertues thereof, as also of the rust of Brasse and yron: Of the scales that shed and flie from yron: and of the liquid emplaster called by the Greekes *Hypgrimplastrum*.

Iron made once hot in the fire, vnlesse it be hardened with the Hammer, doth soone waste and corrupt. So long as it looketh but red, it is not ready for the hammer, neither would it be beaten before it begin to look white in the fire. Besmeare it with vineger and Allum, it wil looke like copper or brasse. If you be desirous to keep any yron worke from rust, giue it a vernish with cerusse, plaster, and tar, incorporat all together. And this is that composition, which is called by the Greekes * *Antipathia*. And some say also, that there is a kind of hallowing yron that will preferue it from rust: as also that there is at this day to be seen the chaine of yron within the city called *Zeugma*, seated vpon *Euphrates*, wherewith king *Alexander* the Great somtime bound and strengthened the bridge ouer the riuer there: the linkes whercof, as many as haue been repaired and made new since, doe gather rust, whereas the rest of the first making, be all free therefrom.

As touching the vse of yron and steele, in Physicke it serueth otherwise than for to launce cut and dismember withall: for take a knife or dagger and make an imaginarie circle two or three times with the point thereof, vpon a yong child, or an elder body, and then goe round withall about the party as often, it is a singular preseruatiue against all poisons, forceries, or incantments. Also to take any yron naile out of the coffin or sepulchre wherein man or woman lieth buried, and to sticke the same fast to the lindle or side-post of a dore, leading either into the house or bed-chamber where any doth lie who is haunted with spirits in the night, hee or shee shall be deliuered and secured from such phantastical illusions. Moreover, it is said, That if one be lightly pricked with the point of sword or dagger which hath bene the death of a man, it

* *Videtur in m.*

is an excellent remedy against the paines of sides or brest, which come with sudden pricks and stitches. An actuall cauterie of yron red hot, cureth many diseases, and especially the biting of a mad dog, in which case it is so effectuall, that if the poison inflicted by that wound, haue pre-uailed so far, that the patient be fallen into an Hydrophobie thereby, and cannot abide drinke or water, let the sore be feared therewith, the party shall find help presently. Gads of Steele or other yron red hot quenched in water, so long vntil the same water be hot, causeth it to be a whole- some drinke in many diseases, but principally in the bloody flux.

The very rust of yron also is counted medicinable: for so *Achilles* is said to haue healed *Telephus*: but whether the head of his speare were yron or brasse, of which he vsed the rust, I doe not certainly know. Certes, he is paynted thus: with his sword scraping and shaking off the rust into the wound. But if you would fetch off the rust from any old nails, scrape it with a knifewet before in water. As touching the vertues thereof, it is clensing, exiccative, and astringent; it recouereth the haire in places despoiled thereof, if they be annointed therewith in the forme of a liniment: being reduced into a salve with wax and oile of Myrtles incorporate together, many vse it for roughnesse about the eie-lids: the pimples also breaking forth all ouer the body. For shingles and *S. Antonies* fire, it is singular good to apply it in an vnguent with vineger: likewise it killeth scabs, and healeth whitlawes of the fingers, and the excrescence or turning vp of the flesh about the roots of the nails, if linnen rags wet therein be applied conueniently. The same conueyed vp in wooll after the manner of a pessary into the naturall parts of women, staieth the immoderat flux both of whites and reds. The rust of yron tempered in wine, and wrought together with Myrrhe, is good for a greene wound: put thereto vineger, and then it helpeth the piles and swelling bigges of the fundament. A liniment made with it, mitigareth the paine of the gout.

As touching the skales of yron that flie from the edge or point of any weapon wrought in the smiths forge: they serue in the same cases, that the rust doth, and haue the like effects, saue only this, that they haue greater acrimonie, and work more eagerly: in which regard they are employed about the repressing of the flux that falleth into watering eies. But marke this one thing: Yron being that which woundeth most and sheddeth blood, yet the skales that come from it, stanch the same: a property they haue besides to stop the flux in women: and being applied to the region of the spleene, they do open the obstructions thereof, and ease other infirmities incident thereto: the running hæmorrhoids they repress, and such vlcers as are giuen to spread farther and corrode as they go. Reduced into a fine powder, and gently strewed vpon the eye-lids, they are good for the accidents thereto belonging. But the principal vse of them, and for which they are most commended, is in a certain liquid plaster called *Hygrementum*, which serueth to mundifie wounds, vlcers, and fistulaes: to eat away all callosities, and to incarnate and engender new flesh about bones that are perished. And this is the receipt of that composition: Take of the scouring Tuckers earth the weight of two oboli, of brasse six drams, of the skales of yron as much, and no lesse of wax, incorporate all these according to art in one sextar of oile. But in case there be need to mundifie any sores, or to incarnate, there would be put thereto some plain cerot besides.

CHAP. XVI.

¶ Of the Mines of Lead ore: of *white lead and blacke.

*Which some hold to be Tin-glasse.
*Our ordinary lead.

Now insueth the discourse of lead, and the nature of it; of which there be two principall kindes, the blacke, and the white. The richest of all, and that which carrieth the greatest price, is that which we in Latine name *Plumbum candidum*, the white bright lead, and the Greeks *Cassiteron*. But I hold it a meere fable and vaine tale, that all of it is fetched as farre as from the Islands of the Atlantick sea, and that the inhabitants of those parts doe conueigh it in little twiggen boats, couered all ouer with feathers. For the truth is, that there is found of it in these daies within Portugall and Gallæcia, growing ebbe vpon the vpmost face of the earth, being among the sands, of a black colour, and by the weight only is knowne from the rest of the soile: and here and there among, a man shall meet with small stones of the same stuffe, most of all within the brookes that be dry sometimes of the yere. This sandie and graucly substance, the mine masters and mettall finers vse to wash, and that which setleth downeward, they burne and

A & melt in the furnace. There is found likewise in the gold mines a kind of lead ore which they cal *Elutia*; for that the water that they let into those mines (as I said before) washeth and carrieth down withall certain little blacke stones streaked and marked a little with a kind of white, and as heauy they be in hand as the very ore of gold; and therefore gathered they be with the same ore, and laid in the paniers together therewith: and afterward in the furnace when the fire hath made a separation between them and gold, so soone as they are melted do resolue into the substance of the white lead or tinglasse aforesaid.

Moreover, this is strange, that throughout all Gallæcia you shall not find a mine of common black lead, & yet in Biskay (which confineth hard vpon it) there is abundance of it & no other; neither out of the vein of this white lead shall you try any siluer, whereas out of the black it is an ordinary thing to extract siluer. Again, this is certain, that two pieces of black lead cannot possibly be sodered together without this tinglasse; neither can this be vnited to the other but by means of oile: nay it is vnpossible to conioyne a piece of tin-soder or white lead with another, but with a soder of the black. This white lead or tinglasse hath bin of long time in estimation, even since the war of Troy, as witnesseth the poet *Homer*, who calls it *Cassiteron*. As for blacke lead, ingendred it is two maner of waies, for either it groweth in a vein of the owne without any other mettall with it, or els it doth participat with siluer in the same mine, and being intermixt in one piece or lump of ore, it is separated from it at the melting and fining only; for the first liquor that runs from it in the furnace is tin, and the second siluer. As for the third part of the vein which remaineth behind in the furnace, it is *Galena*, that is to say, the very mettall it selfe of lead; which beeing once againe melted and tried in the fire, after two parts thereof be deducted, yeeldeth that black lead whereof we now do treat.

CHAP. XVII.

¶ Of Tin, of Argentine Lead, and other points pertinent to these matters.

T In hath a proper vse to enhuile vessels of brasse, partly to take away the euil tast they haue, and to make them sweeter, and partly to preserve them from rust, or to qualifie the malitious nature of brasse: and yet wonderfull it is, that such vessels thus tinned are neuer a jot the heauier by that means. Also in times past there were (as I haue already said) excellent Mirrors made of tin, and the same were tempered & wrought at Brundise: but those of siluer haue put them down since, that euery chamber-maid and such like seruing creature would be at their looking-glasse of siluer. But tin is found much counterfeited in these daies, by putting to White lead aboue said a third part of white brasse: yea and there is another deuise to sophisticate tin, to wit, by mixing white and blacke lead one with another by euery weight and portion: and this maassen some call at this day, *siluer lead or argentine. As for that mixed matter wherein be two parts of black lead, and one of the white, they cal it *Tertiarium*: this kind of tinne is sold after *30 the pound, and it is that wherewith they vse to soder conduit pipes: but the lewder disposed pewterers haue a cast to put vnto this tin called *Tertiarium*, an equal quantity of white lead and then they call it *Argentarium*: which mettall they employ in vessels for the kitchen, to seeth meat or what they list in them: and this kind of pewter wanteth no price, for they set it at 130 the pound, whereas a pound of white lead or tinglasse pure and fine of it selfe, is sold for thirty, and the blacke for sixteen. As touching the temperature and nature of the white lead, it standeth more vpon a dry substance, contrariwise, that of blacke is wholly moist and liquid: which is the reason that the said white lead or tinglasse will serue to no vse or purpose vnlesse it be mixed with some other mettall; neither is it good to lead or soder siluer with, for sooner will siluer melt in the fire than it. There is a deuise to tin pots, pans, and other pieces of brasse so artificially with white lead or tinglasse (an inuention which came out of France) that hardly a man shall discern them from vessell of siluer; and such leaded vessels are commonly called *Incoctilia*. After the same maner they haue taken vp of late another custome, to siluer the trappings especially and caparisons of their horses of seruice, yea and the harness of coach-horses and draught jades, and namely in the town Alexia. As for the former inuention, those of Bourges haue the honour of it. Neither rested they so, but haue proceeded to adorn and garnish in

*I. Pewter, as some take it.

*This place seemeth to be corrupt.

Y y

that

that maner their chariots, wagons, and coaches. But our vain and wastful wantons not herewith contented, are come now to their wagon seats, not of siluer only, but also of gold: and that which in times past was condemned as monstrous prodigality, to be put into drinking vessels; the same to tread vpon now with the feet, and to waste and consume about waggons and chariots, is commended for finenesse, neatnesse, and elegancie. But to return againe vnto our white lead, if you would know whether it be right and good or no, the proof is to be made in paper: for put it melted into a sheet of paper, if it be not falsified, it will seem to break and rend the paper with the weight, and not with the scalding heat thereof.

Moreouer, it is worth the obseruation, that the Indians haue no mines among them either of brasse or lead, but are content to part with their pearles and pretious stones vnto merchants, by way of counterchange for these mettals.

Black lead or common lead is much vsed with vs for sheets to make conduit pipes; also it is driuen with the hammer into thin plates and leaues. This metall requireth much labor & toile in Spain and France, before it be gotten out of the mine, so deepe it lieth; whereas in Brittain it runneth ebb in the vppermost coat of the ground, and that in such abundance, that by an expresse act among the Islanders themselves, it is not lawfull to dig and gather ore about such a proportion, set down by stint. Furthermore, all the black lead which now men haue in request, is known by these names, to wit, Iovetanum, Capariense, and Oleastrense. As for the drosse and refuse that is purged from it, there is no difference at all, so that it haue the due cleansing by the fire as it ought. These mines alone of lead haue one wonderfull and admirable gift about all others, That if they be forelet a time and suffered to rest, they will grow againe and be more fertile of ore thereby. And in truth this seems to be the reason thereof, for that the aire hath good means and libertie to infuse it selfe, and to enter in at the pores and passages which it findes enlarged and open: much like as we obserue in certain women, who vpon their slips of abortiue fruit, proue thereby more fruitfull and apt to conceiue. And that this is true that I say of lead mines, it was found of late by good experience in the mines of Santaria in the prouince of Boticia in Spain: for whereas in times past for two hundred yeares together, it was wont to be set for a rent of ten pound weight, after it had taken repose and was opened againe, it yeelded for euerie ten, 55. Likewise the lead mine named Antimonianum within the said prouince, which paid in old time but a chiefe of ten pound weight, is come now to a yearly reuenue of four hundred pound. To conclude, one marvellous quality lead hath besides, That no vessel made thereof will melt ouer the fire, if there be water in it: and yet cast into the said water a little stone, or a small piece of brasse coin, although it be no more than a Quadrant, you shall see it melt, and a hole burnt through it by and by.

CHAP. XVIII.

¶ *The medicines that we haue from Lead, and the refuse and drosse of Lead: of the wine of Lead called Molybdæa or Galena: of Ceruse, white Lead, or Spanish White, called Pimmithyum: and of Sandarach.*

Great vse there is in physicke of lead applied by it selfe alone, and namely to repress and keepe downe the skars and cicatrices that rise about the other skin: also by the refrigeratiue quality that it hath to coole the heat of fleshly lust, if there be bound vnto the loins and region of the reins a thin plate or leafe thereof. And verily Calvus the Orator, who by occasion of much dreaming in his sleepe of venereous sports, fell into mighty pollutions, and so farther into the grievous maladie of Gonorrhæa or running of the reins, with wearing ordinarily these leaden plates, stayed (by report) all such vaine and wanton fantasies and imaginati- ons: by which means he preferred also his strength, and had a body able to endure the labor of much study and sitting at his booke. And Nero the Emperor (since the gods would haue it so) vsed ordinarily to weare a plate of Lead to his breast, vnder which he would chaunt out lustily with a wide throat and strong voice, his filthy Sonnets and beastly Ballads: but hee shewed thereby that Lead was a singular meanes to maintaine a good voice. But to serue otherwise in

Physicke,

A Physick, lead ought to be prepared and baked after this manner: take an earthen pan of potters worke, and lay one bed therin of brimstone finely powdered, vpon which, bestow another couch of thin leaues or plates of lead, and a third course ouer them of brimstone and yron file dust together, for to couer all: this being done, set the vessel into a furnace; but while these things are calcining, meet it is and necessary that the vessell or pan aforesaid be well luted and stopped close, that there be no venting or breathing hole at all; for otherwise the lead within the said pan would send forth a noisome vapour and pestilent, most dangerous to all that be within the sent thereof, but to dogges especially, whom it killeth out of hand: and verily, as this exhalation of lead is deadly vnto them, so the aire of all mettals in generall, is aduerse and contrary vnto flies and gnats: which is the reason, that a man shall neuer see any of these insects in mines, forges, B and bloome-smithies, where mettals be vsually tried. Now in the calcining of lead, some there be who chuse rather to take the dust of lead gotten off with a file, & to mix the same with brimstone: others think it better to vse cerusse rather than brimstone. Furthermore, lead doth yeeld from it selfe a certaine substance by way of loture, which is of right great and manifold vse in physicke: the making whereof is in this manner, They take a leaden mortar, they pun and stamp the same with a leaden pestill, casting in raine water estloones; and thus they labour at it continually vntill such time as the water grow to some consistence and be thicke againe; this they permit to rest and settle: the pure and cleare portion that is aloft, they suck and soke away with sponges: the grossest part that is settled in the bottome, after it is dried, they reduce into trochisks. There be some who stamp in the same order, the file-dust which commeth of lead: others C put thereto some lead ore among: and as there be many that vse vineger or wine in this operation, so there are some againe who take greace or roses in lieu thereof. You shall haue those that for this purpose make choice of a stone mortar, especially of Thebaicke marble, but they take a leaden pestill rather than any other, to bray and pun withall: and by this means the medicinal lead will be the whiter.

Now as touching the lead calcined in manner aforesaid, it may be washed also after the order of Antimonie and Cadmia: and in this manner prepared, it is of power astringent, good to stop any flux or rheume, proper also to skin and make a final skar. Much vse there is of lead thus burnt and washed, in collyries or eie-salues, and principally if the eies either stand out too far, or be sunke in too deepe: also it is singular to repress the excrescence of flesh in vlcers, to heale D the chaps in the seat or fundament, to cure the running hæmorrhoids, and to discusse or keepe downe the blind and swollen piles: and for all these accidents in generall, the loture of lead aforesaid is most excellent. But the ashes of lead burnt and calcined, is more proper for the cure of corroding vlcers and filthy sores. And in one word, the same effects and operations it hath, that the ashes of paper. Also the manner of burning and calcining lead, is to put into a pan certaine little plates thereof, together with brimstone, turning the same euery and anon either with some yron rod or stiffe stalke and stem of Ferula plants, vntill such time as both the one and the other being liquefied, be conuerted & turned into ashes: the same, after that they be once cooled, ought to be punned and beaten againe, and reduced into a most pure and exquisite fine powder. Some there be who take file-dust of lead, put the same in an earthen pot or greene potters E clay, set the same into an oven, and so let it calcine therein vntill such time as the pot be well and thoroughly baked: others againe there are, who mix with lead the like quantity of cerusse, or els of barly, and pun the same like crude lead vncalcined in manner aforesaid, for a loture; and when it is reduced thus into powder, they make more reckoning of it than of the Cyprian Spodium.

Ouer and besides, the drosse or refuse of lead is medicinal: and the best is that accounted, which commeth nearest to a yellow colour, without any reliques at all of the lead among; or else inclining to the hew of brimstone, and cleansed from all earthly substance: this also being braied and broken into small parcels, may be washed in manner aforesaid, and stamped with water in a mortar, vntill such time as the water looke yellow; then must it bee powred forth into a pure cleane vessel; and this tranflation ought so long to be continued out of one vessel into another, vntill such time as it haue done casting any residue downward; for the sediment that resteth in the bottome is the best, working the self-same effect as lead doth, but with more acrimony. When I consider all this, mee thinkes I cannot sufficiently admire the diligence of men, who haue made such experiments of all things in the world, sparing not so much as the very ordure,

ordure, offall, and filthy excrements, but haue tried conclusions therein so many waies, and left G nothing vnattempted.

There is a kind of Spodium also made of lead in the furnace, after the same manner as I shewed before, of copper or Cyprian brasse: the order of washing wherof, is this; to put it in a course linnen cloth, and to lay the same in rain water, that the terrene substance may be separated from the rest that is transfused or passeth through the cloth with the water: and yet the same must be cribled or serced afterwards, and beaten to pouder. Some thinke it better to wipe and scoure off the dust from the Calamine with wings, and then to beat it in a mortar with the most odoriferous wine they can get.

There is besides, a minerall named Molybdena, which elsewhere I haue called Galena; by which I meane in this place, the ore or veine that containeth within it, both siluer and lead: the better this is thought to be, the more that it inclineth to the colour of gold, and the lesse that it standeth vpon lead: the same also is brittle, apt to crumble, and in proportion of the quantity not very weighty in hand: the same, if it be boiled with oile, will in colour resemble liuer. There is a kind of Galena likewise that sticketh to the furnaces of gold and siluer: but this (whereof I now speake) they call Metallica: that is to say, the Minerall: and verily the best of this kinde, is that which is found in Zephyrium: the marks whereof are these; if it haue little or no earth in it, nor be any waies stony: the same is burnt, calcined, and washed, neither more nor lesse than the drosse Scoria. Much vsed this minerall is in those vnctuous liniments or salues called Liparæ,

* *Quæ non alligantur* it is thought that Plinie mistook in Dioscor. and for *arsenicus*, read *crumulus*, which he hath translated without any sense at all or congruity to the place.

deuised as lenitiue & refrigerant, for vlcers: also it entrench into plasters which are * not mordicant: but being applied to any sore in tender and delicat bodies, and in the softest parts, it doth I heale faire, and skin throughly. The composition of which plasters, is after this manner; Take three pound weight of this minerall lead Molybdena, put thereto of wax one pound, and of oile three hemines which done, incorporate all together (according to art) into the forme of an em-plastre. Now if it so fall out that the patient be an elderly body, there would be an addition put thereto of the lees or mother of oile aliue. This minerall may be tempered also to right good purpose, with litharge of siluer, and the drosse of lead, and then it is a most excellent medicine (to be injected by a clystere) for the dysenterie or bloody flux; for the tinesm also, which is an inordinat desire to the stoole without doing any thing; provided alwaies, that the belly be fomented besides with hot water.

There is another mineral besides, called Pimimithum, which is al one with Ceruse: and this, K the furnace and mine of lead ore doth yeeld: but the best of this kind is brought from the Island Rhodes. The manner of making it is this: Take the finest pieces that are scraped from lead, let the same be hung ouer a vessell of the strongest and sharpest vinegar that possibly can be had, that they may distill thereinto: and looke what of it is fallen into the said vinegar, must be dried afterwards, ground into pouder, and searced; & then a second time it ought to be tempered with vinegar, and so reduced into seuerall trochiske to be dried in the Sun during Summer. There is another way of making Ceruse besides this, namely, to put lead into certaine pots or pitchers of vinegar well and thoroughly stopped, that no aire go out, and therein to let it rest for ten daies space together: after which time, to take it forth, and scrape from it the mouldinesse or vine- L ing that doth surr or gather about it: which done, to cast it in againe into the said vessels, con- tinuing so, vntill such time as the lead be consumed to nothing. Now that which hath been thus scraped from it, they take and beat into pouder, they serce it also very fine, calcin it ouer the fire in a pan, stirring and mixing it together with little slices or pot-sticks, vntill such time as it wax red, and be like vnto Sandarach. After all this, they wash it in fresh water so long vntill that all the grossenesse be scoured off: which when it is dry, in like manner as before, they digest into trochiskes. This Ceruse serueth to the same purposes that the rest abouenamed (onely of al the other it is lightest in operation) and besides serueth to make an excellent blanch for women, that desire a white complexion: but deadly it is, being taken inwardly in drink; like as letharge also. This ceruse thus made, as white as it is, in case it be afterwards burnt againe, turneth to be reddish.

As touching Sandarache, I haue already shewed in manner all that concerneth the nature of it; howbeit, this would be noted ouer and aboue, that it is found in the mines as well of siluer as of gold; the redder it is, and of a more strong and violent smell, the better men take it to be; such also is pure, clear, and brittle withal, or easie to crumble: mundificatiue it is and astrigent, heating

heating also and exceeding corrosiue: and the principal vertue that it hath, is to fret and putrifie whatsoeuer it worketh vpon: in a liniment with vinegar, it causeth the haire to come vp thicke againe in places despoiled thereof by any disease. It entrench into collyries or cie-salues: reduced into a lioch with hony, it cleneth the throat, and maketh a cleare thrill, and loud voice: eaten by way of a bole with turpentine, it is a gentle and pleasant medicine for those that be short-winded and troubled with the cough: a perfume also made with it and Cedar together, is good in the same cases, so that the smoke be receiued vp at the mouth. As for * Arsenicke, it is of the same stuffe: that which is best of this kind, resembleth burnished gold in colour: the paler kind inclining to the colour of Sandarach, is thought to be the worse. A third sort there is, of a mid- dle and medled colour, compounded as it were of gold and Sandarach. These two later kinds be B skaly aloft: as for the first, which is dry and pure, it is ful of small veins running here and there, whereby it is apt to cleaue as the veine goeth. Of the same operation is Arsenicke as the rest, but that it is more hot and biting; in which regard, it is vsed in potentiall cauteries, and depila- tories: it taketh away the carnosities and apostemations about the nailes of the fingers: the superfluous flesh also within the nostrils: the bigs that hang forth of the fundament: and in one word, it eateth away any excrecence whatsoeuer. To conclude, much better it is and more pow- erfull in operation, in case it be calcined in a new earthen pan, where it must torrifie so long vntill it change the colour.

* Yellow orpi- ment.

THE XXXV. BOOKE OF THE HISTORIE OF NATURE, WRITTEN BY C. PLINIUS SECVNDVS.

The Proem.

E **H**is discourse of Mines and Metals, wherein principally consisteth the wealth of the world: of other Mineralls also growing to them, with the Natures, Operations, and effects of them all, is an argument so knit and annexed to Physicke, that the handling thereof, (which I haue already well-near performed) not onely discovereth a world of wholesome medicines profitable for the life and health of man, but also inferreth a number of hidden secrets, couched within the Apothecaries shops; yea, and openeth the way vnto the curious Art and subtil deuises of Grauers, Painters, and Diers, inducing me withall to take them also before me, and to treat thereof accordingly: which when I haue done, there remaineth yet for mee a new worke to take in hand; namely, to write of sundry kinds of Earth and Stone, and those linked together & carrying with them a longer traine by far, than the former mineralls. Concerning which, other authors, and the Greeke writers especially, haue so particularized, that of each one of them they haue written many volumes. For mine owne part, I mean not to follow their steps, but by way of compendious breuitie, to proceed as I haue begun, and yet to omit nothing that is necessary, profitable, and pertinent to Nature.

CHAP. I.

¶ The honour of flat picture in old time.

O begin then with that which remaineth as touching Picture and Painting, this would be knowne, That in times past it was reputed a noble and excellent art: in those daies I meane, when Kings and whole Sates made account thereof; and when those onely were thought innobled and immortalized, whom Painters vouchsafed to commend by their workmanship to posterity. But now, the marble and porphyrit stones haue put painting clean down: the gold also laid vpon them hath woon all credit from painters colours: gold I say, wherewith not only plain and entire walls are richly guilded all ouer, but also the polished works of marble engrauen vpon them after the manner of inlaid work and marquettage of diuers pieces, resembling men, beasts, and floures, and all things else: for in these daies contented we are not with plaine squares and tables of marble, nor with the riches of mighty mountains, coucht vnder couert, & laid within our bed-chambers in that sort as they grew, but come we are now to paint-stones. Deuised this was first in the daies of *Claudius Caesar*: but when *Nero* came to be Emperour, the inuention was taken vp, to giue those colours to stones in their superficiall outside, which they had not of their own; to make them spotted, which naturally were of one simple colour: that by the helpe of mans hand, the * Numidian red porphyrit should be set out with white spots in * eg-fashion: the * Sinadian grey marble distinguished with marks and strakes of purple: as if our delicate wantons I shewed thereby how they could haue wished the stones to grow. Thus would they seem to correct the works of Nature, to supply the wants of mountains and quarries, and to make amends for the hills clouen in sunder for gold, and hewed in pieces for marble. And what is the end of all this prodigious prodigality and wastfull superfluity? but that the fire when it commeth, may consume in one houre a world of wealth.

CHAP. II.

¶ The estimation and account that was made of Images in times past, represented by liuely pictures.

The manner was in antient time, to continue and perpetuat the memorial of men, by drawing their pourtraitures in liuely colours, as like to their proportion and shape as possibly could be; but this custome is growne now altogether out of vse: in stead whereof wee haue shields and scutcheons set vp of brasle: we haue faces of siluer in them, without any liuely distinction of one from another: and as for our sesterces, the heads vpon them otherwhiles be changed one for another: which hath giuen occasion long since of many a jest and libel spread abroad in time and sung in euery street. In so much as all men now adaies are more desirous to haue the rich matter scene that goeth to the making of images, than to be knowne by their own personage and visage as it is: and yet euery man delighteth to haue his cabinet and closet well furnished with antique painted tables: the statues & images of other men they think it enough to honor and adore, whiles they themselues, measuring worship by wealth, & thinking nothing honorable that is not sumptuous and costly, see not how by this meanes they giue occasion to their heires for to break open their counters and make spoile of all, or els before that day come, entice a thiefe to be hooking or twitching them away with gins and snares. Considering then, that no man careth for a liuely picture, all the monuments that they leaue vnto their heires, are images rather of their monies, than resemblances of themselues. Howbeit, these great men take pleasure to haue their owne wrestling places and halls of exercise, yea and the roomes where they are annoiued, beautified and adorned with the pourtraitures of noble champions: they delight also to haue the face of *Epicurus* in euery chamber of the house, yea and to carry the same about them vpon their rings wheresoever they go: in the remembrance and honour of his natiuitie, they doe offer sacrifice euery 20 day of the Moone, and these moneth-minde they keep as holy-daies duly, which thereupon they call *Idades*: and none so much as they who will not abide to be knowne another day by any liuely image drawne whiles they be aliue. Thus it is come to passe, that whiles artificers play them and sit still for want of worke, noble arts by the

* Numidicum.

* for they were
so made that
they might be
taken off and
set on againe.

G

A means are decayed and perished. But I maruel nothing hereat: for thus it is verily and no otherwise, when we haue no respect or care in the world to leaue good deeds behind vs, as the Images of our minds, we do neglect the liuely portraitures and similitudes also of our bodies. In our forefathers daies ywis it was otherwise: their halls and stately courts were not set out with images and pourtraitures after this sort, therewere not in them to be seene any statues or images wrought by artizan strangers, none of brasle they had, none of marble, their Oratories & Chappels were furnished with their own and their ancestors * pourtraitures in wax, and those liuely and expressely representing their visages; these were set out and disposed in order, these were the images that attended the funerals of any that was to be interred out of that stock & linage. Thus alwaies as any gentleman died, a man should see a goodly traine of all those which were B liuing of that house, accompanying the corps, causing also the images of their predecessors to march ranke by ranke in order, according to their seuerall descents: in which solemne shew, the whole generation that euer was of that family, represented by these images, is there present, ready to performe that last duty and honour to their kinsman. Moreover, wheresoever these images stood within the oratory and chappell before said, there were lines drawne from them vpon the wall, directing to the seuerall titles and inscriptions which contained their stile, their dignities and honors, &c. As for their studies and counting houses, full they were of books, records, and rols, testifying all acts done & executed by them both at home & abroad, during the time they were in place to beare office of state.ouer and besides those images within house, resembling the bodily shape & countenance, there were others also without dores, to wit, about the portals C and gates of the house, which were the testimonies of braue minds & valiant hearts: there hung fixed the spoiles conquered and taken from the enemies, which notwithstanding any sale or alienation, it was not lawfull for the purchaser to pluck down; in such sort, as the house it self triumphed still and retained the former dignity, notwithstanding it had a new lord and master: and verily, this was to the master and owner a great spur to valour and vertue: considering, that if he were not in heart & courage answerable to his predecessor, he could neuer come in at the gates, but the house was ready to reproch and vpbraide him daily for entering into the triumph of another. Extant there is vpon record, an Oration or act of *Messala* (a great Orator in his time) wherein vpon a great indignation he expressely forbad that there should be intermingled one image D of confounding the race of his family and ancestors. The like occasion moued and inforced old *Messala* to put forth and publish those bookes which he had made of the descents and pedigrees of the Roman houses: for that vpon a time as he passed through the gallerie belonging to *Scipio Africanus* his house, he beheld therein his stile, augmented by the addition of *Salutio* (for that was one of his synames) which sel vnto him by the last wil and testament of a certain rich man so called, who adopted him for his owne son: as being greatly discontented in his minde, that so base a name as that (to the shame and dishonor of the *Africanus*) should creepe into the noble family of the *Scipios*. But if I may speak without offence of these two *Messala*, it should in my conceit be some token of a noble spirit and good mind that loueth and imbraceth vertue, to entitle his owne name, although vntruly, to the armes and images of others, so long as they E be noble and renowned: and I hold it a greater credit so to doe, than to demeane our selues so vnworthily, as that no man should desire any of our armes or images. And seeing that I am so far entered into this team, I must not passe ouer one new deuise and inuention come vp of late, namely, to dedicat and set vp in libraries the statues in gold or siluer, or at leastwise in brasle, of those diuine and heavenly men, whose immortall spirits do speak still and euer shall, in those places where their bookes are. And although it be vnpossible to recouer the true and liuely pourtraits of many of them, yet we forbear not for all that to deuise one Image or other to represent their face and personage, though we are sure it be nothing like them: and the want thereof doth breed and kindle in vs a great desire and longing, to know what visage that might be indeed which was neuer deliuered vnto vs: as it appeareth by the statue of *Homer*. Certes, in my opinion there can be no greater argument of the felicity & happinesse of any man, than to haue all the world euermore desirous to know, What kinde of person hee was whiles he liued? This inuention of erecting libraries, especially here at Rome, came from *Asinius Pollio*, who by dedicating his Bibliothecque, containing all the bookes that euer were written, was the first that made the wits and workes of learned men, a publique matter and a benefit to a Commonweale.

But

* Ptolomæus.
* Philadelphus.
* Attalus.

But whether the kings of * Alexandria in Egypt, or of * Pergamus, began this enterprife before (who vpon a certain emulation and strife one with another, went in hand to make their stately and sumptuous libraries) I am not able to auouch for certain. But to returne againe to our flat images and pictures, that men in old time delighted much therein, yea, and were carried away with an ardent and extraordinary affection to them, may appeare by the testimony, not only of *Atticus* that great friend of *Cicero's* (who set forth a book intituled, A Treatise of painted images) but also of *M. Varro*, who in all his volumes, whereof hee wrote a great number, vpon a most thankfull and bountifull mind that he carried, deuised to insert not onely the names of 700 famous and notable persons, but also in some sort to set down their physiognomy & resemblance of their visage: not willing as it might seem that their remembrance should perish, but desirous to preferue the shapes and portraits of so worthy personages against the injury of time, which H weareth and consumeth all things, indeuoring by this means, & as it were in a kind of emulation struing to do as much for them in this behalf, as the gods could do, not only in giuing them immortality, but also by dispersing those pourtraits into all parts of the world, to shew them personally in euery place to the eyes of men, as if they were present.

CHAP. III.

¶ At what time scutchions and shields, with images ingrauen in them, were first erected in publique place. Where they began to be set up in priuat houses. The originall of pictures. The first pourtrait that was of one single colour. Of the first Painters. How antient the Art of Painting was in Italy.

And this verily which *Varro* did, namely, to insert the names & counterfeits of famous men in his books, was to gratifie strangers only. But of those who were desirous in this kinde, to honour Romans, I find in the Chronicles, that *Appius Claudius* was the first (him I meane, who in the 259 yeare after the foundation of the city of Rome, bare the Consulship with *Seruius*, and namely, by dedicating in temples and publicke places of the city, the shields of his predecessors by themselves alone. For within the chappell of *Bellona*, hee caused to bee set vp the scutchions and shields of his ancestors, taking great contentment to haue the armes of his predecessors seen on high, and the same accompanied with the titles of their honorable dignities K to be read. A goodly shew, no doubt, and a magnificent, in case there should be shewed withall a long descent of petty images representing a number of children, as it were the nest of a faire brood and off-spring: for who would not take great joy and pleasure to see such a sight, who would not fauorably behold the arms of such a race and linage? After that *Appius Claudius* had giuen this precedent at Rome, there followed *M. Æmilius*, companion in the same Consulship with *Q. Lutatius*, who not contented to haue the Armoires and coats of his Progenitors, to be aduanced aloft in the stately hall and pallace *Æmilia* only, tooke order, that they should stand also at home in his owne house: and this also was a matter of right great consequence, beeing done according to the pattern and example of the martiall worthies in *Homer*: for within these shields & scutchions, resembling those which were vsed in old time in the battels before Troy, L were represented the images of such as serten with them, ingrauen therein: for thereupon such shields took the name * *Clypeis*, chafed and ingrauen, not of the old word in Latine *Cluere*, which signifieth to fight, or to be well reputed, as our thwarting Grammarians would with their subtile sophistric seeme to etymologize and deriue it. Certes, this originall of shields and coats of armours, implied abraue mind and noble spirit full of vertue and valour, when euery mans shield shewed the liuely pourtrait of him that bare it in the warres. The Carthaginians were wont to make their targuets of beaten gold, and those likewise they caused to bee ingrauen with their own portraits, & carried the same with them to the wars. And verily, *Q. Martins* that worthy warrior, and reuenger of the 2 *Scipio's* in Spain, hauing defeated the Carthaginians & taken many of them prisoners, found among other spoils and pillage, the shield of *Asdrubal*, made in maner M afore said: Which shield was erected & hung vp ouer the porch of *Iupiters* temple vpon Capitoll hill, and remained there vnto the first fire that consumed the temple. And seeing I am fallen vpon this poynt, namely, of erecting the armours woon from enemies, in publicke place; I may not passe ouer in silence the securitie and carelesse regard that our forefathers had in this behalfe:

* Quasi clypeus.
* In armis.
* In Calinde.

A behalfe: which was so great, that *M. Aufidius*, who farmed and vnder took the custody or keeping of the Capitoll, the temple, and all therein, the same yeare wherein *L. Manlius*, and *Q. Fulvius* were Consuls, and which was from the foundation of the city of Rome 575 yeares, aduertised the Senat, That those shields there, which for so long together were appointed & assigned thither by the Censors, were not of brasse, as they had been taken for, but of siluer.

Concerning pictures, and the first originall of painters art, I am not able to resolue and see downe any thing for certain: neither is it a question pertinent to my designe and purpose, I am not ignorant that the Egyptians do vaunt thereof, auouching that it was deuised among them: and practised 6000 yeres, before there was any talk or knowledge thereof in Greece: again brag and ostentation of theirs, as all the world may see. As for the Greeke writers, some ascribe the B inuention of painting to the Sicyonians, others to the Corinthians. But they do all jointly agree in this, That the first pourtrait was nothing els but the bare pouring and drawing onely the shadow of a person to his iust proportion and liniments. This first draught or ground, they began afterwards to lay with one simple colour, and no more: which kind of picture, after that they fell once to more curious workmanship, they called Monochromaton, i. a pourtrait of one colour, for distinction sake from other pictures of sundry colours: which notwithstanding, yet this plaine manner of painting continueth at this day, and is much vsed. As for the linearie: portraying or drawing shapes and proportions by lines alone, it is said, that either *Philoctes* the Egyptian, or els *Cleantes* the Corinthian was the inuention thereof. But whosoever deuised it, certes *Arctices* the Corinthian, and *Telephanes* the Sicyonian, were the first that practised it: howbeit their colours they vsed none, yet they proceeded thus far as to disperse their lines within, as well: as to draw the pourtrais, and all with a coale and nothing els. And therefore their manner and order was to write also the names of such as they thus painted, and alwaies to set them close to the pictures. But the first that tooke vpon him to paint with colour, was *Cleophantus* the Corinthian, who (as they say) took no more but a piece of a red potsherd, which he ground into powder, and this was all the colour that he vsed. This *Cleophantus*, or some other of that name, was he who by the testimony of *Cornelius Nepos*, as I will anon shew more at large, accompanied *Demaratus* the father of *Tarquinius Priscus* king of Rome, when he fled from Corinth to auoid the wrongs of *Cypsellus* the tyrant, who persecuted and oppressed him. But it cannot be so: for surely before this *Tarquines* time, the art of painting was grown to some perfection, euen in Italy: for D prooue wherof, extant here be at this day to be seen at Ardea within the temples there, antique pictures, and indeed more antient than the city of Rome: and I assure you, no pictures came euer to my sight, which I wonder so much at, namely, that they should continue so long, fresh, and as if they were but newly made, considering the places where they be, so ruinated and vncovered ouer head. Semblably, at Lanuvium there remaine yet two pictures of lady *Atalanta*, and queen *Helena*, close one to the other, painted naked, by one and the same hand: both of them are for beauty incomparable, and yet a man may discern the * one of them to be a maiden, for her modest and chaste countenance; which pictures, notwithstanding the ruins of the temple where they stand, are not a whit disfigured or defaced. Of late daies, *Pontius* lieutenant vnder *C. Caligula* the Emperor, did what he could to haue remoued them out of the place, and carried them away whole and entire, vpon a wanton affection and lustfull fancy that he cast vnto them: but the plastre or porget of the wall whereupon they were painted, was of that temper that would not abide to be stirred. At Cære there continue certaine pictures of greater antiquity than those which I haue named. And verily, whosoever shall well view and peruse the rare workmanship therein, will confesse, that no art in the world grew sooner to the height of absolute perfection than it, considering that during the state of Troy no man knew what painting was.

CHAP. IIII.

Of Romanes that were excellent Painters. When the art of painting came first into credit and estimation at Rome. What Romanes they were that exhibited the pourtraits of their owne victories in pictures. And about what time painted tables made by strangers in forreine parts, were accepted and in great request at Rome.

Amongst the Romanes also this Art grew betimes into reputation; as may appeare by the * *Fabij*, a most noble and honourable house in Rome, who of this science were synnamed Pictures,

Pictores. i. Painters: & the first who was intituled with that addition, painted with his own hand G the temple of *Salus*; and this was in the 450 yeare after the foundation of our city: which painting continued in our age, even vnto the time of *Claudius Caesar* the Emperor, in whose daies the temple it selfe with the painting, was consumed with fire. Next after this, the workmanship of *Pacuvius* the Poet (who likewise painted the chappell of *Hercules* in the beaſt-market at Rome) was highly eſteemed and gaue much credit to the art. This *Pacuvius* was *Ennius* the Poets ſiſters ſonne: and being as he was a famous Tragædian beſides, and of great name vpon the ſtage, the excellency of his ſpirit that way, much commended at Rome his handy-work and painting aforeſaid. After him, I doe not finde that any perſon of worth and quality tooke penſill in hand and praïſed painting, vneſſe haply a man would nominat *Turpilus* a gentleman of Rome in our time, and a Venetian born, of whose workmanship there be many faire parcels of paynting H extant at this day in Verona: and yet this *Turpilus* was altogether left-handed, and painted therewith; a thing that I doe not heare any man did before him. As for *Aterius Labeo*, a noble man of Rome, late Lord Pretour, and who otherwiſe had been vice-conſull in Gallia, Narbonenſis or Languedoc, who liued to a very great age and died not long ſince, he praïſed painting; and all his delight and glory that he tooke, was in ſine and ſmal works of a little compaſſe: howbeit he was but laughed at, and ſcorned for that quality, and in his time the handicraft grew to be baſe and contemptible. Yet I thinke it not amiſſe to put downe for the better credit of painters, a notable conſultation held by certaine right honourable perſonages as touching the Art, and their reſolution in the end. And this was the caſe: *Q. Papius*, the little nephew of *Q. Papius* I who had bin Conſull in his time and entred Rome in triumph, him I mean whom *C. Caesar* Dictator, made co-heire with *Augustus*, hapned to be born dumb; and *Meſſala* the great Oratour, out of whose houſe the grandmother of this child was deſcended, being careful how the boy ſhould be brought vp; after mature aduiſe and deliberation, thought good that hee ſhould by ſignes and imitation be trained vp in the art of painting, which counſell of his was approoued alſo by *Augustus Caesar*. And in truth, this yong gentleman being apt thereto, profited maruellous much therein, and died in his youth. But the principall credit that painters attained vnto at Rome, was, as I take it, by the means of *M. Valerius Maximus*, firſt ſurnamed *Meſſala*, who beeing one of the grand-ſeigneurs of Rome, was the firſt that propoſed to the view of all the world, and ſet vp at a ſide of the ſtately hall or court Hoſtilia, one picture in a table, wherein hee cauſed to be painted that battell in Sicily wherein himſelfe had defeated the Carthaginians and *K. Hiero*, K which happened in the yeare from the foundation of Rome 490. The like alſo, I muſt needs ſay, did *L. Scipio*, and hung vp a painted table in the Capitol temple, containing his victory and conqueſt of Asia, whereupon he was ſurnamed *Aſiaticus*. But (as it is ſaid) *Africanus* although hee were his owne brother, was highly diſpleaſed therewith: and good cauſe he had to be angry and offended, becauſe in that battell his own ſon was taken priſoner by the enemy. The like offence was taken alſo by *Scipio Emilianus*, againſt *Lucius Hoſtilius Mancinus*, who was the firſt that entred perforce the city of Carthage; for that hee had cauſed to be ſet vp in the market place of Rome a faire painted table, wherein was liuely drawne the ſtrong ſcituation of Carthage; and the warlike means vſed in the aſſaulting and winning of it, together with all the particulars and circumſtances thereof: which *Mancinus* himſelfe in perſon ſitting by the ſaid picture, deſcrip- L hred from point to point vnto the people that came to behold it; by which courteſie of his hee wooon the hearts of the people, inſomuch, as at the next election of Magiſtrates, his popularitie gained him a Conſulſhip. In the publicke plaies which *Claudius Pulcher* exhibited at Rome, the painted clothes about the ſtage and Theatre (which repreſented building) brought this art into great admiration: for the workmanship was ſo artificiall and liuely, that the very rauens in the aire, deceived with the likenefſe of houſes, flew thither apace for to ſettle thereupon, ſuppoſing verily there had been tiles and ereſts indeed. And thus much concerning Painters craft, exerciſed in Rome.

To come now to ſorrain pictures, *Lu. Mummius*, ſurnamed *Achaicus* (for his conqueſt of Asia) was the firſt man at Rome, who made open ſhew of painted tables wrought by ſtrangers, and cauſed them to be of price and eſtimation: for when as in the port-fale of all the bootie and pillage gotten in that victory, king *Attalus* had brought one of them, wrought by the hand of *Ariſtides*, containing the picture only of god *Bacchus*, which was to coſt him * ſix thouſand Se- ſterces, *Mummius* wondering at the price, & ſuppoſing that this table had ſome ſpeciall and ſe- cret

A cret propertie in it more than himſelfe knew of, brake the bargain, called for the picture again, & would not ſuffer it to be caried away, notwithstanding *Attalus* complained much at the hard meaſure offered vnto him; and ſo he brought it with him to Rome, and dedicated it in the chap- pel of *Ceres*. And verily this I take to be the firſt painted table of a forreiners making, that euer was ſet vp in publick place at Rome. But after he had once begun, I ſee it was an ordinary thing to adorn and beautifie euen the common place alſo with ſuch like: for vpon this occaſion arole that pretty ſcoffe which was given by *Craſſus* the Oratour, as hee pleaded vpon a time vnder the * old Roſtra: for when there was a Witneſſe produced to depole againſt him, whom hee would ſeeme to challenge and reprove, whereupon the party replied again and vrged him inſtantly in theſe termes, Speake out *Craſſus*, and in the face of all this Court ſay, what kinde of perſon you would make me to be? Mary (quoth he again) I take thee to be ſuch an one (pointing directly to a table hanging there by, wherein was painted a certain Frenchman yawning and ſtretching out his tongue full ſilauoredly.) In the ſame Forum or Grand place at Rome there ſtood ſometime the picture of an old ſheepheard leaning vpon his crooke, as touching which (for that as it ſhould ſeem it was very common like made) when a certain Dutch Embaſſador who beheld it was de- manded, at what price hee eſteemed it; answered ſhort & quick, What a queſtion is that? I would not haue ſuch an one (were hee aliuie, as I ſee he is but painted) though hee were giuen me for nothing. But if I ſhould ſpeake at once, who it was that gaue the greateſt countenance vnto ſuch tables in open view, I muſt needs ſay it was *Cæſar* Dictator, who ſhrined the pictures of *Ajax* and *Medea* in no meaner place than before the temple of *Venus Genetrix*. Next after him came *M. Agrippa*, a man by nature inclined rather to ruſticitie than to delights, and more like a rude pea- ſant than a ciuill gentleman. But ſurely there is extant a worthy Oration of his, and beſeeming the principal perſon of a whole city, as touching the open ſale of all painted tables, ſtatues, and images, that were in the hands of priuat men, and the ſetting of them vp in publicke places for to adorn the city: which no doubt had bin far better than to haue them baniſhed (as it were) and ſent as they be into the country, to beautifie manors and retyring houſes of pleaſure: howbeit as ſterne and grim a ſir as he was, hee could find in his heart to beſtow vpon two tables with the pictures of *Venus* and *Ajax*, 12000 ſeſterces, which hee paid vnto the Cyzicenes for them. Alſo hee had cauſed to be ſet in marble ſtone inchaſed, within the hotteſt part of his baths, many rich pictures of a ſmall making, and couched in ſmall tables, the which were taken away but a little before the ſaid baths were repaired. But aboue all that euer were, *Cæſar* *Augustus* the Em- peror of famous memory, did ſet vp in the moſt frequented or perſpicuous place of his Forum or ſtately hal, two excellent painted tables, one containing the liuely portrait of War, the other of Triumph. Hee alſo dedicated the pictures of *Caſtor* and *Pollux*, beſides others, whereof I will write in my catalogue of Painters: which hee hung vp all within the temple of *Iulius Caesar* his father. The ſame *Augustus Caesar* incloſed within the wall of that Curia, which hee erected and conſecrated in the common place called Comitium, two Tables painted; the one reſembling the Forreſt Nemea, in habit of a woman ſitting vpon a lion, ſhe carrierh in her hand a date tree; and there ſtandeth by her an old man reſting vpon his ſtaffe, ouer whose head there was a pretty table hanging down as a label, from a chariot drawn by two horſes, with this inſcription, *Nicias me inuſit*. *Nicias* inamelled or wrought me with fire: for that verb [*inuſit*] it pleaſed him to uſe. As for the other table, the admirable workmanship therein was this, An old grey-beard accompanied with his ſon, a youth exceeding like his father, ſaue onely for the difference in age; which appeared in the yong down that ſprung vpon his cheeks and chin. A deuſe there was be- ſides of an *Ægle* flying ouer their heads, claſping a dragon within her talons: and as it appeared by the ſuperſcription, *Philocharis* was the workman. By which one table (if there were no more but it in the whole world) a man may make an eſtimate of the infinite power that is in this art, which could cauſe the Senat & people of Rome to take ſuch pleaſure ſo many yeares together to look vpon *Glaucion* and his ſon *Ariſtippus*, perſons otherwiſe moſt baſe and contemptible, on- ly in reſpect of *Philocharis* who painted them. As for *Tiberius Caesar* the Emperor, albeit hee was a prince of all other leaſt courteous and affable, yet he delighted to hang vp thoſe painted tables within the temple of *Augustus Caesar*, whereof I mean to write hereafter.

* *Sub uentibus*, which ſome interpret *Taverna*.

Quintilianus reporteth this otherwiſe.

CHAP. V.

¶ The art and manner of Painting: the Colours that Painters vse.

Thus far forth may suffice to be spoken of the antient dignitie of that art, which begins already to decay and die. What were the colors also that the first painters vsed in old time, when they drew their portraicts with one simple colour, I haue written already in my treatise of Mines & Minerals, where I discoursed likewise of painters colours. Touching those that named certain kind of pictures Monochromateas, as also who enriched them with more colours, who inuented this or that for the bettering and perfecting of them, and at what time each of these additions accrued thereto, I mean to referre vnto my catalogue of painters: for the order and consequence of my work requireth, that I should first set down the nature of euery colour.

First and formost therefore this is to be noted, That in proceffe of time the artificer who began with one bare colour, found out the difference himselfe between * light and shadow, & deuised by this distinction to set vp and debate the one and the other alternatiuely, and the same more or lesse according to his feuerall intentions. After these lights and shadowes there was inuented a kind of lustre or glosse, different from the light aforesaid, which because it is of a mean nature between the shade and the light, and participates of both, they called by a Greeke word Tonos. As for the apt coherence of one colour with another, the ioint as it were between, and the passage from one to another, they named it Harmoge.

CHAP. VI.

¶ Of Painters colours, naturall and artificiall.

* 1. White and blacke.

1 Because they be rich and costly.
2 Minium.
3 Armenium.
4 Cinabaris.
5 Ceryficolla.
6 Jadicum.
Lacta mixta cum cerulo.
7 Purpurissum.
8 Sinapis.
9 Rubrica.
10 A white kind of faerie earth like plastre.
11 A white earthlike chalker.
12 A whitish earth or ash-colour white.
13 Auripigmentum.
* Or rather three denarij, for otherwise there were no proportion betwene it and the other of that kind.

All colors be either sad or liuely, and those be so either naturally, or by artificiall mixture. Liuely or gay colors be such as the * master deliuiers to the painter by weight & measure: as namely, * Vermilion, * Verd d'Azur, * Sang-dragon, * Verd de terre, or Borrax, * Indico, and * Roset. The rest be sad or duskyish, and as wel the one as the other be all either naturall or artificiall. Among the naturall of this sort (to wit the sad colours) I reckon the * common bole Armin, * Ruddel or red stone, * Paretonium, * Melinum, * Eretria, and * Orpin. The rest of these kinds be artificiall, & principally those which I haue already spoken of in the treatise of mines. Moreouer, of the baser sort are Ocre and Ruddel, burnt Cerusse or Spanish white, Sandix mineral, and Scyricum, Sandaracha, Vitriol, or Black. As for Sinapis or common bole Armin, found out first it was at Sinope, a maritime town in the kingdom of Pontus, wherof it took that name; it groweth also in Egypt, the Baleare Islands, and Africk; but the best is found in the Isle Lemnos, and in Cappadocia, digged out of certain caues and holes. That which sticke fast vnto the rocks excelleth all the rest. The pieces of this earth if a man do breake, shew the owne naturall colour which is not mixed, without-forth they be spotted. And this earth in old time was vsed for to giue a lustre vnto other colours. Of this Sinapis or Bole Armin common there be three kindes, the deepe red, the pale or weake red, and the meane between both. The best Sinapis is esteemed worth * thirteene denarij Roman by the pound: this may serue the painters penfill, yea or in grosser work, if a man list to colour posts, beams, or wood: as for that which commeth out of Africk, it is worth eight asses euery pound; and this they call Cicirculum: that which is redder than the rest serueth better for painting of tablements: as for that which is most brown and duskyish, called in Latine Pressior, it is of the same price that the other, and employed in the bases and feet of such tablements. And thus much for the vse in painting. Touching Physicke and the medicinable properties thereof, milde it is of nature, and in that regard of gentle operation, whether it enter into hard emplaires of a dry composition, or into immolitiue plasters that are more liquid, and principally such as are deuised for vlcers in any moist part, as the mouth or fundament. This earth, if it be injected by a clistere, stoppeth a laske: and being giuen to women in drinke to the weight of one denarius, i. a dram, it stayeth their immoderate fluxes of the matrice. The same burnt or calcined drieth vp the fretting roughnesse of the eyes, principally if it be applied with vineger. This kinde of red earth some would haue to be counted in a second degree of Rubrica for goodnesse, for they alwaies reckoned that of Lemnos to be the chiefe

A chiefe & simply best, as comming next in price to Minium, i. Vermilion. And in truth, this Terra Sigillata or Lemnia, was highly accounted of in old time, like as the Island Lemnos from whence it comes: neither was it lawfull to sel any of it before it was * marked or sealed, & then upon they vsed to cal it Sphragis. The painters ordinarily lay a ground of this vnder their vermilion, and sophisticate it many waies. In physick it is holden to be a soueraigne thing: for if the eyes be annointed round about therewith in manner of a liniment, it representeth the flux of rheumatick humors and doth mitigate the pains incident to them: the fistulous sores likewise about the angles or corners of the eyes, it drieth vp that they shall not run as they vse to doe. Inwardly also it is commonly giuen in vineger, to such as cast vp blood at the mouth. It is taken also in drinke, for the opilations and other accidents as wel of the spleen as kidnies: and besides, to stop the excessiue fluxes that be incident to women. Singular it is against any poison or venomous sting of serpents, either vpon land or sea; and therefore is a familiar ingredient into all antidors or counterpoisons. Of all other sorts of red earth, the ruddle of Egypt and Africke is fittest for Carpenters; for if they strike their line vpon timber with it, they shall be sure that it will take colour and be marked very well. Moreouer, another sort there is of this red earth mineral, found with yron ore, and the same is good also for painters. There is a kind of ruddle also made of ochre burnt and calcined in new earthen pots well luted all ouer: and the greater fire that it meeteth withall in the furnace, the better it is. In generall, any ruddle whatsoever is exiccative, in which regard it agreeth wel with salues and healing plasters, and is very proper for to repress shingles & such cutaneous wild-fires that wil stand in drops. Take of Sinapis or Bole Armin common that commeth out of Pontus * halfe a pound, of bright Sil or ochre 10 pound, of the Greek white earth Melinum 2 pound; pun them all together, and mix them wel, so as they may ferment 12 daies together: and hereof is made Leucophorum, i. a kind of gum or size to lay vnder gold-foile for to guild timber.

Touching the white earth Parætonium, it carieth the name of a place in Egypt from whence it commeth: and many say, that it is nothing but the some of the sea, incorporat and hardened together with the slime & mud of the shore: and therefore there be winkles and such shell-fishes found therewith. It is ingendred also in the Isle Candy, and the country of Cyrenæ. At Rome they haue a deuise to sophisticate it, namely by boiling fullers earth vntil it be of a fast & massie consistence: the price of the best is after 6 denier, the pound. Of all white colors it is the fastest, and for that it runs out smooth in the working, it is the fastest parget to ouercast walls withall.

As for the earth Melinum, white it is likewise, but the best is that which the Isle Melos doth yeeld, whereupon it took that name. In Samos also it is to be found, but painters vse it not, because it is ouer clammy and vnctuous. The Islanders are wont to creep on all foure and to lie along at their work when they dig it forth of the rocks, for search it they must among the veines that run therein. The same * operation it hath in physicke that the earth Eretria also, if a man touch it with the tongue, he shall find it astringent and drying: howbeit, a depilatory it is in some sort, and fetcheth away haire, or els causeth it to grow thin. A pound of it is worth a Sesterce.

There is of white colors a third kind, and that is Cerussa or white lead, the reason & making whereof, I haue shewed in my discourse of minerals: and yet there was found of it in the nature of a very earth by it selfe at Smyrna, within the land belonging to one Theodosius, wherewith in old time they vsed to color and paint ships. But in these daies we haue no other cerusse or Spanish white but that which is artificiall, made of lead & vineger, in manner aforesaid. As touching cerusse burnt, the inuention thereof came by meere chance, vpon occasion of a skare-fire happening in the harbor of Piræum, which caught the pots and boxes wherein the Athenian dames that dwelt by the said harbor kept their blanch of cerusse for complexion: and this cerusse thus calcined, the first that vsed in picture was Nicias, of whom I haue already spoken. The best that we haue in these daies comes out of Asia, and for that it inclineth to a purple colour, they call it Purpurea: a pound of it is sold for 16 deniers Roman. This also is made in Rome, namely by calcining Sil or ochre mineral, which standeth much vpon marble, and then quenching it with vineger. Such vse the painters make thereof thus burnt, that no shadowes will do well without it.

Concerning Eretria, another kind of white earth, it takes the name of the place from whence it commeth. Nicomachus & Parasius vsed this colour much. In Physick, it is found to be cooling and emolitiue. Being burnt or calcined, it is an excellent incarnatiue: singular good for to drie any sore; proper also to be applied to the forehead for the headach, like as, to discouer any festring

* With the image of a goat, as Diofscorid faith: or of Diana, according to Galen.

Thus Dalerchamp reads this place according to the Islander, out of Diofscorid and Theophrast. * Sclibris: rather read St. x. libris.

* To staunch blood.

or rankling matter that lieth secret within: for if a place be anointed therewith, when it is reduced into a liniment with water, in case it wax not dry, be sure there is some suppuration vnderneath

As touching Sandaracha and Ochra, *K. Iuba* writeth, that they are to be found in Tapazus, an Island within the red sea; but that which we haue, was neuer brought from thence. How Sandaracha is ingendred, I haue said already in the discourse of mines. There is an artificiall and sophisticated Sandaracha, made of cerusse burnt in a furnace. The colour of Sandaracha ought to be fiery like a flame: a pound thereof is bought for 5 Asses, i. halfe a denier. Calcine this and Ruddle together, and of both, being concorporat in euall quantity, you shall haue the color called Sandyx. Howbeit, I do obserue in *Virgil*, that he took Sandyx for an herb, as may appear by this verse:

Sponte sua Sandyx pascens vestiet agnos.
A ruddie fleece shall Sandyx yeeld,
To lambs, as they do graze in field.

This Sandyx to be bought and sold, carrieth but halfe the price of Sandaracha: neither bee there any colours more weighty than these in the ballance.

Among the artificiall and made colors, I reckon Scyricum, which as I haue already said, serueth for a good ground to take vermillion. The maner of making it, is to mix the best ruddle Sinopis and this Sandyx together.

Painters black [called in Latine *Atramentum*] I count an artificiall colour, although I know there is a vitrioll or coperofoe going vnder that name, which is minerall, and is ingendred two manner of waies: for either it issueth and oofeth out of the mine in maner of a salt humor or liquor, or els there groweth an earth it self of a brimstone colour, which serueth for it, that it may be drawn out thereof. Some painters haue bin knowne, who for to get black, haue searched into sepulchres for the coles there, among the reliques and ashes of the dead. But in mine opinion, all these be but new deuises, and foolish irregular toies without any reason; for a man need seek no farther but to foot, and that made many waies, by burning either of rosin or pitch: in which regard, many haue built places and forges of purpose to burn them in, without any emissaries, tunnels, or holes, that the said foot or smoke may not get forth: but the best black in that maner made, comes of the smoke of torchwood. This fine foot is sophisticated with grosse foot that doth gather and ingender in forges, furnaces, & stouphs: and this is that inke wherewith wee vse to write our books. Some there be who take the lees or dregs of wine, and when it is dried, boile it thoroughly; and they affirme, that if the wine were good whereof those lees came, the said inke or black will make a colour like Indico. And in truth, *Polygnotus* and *Mycon* (two as renowned painters as euer were) vied no other black at all, but that which they made of the mare or refuse of grapes after they be pressed, & this they call Tryginon. *Apelles* deuised a way by himself, to make it of yuorie or the elephants tooth burnt, and this they named therupon Elephantinum: as touching the black called Indicum, it is brought from India: but as yet I know not the maner either of the making or the ingendring of it. A kind thereof I see the diers do make, of that black florice which sticketh to their coppers. Also, there is a black made of torchwood burnt, & the coles that come of it punned to powder in a mortar. And here commeth to my mind the wonderfull nature of Cuttle fishes, which do yeeld a black humor from them like to inke: howbeit, I do not find that painters or writers make any vse thereof. But all blacks whatsoeuer take their perfection by sunning: if it be writing inke, with gum (Arabick); if to colour pargetting or walls, with glew among; and looke what blacke is dissolved and liquified in vineger, the same will hold well and hardly bewashed off. And thus much of the ordinary colours low prized.

Of all the colours besides, which (as I said once before) for their high price the poore painters be serued with from their masters hands who set them on worke, the rich roset or purple red that is made of Tripolie or goldsmiths earth, is simply the best: for this Tripolie is commonly died together with purples, and no silk, wooll, or cloth, will so soon take that tincture as it. The principal is that, which hauing had the floure of a fatt, hath drunk the fil as it were, whiles the liquor is yet boiling, and the drugs within the caudron be in their verdure and haue not lost the heart. When this first Tripoly thus deeply died, is cast vp and taken forth, that which is put in next into the said liquor, is counted the second in goodnes; & so consequently by degrees; for the former euer taketh the higher die, & the oftner you dip therein, the weaker will the tincture be: which is the reason that the roset or purple red of Puteoli, is more commended, than either the

the Tyrian, Getulian, or Lacedemonian, notwithstanding from thence come the most rich and pretious pearls. The reason is, because the Tripoli in Puteoli is died most with the juice of the Magaleb berries among, which yeelds the gallant red, & besides, is forced to drink the tincture of Mader. That roset which is made at Canusium is the worst of all other, and carrieth the lowest price: a pound of roset costeth vually * 30 deniers Roman. Painters or complexioners, when they would counterfeit a lustre or glosse of vermillion, lay a ground first with Sandyx, and then charge roset vpon it with the white of an egg: but if they be desirous to make a purple colour, the first course or ground is azur, and straitwaies they come vpon it with * roset and the white of an egg abouesaid. After this rich and liuely roset or purple red, Indico is a colour most esteemed: out of India it comes, wherupon it took the name; and it is nothing els * but a slimy mud cleauing to the some that gathereth about canes and reeds: while it is punned or ground it looketh black, but being dissolved, it yeelds a wonderfull louely mixture of purple and azur. There is a second sort of it found swimming vpon the coppers or vats in purple Diers worke-houses: and in truth, nothing els but the very fume or scum that the purple casts vp as it boileth, in maner of a florey. Some there be that do counterfeit and deeply coloured with the true Indico: but the prooffe thereof is by fire; for cast the right Indico vpon liue coles, it yeeldeth a flame of most excellent purple, and while it smoketh, the fume senteth of the sea; which is the reason that some do imagine it is gathered out of the rockes standing in the sea. Indico is valued at 20 denarij the pound. In physicke there is vse of this Indico, for it doth assuage swellings that do stretch the skin: it represseth violent rheums and inflammations, and drieth vlcers.

The land of Armenia doth furnish vs with the colour verd d' azur, and of that country it is named Armenicus: a stone it is that is likewise died before it can die, in manner of Borrass or verd d' terre: the best is the greenest, & yet withall it doth participat the colour of azur; in which regard it may properly be called Verd d' azur. In times past a pound of it was held at 300 Sesterces: but since there was found in Spain a kind of sand that would take the like tincture and do as well, the price hath bin well abated, and is come downe to six deniers. All the difference between this colour and azur is this, for that it stands more vpon the white, which causeth this colour to be lighter and weaker. The only vse that it hath in physick, is to nourish hairs, & especially those of the eie lids.ouer and besides all these colours aboue named, there be two more newly come vp, and those beare but a very low price; to wit, the green called Appianum, & oft times it is taken for Borrass or Verd d' terre, as if there were not other things enough that did counterfeit and resemble it. Made it is of a certain Greene chalky earth, & is worth but one Sesterce a pound. The second new colour is a white, called Anulare, being that which in womens pictures giues a lightfom carnation white: this also is made of a kind of chalk, & certain glassy gems or bugles, which the common sort vse to weare in rings, & thereupon is called Anulare.

CHAP. VII.

¶ What Colours refuse to be layd vpon some grounds: with what colours they painted in old time: and when the sight of Sword-fencers was first proposed to be seen at Rome.

Of all colours, Rolet, Indico, Azur, Tripoli or Melinum, Orpiment, white lead or Cerusse, loue not to be laid vpon plaister-work or any ground, while it is moist; & yet wax will take any of these colours abouesaid, to be imploied in those kind of works which are wrought by fire (so it be not vpon plaister, parget, & wals, for that is impossible) whether they be inameld or damaskd, yea and in their painting of ships at sea, as well hulks & hoies of burden, as gallies and ships of war: for now wee are come (forsooth) to inamel and paint those things that are in danger to perish & be cast away euery houre: so as we need not maruel any longer, that the coffin going with a dead corps to a funerall fire, is richly painted: and we take a delight when wee mind to fight at sea, to sail with our fleet gallantly dight & enriched with colours, which must cary vs into dangers, either to our own death, or to the carnage of others. And when I consider so many colours, & those so variable, as be now adaies in vse, I must needs admire those artificers of old time; and namely of *Apelles*, *Echion*, *Melancthius*, and *Nicomachus*, most excellent painters, and whose tables were sold for as much apiece, as a good town was worth; and yet none of these vsed aboue foure colours in all those rich and durable works. And what might those be?

* *Ja. singularis
libris ad dena-
rijs triginta.*

* our painters
in stead thereof
vse Lac.

* They say it is
made of Oade
and in those
counties from
whence it com-
meth, Gallia
Nila.

Of all whites they had the white Tripoli of Melos; for yellow ochres they took that of Athens: G
for reds, they sought no farther than to the red ochre or Sinopie ruddle in Pontus: & their black
was no other than ordinarie vitriol or shoemakers black. And now adaies, when we haue such
plenty of purple, that the very walls of our houses be painted all ouer therewith, when there com-
meth from India store enough not only of Indico, which the mud of their riuers do yeeld, but
also of Cinnambre, which is the mixed bloud of their fel dragons and mighty elephants, yet a-
mong all our modern pictures we cannot shew one faire piece of worke: insomuch as wee may
conclude, All things were done better then, notwithstanding the scarcitie that was of stufte and
matter. But to say a truth, the reason is, Giuen wee are now (as I haue oftentimes said) to e-
steem of things that be rich and costly, neuer regarding the art that is imployed about them.
And here I thinke it not amisse to set down the outrageous excessse of this age, as touching pi- H
ctures. Nero the emperor commanded, that the portraict of himselfe should be painted in linnen
cloth, after the maner of a gyant-like colosse 120 foot high; a thing that neuer had been heard
or seen before. But see what became of it! when this monstrous picture (which was drawne and
made in the garden of *Marius*) was don and finished, the lightning and fire from heauen caught
it, and not only consumed it, but also burnt withall the best part of the building about the gar-
den. A slave of his infranchising (as it is wel known) when he was to exhibit at Antium certain
solemnities, and namely a spectacle of sword-fencers fighting at sharp, caused all the scaffolds,
publique galleries, and walking places of that city to be hung & tapisied with painted cloths,
wherein were represented the liuely pictures of the sword-players themselves, with all the wif- I
fers and seruitors to them belonging. But to conclude, the best and most magnanimous men,
that for many a hundred yeares our country hath bred, haue taken delight (I must needs say) in
this art, and set their minds vpon good pictures. But to portray in imagery tables and painted
cloth the publick shews of fencers & sword-players, and to set them vp to be seen in open place
to the view of the world, began by *C. Terentius* a Lucan: for this man to honour his grandfather,
who had made him his own son by adoption, exhibited a shew for three days together of thirty
paire of such fencers fighting with vnrebat swords; and a faire painted table which carried
the liuely resemblance of this spectacle, hee set vp and dedicated within the sacred groue of
Diana.

CHAP. VIII.

¶ The antiquitie of Painting, and the severall ages wherein the famous Painters liued. A
survey of excellent Pictures, and the Artificers that made them, together with
the prices that their workmanship was valued at: and no-
table pictures to the number of 305.

This argument
or title reacheth
to many
chapters fol-
lowing.

NOW will I after a cursorie sort run through all the famous professors and Artizans in this
kind, and that with as great breuitie as possibly I can; for the scope I haue proposed to my
selfe tends another way: and therefore let not the Reader think much if I do but touch
the names of some, as it were passing by, and by occasion of others whose catalogue I meane to L
deliuer. Howbeit, in making this list, my purpose is not to omit any excellent piece of worke
which is worth the remembrance and relation; whether the same be extant at this day, or lost
and perished. Where I must aduertise the readers, that in this argument my meaning is not to
stand much vpon the authoritie of Greeke writers, who indeed deliuer no certitude, nor agree in
their records as touching this point (notwithstanding that they would seeme diligent in that
behalf) and namely, in that they haue written, That the excellent painters flourished so many
Olympiads after the famous Imageurs; and haue nominated for the first and chiefe to haue li-
ued in name, about the time of the 90 Olympiad: whereas this is for certain reported, that *Phi-*
dius himself was a painter in the beginning, and that the noble shield of *Minerva* in Athens was M
by him painted: besides, this is confessed and resolu'd vpon for a truth, that *Panaus* his brother
liued in the 83 Olympias, and painted the inside of the said shield; who also in another scut-
chion of *Minerva*, which *Colores* the apprentice of *Phidias* had made; as also in making the statue
of *Iupiter Olympius*, wrought with the said *Colores* and helped him. But what should I dwell long
in this matter? Is there any doubt made, that *Candaules* King of Lydia, the last of the race and
family

A family of the *Heraclidae*, who also was commonly caled *Myrsilus*, bought the painted table which
contained the battell of the Magnetes, and paid for it to *Bularchus* (the painter or workman ther-
of) as much gold as it came to in weight. See of what price and estimation pictures were euen
in those daies! And needs it must be that this hapned about that age wherein *K. Romulus* liued:
for the said *K. Candaules* died in the 18 Olympias; or as some write, in that very yeare that *Romu-*
lus departed this life: at what time this skill of painting (if I be not much deceiued) was in
great request euery where, and growne already to an absolute perfection. Which being gran-
ted, as of necessitie it cannot be denied, euident and apparent it is, that the originall and begin-
ning of this art, was much more antient: and that those painters who vsed one colour and no
more in their plain draughts called Monocromata (towit, *Hygieon*, *Dinius*, and *Charmas*) liued
B a good while before, although it be not recorded in any writer in what age precisely they flou-
rished: as also that *Eumarnus* the Athenian painter, who deuised first to distinguish male and fe-
male in painting; and besides, vndertook to draw with his pensill the proportion & shape of any
thing that he saw; together with *Cimon* the Cleonæan, who followed his steps, and practised his
inventions, could not chuse but by a congruity & consequence be of more antiquity than *Bular-*
chus aforesaid, or the reign of *Romulus* & *Candaules*: this *Cimon* deuised the works called Catagra-
pha, i. pourtraits and images standing byas and side-long: the sundry habits also of the visage
and cast of the eie, making them to look, some backward ouer their shoulders, others aloft, and
some againe downward: his cunning it was to shew in a picture, the knitting of the members in
C every ioint: to make the veins appeare how they branched and spread: and besides, the first hee
was that counterfeited in flat pictures, the plaits, folds, wrinkles, and hollow lappets of a
garment. As touching *Phaneus* the brother of *Phidias*, hee painted also the battell betwene
the Athenians and the Persians, vpon the plains of Marathon; for now by this time were paint-
ers furnished in some sort with colours to their purpose, and the art was growne to such perfe-
ction, that in the picture resembling the said battell, the full personages were pourtraied most
liuely, of the captains on both sides, towit, *Milciades*, *Callimachus*, and *Cynegyrs*, for the Atheni-
ans; *Datis* also and *Artaphanes*, for the Barbarians or Persians.

CHAP. IX.

D ¶ The Painters that first entred into contention for to win the prize by their Art: and
who deuised to paint with the pensill.

MOREouer, during the time that the aboue-named *Panaus* flourished, there were prizes pro-
posed at Corinth and Delphos, for those painters that could win them: and the first that
struiued for the best game, was the said *Panaus*, who challenged *Timagoras* the Chalcidian
vpon this occasion, That the same *Timagoras* had giuen him the foile before at the Pythian
games; which also doth appeare by certain verses composed by *Timagoras* himselfe as touching
that argument, which fauor of great antiquity. Whereby the error of *Chronicles* before said is
manifestly conuinc'd, who haue failed much in the calculation of the times. Furthermore, be-
E sides these painters aboue rehearsed, others there were of great name, and yet all of them before
that 90 Olympiad whereof they write; as namely, *Polygnatus* the Thasian, who was the first that
painted women in gay and light apparell, with their hoods and other head attire of sundry co-
lours; and in one word, passed all others before him in deuises, for the bettering of this art. His
inuenition it was to paint images with their mouths open, to make them shew their teeth; and
in one word, represented much variety of countenance, far different from the rigorous and hea-
uy looke of the visage beforetime. Of this *Polygnatus* workmanship, is that picture in a table
which now standeth in the stately gallerie of *Pompeius*, and hung sometime before the Curia or
Hall that beareth his name, in which table he painted one vpon a scaling ladder, with a targuet
in his hand; but so artificially it is done, and with such dexterity, that whosoever looketh vpon
him, cannot tell whether he is climbing vp or coming downe. All the painting of *Apollo* his
F temple at Delphos, was of this mans doing; who also beautified with pictures, the great gallery
or walking place at Athens, which thereupon was called *Pœcile*; and this he did gratis, and
would not take one penny for it; whereas *Mycon* afore him, painted one part thereof, & was well
paid for his workmanship; which liberall mind of his, wan him the greater credit and honor be-
sides: for by a decree from the Amphyctions (who are the lords of the publick counsell of state
Z z 3
in

in Grece) it was granted, that in all cities and towns of Greece wherefoever he came, he should be lodged and entertained of free cost. Besides that *Mycon* before mentioned, there was another of the name, distinguished only by this, that the former was called *Mycon* the elder, and this *Mycon* the younger, who had a daughter named *Timarata*, & she could paint likewise excellently. But to come now to that ninetieth Olympia, there flourished in that time *Aglaophon*, *Cephisodorus*, *Phrylus*, and *Euenor*, who was both father and master to *Parasius* that most renowned painter, of whom I purpose to speak in his rank when the time comes; all these were reputed very good artists in their time, howbeit not so excellent that I should need stand long upon them or their workmanship, making haste as I do unto those glorious and glittering painters indeed, who shine as bright stars about all their fellowes; among whom, *Apollodorus* the Athenian was the first that gaue light, and he lived in the 93 Olympias; this man led the way to others, & taught them to expresse the fauor and beauty of any thing, which he obserued especially; of whom I may well and truly say, that he and none before him brought the penfill into a glorious name & especial credit. Of his making there is one picture, of a priest at his deuotions, praying & worshipping; as also another representing *Ajax*, all on a flaming fire with a flash of lightning, which at this day is to be seen at Pergamus, as an excellent piece of worke. And verily before his daies there cannot be shewed a table of any ones painting worth the sight, and which a man would take pleasure to behold and looke vpon any long time.

* For Olympias was counted the space of five yeares.

When this man had opened the dore once, and shewed the way to this art, *Zeuxis* of Heraclea entred in, and that was in the fourth yere of the 95 * Olympias: and now that the penfill was taken in hand (for now I speak thereof) he seeing that it made good worke, followed on therewith, and by continuall practise brought the same to great perfection, whereby he wan much credit to the art, and reputation to himselfe. Some writers there bee, who range him wrong in the 89 Olympias; at which time it must needs be, that *Demophilus* the Himeræan and *Neseas* the Thracian liued; for to one of them apprentice he was: but whether of the two was his master, there is some doubt made; and verily so excellent he proued in his art, that the abouenamed *Apollodorus* made verses of him; in which he signifieth, that *Zeuxis* had stolen the cunning from them all, and he alone went away with the art. He grew in proceesse of time to such wealth by the means only of his excellent hand, that for to make shew how rich he was, when he went to the solemnity of the games at Olympia, he caused his owne name to be imbrodered in golden letters, within the lozenge worke of his clokes, whereof he had change, and which he brought thither to be seen. In the end, he resolu'd with himselfe to work no longer for money, but to giue away all his pictures, saying, That he valued them about any price. Thus he bestowed vpon the Agrigentines, one picture of queen *Alcmena*; and to king *Archelaus* he gaue another of the rustical god *Pan*: there was also the pourtrait of lady *Penelope*, which he drew in colours, wherein he seemeth not only to haue depainted the outward personage and feature of the body, but also to haue expressest most liuely the inward affections and qualities of her mind: and much speech there is of a wrestler or champion of his painting, in which picture he pleased himselfe so well, that he subscribed this verse vnder it, * *invisurus aliquis facilius quam imitaturus*. Sooner will a man enuy me, than set such another by me. Which thereupon grew to be a by-word in euery mans mouth. One stately picture there is of his workmanship, *Iupiter* sitting vpon a throne in his Majestie, with all the other gods standing by and making court vnto him. Hee pourtraied *Hercules* also as a babe lying in a cradle, and strangling two fell serpents with his hand, together with his mother *Alcmena*, and her husband *K. Amphitryon* in place, affrighted both at the sight thereof. Howbeit, this *Zeuxis* as excellent a painter as he was, is noted for one fault and imperfection; namely, that the head and joints of his pourtraicts, were in some proportion to the rest somely, that with the biggest, for otherwise so curious and exquisite hee was, that when he should make a table with a picture for the Agrigentines, to be set vp in the temple of *Inno Lacinia*, at the charges of the city, according to a vow that they had made, he would needs see all the mayden of the city naked, and from all that company he chose 5 of the fairest to take out as from seuerall patterns, whatsoeuer he liked best in any of them; and of all the lovely parts of those faire, to make one body of incomparable beaurty. Many draughts he made of one color, in white. There liued in his time *Timanthes*, *Androcydes*, *Eupompus*, and *Parasius*, who were his concurrents, and thought as well of themselves as he did.

* *Græcè melius inuenitur, quàm imitaturus*: which Iambick verse some attribute to *Apollodorus*.

CHAP.

CHAP. X.

Of birds deceived by pictures. What is the hardest point in the art of painting?

Of those foure before named, *Parasius* by report was so bold as to challenge *Zeuxis* openly and to enter the lists with him for the victory, in which contention and triall, *Zeuxis* for prooffe of his cunning, brought vpon the scaffold a table, wherein were clusters of grapes so liuely painted, that the very birds of the aire flew flocking thither for to bee pecking at the grapes. *Parasius* againe for his part to shew his workmanship, came with another picture, wherein he had painted a linnen sheet, so like to a sheet indeed, that *Zeuxis* in a glorious brauery and pride of his heart, because the birds had approoued of his handy worke, came to *Parasius* with these words by way of a scorn and frumpe, Come on sir, away with your sheet once, that we may see your goodly picture. But taking himselfe with the manner, and perceiuing his own error, he was mightily abashed, & like an honest minded man yeelded the victory to his aduersary, saying withall, *Zeuxis* hath beguiled poore birds, but *Parrhasius* hath deceiued *Zeuxis*; a professed artifice. This *Zeuxis*, as it is reported, painted afterwards another table, wherein he had made a boy carrying certaine bunches of grapes in a flasker, and seeing again that the birds flew to the grapes, he shook the head, and comming to his picture, with the like ingenious mind as before, brake out into these words, and said, Ah, I see well enough where I haue failed, I haue painted the grapes better than the boy, for if I had don him as naturally, the birds would haue bin afraid and neuer approched the grapes. He pourtraied also diuers pieces of earthen vessels in porterie, which onely were left behind in *Ambracia*, at what time as *Enluis* surnamed *Nobilior*, remoued the Mules from thence of his pourtraying, and brought them to Rome. Moreouer, there remaineth yet at Rome within the galleries of *Philippus*, the picture of *Helena*, wrought by the hand of *Zeuxis*: and in the temple of *Concord* another, resembling *Marsius* the Musitian bound to a tree.

As for *Parasius* before named, borne hee was at Ephesus, and inuented also diuers things of himselfe to the aduancement of this art: for the first he was that gaue the true symmetrie to a portraiture, and obserued the iust proportions: he first exactly kept the sundry habits and gestures of the countenance: he it was, that first stood vpon the curious workmanship of couching and laying the haire of the head in order: the louely grace and beauty about the mouth and lips, he first exactly expressest: and by the confession of all painters that saw his worke, he woon the praise and praise from them all in making vp the pourtrails and extenuities of his liniments, which is the principall point and hardest matter belonging to the whole art: for to draw forth the bodily proportion of things, to hatch also, yea, and to fill within, requireth (I confesse) much labour and good workmanship; but many haue bin excellent in that behalfe, many to pourtrill wel, i. to make the extremities of any part, to mark duly the diuisions of parcels, & to giue enery one their iust compasse and measure is exceeding difficult; and few when they come to the doing of it, haue been found to attaine vnto that felicity. For the utmost edge of a worke must fall round vpon it selfe, and so knit vp in the end, as if it shadowed somewhat behind, and yet shewed that which it seemeth to hide. In this so curious and inexplicable a point, *Antigonus* and *Xenocrates* both, who wrote as touching this art, haue giuen him the honour of the best, not onely confessing his singular gift herein, but also commending him for it. Many other plots and projects there doe remaine of his drawing, pourtraied as well in tables as vpon parchement, which serue as patterns (they say) for painters to learn much cunning by. And yet for inward works, and to expresse the middle parts of a portraiture, he seemeth not so perfect, nor answerable to himselfe otherwise. There is a notable picture of his making, which he called * *Demon Atheniensium*, that is to say, * *the spirit*. For his intention was in one and the same pourtrait, and vnder one object of the eye to expresse the nature of the people, variable, wrathfull, vnjust, and vnconstant; the same also he would haue to appeare exorable, milde, and pittifull; haughtie, glorious and proud, and humble, lowly, and submisse; fierce and furious, and the same coward-like, and ready to run away: all these properties, I say, he represented vnder one cast of the eye. This workman painted also *Theusus*, which stood sometimes in the capitoll of Rome; a certaine Admirall likewise of a nauie,

naue armed with a corselet. In one table also which is at Rhodes, he depainted *Melager*, *Hercules*, and *Perseus*. This table was thrice blasted with lightening; howbeit, the pictures were not defaced, but remained whole and entire as at the first: a miraculous thing, and that which maketh much for the credit of the picture. *Archigallus* was of his painting; a picture that *Tiberius* the Emperor tooke great pleasure in; and as *Escolio* mine author doth testifie, he esteemed it worth 60000 sesterces, and inclosed it within his bed-chamber. Moreover, he counterfeited one *Gressu* a nourse, with her infant in her arms: he pourtraied *Philisus*, and god *Bacchus* with the goddesse *Vertue* standing by him: also two boies, on whom a man might see most liuely resembled, the carelesnesse and simplicity of that age: likewise a priest, attended vpon with a pretty boy, holding a censar in his hand, and a coroner.ouer and besides, two pictures there be of his handie work, going vnder the name of *Hoplites*, i. armed: the one running in his armour in battel-wise, H so as he seemeth all in a sweat: the other disarming himself, all wearied, so as a man would think his hind were gone, or that he drew it very short. Great praise there is of one table of his, wherein are depainted, *Aeneas*, *Castor*, and *Pollux*; also of another, which contained *Telephus*, *Achilles*, *Agamemnon* & *Plysses*. An artfisan full of work, & who would euer be doing one thing or other; but so arrogant withall, as no man euer shewed more insolency than he, in regard that hee was cunning and well thought of: which he knew well enough, and no man needed to tell him. In this proud spirit of his, he would take vpon him diuers titles and additions to his name: among others, he would call himselfe * *Abrodiatus*: and other words he vsed, whereby hee would make himselfe known that he was prince of painters, and the art by him made perfect and accomplished. But it exceedeth how vaine-glorious he shewed himselfe, in that hee gaue out, hee was in I right line descended from *Apollo*: also that the pourtrait of *Hercules*, which is in a table at Lin-dos, he drew from the very person of *Hercules* himselfe, answerable in all points to the proportion and lineaments of his body, who (by his saying) had appeared to him oftentimes in his sleep of purpose, that he might paint him liuely as he was. In this veine of vanity, being vpon a time put down by *Timanthes* the Painter at Samos, where, by the judgement of all that were present, his picture representing *Ajax*, and the awarding of the armor of *Achilles* from him to *Plysses*, was not thought comparable to another of *Timanthes* his making: I am ill apaid (quoth he) and so-ry at the heart, for this noble knight and braue warrior *Ajax*, whose euill hap it is thus to be foiled once againe by so vnworthy a weight, and a far meaner person than himselfe. He delighted also to paint small pictures in pretie tables, and those representing wantonneffe and lecherie: K and this he did (as he was wont to say) for his recreation, and as it were to breath himselfe when he had laboured hard at greater workes.

As for *Timanthes*, an excellent fine wit he had of his owne, & full he was of rare inuentions: he it was that made the famous picture of *Iphigenia*, so highly commended by eloquent orators: and to say a truth, his conceit therein was admirable: for when he had deuised that the poor innocent lady should stand hard at the altar, ready to be slain for sacrifice, and had painted those that were present about her, with heauy and sad countenance, weeping & wailing all for the instant death of this young princeffe, and her vnckle *Menelaus* about the rest, full of sorrow and lamentation, and shewing the same as much as possibly might be: hauing by this time spent in them all the signes that might testifie the hearts griefe, and that he was come to pourtray her own father *Agamemnon*, he represented his visage couered with a vail, for that he was not able to expresse sufficiently the extraordinary sorrow about the rest which he had to see his own daughter sacrificed, and her guiltlesse blood spilt. Other pieces of worke there be, patternes all of singular wit: among the rest, he deuised within a very small table, a Cyclops lying a sleepe; and yet because he would seeme even in that little compasse to shew his giant-like bignesse, hee deuised withall to paint little eluifh Satyres hard by, and those taking measure of one of his thumbes with long perches. In sum, so inuentiue he was, that in the workes which passed through his hand, a man shal euer conceiue & vnderstand some hidden thing within more than is painted without: for albeit a man shal see in his pictures as much art as may bee, yet his wit went alwaies beyond his art. Moreover, his picture of a prince was thought to be most absolute; the majesty whereof is such, that all the art of painting a man, seemeth to be comprised in that one pourtrait. This piece of worke remaineth at this day within the temple of *Peace*, in Rome.

In this age flourished *Euxenidas*, and taught *Aristides* his cunning, who prooued afterwards a singular workeman. *Enpompus* also trained vp *Pamphilus* the painter vnder him, whose apprentice was

A was *Apelles*. There is a fine picture of *Enpompus* his making, to wit, one who had obtained the victorie at the publique Gymnick exercises of actiuitie, painted naked as hee performed his deuoir, holding in his hand the branch of a date tree. This *Enpompus* was of such authoritie, that whereas before his time there were but two kinds of pictures, to wit, Helladicum, i. the Greekish; and Asiaticum, i. Asiatick; he brought in a new diuision, and made 3 distinct members thereof: for in loue of him, because he was a Sicyonian borne, the foresaid Helladicum beeing parted in twain, there arose three feuerall forts, the Ionian, Sicyonian, and Attick.

As for *Pamphilus*, renowned he was for painting a confraternity or kindred; the battel fought before Phlius, and the victorie of the Athenians: semblably, of his making is the picture of *Vlysses* in a punt or small bottom. Himselfe was a Macedonian borne, but of all painters, the first B that gaue his mind to other good literature, and especially to Arithmetick & Geometry, without the insight of which two sciences, hee was of opinion, that vnpossible it was to be a perfect painter. He taught none his cunning vnder * a talent of siluer for 10 yeares together: and thus much paid *Apelles* and *Melanthus* vnto him for to learn his art. His authoritie brought to passe, that ordained it was at Sicyone, and so consequently throughout all Greece, that gentlemen sons or free-born should go to painting schoole, and there be taught first aboute all other things the art Diagraphice, that is to say, the skill to draw and paint in box tables: and for the credit of Painters he brought to passe, that the art should be ranged in the first degree of liberall Sciences. And verily this craft of painting hath bin alwaies of that good respect and so honored, that none but gentlemen and free-born at the first beginning medled therewith, yea, and afterwards C honorable personages gaue themselves to the practise thereof, with this charge from time to time, to teach no slaue the myserie of painting, who by a strict and perpetuall edict were excluded from the benefit thereof. Neither shall you euer heare of any piece either of picture or grauerie and embossing, that came out of a seruile hand.

Furthermore, about the 170 Olympias there flourished *Echion* and *Terimachus*, two renowned painters: as for *Echion*, ennobled he is for these pictures, god *Bacchus*, a Tragedie and a Comedie, represented by painting: also *Semiramis*, who of a bond-maiden came to be a queen; an ancient woman carrying a torch or lamp, going before a yong wife newly wedded, and leading her to the bride-bed, who followeth with a modest, shamefast, and bashfull countenance most apparant to the eie.

D But what should I speake of these painters, when as *Apelles* surmounted all that either were before, or came after. This *Apelles* flourished about the 112 Olympias, by which time hee became so consummate and accomplished in the art, that hee alone did illustrate and enrich it as much, if not more, than all his predecessors besides: who compiled also diuers bookes, wherein the rules and principles, yea and the very secrets of the art are comprised. The speciall gift that he had was this, that he was able to giue his pictures a certain louely grace inimitable: and yet hee beheld hee would praise them all, howbeit not without a but: for his ordinarie phrase was this, Here is an excellent picture, but that it wants one thing, & that is the *Venus* it should haue; which *Venus* the Greeks call *Charis*, as one would say, the grace: and in truth he would confesse, that other mens pictures had all things els that they should haue, this onely excepted; wherein E hee was perswaded that he had not his peere or second. Moreover, he attributed vnto himselfe another propertie, wherein hee gloried not a little, and that was that hee could see to make an end when a thing was well done. For beholding wistly vpon a time a piece of worke of *Protagenes* his doing, wherein he saw there was infinite pains taken, admiring also the exceeding curiositie of the man in each point beyond all measure, he confessed & said, That *Protagenes* in euery thing els had done as well as himselfe could haue done, yea and better too. But in one thing he surpassed *Protagenes*, for that he could not skill of laying worke out of his hand when it was finished well enough. A memorable admonition, teaching vs all, That double diligence and ouermuch curiositie doth hurt otherwhiles. This painter was not more renowned for his skill and excellencie in art, than he was commended for his simplicitie and singleness of heart: for as he gaue place to *Amphion* in disposition, so hee yielded to *Astelepidorus* in measures and proportion, that is to say, in the iust knowledge how far distant one thing ought to be from another. And to this purpose impertinent it is not, to report a pretty occurrent that fell between *Protagenes* and him: for being very desirous to be acquainted with *Protagenes*, a man whom hee had

* i. fine, delicate and sumptuous: for he would be in his purple, or his golden chaplets, his staffe, tipped with gold, and his shoon buckles of the same.

* *Minos* ten into annis decem: yet *Budeus* readeth *Annus talentis decem*, ten talents by the yeare.

had neuer seen, and of his works, whereof there went so great a name, he imbarqued and sailed to Rhodes, where *Protagenes* dwelt: and no sooner was hee landed, but he enquired where his shop was, and forthwith went directly thither. *Protagenes* himselfe was not at home, only there was an old woman in the house who had the keeping of a mighty large table set in a frame, and fitted ready for a picture: and when he enquired for *Protagenes*, she made answer, that he was not with-in; and seeing him thereupon ready to depart, demanded what his name was, & who she should tell her master asked for him. *Apelles* then, seeing the foresaid table standing before him, tooke a pensil in hand and drew in colour a passing fine and smal line through the said table, saying to the woman, Tell thy master, that he who made this line enquired for him; and so he went his wayes. Now when *Protagenes* was returned home, the old woman made relation vnto him of this that hapned in his absence; and as it is reported, the artificer had no sooner scene and beheld the draught of this small line, but he knew who had been there, and said withall, Surely *Apelles* is come to town; for vnpossible it is, that any but hee should make in colour so fine workman-ship. With that hee takes me the pensil, and with another colour drew within the same line a smaller than it: willing the woman when hee went forth of doores, that if the party came againe, she should shew him what he had done, and say withall, that there was the man whom he in-quired after. And so it fell out indeed, for *Apelles* made an errand againe to the shop, and seeing the second line, was dismayed at first and blushed withal to see himselfe thus ouercome; but taking his pensil, cut the foresaid colours throughout the length, with a third colour distinct from the rest, and left no room at all for a fourth to be drawn within it. Which when *Protagenes* saw, hee confessed that he had met with his match and his master both; and made all the hast he could to the haue to seeke for *Apelles* to bid him welcome & giue him friendly entertainment. In me-moriall whereof it was thought good both by the one and the other, to leaue vnto posterity this table thus naked without any more work in it, to the wonder of all men that euer saw it, but of cunning artificers and painters especially: for this table was kept a long time, and as it is well known, consumed to ashes in that first fire that caught *Cæsars* house within the Palatine hill: and ordinarily we took great pleasure before that, to see it many times, containing in that large & extra-ordinary capacitie that it had, nothing els but certaine lines, which were so fine and small, that vnneeth or hardly they could be discerned by the eie. And in truth, when it stood among the ex-cellent painted tables of many other workemen, it seemed a very blanke hauing nothing in it: howbeit as void and naked as it was, it drew many to it euen in that respect, being more looked vpon and esteemed better than any other rich and curious work whatsoever. But to come againe vnto *Apelles*, this was his manner and custom besides, which he perpetually obserued, that no day went ouer his head, but what businesse soeuer he had otherwise to call him away, he would make one draught or other (and neuer misse) for to exercise his hand and keepe it in vre, in so much as from him grew the prouerbe, *Nulla dies sine Linea*, i. Be alwaies doing somewhat, though you doe but draw a line. His order was when he had finished a piece of work or painted table, and layd it out of his hand, to set it forth in some open gallerie or thorow-fare, to be seen of folke that passed by, and himselfe would lie close behind it to hearken what faults were found there-with; preferring the iudgement of the common people before his owne, and imagining they would spy more narrowly, and censure his doings sooner than himselfe: and as the tale is told, it fell out vpon a time, that a shoemaker as he went by seemed to controlle his workmanship about the shoo or pantofole that he had made to a picture, & namely, that there was one latchet fewer than there should be: *Apelles* acknowledging that the man said true indeed, mended that fault by the next morning, and set forth his table as his manner was. The same shoemaker com-ming againe the morrow after, and finding the want supplied which he noted the day before, took some pride vnto himselfe, that his former admonition had sped so well, and was so bold as to cauil at somewhat about the leg. *Apelles* could not endure that, but putting forth his head from behind the painted table, and scorning thus to be checked and reprobud, Sirrha (quoth hee) re-member you are but a shoemaker, & therefore meddle no higher I aduise you, than with shoes. Which words also of his came afterwards to be a common prouerbe, *Ne sutor ultra crepidam*. Which Ouer and besides, very courteous he was and faire spoken, in which regard King *Alexander* the Great accepted the better of him, and much frequented his shop in his owne person: for, as I haue said before, he gaue streight commandement, That no painter should bee so hardie as to make his picture but only *Apelles*. Now when the King being in his shop, would seeme to talke much

A much and reason about his art, and many times let fall some words to little purpose, bewraying his ignorance, *Apelles* after his mild manner, would desire his grace to hold his peace, & said, sir, no more words, for feare the prentise boies there that are grinding of colours, do laugh you to scorn: So reuerently thought the king of him, that being otherwise a cholericke prince, yet hee would take any word at his hands in that familiar sort spoken in the best part, and be neuer of-fended. And verily, what good reckoning *Alexander* made of him, he shewed by one notable ar-gument; for hauing among his courtesans one named *Campaspe*, whom he fancied especially a-boue the rest, in regard as well of that affection of his as her incomparable beauty, he gaue com-mandement to *Apelles* for to draw her picture all naked: but perceiuing *Apelles* at the same time to be wounded with the like dart of loue as well as himselfe, he bestowed her on him most frank-ly. By which example, hee shewed moreouer, that how great a Commander, and high minded a prince he was otherwise, yet in this mastering and commanding of his affections, his magnani-mity was more seen: and in this act of his he was as much honor and glory, as by any victory o-uer his enemies; for now he had conquered himselfe, and not onely made *Apelles* partner with him of his loue, but also gaue his affection clean away from her vnto him, nothing mooued with the respect of her whom before he so dearly loued, that being the concubine of a king, she should now become the bed fellow of a painter. Some are of opinion, That by the patterne of this *Cam-paspe*, *Apelles* made the picture of *Venus* * *Anadyomene*. Moreouer, *Apelles* was of a kind bountifull disposition euen to other painters of his time, who commonly as concurrents, do enuie one ano-ther. And the first he was that brought *Protagenes* into credit and estimation at Rhodes; for at the first, his owne countrymen made no account at all of him (a thing ordinarily seen, that in our own country we are least regarded) but *Apelles*, for to countenance and credit the man, demanded of him what price he would set of all the pictures that he had ready made, *Protagenes* asked some small matter and trifle to speake of: howbeit, *Apelles* esteemed them at fifty talents, and promi-sed to giue so much for them: raising a bruit by this means abroad in the world, that he bought them for to sel againe as his owne. The Rhodians hereat were moued and stirred vp to take bet-ter knowledge of *Protagenes*, what an excellent workeman they had of him: neither would *Prota-genes* part with any of his pictures vnto them, vnlesse they would come off roundly and rise to a better price than before time. As for *Apelles*, he had such a dexterity in drawing pourtraits so liuely, and so neer resembling those for whom they were made, that hardly one could be known from the other; in so much, as *Apion* the Grammarian hath left in writing (a thing incredible to be spoken) that a certain Physiognomist or teller of Fortune, by looking onely vpon the face of men and women, such as the Greekes call *Metoposcopos*, judged truly by the portraits that *A-pelles* had drawne, how many yeres they either had liued or were to liue, for whom those pictures were made. But as gracious as he was otherwise with *Alexander* and his train, yet he could neuer win the loue and fauor of prince *Protolomeus*, who at that time followed the court of *K. Alexander*, and was afterwards king of Egypt. It fortun'd, that after the decease of *Alexander*, and during the reigne of *K. Protolomeus* aforesaid, this *Apelles* was by a tempest at sea cast vpon the coast of Æ-gypt, and forced to land at Alexandria; where, other painters that were no well willers of his, practised with a jugler or jester of the kings, and suborned him in the kings name to train *A-pelles* to take his supper with the king. To the court came *Apelles* accordingly, and shewed him-self in the presence. *Protolomeus* hauing espied him, with a stern and angry countenance demanded of him what he made there, and who had sent for him; and with that shewed vnto him all his seru-i-tors who ordinarily had the inuiting of ghefts to the kings table, commanding him to say which of all them had bidden him: whereat *Apelles*, not knowing the name of the party who had brought him thither, and beeing thus put to his shifts, caught vp a dead cole of fire from the hearth thereby, and began therewith to delineate and draw vpon the wall the proportion of that con-finer before said. He had no sooner pourtried a little about the visage, but the king presently tooke knowledge thereby of the party that had played this pranke by him and wrought him this displeasure. This *Apelles* drew the face of *K. Antiochus* also, who had but one eie to see withall: for to hide which deformity and imperfection, he deuised to paint him, turning his vi-sage a little away, and so he shewed but the one side of his face, to the end, that whatsoever was wanting in the picture, might be imputed rather to the painter, than to the person whom he por-trayed. And in truth, from him cameth this inuention first to conceale the defects & blemishes of the visage, and to make one halfe face onely, when it might be represented full and whole, if it pleased

* *Ortani mari*
rising out of
the sea.

pleased the painter. Among other principall pieces of worke, some pictures there be of his making, resembling men and women lying at the point of death, and euen ready to gasp and yeeld vp the ghost. But of all the pictures & portraitures that he made, to say precisely which be the most excellent, it were a very hard matter: as for the painted table of *Venus*, arising out of the sea (which is commonly knowne by the name of *Anadyomene*) *Augustus Caesar*, late Emperour of famous memory, dedicated it in the temple of *Iulius Caesar*, his father; which hee enriched with an Epigram of certaine Greeke verses, in commendation as well of the picture, as the painter. And albeit the artificiall contriuing of the said verses went beyond the worke, which they seemed to praise, yet they beautified and set out the table not a little. The nether part of this picture had caught some hurt by a mischance: but there neuer could be found that painter yet, who would take in hand to repaire the same and make it vp again as it was at first: so as, this wrong & harm done vnto the worke, and continuing still vpon the same, turned to the glory of the workman. This table remained a long time to be seen, vntill in the end for age it was worm-eaten and rotten: in such sort, as *Nero* being Emperour was faine to set another in the place, wrought by the hand of *Dorathus*. But to come againe vnto *Apelles*: he had begun another picture of *Venus Anadyomene*, for the inhabitants of the Island *Cos*, which hee minded should haue surpassed the former: howbeit, before he could finish it, surprised he was with death, which seemed to enue so perfect workmanship: and neuer was that painter knowne to this day, who would turne his hand to that piece of worke, and seeme to go forward where *Apelles* left, or to follow on in those traicts and liniments, which he had purfild and begun. One picture he drew of **K. Alexander* the Great, holding a * thunderbolt and lightening in his hand, which cost twentie talents of gold, and was hung in the temple of *Diana* at *Ephesus*. And verily, this deuise was so finely contriued, that as *Alexanders* fingers seemed to bear out higher than the rest of the worke, so the lightening appeared to be cleane without the ground of the table, and not once to touch it. [But before I proceed any farther, let the readers take this with them, and alwaies remember, that these rich and costly pictures were wrought with foure colours and no more.] And for the workmanship of this picture, the price thereof was paid him in good gold coine by weight and measure, and neuer told and counted by tale. Of his handy worke was the picture of a Megabyzus or guelded priest of *Diana* in *Ephesus*, sacrificing in his pontificall habits & vestiments accordingly. Also the counterfeite of prince *Clytus*, armed at all pieces (saue his head, mounted on horse-back and hasting to a battell, calling vnto his squire or henxman for his helmet, who was K. *Alexander* also reaching it vnto him. To reckon how many pictures *Apelles* made of *K. Alexander* and his father *Philip*, were but losse of time, and a needlesse discourse. But I cannot omit the painted table, containing the pourtrait of *Abron* that wanton and effeminate person; which piece of worke the Samians so highly extoll and magnifie: ne yet another picture of *Menander* the sonne of *Caria*, that he made for the Rhodians, and which they so much admire. Neither must I forget the counterfeite of *Ancus*: of *Gorgosthenes* the Tragedian, which he made at *Alexandria*: or while he was at Rome, one table containing *Castor* and *Pollux*, with the image of *Victoric*, and *Alexander* the Great: Likewise another representing the counterfeite of *Warre* in person, bound with his hands behind at the backe, and *Alexander* the king mounted in a charriot triumphant: both which tables *Augustus* late Emperour of immortal memory, had dedicated modestly, and in simplicity of heart caused them to be hung vp in the most conspicuous places of his Forum or hall that he built: but when *Claudius Caesar* came to weare the diademe, he thought it more for the honour of *Augustus*, to scrape out the face of *Alexander*, as well in the one as in the other, and to set in the place the liuely image of the said *Augustus* to be seen. It is thought likewise, that the full pourtrait of *Hercules*, painted in a table, standing now in the temple of *Antonia*, was of his doing: an exquisite piece of worke no doubt, for notwithstanding that the backe part stand toward them that looke vpon it, yet it sheweth the entire visage, which is an exceeding hard matter: a man that beholdeth this *Hercules*, would thinke that the picture it selfe turned the face to be seen, which the painter seemed by the rest of the worke to hide from the eie. Of his painting there is a * prince or worthy knight all naked, in which picture he seemed to challenge Nature: and to haue pourtraied euery part so well, as shew her selfe could not haue framed the same better. There is or was at leastwise, a horse of his painting, which he pourtraied, to set against other horses painted by diuerse workemen, with whom he was entred into contention for the victory: in which triall, he appealed from the sentence of men to the iudgement of foure-footed beasts,

* Of this picture *Apelles* was wont to say, That there were two *Alexanders*: the one begotten by *Philip*, who was *Alexander*; & the other painted by *Apelles*, and he was *Apelles*. The manner was to expresse lightening, by three shafts bound together in the middle.

* Some thinke he meant *Hercules* & *Leander*: and they read, He ro *Leander* pinning it, he painted *Hercules* and *Leander*.

A euen liuing horses indeed; for perceiuing that his concurrents were in fauor too mighty for him and that they were like to carry away the prize by corrupting the iudges and vmpires, he caused liuing horses to be brought vp into the place; and hauing presented before them the pictures of his concurrents horses one by one, they seemed not to joy nor make toward them: but no sooner had he shewed * that of his owne pourtraying, but they fell all to neigh, as taking it for one of their fellows; which experiment serued euery after for a rule, to know indeed a good piece of workmanship in that kind. Moreover, he made a picture representing *Neoptolemus* the sonne of *Achilles*, in habit of a man of armes, sitting on horsebacke and riding against the Persians: likewise another, resembling *Archelaus* with his wife and little daughter: also *K. Antigonus* armed before with a cuirace, & marching on foot with his horse of seruice led by him. Howbeit those B Painters that are counted more skilfull and cunning than others, preferre before all other pieces of his workmanship, one picture of the same king sitting vpon his horse; and another which doth represent the goddess *Diana*, among a confort or company of other virgins at sacrifice; whom he depainted so artificially in this table, that he seemeth to haue surmounted *Homer* the Poet, who effusions in his poems describeth the same maiden *Diana* with her traine of yong damosels. What would you haue more? he would seeme to pourtray those things which indeed cannot be pourtraied, crackes of thunder, leames or flashes of lightning, and thunderbolts; all which pictures go vnder the name of *Brontes*, *Astrape*, and *Ceraunobolus*; his inuentions serued as precedents and patterns for others in that art to follow. One secret he had himselfe, which no man was euer able to attaine and reach vnto, and that was a certain blacke vernish which he used to lay vpon his painted tables when he had finished them; which was so finely tempered, and withall driuen vpon the worke so thin, that by the repercussion thereof it gaue an excellent gloss and pleasant lustre to the colors; the same also preserved the picture from dust and filthiness: and yet a man could not perceiue any such thing at all, vnlesse he held the table close at hand, and looked very neere. And great reason hee had besides to vse this vernish, namely, lest the brightnesse of the colours without it, might offend and dazzle the eyes, which now beheld them as it were as farre off through a glasse stone; and withall, the same gaue a secret deeping and sadnesse to those colours which were too gay and gallant. And thus much may suffice for *Apelles*.

D In his time liued *Arifides* the Thebane, a famous painter. This *Arifides* was the first that would seeme to paint the conceptions of the mind, and to expresse all the inward dispositions and actions thereof, which the Greeks call *Erthe*: yea, the very perturbations and passions of the soule he represented in picture: howbeit, his colours were vnpleasant and somewhat too harsh: He represented in a table the winning of a towne by force, wherein was pourtraied most liuely a little infant winding it selfe and making pretty means to creep vnto the mothers pap, who lay a dying vpon a mortall wound receiued in her brest; but it passed, how naturally the poor womans affection was expressed in this picture; for a man might perceiue in her, very sensibly, a certaine sympathie and tender affection yet, vnto her babe, albeit she were now in her deadly pangs and going out of the world, tearing euen then, least the childe should meet with no milke when she was dead, but in stead of sucking it, fall to lick her bloud, and doe it selfe hurt and iniurie: this painted table *K. Alexander* the Great translated from Thebes to Pella, the city where himselfe was borne. The same *Arifides* painted the counterfeite of a battell betwene the Greeks and the Persians: in which table, he comprised an hundred fighting men: his bargain was to haue of *Anafon* the tyrant or *K. of Elate*, for euery personage that hee made * ten pounds of siluer. Hee haue thought he saw the wheels running about. And as for an humble suter or suppliant, he depainted him so naturally, making his petition and following it with such earnestnesse, that hee seemed in maner to cry with an audible voice from the very picture. He counterfeited in a painted table, hunters with their venison that they had taken. *Leontion* also the painter, and a woman vnder the name of *Anapaumene*, dying for kind heart and the loue of her brother: likewise prince *Bacchus*, and lady *Ariadne* his wife, which be pictures much looked vpon at Rome in these dayes within the temple of *Ceres*; a plaier besides in a tragœdy, accompanied with a boy (& these are to be seen in the chappell of *Apollo*) howbeit, this table hath lost the beauty which it first had, through the folly of an vnskillfull painter, vnto whom it was put forth to be scoured and refreshed, by *M. Innins* the Pretor, against the solemnities of the Apollinar games. Moreover, there was

* *Peter Mar.* reported that he painted a mare.

* *M. Mar.*

to be seen in the chappell of *Faith* within the Capitoll, the picture of an old man with an harp, G teaching a boy to play, which was of *Aristides* his making; but there is a man lying sicke in his bed, of his painting, that cannot be praised sufficiently. And verily to conclude with his owne word, so accomplished he was in this art, that *K. Attalus* (by report) gaue vnto him for one table with the picture, one hundred talents of siluer.

About the same time, there flourished (as I haue said before) *Protagenes*; born he was at *Cauos* a city in *Cilicia*, and subject to the *Rhodians*; he was so exceeding poore at the beginning, and withall, so studious, intenuate, and curious in his worke without all end, that fawer pictures by that means came out of his hands, and himselfe neuer rise to any great wealth. Who it was that taught him his art, it is not knowne for certaine: but some say that he painted ships vntill he was 50 yeres of age: which they collect by this argument, That when at *Athens* in the most H conspicuous and frequented place of the city, he was to adorne with pictures the porch before the temple of *Minerva*, wherein he depainted that famous * *Paralus* and * *Hemionis*, which some call *Nausicaa*, he deuised certaine borders without: wherein he painted among those by-works (which painters call *Parerga*) certaine small gallies and little long barks, to shew thereby the small beginnings of his art, and to what height of perfection hee was come to in the end, when his workmanship was thought worthy to be seen in the most eminent place of that citie. But of all the painted tables that euer he wrought, that of * *Ialysus* is accounted the principall, which is now dedicated at *Rome* within the temple of *Peace*: whiles he was in painting this *Ialysus*, it is said, that he liued only vpon steeped Lupines, which might serue him in stead of meat and drinke both, to satisfie his hunger and quench his thirst: and this hee did, for feare least too much sweetnesse of other viands should cause him to feed ouerliberally, and so dul his spirit and senses. And to the end that this picture should be lesse subiect to other injuries, and last the longer, he charged it with foure grounds of colours, which he laid one vpon another: that euer as the upper coat went, that vnderneath might succeed in the place and shew fresh againe. In this table, the pourtraiture of a dog is admirable and miraculous; for not only art, but fortune also ment together in the painting thereof; for when he had done the dog in all parts to the contentment of his owne minde (and that ywis was a very hard and rare matter with him) & could not satisfie and please himselfe in expressing the froth which fell from his mouth as he panted and blowed almost windlesse with running, displeased he was with the very art it selfe: and albeit he thought that he had bin long enough already about the said froth, and spent therein but too K much art and curiositie, yet somewhat (he wist not what) was to be diminished or altered therein: the more workmanship and skill that went thereto, the farther off it was from the truth in: the deed and the nature of froth (the onely marke that he shot at:) for when he had done all that he could, it seemed still but painted froth, and not that which came out of the dogs mouth, where- as it should haue been the very same and no other, which had been there before. Hereat he was troubled and vexed in his mind, as one who would not haue any thing scene in a picture of his, that might be said like, but the very same indeed. Many a time he had changed his penfill and colours, as often, he had wiped out that which was done, and al to see if he could hit vpon it, but it would not be, for yet it was not to his fanfic. At the last, falling clean out with his own work- manship, because the art might be perceived in it, in a pelting chafe he flings me the sponge-ful L of colors that he had wiped out, full against that vnhappy place of the table which had put him to all this trouble: but see what came of it! the sponge left the colours behind, in better order than hee could haue laied them, and in truth, as well as his heart could wish. Thus was the froth made to his full mind, and naturally indeed by meere chance, which all the wit and cunning in his head could not reach vnto. [After whose example, *Neacles* another painter did the like, and sped as well, in making the froth falling naturally from a horses mouth; namely, by throwing his sponge against the table before him, at what time as he painted a horse-rider cheering and cher- king vp his horse, yet reining him hard as he champed vpon his bit.] Thus (I say) Fortune taught *Protagenes* to finish his dog. This picture of *Ialysus* and his dog, was of such name and so highly esteemed, that *K. Demetrius* when hee might haue forced the city of *Rhodes*, on that side onely M where *Protagenes* dwelt, forbore to set it on fire, because he would not burne it among other pain- ted tables: and thus for to spare a picture, he lost the opportunitie of winning a towne. During this strait siege and hot assault of *Rhodes*, it chanced that *Protagenes* himselfe was at worke in a little garden that he had by the townes side, euen as a man would say within the compasse of *Demetrius*

* Names of gallies.

* A worthy knight, sonne of *Ochimus*.

A *Demetrius* his camp. And for all the fury of warre and the daily skirmishes within his sight and bearing, yet he went on still with his workes that he had in hand, and neuer discontinued one hour. But being sent for by the king, and demanded, How he durst so confidently abide without the walls of the city in that dangerous time? he answered, That he knew full well that *Demetrius* warred against the *Rhodians*, and had no quarrell to good Arts and Sciences. The king then (glad in his heart that it lay now in his hand to saue those things, which he had spared before, and whereof he had so good respect) bestowed a very strong guard about *Protagenes* for his better safety & security: and as great an enemy as he was to the *Rhodians*, yet he vsed otherwhiles to visit *Protagenes* of his owne accord in proper person, because he would not eftsoones call him out of his shop from worke: and setting aside the maine point and occasion of lying before B *Rhodes*, which was the winning thereof, the thing that hee so much desired; euen amid the assaults, skirmishes, and battels, hee would finde time to come to *Protagenes*, and took great pleasure to see his worke. By occasion of this siege and hostilitie, arose this tale moreover of one table of his making, That all the whiles he painted it, the dagger (forfooth) was set to his heart, and a sword ready to cut his throat: and it was the picture of a *Satyre* playing vpon a paire of bag-pipes, which he called * *Anapaomenos*: by which name, as well as by the thing it selfe, hee would seem to signifie, that he took but little thought and care during those dangerous troubles. Moreover, he made the picture of lady *Cydippe*, and of * *Tlepolemus*: he painted also *Philiscus* a writer of Tragoedies, sitting close at his study meditating and musing. Also, there be of his making, a wrestler or champion, *Antigonus* the king, and the * mother of *Aristotle* the Philoso- C pher, who also was in hand with *Protagenes*, perswading him to busie himselfe in painting all the noble acts, victories, and whole life of king *Alexander* the Great, for euermlasting memoriall and perpetuities: but the vehement affection and inclination of his minde stood another way, and a certaine itching desire to search into the secrets of the art, tickled him, and rather drew him to these kinds of curious workes whereof I haue already spoken. Yet in the later end of his daies, he painted *K. Alexander* himselfe, and god *Pan*. Ouer and besides this flat painting, he gaue him- selfe greatly to the practise of founderie, and to cast certaine images of brasle, according as I haue already said.

* One at rest, or reposing himselfe. Some reade, *Tripolemus*.

* *Philiscus*.

At the very same time liued *Asclepiodorus*, whom for his singular skill in obseruing symetries and iust proportions, *Apelles* himselfe was wont to admire. This Painter pourtraied for *Mnason* D the foresaid king of the *Elateans*, the 12 principall gods, and receiued for euery one of them 300 pound of siluer. The said *Mnason* gaue vnto *Theomastus* for painting certaine Princes or Worthies, one hundred pounds apiece.

In this rank is to be ranged *Nicomachus*, son and apprentice both to *Aristodemus*. This *Nichomachus* pourtraied the rauishing of *Proserpine* by *Dis* or *Pluto*: which picture standeth in a table within the Chappell of *Minerva* in the Capitoll, about the little cell or shrine of *Iuuentus*. In the same Capitoll, another table there is likewise of his making, which *Plancus* (Lord Generall of an army for the time being) had there dedicated and set vp: the same doth represent *Victorie* catching vp a triumphant chariot drawn with four horses aloft into heauen. He was the first that pourtraied prince *Vlixes* in a picture, with a * cap vpon his head. He painted also *Apollo* and *Di-* E *ana*: *Cybele* likewise the mother of the gods, sitting vpon a Lyon: of his workmanship is the table, representing the religious priestesses of *Bacchus* in their habite, together with the wanton *Satyres* creeping and making toward them. Semblably, the monstrous mermaid *Scylla*, which at this day is to be seen at *Rome* within the temple of *Peace*. A ready workman he was, & you shall not heare of a painter that had a quicker hand than he, at his worke: for prooffe whereof, this voice goeth of him, That hauing undertaken for a certain sum of money to *Aristraus* the tyrant of *Sicyone*, to paint a monument or tombe which he caused to be made for *Telestes* the Poet, and to finish it by such a day appointed and set downe in the couenants of the bargain, he made no great hast to go about it, but came some few daies before the expiation of the prescript term for to begin the same worke: whereat the tyrant was wroth, and menaced to punish him for ex- ample: howbeit, he quit himselfe so well, and followed his worke with such wonderfull celeritie, that in few daies space he brought it to an end: and yet the art and workmanship therof was admirable. Vnder him were brought vp as apprentices, his brother *Aristides*, his owne son *Aristo-* F *cles*, and *Philoxenus* the Eretrian.

* In token of nobility, as *Virgil* noteth in his *Hieroglyphicke*, &c.

This *Philoxenus* made one painted table for *Cassander* the king, containing the battel between Alexander

Alexander the Great and *K. Darins*, which for exquisite art commeth not behind any other whatsoever. One picture there is of his doing, wherein he would seeme to depaint lascivious wantonnesse, which he pourtraied by 3 drunken *Sylenes* making merry and banquetting together. He gaue himselfe also to the speedy workmanship of his master before him, and for that purpose inuented other compendious means of greater breuitie to make riddance and quicke dispatch with his pencill.

With these may be sorted *Nicophanes* also, a proper, feat, and fine workman, whose manner was to take out all pictures and paint them new againe, thereby as it were to immortalize the memory of things: a running hand hee had of his owne, and besides, was by nature hasty and furious: howbeit, for skill and cunning there were but few comparable vnto him. In all his workes hee aimed at loftinesse and grauity: so that a man may attribute the stately port that is in this Art, H vnto him and no other.

As touching *Perseus* apprentice to *Apelles*, & who wrote a book to him of the very art) he came far short both of his master & also of *Zeuxis*. As for *Aristides* the Theban, who also liued in this age, he brought vp vnder him his two sons, *Niceros* and *Aristippus*. This *Aristippus* pourtraied a Satyre crowned with a chaplet, and carrying a goblet or drinking cup: he taught *Antionides* and *Euphranor* his cunning; of whom I will write anon: for meet it is to annex vnto the rest, such as haue bin famous with the pencill in smaller workes and lesse pictures; among whom I may reckon *Pyreicus*, who for art and skill had not many that went before him; and verily of this man, I wot not well, whether he debased himselfe and bare a low sale, of purpose, or no? for surely his mind was wholly set vpon painting of simple and base things: howbeit, in that humble & lowly carriage of himselfe, hee attained to a name of glory in the highest degree; his delight was to paint shops, of barbers, shoemakers, cobblers, taylers; and semsters: hee had a good hand in pourtraying of poore asses, with the viduals that they bring to market, & such homely stuffe: where by he got himselfe a by-name, and was called *Rhyarographus*. Howbeit, such rude and simple toies as these were so artificially wrought, that they pleased & contented the beholders, no thing so much. Many chapmen he had for these trifling pieces, and a greater price they yeelded vnto him, than the fairest and largest tables of many others. Whereas contrariwise, *Serapion* vied to make such great and goodly pictures, that (as *M. Varro* writeth) they were able to take vp & fill all the stals, bulks, and shops, jutting forth into the street vnder the old market place *Roftra*; this *Serapion* had an excellent grace in pourtraying tents, booths, stages, and theatres; but to paint a man or woman, he knew not which way to begin. On the other side, *Dionysius* was good at nothing els, and therefore he was commonly called *Anthropographus*. Moreover, *Callicles* also occupied himselfe in smal workes; and *Calaces* set his mind especially vpon little tables and pictures which were to set out comedies and interludes; but *Antiphilus* practised both the one and the other; for he pictured the noble ladie *Hesione*, *K. Alexander the Great*, and *Philip* the king his father, with the goddesse *Minerva*: which tables hang in the Philosophers schoole or walking place within the stately galleries of *Ostiaua*, where the learned clerks and gentlemen fauorers of learning, were wont to meet and conuerse. Within the galleries also of *Philippus*, there are to be seen, the picture of prince *Bacchus*, the pourtrait of *Alexander* in his childhood, and of *Hyppolitus* the yong gentleman, affrighted and astonied at the sight of a monstrous bull let loose and ready to encounter him. Likewise in the gallerie of *Pompey*, the counterfeits of *Cadmus* and *Europa*; all pictures of *Antiphilus* his making. Of his handy-workes, there is a fool with his bel, cockscorn, bable, and in other ridiculous habit, going vnder the name of *Gryllus*, deuised for the nones to make sport and pastime; wherupon all such foolish pictures be called *Grylly*. Himselfe was born in *Egypt*, howbeit he learned all his cunning of *Cresidemus*. In this bed-roll of painters, I should not do well to passe ouer in silence, the workman that painted the temple of *Iuno*, at *Ardea*, especially seeing that he was enfranchised free burgeois of that city, and honored besides with an Epigram or Tetrastichon, remaining yet to be read in the mids of his pictures in these foure Hexameter verses following;

*Dignis digna loca picturis condecorauit,
Regina Iunonis supremi conjugis templum
Marcus Ludius Elorus Etolia oriundus;
Quem nunc, & post semper ob artem hanc Ardea laudat.*

This

A This stately Church of *Iuno* Queen, with pictures richly dight,
Whom wife to mighty *Iupiter*, and sister, men do call;
Commends the hand of *Murke Ludie*, *Elorus* also high,
Etolian born: whom *Ardea* doth praise, and euer shall.

These verses are written in antique Latine letters. By occasion of whose name, I must not de- fraud another *Ludius* of his due praise and commendation, who liued in the time of *Augustus* *Cesar* Emperor of happy memory: for this *Ludius* was he who first deuised to beautifie the wals of an house with the pleasauntest painting that is in all varietie, to wit, with the resemblance of manors, farms, & houses of pleasure in the country, hauens, vinets, floure-work in knors, groues, woods, forrests, hills, fish pooles, conduits, and drains, riuers, riuersets, with their banks, and what- B focuer a man would wish for to see: wherein also he would represent sundry other shews of people, some walking and going to and fro on foot, others sailing & rowing vp and down the stream vpon the riuier, or els riding by land to their farms, either mounted vpon their mules and asses, or els in wagons and coaches: there a man should see folk in this place fishing and angling, in that place lauking and fouling: some hunting here, the hare, the fox, or deere both red and fal- low; others busie there in haruest or vintage. In this manner of painting a man should behold of his workmanship faire houses standing vpon marishes, vnto which all the ways that lead be ticklish and full of bogs, where you should see the paths so slipperie, that women as they goe are afraid to set one foot afore another; some at euery step ready to slide, others bending forwards with their heads as though they caried some burdens vpon their neck and shoulders, and all for C feare lest, their feet failing vnder them, they should catch a fall; and a thousand more deuises and pretty conceits as these full of pleasure and delight. The same *Ludius* deuised wals without dores, and abroad in the open aire to paint Cities standing by the sea side. All which kinde of painting pleaseth the eie very well, and is besides of little or no cost. Howbeit, neither hee nor any other in this kinde (howsoeuer otherwise respected) grew euer to be famous and of great name, that felicitie they only attained vnto, who vsed to paint in tables: and therefore in this regard, venerable antiquitie we haue in greater admiration; for painters in old time loued not to garnish wals for to pleasure the master only of the house, ne yet to bedeck houses in that maner which canot stir out of the place, nor shift and saue themselves when fire commeth, as painted D tables may, that are to be remoued with ease. *Protagenes*, as excellent a painter as he was, contented himselfe to liue within a little garden in a small cottage, and I warrant you no part thereof was painted. *Apelles* himselfe might well haue the wals of his house rough cast or finely plaiter, but neuer a patch thereof had any painting: they took no pleasure, nay they had no lust at all to paint vpon the whole wals, and to work vpon them from one end to another; al their skill and cunning attended vpon the publique seruice of states and cities: and a painter was not for this or that place only, but imploied for the benefit indifferently of all countries and nations.

But to returne againe to our particular painters: there flourished at Rome a little before *Augustus* *Cesars* days, one *Arellius* a renowned painter, but that he had one notable foul fault that marred all and discredited his art; giuen he was exceedingly to wenching, and sure hee would be to E haue one woman or other all times in chafe: which was the reason hee loued alife to be painting of goddeses, which were euer drawn by the pattern of his sweet-hearts whom hee courted. A man might know by his pictures, how many queans he kept, and which were the mistresses or rather goddeses whom he serued. Of late daies wee had among vs here at Rome one *Amulius* a Painter; he caried with him in his countenance and habit grauitie and severity; howbeit hee loued to make gay and gallant pictures, neither scorned he to paint the most trifling toies & meanest things that were. The picture of *Minerva* was of his making, which seemes to haue her eie full directly vpon you, looke which way soeuer you will vpon her. Hee wrought but some few houres of the day, and then would he seem very graue and antient, for you should neuer find him out of his gown and long robe, but very formall, though he were clofe set at work & euen lockt as it were to his frame. The golden house or palace of *Nero* caught vp all the workes hee made, where they remained as it were in prison, and neuer came abroad; which is the reason that none of his pictures els be extant. After him succeeded *Cornelius Pinus*, and *Aelius Priscus*, two Painters of good reputation, who painted the temples of *Honour* and *Verue* for *Vespasianus Augustus* the Emperor, when he caused them to be re-edified: but of the twaine, *Priscus* in his workmanship came neerer to the painters of antient time.

Aaa 3

CHAP.

¶ The manner how to make Birds silent, and to leane their chattering and singing. Who first deuised with fire and pencill to enamel and paint the arched rouses and embowed feelings of houses. The admirable price of pictures inserted here and there among other matters.

Since I haue proceeded so far in the discourse of Painters and their art, I must not forget to set down a pretty jest, which hath bin reported by many as touching *Lepidus*: It hapned during the time of his Triumvirat, that in a certain place where he was, the magistrates attending him to his lodging enuironed as it were with woods on euery side: the next morrow *Lepidus* took them vp for it, and in bitter tearmes and minatorie words chid them, for that they had laid him where he could not sleepe a wink all night long, for the noise and singing that the birds made about him. They being thus checked and rebuked, deuised against the next night to paint in a piece of parchment of great length a long Dragon or serpent, wherewith they compassed the place where *Lepidus* should take his repose; the sight of which serpent thus painted terrified the birds, that they had no mind to sing, but were altogether silent. By which experiment at that time, it was known afterwards, that birds by this means might be stilled.

Encaustice.

As touching the feat of setting colours with wax, and * enamelling with fire, who first began & deuised the same, it is not known. Some are of opinion, that the inuention thereof came from *Aristides*; and that *Praxiteles* practised the same, & brought to an absolute perfection. But surely there were pictures wrought by fire a good while before *Aristides* daies; and namely by *Polygnotus*, *Nicanor*, and *Arceilaus* of Paros. *Lyfippus* also in his painted tables that he made at *Aegina* vsed to entitle them with this inscription, *Antiquae inuentionis*. *Lyfippus* painted this with fire: which verily he would neuer haue done, if the art of painting with fire (called Encaustice) had not bin before deuised. Moreover, *Pamphilus*, master to *Apelles*, is reported not onely to haue himselfe practised this painting with vernish, and to inamel by the means of fire, but also to haue taught it vnto *Pausias* the Sicyonian, who was the first that excelled in this kinde, and caried away the name from all others in his time. This *Pausias* was the son of *Brietes*, and apprentice also to his father in the beginning: he vsed also the plaine pensil, wherewith he wrought vpon the walls at *Thepiræ*; which hauing been in times past painted by *Polygnotus*, were now to be refreshed and painted new again by his hand: howbeit in comparison of the former worke he was thought to come a great way short of *Polygnotus*; and the reason was, because he dealt in that kind of work which was not indeed his proper profession. He it was that brought vp first the deuice of painting vaulted rouses; for neuer was it the manner to adorne and garnish embowed feeling over head with colours, before his time. His delight naturally was to be painting little tables, and therein he loued to portray little boies. Other painters his concurrents, and no well-willers of his, gaue it out, that he made choice of this kind of work, because such painting went but slowly away, and required no quicke and nimble hand. Whereupon *Pausias*, to disproue his aduersaries, and withall to get himselfe a name, as well for celeritie and expedition, as for his art and skill otherwise in these small pieces, began and finished in a table the picture of a boy, within one day, and thereupon it was called *Hemeresios*. In his youthfull daies he fell in fancie with a woman in the same towne where he dwelt, named *Glycera*: a fine wit she had of her owne, and specially in making chaplets and guirlands of floures, she was full of inuention. *Pausias* by his acquaintance with her, and struing to imitate with his pensill her handiworke, and to expresse that varietie of floures which she gathered and couched together full artificially in her Coronnets, enriched his owne pictures also with a number of colours, and brought the art to wonderfull perfection in that point. In the end he painted *Glycera* also his loue, sitting, with a Chaplet of floures her hand: and certes this is the most excellent peece of worke that euer went out of his shop: this table with the picture was thereupon called by some, *Stephanoplocos*, i. [A woman] plaiting and twisting a guarland: by others, *Stephanopolis*. Selling guarlands: for that this *Glycera* got a poor liuing by making chaplets, and had no other good means to maintain her selfe. The counterfeite taken from this table and made by it (which kind of pattern the Greekes call *Apographon*) *L. Lucullus* bought of *Dionysius* a painter of Athens, and it cost him * 78 talents of siluer. Furthermore, this *Pausias* made faire and great pictures also; and

G

A namely, one of his making which doth represent a solemne sacrifice of oxen, is to be seen at this day within the stately galleries of *Pompeius*: and verily, this maner of painting, the solemnity of a sacrifice he first inuented: but no man euer after could attaine to his dexteritie in that kinde: and notwithstanding many gaue the attempt, and seemed to imitate him, yet they came all short of him: aboute al, he had a singular gift to work by perspective, for when he was minded to paint a boeuf or ox, to shew the full length, he would not portray him, as he long or short, but afronte; by which means the beast is best represented, not only how long, but also how large and big he is euery way. Again, whereas all other painters, whensoever they would raise their work, & make any thing seeme eminent and high, vse to colour the same white and bright, and the better to make their perspective, do shadow or deep the same with black: this man in lieu thereof, would paint the ox all of a black colour, and cause the body as it were of the shadow to arise out of it selfe. And verily so excellent he was in this perspective, that a man would say, his euen, plaine, and flat picture were embossed and raised work, yea and imagin where fractures were, that al was found and entire. This man liued also at *Sicyone*, and verily for a long time this city was reputed the native cuntry that bred painters, and the onely place stored with excellent pictures. But during that time wherein *Scourus* was *Ædile* at *Rome*, all the rich tables which were in the publick places of that city, whether in the market steads, temples, or common halls, were seised vpon and brought to *Rome*, for to satisfie great sums of money wherein the *Sicyonians* stood indebted.

After *Pausias*, there arose one *Euphranor* the *Isthmian*, whom flourished about the 104 Olym-pias, far surpassing all other painters of his time. This *Euphranor* is hee whom I haue named among the famous imageurs and founders. Of his workmanship there be Colosses of bras, statues of marble stone, yea and faire drinking cups chased and engrauen. Of an excellent capacity he was, and apt to learn any thing, studious withall, and painfull aboute all others, and whatsoeuer he gaue his mind vnto, therein he excelled: and in one word, a general man he was like him, selfe still, that is to say, his craftsman in all, and as good in one thing as another. This is hee who seems to haue expressed first the port and maiestie that is in princes and great states, and to haue obserued symmetry and proportion: & yet he was not without his imperfection, for commonly as he made the bulk of the body too slender, so the joints and heads were somewhat with the biggest, howbeit he wrote books touching symmetry and proportion, as also of colours. Among other works of his, there are reckoned these, to wit, the portraiture of a battell or skirmish of horsemen, the twelve chiefe gods and goddeses, also the liuely picture of *Theseus*, of whom he was wont to say, That the *Theseus* of *Parafus* painting was fed with roses, but this *Theseus* of his with good flesh. There be excellent tables of his making at *Ephesus*, to wit, *Plyxes* feigning himselfe mad, and in that fit coupling an ox and a horse in one and the same yoke: also diuers personages in their clothes and mantles after the Greekish fashon, musing and in a deep study, likewise a captain putting vp his sword into his scabbard.

At the same time liued *Cydias*, he who in a table represented the * Argonauts, for which *Hor-tensius* the Orator was content to pay 144000 Sesterces. This picture he thrined in an Oratorie or chappell built of purpose for it, in a house of pleasure that he had at *Thusculum*.

E As for *Antidotus*, apprentice he was to *Euphranor*: of his handiwork there is a picture at Athens resembling one with a shield ready to enter into combat or fight, also a wrestler and a plaier vpon the fife or hautbois, which is a piece of work highly commended, and few comparable vnto it: more curious and precise he was in the secrets of the art, than obseruant of symmetry & proportion; being otherwise giuen to vse sad and dusky colours. The greatest name that he had, was for bringing vp *Nicias* the Athenian, who of all others painted women most excellently. For lights and shadowes in perspective he was excellent: also a passing great care and regard he had so to raise his worke, as that it seemed to be embossed and higher than the boord of his table: the pictures of *Nemea*, which out of *Asia* were transported to *Rome* by *Syllanus*, and hung vp in the Senat house, as I haue shewed heretofore, of prince *Bacchus*, within the temple of *Concord*, of *Hyacinthus*, which *Augustus Caesar* vpon a speciall liking to it brought with him to *Rome*, after hee had forced and sacked *Alexandria*: (in which regard *Tiberius Caesar* his successor, seeing what affection *Augustus Caesar* had vnto it in his life time, dedicated it in the Temple of the said *Augustus*) and lastly of the goddesse *Diana*, were all proofes of his skill and workmanship. Moreover, at *Ephesus* the Sepulchre of *Megabyzus* one of the Priests of the Or-

* i. Diuers valiant knights, who accompanied *Antidotus* in his voyage to *Colchos* for the golden fleece.

* 78 talents of siluer. * two talents of siluer.

der of *Diana* of Ephesus was of his painting: like as at Athens, the necromancie of the Poet *Homer*. This picture *Nicias* held at so high a price, that he would not let it go vnto *K. Attalus* for 60 talents, but chose rather to bestow it freely vpon his own native country, being otherwise a man for his own priuat state very wealthy. Besides these before rehearsed, he made others of a larger size, among which are reckoned *Calyppo*, *Io*, and the lady *Andromeda*. The excellent picture also of *K. Alexander*, which is in the gallery of *Pompeius*, together with *Calyppo* painted sitting, came out of his shop. The perfect pourtraying of fourfooted beasts is ascribed vnto him; and in truth, a singular grace he had and felicitie in painting dogs. This is that *Nicias* of whom *Praxiteles* gaue so good testimonie: for being asked vpon a time, what pieces he esteemed best of all those that himselfe had cut in marble? he answered, Euen those wherein *Nicias* hath had a hand: so much did he attribute vnto his *vernish and polishing. Another *Nicias* there was, who liued in the 112 Olympias; but whether this man were he or no, it is not certainly knowne; howbeit some there be that would haue him to be the same. Certes, *Athenian* of Marona was taken for as good a workman euery way as *Nicias*, and in some respects better: he learned the art of *Glaucion* the Corinthian. In choice of his colours he stood not so much vpon gallantnesse, but vsed those that were with the saddest; howbeit those dark and shadowed works of his shewed more pleasant and delectable than his masters: wherby appeared his profound knowledge and deep skill, in the very laying and couching of his colours. The picture of *Philarchus* he drew, which is in the Temple of *Ceres Eleusine*. The frequent assembly also of the dames of Athens, which they call *Polygynæcon*, was of his pourtraying: likewise he represented *Achilles* in his youth, hidden vnder the habit of a yong damosell, and how the crafty foxe *Vlysses* discouered and found him out, notwithstanding he was so disguised. But one table about the rest woon him the greatest credit, and that was, wherein he painted an horsekeeper training and nurturing his palfrey. Certes, but that he died in his youth, there had not been a painter in all the world comparable vnto him.

As touching *Heraclides* the Macedonian, he also may run in the range of famous Painters: at the beginning he employed himselfe in painting ships: after that King *Perseus* was taken prisoner, he left his native country and went to Athens, where liued at that time *Metrodorus*, a Painter and Philosopher both, a man of great name and authoritie as well in the one profession as the other: and therefore when *L. Paulus* after the defeature of the said *Perseus* sent vnto the Athenians, and requested them to send vnto him an excellent Philosopher to teach and instruct his children, together with a singular painter to set out his triumph with curious pictures, the Athenians made choice of *Metrodorus* onely, and commended him alone vnto *Lucius Paulus*, for the best approoued and most consummate to serue his turne and satisfie both his desires: which by good prooue and experience *Paulus* found true, and gaue iudgement of him accordingly.

Timomachus the Byzantine flourished in the dayes of *Cæsar* Dictatour, for whom hee painted *Ajax* and *Medea*: which pictures when he bought of him for 80 talents, hee caused to be hung vp in the temple of *Venus * Genetrix*. Now when I speake of a talent, you must vnderstand the Attick talent, which *M. Varro* doth value at 6000 deniers Roman. There goeth as great praise likewise and commendation of other pieces that passed from vnder the hands of *Timomachus*, to wit, the pictures of *Orestes*, of *Iphigenia* in Tauris, and of *Lecythion*, who taught youths dancing, vaulting, and other feats of actiuitie: he pourtraied also in a table, a goodly race, descent, and kindred of gentlemen; two persons besides in their clokes or mantles, after the Greekish fashion, ready to make a speech vnto the people, the one set, the other standing vpon his feet: but it seemed that art fauored and graced him most in painting *Minerva's* shield, where he portraied *Gorgon* or *Medusa's* head most liuely.

Aristeas was the son of *Paufias*, and vnder his father he learned the myserie of painting, who is counted one of the greatest painters that euer was. Of his workmanship are the tables containing the pictures of *Epaminondas*, *Pericles*, *Medea*, *Vertue*, and *Thesens*. Hee also drew with his pensil in colours, the common people of Athens, and a solemne sacrifice of Oxen.

There was also one *Meehopanes*, apprentife likewise vnto the same *Paufias*, who is highly commended by some for his curious and exquisite workmanship: but such it is, as none but cunning artists can conceiue, for otherwise I assure you his colours are vnplesant, and hee loued to lay on too much of one thing, and that was Sil.

A As for *Socrates* the painter, his pictures were liked very well of all that saw them, and in truth, they deserued no lesse: for of his doing are these and such like, to wit, *Esculapius*, with his daughters, *Hygia*, *Ascle*, *Panacea*, and (1) *Iaso*: and an idle lazy lubber, knowne by a deuised name *Ocnos*, whom he pourtraied twitting a cord of Spart, and euer as he did it, an affe behind him gnawed it asunder. Thus much may serue concerning the principall painters that haue been knowne to excell in both kinds, to wit, with the penstill, and with fire: it remaineth now that I should discourse of those who were next vnto the principall, and so reputed.

In this second course of painters I must range *Aristocles*, who beautified with his pictures the temple of *Apollo* in Delphos: as for *Antiphilus*, he is as much praised for painting a boy blowing hard at the coles, in which table, it is a pretie sight to see how all the house (which was faire enough besides) shineth by the fire that he makes, as also what a mouth the boy makes: likewise for the picture of a company of Spinsters, so liuely, that one would imagin he saw euery woman making hast to spin off her distaffe, strining aue who shal haue don her task first. He deuised also to portray *Ptoloma* hunting, & this they call (2) *Aposcopon*, for which he is much commended: but principally for a braue Satyr of his workmanship, clad in a Panthers skin. *Aristophon* woone much credit by painting *Ancus* wounded to death by a wild bore, & his wife *Althypate* standing hard by, who seemeth to lament for his sake, and (as it were) to feele part of his paine: he made also one faire table, enriched with a number of personages, to wit, *K. Priamus*, faire *Helena*, dame *Credulite*, *Vluxes*, *Deiphobus*, and *Dolori*. *Androbios* got himself a great name by a picture, representing one (3) *Scyllus* [a cunning diuer] cutting in two the anker cables of the Persian fleet, riding at sea. *Arimon* likewise was renowned for the counterfeit of lady *Danae*, found floating in the sea by (4) rousers or men of war, who seemed to wonder at her beauty, and to behold her with much contentment: also for picturing queene *Statonice*: *Hercules* and *Deianira* his wife: but the most excellent pieces of his workmanship, be those which are to be seene in the galleries of *Ostia*, among other of her stately buildings; to wit, *Hercules* ascending vp into heauen from the mountaine *Oeta* within the region of *Doris*, where he changed this mortall life, and by the generall consent of all the gods, was receiued into their sociery: the whole history also of *Laomedon*, as touching his fallhood to *Hercules* and *Neptune*. *Alcimachus* the painter was renowned for the picture of hardy *Dioxippus*, who (5) carried away the prize in all feats of actiuitie, at the solemne games of Olympia, and neuer sweat nor touched (6) dust for it; which easie victory the Greekes call *Aconiti*. As for *Canus*, he was excellent at painting Coronets & Garlands: also at drawing coats of arms in scutcheions, of gentlemen and noble persons, with the stile of their titles & dignities. *Ctesiphon*, an apprentice to *Apelles*, became very famous for one picture about the rest, although it were but a wanton one and offensive to chaste eies; wherein forsooth hee depainted *Iulian*, attired in a caule or coife about his head like a woman, groning and crying out also (as women do in trauell of childe birth) among the goddesses for their helping hand, who plaid the midwiues about him, vntil he was deliuered of god *Bacchus*, and brought to bed. *Cleon* was much spoken of, for the picture which hee made of *K. Admetus*: *Ctesidamus* for pourtraying the winning of *Oechalia* by *Hercules*. And for drawing the picture of lady *Laodamia*, the wife of *Protesilaus*. *Cleides* was notorious for one picture which he made in despight of queene *Stratonice*, wife to *K. Antiochus*, and to be reuenged of her for a disgrace that he had receiued at her hands: for being in the court, and perceiuing that the queen did him no honour at all, nor gaue him any countenance, he made no more ado, but painted her in her colours, tumbling and wallowing along full vnseemly with an odde base fisherman, whom as the voice went, she was inamored vpon; and when he had done, set it vp in the very haue of Ephesus, recovered a barke presently, and away he went vnder sale as fast as wind and tide would carry him. When the queene heard of it, she made but a jaest and mocke of it; neither would shee suffer the picture to be taken away, in regard of the wonderfull workmanship, which expressed her and him so like and liuely. *Craterus* was a Comcedian and plaier in Enterludes, howbeit, a fine Painter, as may appeare by his handiwork at Athens, within the publicke place *Pompeium*. *Eutychides* pourtraied a charriot drawne with two horses, and *Vittorie* to guid and driue the same. *Eudoxus* had the name for his pictures which are seen at stage-plaies, to beautifie the place: who also was a good imageur and cast many faire pieces in brasse. *Iphis* was well thought of for *Neptune* and *Vittorie* of his painting: and *Abion* was no lesse esteemed for the pictures resembling *Amity* and *Concord*; as also for the pourtraitures of the gods. *Leontiscus* pictured *Aratus* the Generall of the Achæans, returning

turning with victory, and triumphing with his trophy. He painted also a minstrel wench playing vpon a Psaltery, and seeming to sing to it, which was thought to be a daintie piece of worke. As for *Leon*, he painted *Sappho* the Poetresse. And *Nicaarchus* was much bruited abroad, for a picture, shewing *Venus* accompanied with the Graces and the pretty *Cupids*. And of his workmanship is *Hercules*, sad and penitente; penitente also and repentant, for that which he had done in his furious madnesse. *Nealos* made one picture of *Venus* most curiously: for passing witty hee was, full of inuention, and exquisit in his art. When he painted the nauall battell betweene the Egyptians and the Persians, which was fought vpon the riuer Nilus, the water whereof is rough and like the sea; because he would haue it knowne, that the fight was vpon the said riuer, he deuised another by worke to expresse the same, which all the Art of painting otherwise could not performe: for he painted an Asse vpon the banke, drinking at the riuer, and a Crocodile lying in wait to catch him: whereby any man might soone know it was the riuer Nilus, and no other water. *Oenias* the painter made one picture about the rest, which he called *Syngenicus*. *Philiscus* became renowned by a painters shop of his painting, where he deuised a prentice boy blowing the coles to kindle a fire. *Phalerion* pourtraied *Scylla*, transformed into a monstrous Meermaid. the coles to kindle a fire. *Phalerion* pourtraied *Scylla*, transformed into a monstrous Meermaid. *Simonides* got credit by the picture of *Agatharrhus*, who woon the best game at running: and of the goddesse of Memory, named *Mnemosyne*. *Simus* took pleasure in painting a yong boy lying at the goddesse of Memory, named *Mnemosyne*. *Simus* took pleasure in painting a yong boy lying at the sleep in a waulke-mill or Fullers worke-house: another sacrificing vnto *Minerva* at the feast *Quinquatrus*: and of the same mans doing, there is an excellent picture of *Nemesis*, representing Iustice and Reuenge. *Theodorus* drew one smetting his nose: and the same painter represented in a table, how *Orestes* murdered his owne mother *Clytemnestra*, and *Agysthus* the Adulterer that kept her. The warre of Troy hee depainted in many severall tables: and these hang in the galleries of *Philip* at Rome. Of his handy worke is lady *Cassandra* the Prophetesse, which is to be seen in the Chappell of *Concord*. Also, *Leontium* the courtifane belonging to *Epicurus* and his followers, was of his painting, like as king *Demetrius* musing and standing in a deepe studie. As for *Theon* the painter, hee described with his pensill the madnesse of *Orestes*, and pourtrayed *Tamyras* the Harper or Musitian. *Tauriscus* made one table, representing a man flinging a coit: and another resembling queene *Clytemnestra*. He pictured also a little *Pan*, whom he called *Panniscus*, in manner of an Anticke: *Polynices* also making claime to his kingdome, and marching in warlike manner to recover the possession thereof againe: and last of all, signieur *Capaneus*, who lost his life in scaling the walls of Thebes. And here commeth to my minde one notable example as touching *Erigonus*, which I cannot passe with silence: This *Erigonus*, seruant sometime to *Nealos* the Painter, and employed onely in grinding colours, profited so much by seeing his master worke, that he became a Painter himselfe, and left behinde him an excellent workman of his owne teaching, *Pausias* brother to *Agineta* the Imageur. But one thing more there is, of rare admiration and worthie to be remembred, That the last peeces of excellent Painters, and namely such tables as bee left vnperfect, are commonly better esteemed than those that bee fully finished: as wee may see by the Raine-bow or Iris which *Aristides* was entered into, the two brethren *Castor* and *Pollux*, begonne by *Nicomachus*; the Picture of *Medea*, killing the children that shee had by *Iason*, which *Timomachus* was in hand with; and the *Venus*, that as I sayd before, *Apelles* liued not to make an end of: for in these and such like imperfect tables, a man may (as it were) see what traicts and lineaments remaine to bee done, as also the verie designes and cogitations of the Artificers: and as these beginnings are attractive allurements to moue vs for to commend those hands that began such Draughts: so the conceit that they be now dead and missing, is no small grieue vnto vs, when wee behold them so raw and fore-let. But to come againe vnto our Painters: there be more yet behinde, and those of verie good regard in their time, howbeit, I will runne them ouer sleightly, and as it were passing and glauncing by them, namely, *Aristonides*, *Anaxander*, *Aristobulus* the Syrian, *Arcefilas* the sonne of *Tisicrates*, *Corybas* Apprentice to *Nicomachus*, *Carmanides* to *Euphranor*, *Dionysolus* the Colophonian, *Diogenes* who followed the Court of King *Demetrius*, *Euthymedes*, *Heodorus* the Macedonian, *Mydon* of Solæ brought vp vnder *Pyromachus* the Imageur, *Mnasithenus* the sonne of *Abron*, *Polemon* of Alexandria, *Theodorus* of Samos, and *Stedius*, and *Nessus* the sonne of *Abion*, *Nicostratus* and *Xenon* of Sicyone, who learned his Craft of *Nealos*.

Moreo-

A Moreouer, women there were also, excellent * Paintresses, to wit, *Timarete*, the daughter of *Nicon*, who made that excellent pourtraiture of *Diana* at Ephesus, a most antique picture: *Irene* the daughter of *Gratinus* the painter, who learned vnder her father, & drew the picture of a yong damofell, which is at Eleusine: *Calyssa*, of whose workmanship there is the picture of an old man, and of *Theodorus* the jgular: *Aleissthene* painted a dauncer: and *Aristarete*, both daughter and apprentice to *Nearchus*, made prooffe how well she had profited, by the picture of *Asculapius*. And *M. Varro* saith, That when he was a yong man, there was at Rome one *Lala*, a Cyzecene borne, who passed her whole life in virginity, and she was skilful both in painting with the pensill, and also in enamelling with hot Steele in yuorie: her delight was principally in drawing women, and yet there is a Neapolitane of her pourtraying in a faire long table: last of all, these B took out her owne counterfeite at a mirroir or looking glasse. This one thing is reported of her, that no painter had a quicker hand or went faster away with his worke than she: and look what pictures soeuer came out of her hands, they were so artificially done, that they did out-sell a great deal the works of *Sapphus* and *Dionysius* (the most famous painters in that age) notwithstanding their pictures and tables were so faire, as that they take vp whole cabinets; and wel was he (before that her pictures came abroad) who could be furnished out of their two shops. There was yet one paintresse more, to wit, *Olympias*: howbeit I heare no great matter of her, but this onely, that she taught *Autobulus* the art of painting.

To come now to painting by the means of fire: I find this agreed vpon by all, that practised it was in old time but two waies only, that is to say, with wax, and in yuorie with a little Steele C or punching yron, vntill such time as they fell to painting ships alfo with wax and fire: and in this third sort the manner is to vse great pensils or brushes dipt in wax molten ouer the fire: and this kind of painting ships is so fast and sure, that neither sun will resolue, nor salt water eat and fret, ne yet wind and weather pierce and chinke it.

Moreouer, in Egypt they haue a deuise to staine cloths after a strange and wonderful maner: They take white clothes, as sailes or curtaines when they haue bin worne, which they besmeare not with colours but with drugs that are apt to drinke and take colour: when they haue so don, there is no apparence in them at all of any dye or tincture. These clothes they cast into a lead or cauldron of some colour that is seething and scalding hot: where, after they haue remained a pretty while, they take them forth againe, all stained and painted in sundry colours. An admirable thing, that there being in the said cauldron but only one kind of tincture, yet out of it the cloth should be stained with this and that colour, and the foresaid boiling liquor change so as it doth, according to the quality & nature of the drugs which were laied vpon the white at first. And verily, these stains or colours are set so sure, as they can neuer be washed off afterwards: thus the scalding liquor, which no doubt if it had diuers tinctures and colours in it, would haue confounded them all into one; now out of one doth dispense and digest them accordingly, and in boiling the drugs of the clothes, setteth the colour and staineth surely. And verily, this good moreouer haue the clothes by this scalding, that they be alwaies more firme and durable, than if they had not come into the boiling cauldron.

CHAP. XII.

¶ The first deuisers of the art of Potterie, and in working in cley. Of Images made of earth. Of earthen vessels, and their value in old time.

NOW that I haue discoursed of painting enough, if not too much, it were good to annexe and ioyné thereto the craft of Potterie, and working out of cley. And to begin with the original and inuention of making the image or likeness of any thing in cley, it is said, that *Dibutades*, a Sicyonian borne, and a Potter, was the first that deuised at Corinth to form an image in the same clay whereof he made his pots, by the occasion and means of a daughter which hee had: who being in loue with a certain yong man, whensoever he was to take a long iourney far from home, vsed ordinarily to mark vpon the wal the shadow of her louers face by candle light and to pourfill the same afterwards deeper, that so she might inioy his visage yet in his absence. This her father perceiuing, followed those traicts, and by clapping cley therupon, perceiued that it took a print, and made a sensible forme of a face: which when hee saw, hee put it into the furnace to bake among other vessels, & when it was hardened, shewed it abroad. And it is said, that this

been in request among riotous gluttons and wastfull spendthrifts, listen what *Fenestella* saith as touching this point, the greatest exceeding (quoth he) and gaudiest fare at a feast, was serued vp in three platters, and was called *Tripatinum*: the one was of Lampreys, the second of Pikes, the third of the fish *Myxon*: whereby it may appeare, that euen in those daies men began at Rome to grow out of order, and to giue themselves to riot and superfluity: yet were not they so bad, but we may prefer them euen before the Philosophers of Greece: for it is written, that in the tale of *Aristotiles* goods, which his heirs made after his decease, there were sold 60 platters, which were wont ordinarily to go about the house. As for that one platter of *Asp* the plaier in tragœdies, which cost six hundred thousand sesterces, I doubt not but their stomackes rise thereat when they reade thereof in my treatise as touching birds. But this is nothing (I assure you) to that charger of *Vitellius*, who whiles he was Emperor caused one to be made and finished that cost a * million of sesterces, for the * making wherof there was a furnace built of purpose in the field; the which I rather note, because they should see the monstrous excessse in these daies, that vessels of earth should be more costly than of Cassidonie. Alluding to this monstrous platter, *Murianus* in his second Consulship (when he ripped vp in a publicke speech, the whole life of *Vitellius*, now dead) vpbraided the very memoriall of him in these very terms, calling his excessse that way, *Patinarum paludes*, i. platters as broad as pools. And verily (saith he) that platter of *Vitellius*, came nothing behind another, which *Cassius Senerus* reproched *Asprenas* withall, whom he accused bitterly, and said, that the poison of that one platter had killed an 130 persons who had tasted thereof.

* Deies sester-
cium, according to *Bude-
us*; but if you
read according
to *Notomanus*,
ducenties, it is
twenty times
as much more.
* This platter
he called, the
charger of *Mi-
seria*, and he
got himselfe
sherby a name
to be called
Patinarum. See
Sueton.

Furthermore, there are certaine townes that are in good account by reason onely of this ves-
sell made therein, and namely *Rhegium* and *Cumæ*.
The priests of *Cybele* the mother of the gods, who are called *Galli*, vse to gueld themselves with a sheard of Samian earth; and they be of opinion, that if it be done with any thing els, they shall die thereof, if we may beleue *M. Calius*, who whetted that tongue of his (which shortly after was in that sort to be cut out) against *Vitellius*; which turned to his great reproch and infamie; for that himselfe euen then railed vpon *Vitellius* in so bad termes, and lost his tongue for his labour.

But to conclude, what is it, that Art and the wit of man hath not deuised? for there is a means found to make a strong kind of mortar or cement by the broken sheards of potters vessell, if the same be ground into powder and tempered with lime; and the ordering of it in this manner, k causeth it to be more firme and last the longer, and such they call *Signina*. And hereby also men haue found out certain durable pauements of that kind.

CHAP. XIII.

¶ The varietie of sundry kinds of earth: of the dust or sand of *Puteoli*: and of other sorts of earth which will harden as a stone.

Over & besides the cement aboue named, there be other percells that the earth it self doth afford, fit to be laid in pauing worke: for who can sufficiently wonder at this, namely, L That the worst part of it (which thereupon is called dust and sand, as it were the very excrement thereof) should be of that nature vpon the side of the hills of *Puteoli*, as being opposite against the waues of the sea, and continually drenched & drowned therewith, should become a stone so compact and vnited together as it were into a rock, that it scorneth all the violence of the surging billows, which are not able to vndermine and pierce the same, but hardeneth euery day more than other; euen as if it were tempered with the strong cement of *Cumes*. Of the same property is the earth within the country about *Cyzicum*: onely this is the difference, that not the dust or sand there, but the earth it selfe cut out into what parcels you will, in case it be drenched in the sea water a certaine time, is taken forth againe a very hard stone. The same (by re-
port) happeneth about the citie *Cassandria*: as also about *Gnidus* in a fountaine of fre sh water, M wherein if earth do lye, within the space of eight moneths it will turne to be a stone. Certes, all the way as a man goeth from *Oropus* as farre as to *Aulis*, what ground soeuer is beaten vpon by the water, changeth into rockes and stones. There is found also in *Nilus* a certaine sand, whereof the finest part differeth not much from that of *Puteoli* before said: not in regard that

A that it is so strong as to breake the force of the sea-water & to beat back the waues, but to sub-
due and crush the bodies of our yong gentlemen, and therefore serueth well in the publicke
place of wrestling for those that be giuen to such exercises: and for this purpose verily was it
brought from thence by sea to *Patrobius*, a slaue lately enfranchised by *Nero* the Emperor. I reade
also, that *Leonatus*, *Cratus*, and *Meleager*, who were great captains vnder *Alexander* the Great, and
followed his court, were wont to haue this sand carried with them, with other baggage belong-
ing to the camp. But I mean not to write any more of this argument, no more verily than of the
vse of earth in those places where our youth annoint their bodies against they should wrestle;
wherein our youths addit themselves so much to the exercise of the body, that they haue spoil-
ed themselves otherwise, and lost the vigor of the mind.

CHAP. XIII.

¶ Of mud walls: of bricke walls, and the order and manner of making them.

W Hat shall we say? See we not in *Africke* and *Spaine* both, certain walls of earth, which
they call * *Formacei*, of the forme and frame that is made of planks and boords of each
side, between which a man may say they are rather infarced & stuffed vp, than otherwise
laid and reared orderly; but I assure you, the earth thus infarced, continueth a world of yeres and
perisheth not, checking the violence of raine, winde and fire, no mortar and cement so stiffe and
strong. There are yet to be seene in diuers parts of *Spaine*, the watch-towers of *Anniball*, the
high turrets and sconces also reared vpon the tops of hills, made all of earth: and hereof we haue
our turfes, which naturally are so proper not only for the rampiers and fortifications of a camp,
but also for wharfs, banks, and buttresses, to breake the violence and inundation of riuers. As
for the manner of making walls, by dawbing windings and hurdles with mud and clay, also of
rearing them otherwhiles with vnbacked bricke, who is so ignorant that he knoweth it not? how-
beit, for to make good bricke, they ought not to be made of any soile that he knoweth it not? how-
grauell, much lesse then of that which standeth much vpon grit & stones, but of a greyish marle
or whitish chalkie clay, or at leastwise a reddish earth: but in case wee be forced to vse that
which is giuen to be sandy, yet we must chuse that kind of sand which is tough and strong. The
best season to make these bricke or tyles, is in the spring time; for in the mids of Summer they
will cleaue and be full of chinkes; but if you would haue good bricke for building, they ought
to be two yeares old at the least. Now the batter or lome that goeth to the making of them,
ought to be well steeped and soked in water, before it be fashioned into bricke or tyle. Bricke
are made of three sizes: the ordinarie bricke that we vse, is called *Didoron*, which carrieth in
length one foot and a halfe, and in breadth a foot: a second sort is named *Tetradoron*, i. three
foot long: and the third, *Pentadoron*, of three foot and nine inches in length: for the Greeks in
old time, called the span or space of the hand from the thumbe to the little fingers end stretch-
ed out, *Doron*; which is the reason that gifts and rewards be called in their language, *Dora*, for
that they were presented by the hand. You see therefore, how according to the length that they
carrie, either of foure or fise spans, they haue their denomination of *Tetradora*, or *Pentadora*;
for the breadth is one and the same in them all, to wit, one foot ouer. Now there beeing this dif-
ference in the size, in Greece the manner is to imploy the smaller sort in their priuat buildings,
but the bigger serueth for greater publicke workes. At *Pitana* in Asia, and in *Massia* and *Ca-
lentum*, cities of low *Spaine*, the bricke that be made, after they are once dried, will not sinke in
the water, but float aloft; for of a spongeous and hollow earth they be made, resembling the na-
ture of the pumith stone, which is very good for this purpose, when it may be wrought. The
Greeks haue alwaies preferred the walls of bricke, before any others, vnlesse it be in those places
where they had flint at hand to build withall: for surely such bricke wals, if they be made plump
vpright & wrought by line and leuell, so as they neither hang nor batter, be euerlasting; & ther-
fore such bricke serue for wals of cities and publick workes; their roial pallaces likewise be built
therewith. After this sort was that part of the wall at Athens laid and reared, which regards the
mount *Hymettus*: so they built also at *Patra*, the temples of *Iupiter* & *Hercules*, although all the
columns, pillars, and architraues round about them, were of ashler stone: thus was the pallace
of *K. Attalus* built at *Tralleis*; likewise that of *K. Crassus* at *Sardis*, which afterward was conuerred

* Some reade
formacei, ar-
ched walls.

to their Senat-houſe; named Geruſia:likewiſe the ſumptuous and ſtately houſe of king Maſo-
lus at Halicarnaffus:which goodly ædifices continue at this day. Wee read in the Chronicles,
that *Murana* and *Varro* when they were the high Ædiles at Rome, cauſed the outmoſt coat
which was ouercaſt of the brick-walls of Lacedæmon, to be cut out whole and entire, and to bee
ſet and enclouſed within certaine frames or caſes of wood, and ſo to be tranſlated from thence to
Rome, for to adorne and beautifie the publicke hall for elections of Magiſtrates, called Comi-
tium; and all for the excellent painting vpon that parget. The workmanſhip therein although
it were excellent and wonderfull in it ſelfe, yet being thus remoued and brought ſo far ſafe, it
was eſteemed more admirable. Moreouer, here within Italy the walls of Aretine and Meuania
be made all of bricke: many at Rome they dare not build their houſes with this kind of bricke,
becauſe a wall bearing in thickeſſe but one foot and an halfe, wil not ſuſtain aboute one ſingle H
ſtory; for the order of the city permitted not the common walls and thoſe which were outmoſt,
to be thicker than a foot and an halfe: neither wil the partition walls within abide that thickeſſe,
but are made after another fort.

*For by reaſon
that Rome was
ſo populous,
they made
many loſſes o-
uer head, ſo
that the build-
ing was rai-
ſed to 60 and
70 foot in vp-
right walls &
theſe ſerued as
tenements, &
were called
Conacule, and
one paire of
ſtaires leading
into the ſtreets,
ſerued them
all wheras the

ſter of the
houſe kept be-
neath with his
houſhold, and
was not trou-
bled with
theſe tenants
or in-mates.

CHAP. XV.

¶ Of Brimſtone and Alum, with their ſeueral kinds: alſo
their medicinable properties.

HAuing ſpoken ſufficiently of Bricks, it remaineth that I ſhould proceed to other kinds of
earth: wherein the nature of ſulphur or brimſtone is moſt wonderfull, being able as it is to
tame and conſume the moſt things that be in the world: it is ingendred within the Iſlands
Æolia, which lie between Italy and Sicily; thoſe I meane which (as I haue ſaid before) doe al-
waies burne by reaſon thereof. Howbeit, the beſt ſulphur is that which commeth from the Iſle
Melos. There is found thereof likewiſe in Italy, within the territory about Naples and Capua,
and namely in the hills called Leucogæ: that which is digged out of the mines, is fined and
brought to perfection by fire. Of brimſtone there be foure kinds, to wit, Sulphur viſ or Quicke-
brimſtone, which the Greeks call Apyron, becauſe it neuer came into the fire: the ſame is found
ſolid of it ſelfe, by whole pieces and in maſſe, which their Phyſicians doe uſe, and none but it,
for all the other kindes conſiſt of a certaine liquid ſubſtance, and being boiled in oile are made
vp and conſected to their conſiſtence: whereas the ſulphur viſ is digged out of the mine ſuch
as we ſee, that is to ſay, transparent, cleere, and greeniſh. The ſecond kind is named Gleba, good
onely for Tuckers and Fullers. The third ſort alſo yeeldeth but one uſe and no more, and that is,
for tincture of wooll, by reaſon that the ſmoke and perfume thereof wil bring it to be white and
ſoft; and this brimſtone they call Egula. As for the fourth kinde, it ſerueth moſt of all for mat-
ches and wicks.

As touching the nature of Brimſtone, ſo forcible it is, that if it be caſt into the fire, the verie
ſmell and ſteeme thereof will driue thoſe in the place into a fit of the falling ſickeſſe, if they
be ſubject thereunto. As for *Anaxilaus*, he would commonly make ſport withall at a feaſt, and
ſet all the gueſts into a merriment: for his manner was to ſet it a burning within a cup of new
earth ouer a chafing diſh of coales, and to carry it about the table where they were at ſupper: L
and in very truth the reuerberation of the flame would make all that were neere it to looke pale
and wan after a moſt fearefull manner, like as if there were as many griſly ghoſts or dead mens
faces. And to come more neere to the properties that it hath reſpectiue vnto Phyſicke, it hea-
leth mightily, and is a maturatiue: it doth reſolue withall and diſcuſſe any gathering of impo-
ſtumes; in which regard it entereth ordinarily into ſuch plaſters that bee diſcuſſiue and emol-
litiue. A cataplaſme made with it, incorporate with greaſe or ſewer, and ſo applyed vnto the
loynes and regions of the Kidnies, doth wonderfully aſſuage the paine and griefe in thoſe pla-
ces: being tempered with turpentine, it riddeth away the ſoule tetter called Lichenes that a-
riſe in the face, yea and cleanſeth the leproſie. The Greekes haue a pretty name for it and call
it Harpaſticon, for the ſpeedy remouing and ſnatching it from the place where it is applyed;
for eſtfoones it ought to be taken away. The ſame reduced into a lochoch or liquid Eleſtuarie,
is good to be licked and let downe ſoftly towards the lungs, in caſe of ſhortneſſe and difficul-
tie of winde: in which ſort it ſerueth for them that ſpit and reach out of the breſt by cough-
ing, filthie matter: and ſoueraigne it is for thoſe that be ſtung with ſcorpions. Take ſulphur viſ

A mix it with ſal-nitre, grind the ſame together with vinegre, it maketh a ſingular good liniment
for to ſcoure the ſoule morpew: let the ſame be tempered and prepared with vinegre of Sanda-
racha, it killeth the nits that breed in the eie-lids. Moreouer, brimſtone is imploied ceremoni-
ouſly in hallowing of houſes; for many are of opinion, that the perfume and burning thereof,
will keep out all enchantments, yea, and driue away ſoule fiends and euill ſpirits that doe haunt
a place. The ſtrength of Sulphur is euidently perceiued & felt in the ſprings of hot waters, that
boile from a vein of it: neither is there in all the world, a thing that ſooner catcheth fire; whereby
it is apparant, that it doth participat much of that element. Thunderbolts & lightnings in like
manner do ſent ſtrongly of brimſtone: the very ſlaſhes and leames thereof ſtand much vpon the
nature of ſulphur, and yeeld the like light. Thus much ſhall ſuffice as touching the nature of
B ſulphur.

The nature of Bitumen approacheth neere vnto brimſtone: where it is to be noted in the firſt
place, that the Bitumen whereof I ſpeake, is in ſome places in manner of a muddy ſlime; in o-
thers, very earth or mineral. The ſlimy bitumen ariſeth (as I haue ſaid before) out of a lake in
Iurie; as for the mineral bitumen, it is found in Syria, about a maritime town vpon the ſea-coaſt
called Sidon: but both the one and the other are of a compact and maſſie ſubſtance, growing to-
gether ſaſt and vnite. And yet there is a kind of Bitumen liquid, and namely that of Zacynthus,
and the Bitumen which is brought from Babylon, where verily it is white naturally as it grow-
eth. The Bitumen alſo which commeth from Apollonia is liquid: and all theſe the Greeks doe
comprehend vnder one name Piſſaſphalton, a word deriued of Pitch and Bitumen. There is a
C fatry kind of Bitumen likewiſe reſembling an vnctuous or oleous liquor, within the territorie
of Agragantum in Sicilie, ariſing out of a fountaine, and it ſtoteſt aloft: The inhabitants of the
countrie vſe to ſcum and ſleet it off by the meanes of certaine chats or catkins which grow vpon
many reeds and canes, for quickly will it hang and cleaue to the downe of ſuch. Great vſe
they haue of this Bitumen, for it ſerueth their turnes to maintain lamp-light, in ſteed of oile: &
therewith alſo they kill the ſarcins, ſcabs, and mange in their jades and laboring garrons. Some
writers there be who reckon Naphtha (whereof I haue written in my ſecond booke) to be a kinde
of Bitumen; but ſo ardent it is, and holdeth ſo much of the fire, that wee know not which way to
make any vſe thereof. Concerning the marks of good Bitumen, the beſt is knowne by the gloſſe
that it carrieth, if it ſhine exceeding much: the ſame alſo is ponderous and weighty: whereas the
D lighter ſort is but indifferent heauy, and argueth ſome ſophiſtication with pitch. In operation
it hath the qualities of brimſtone; aſtringent it is, and yet reſolutiue: it draweth together, and
ſoldereth withall. A perfume thereof while it burneth, chaſeth away ſerpents. The Babylonian
Bitumen is thought to be very effectual for the cataraſts, pearles, and ſlimes that ouerſpred the
eies: ſoueraigne likewiſe for the leproie, and filthy tetter of the face called Lichenes, and the
itch in any part of the body: it ſerueth in a liniment for the gout: and there is no kind thereof,
but it cauſeth the haire of the eie-lids, which grow vntowardly and fall into the eies, for to turn
vp againe. If the teeth be well rubbed with bitumen and ſal-nitre together, it doth eaſe and aſ-
ſuage their paine: and being giuen in wine, it helpeth an old cough, and the ſhortneſſe of wind.
In caſe alſo of the diſſenterie, it is taken in that manner, for it ſtaicth a bloody flux: but if it
bee drunke with vinegre, it doth diſcuſſe and diſſolue * cluttered bloud which is within the
E body, and expelleth the ſame downward by ſeege: it doth likewiſe aſſuage the paine of the
loynes or ſmall of the backe, and generally mitigateth any griefe of the joints, if it bee layed
too in manner of a cataplaſme with Barley meale. There is a ſpeciall plaſtre or cataplaſme
made of Bitumen, which carrieth the name thereof; it ſtancheth bloud, it bindeth and draweth
together the edges of a wound, alſo it knitteth and vniteth again ſinews which be cut in twain.
There is an ordinary medicine alſo for the quartane ague, made in this wiſe: Take of Bitumen
one dramme, of Mints the like weight, of Myrre the quantitie of one Obolus, mix and incor-
porat all theſe together: a perfume or ſmoke thereof will bewray the falling ſickeſſe. The ve-
ry ſmell of Bitumen alſo diſcuſſeth the fits of the mother when it riſeth and ſtoppeth the wo-
mans breath: A ſuffumigation thereof, doth likewiſe reduce the matrice and tiwill into the
right place, if they bee ſlipped and fallen downe too low, and ready to hang forth of the
bodie: beeing drunke with Wine and Caſtoreum, it bringeth the ordinary courſe of the
monethly termes in women. It ſerueth alſo for diuerſe and ſundrie other vſes than in Phy-
ſicke: For if any braſen Pots, Chaufers, pannes or kettles, or ſuch like veſſels, bee enhuiled
there-

*Hæmiponit

medicine, to
giue Mumiæ
(which is Piſ-
ſaſphalton) vnto
thoſe that are
ſaine from on
high and bee
inwardly brui-
ſed.

therwith, it hardeneth them against the violence of fire. I haue said already, that they were wont in old time to vernish their images with bitumen: it hath bene vsed in mortar also in stead of lime, and with that kind of cement were the walls of Babylon laid, and the stones sodered together. Iron-smiths also haue much vse of bitumen, and namely, in sanguining or colouring their ironworke; and nailers especially about their naile heads; many other waies likewise it serueth their tume.

As touching Alum, which we take to be a certain salt substance or liquor issuing out of the earth, there is no lesse vse therof than of bitumen, and the emploiment is not much vnlike. Of alum there be many kinds: in the Island Cypresse there is found alum which they call White, and another named Blacke; and albeit the distinction in the colour be but small, yet it is occupied to farre different vses; for the cleare alum which they name the white, is proper for to copied to four wooll with any bright tincture; contrariwise, the blacke serueth for sad, darke, and browne colours. The foresaid black alum is occupied much by goldsmiths, to purge and purifie their gold; and yet all these alumes the one as well as the other, be engendred of water & slimie mud, that is to say, of a certaine sweat that the earth naturally doth yeeld: it is suffered to run and gather together into a place, during winter; and in the heat of summer, it fermenteth and taketh the perfection: that which commeth soonest to concoction and ripeness, the same is alwaies the whitest and purest. As touching the mines of alum, they grow naturally in Spaine, Ægypt, Armenia, Macedonia, Pontus and Affricke, which be all countries of the continent: in the Islands likewise it is found, namely in Sardinia, Melos, Lipara, and Strongyle. The best simply is that which commeth out of Ægypt, and in the next place is that accounted of Melos. In sum, alum may be reduced into two principal kinds; for either it is pure and cleare, or els thick and grosse: as for the former kind, it may be knowne whether it be good and naturall, if it be bright like water, & white as milk, not offensive to their hands that rub it, & yet participating in some sort of a fiery heat; this they call Phormion; but in case it is sophisticated, you may soon find it by the juice of a pomegranat, for that which is true and the right kind, is no sooner mixed therewith, but it waxeth black. The second sort is of a pale color, and besides naturally rugged in the hand, and lightly it will stain like gall nuts, which is the reason that the Greeks call it Paraphoron. The vertues of the cleare alum, be astringent, hardning, and fretting; if it be tempered with hony, it healeth the cankers or sores in the mouth: wheals and itch it likewise cures in any part of the body: but this inunction must be vsed in a baينه; and regard ought to be had of it in the proportion, namely, that there be two third parts of hony to one of alum. The ranke smell of the arme-holes it doth allay, and represseth sweat and the stinke therof: it is taken in pills, for the obstructions and schirrosities of the spleene; and in that sort, it drieth away an itch & sendeth forth corrupt bloud by vrine: made into an vnguent with Sal-nitre and Nigella Romana, it healeth the bleach or scabs. Of alum that is thick, hard, and massiue, there is one kind which the Greeks call * Schistos, and the nature thereof is to cleaue along into certaine filiments or threads like haire, of a greenish colour; which is the reason that some haue giuen it rather the name of Trichitis: howfoeuer it be named, it commeth of a certaine marquisit stone, wherupon also they call it Chalcitis; so as it may be counted a very sweat of the said stone, gathered together or congealed into a fume. This kind of alum is exiccative; howbeit, not so good as the other to repress any offensive humors in the body: but surely it is singular for the ears, either infused, or applied as a liniment: it helps also the sores of the mouth, if a man let it melt together with the spittle or moisture of the mouth: for eyesalues likewise it serues fitly among other ingredients; and is very appropriat for the accidents befalling to the secret parts of either sex, as well men as women: but before it be vsed, it would be boiled vpon a pan ouer the fire, till it giue ouer to melt. There is another sort of alum, that is weaker in operation, which the Greeks call Strongyle: and this likewise is found of two sorts; the one is hollow and light in manner of mushrooms, easie to be melted in any kind of liquor; and this is altogether rejected as good for nothing: the other is hollow also and light in manner of a pumish stone, full of holes too, but resembling the pipes rather of sponges; the same is round in forme, and enclining to a white colour; a certaine vntuositie or fattiness it carrieth with it, apt to breake and crumble, and yet without sand, neither will it colour and staine the fingers blacke in the handling: this must be calcined by it selfe vpon cleare burning coales, vntill such time as it be reduced into ashes. But would you know the best and principall alum of all the sorts that are? it is that (no doubt) which

* Some take this for Alum de plume: others, for the stone Amian-
tine.

A which (as I haue said before) is brought out of the Island Melos, and therefore called Melinum. Certes, there is not an Alum more astringent, nor more proper to harden: none more firm and thicke than it. It doth subtiliar the roughnes of the eyes: and being calcined, it is the better for to repress the fluxion of humors into the eyes: and in the same sort prepared, it killeth the itch in any part of the body: generally, wherfoeuer it is applied outwardly, it stauncheth bloud: being vsed in a liniment with vinegre vnto any place where the haire hath been plucked vp, it causeth that which commeth again to be but soft and in maner of a downe. There is no kind of it, but the same is exceeding astringent, wherupon it took the name in * Greek. In regard of which stypticitie, they are all very good for the accidents of the eyes. Alum incorporat with some grease or fat, is singular to repress the flux of bloud: very proper also for the red gum incident to children: and in some sort staideth such vlcers as tend to putrifaction, yea, it drieth vp the breaking forth of wheales and pushes. With the juice of the Pomgranat, it is good for the infirmities of the eares; in which sort it doth amend the ruggednesse of the nailes, the hardnesse and nodocitie of cicatrices or skars, the excrecence and turning vp of the flesh about the naile roots, and the kibes of the heeles. With vinegre, or calcined with the like weight of gall nuts, it is excellent for cankers and inflammation of such vlcers as be corrosiue. Tempered with the iuice of Beets or Coleworts, it cleanseth the leprosie. Incorporat with two parts of salt, it healeth those sores which are giuen to eat and spread farther: and mingled with water it riddeth away nits, lice, and such vermine breeding in the head; in which manner it healeth burnes and scalds. But with pitch and the floure of Erules, it scoures away dandruffe and scurfie in any part of the body. In a clystire, Alum is soueraigne for the bloudie flux. It serueth likewise for the uvula in the mouth, and the inflammation of the Amygdales. In one word, for all those purposes which I haue said, other sorts of Alum are good for, we must alwaies thinke, that the Alum brought from Melos, is the best and most effectual. As touching other vses besides Physicke, wherein it is employed necessarily, and namely in dressing of skins and colouring wooll, of what reckoning it is, I haue shewed already. It remaineth now to treat of all other kinds of earth respectiue, as they serue in the vse of Physicke.

CHAP. XVI.

D ¶ Of the diuerse sorts of earth, to wit, of Samia, Eretria, Chia, Selinusia, Pnigitis, and Ampelis, together with their medicinable properties.

FROM the Isle Samos there be brought two kinds of earth: whereof the one is called by the Greekes Syropicon, the other Aster. As for the former, the commendation of it, is to be fresh, light, and cleauing to the tongue: The other, is white and of a more compact constitution: but both the one and the other, before they be vsed, ought to be calcined and washed. Some there be who preferre the former: but both be very good for those that spit bloud. They enter into emplastrs, which are deuised and made for to exiccat: and they are mingled also with eie-salues.

E Touching the earth Eretria distinguished it is likewise by two kindes, for some there is of it white, other of ash colour: and this for Physick is held to be the better. It is known to be good, if it be soft in hand, and, if vpon a piece of brasse it draw a line of purple colour. What power it hath, and how it is to be vsed in Physicke, I haue shewed already in my discourse of painters colours. But this is a general rule in all kinds of earth (for I will put it off no longer) that are to be washed, first to let them lie well steeped in water, then ought the same to be dried in the Sun; which done, it ought once againe to be braied in water, and let to rest vntill they be settled, that they may be digested and reduced into trochiskes. But for the burning and calcining of these earths, it ought to be done in certaine pots, and estoones followed and plied with shaking and stirring.

Among the sorts of earth that be medicinable, there is reckoned that which commeth from Chios, & the same is white, hauing the same effects that the earth of Samos: but our dames vse it most for to embellish & beautifie the skin. To which purpose, the earth of Selenus likewise is employed: White this earth is as milke, and of all others, will soonest resolute in water, which if it be tempered with milke, serues to whiten and refresh the pargetting and painting of wals.

The earth called * Pnigitis, is very like vnto Eretria beforenamed, only it is found in greater clots.

* Some reade Pnigitis.

clots or pieces, & otherwise is glutinous. The same effects it hath that Cimolia, howbeit, some-
what weaker in operation.

There is an earth called Ampelitis, which resembleth Bitumen as neer as may be. The triall of that which is good indeed, is, if in oile it be gentle to be wrought as wax; and if when it is tor-
rified, it continue still of a blacke colour. It entreth into medicines and compositions, which
are made to mollifie and discusse; but principally it serueth to beautifie the eie-browes, and to
colour the haire of the head blacke.

CHAP. XVII.

¶ Sundry sorts of chaulkes for to scoure clothes, and namely the Tuckers earth
Cimolia, Sarda, and Vmbria. Of the common chaulke:
and of Tripolium.

OF Chaulks there be many kinds: of which, Cimolia doth afford two sorts, and both per-
tinent to Physick; the one is white, the other inclineth to the colour of Roset. Both the
one and the other is of power to discusse tumors, and to stay distillations, if they be vsed
with vineger. They do keep downe biles and emunctories and swellings behind the eares: the
foule tertars also, and other offensive pimples and pushes they repress, applied in the forme of
a liniment: incorporat therewith salt-petre, salnitre, and put vineger thereto, it is an excellent
medicine to allay the swellings of the feet; with this charge, that this cure be done in the Sun,
and that after six houres, the medicine be washed off with salt water. Put thereto the cerot Cy-
prinum, it is singular good for the swelling of the genitoirs. This Fullers earth Cimolia is of a
cooling nature, and being vsed in the forme of a liniment, it staieth immoderat sweats: the same
taken inwardly with wine in the baine or hot-house, restraineth the breaking forth of pimples.
The best of this kind, is that which commeth out of Thessalie. It is to be found also in Lycia a-
bout Bubon. There is ouer and besides, another vse of this Cimolia or Tuckers cley, to wit, in
scouring clothes. As for the chaulke Sarda, so called because it is brought out of Sardinia, it is
employed only about white clothes, for if they be moteley or pied coloured, it is of no vse. Of al
kinds of Cimolia it is the cheapest, and of safest account: yet that of Vmbria is of more price,
and that which they call Saxum in Latine, and is our ordinary white chaulke: this property it
hath, that with lying in water it groweth; this is commonly bought therefore by weight, where-
as the other is sold by measure. As for the foresaid earth of Vmbria, it serueth only for to polish
and giue a glosse to clothes: for why should I scorne or thinke much to handle this matter al-
so? seeing there is the expresse law or act Metella, prouided for Fullers, the which C. Flaminius
and Lu. Emilius, when they were Censors, proposed vnto the people for to be enacted; so care-
full were our predecessors, to take order for all things. To come then to the mysterie of Fullers
craft: First they wash and scour a piece of cloth with the earth of Sardinia, then they perfume
it with the smoake of brimstone, which done, they fall anone to burling of it with Cimolia; pro-
vided alwaies that it be the right and haue the natue colour, for if it be sophisticat, it is soone
knowne by this, that it waxeth blacke, and wil chaune and cleaue, if it come after sulphur: and if
it be the true Cimolia, it doth refresh and giue a cheerefull hew to precious and rich colors, yea
it setteth a certain glosse and lustre vpon them, if they were made dusky & sad by the smoake
of sulphur. But in case the clothes be white, then the common chaulke is better to be vsed pre-
sently after the brimstone: for hurtfull it is to other colors. In Greece, they vse in stead of Ci-
moliam, a certaine plastre which they haue from Tympe. Yet is there another kind of chalke or
whire cley, named Argentaria, for that it giueth a glistering siluer color to clothes. Howbeit,
one sort more there is of chalk, which of all others is most base, and least esteemed; this is that
chalke, wherewith our auncestours in old time ordained to whiten the cirque, in token of victo-
ry: wherewith also they vse to marke the feet of those slaues which were brought ouer from be-
yond sea, to be bought and sold in the markets: such an one somtime was that Publius, the deu-
iser of riming and wanton jestures vpon a stage: such another was his cousin germaine, Manilius
Antiochus, the Astrologer; yea, and Taberius Erotes the excellent Grammarian: whom all three,
our great grandfathers saw in that manner brought ouer in one and the same ship.

CHAP

CHAP. XVIII.

¶ Who they were in Rome, and of whom enfranchised, that of slaues rise to be
mightie, and of exceeding wealth.

BUT what meane I to stand vpon those who had learning to commend and bring them into
some state of credit and honour? Haue not the same forefathers of ours seene in the like
plight standing within a cage, with a marke of chaulke vpon their feet, and a locke about
their heeles, Chrysogonus the slaue to Sylla, Amphion to Qu. Catulus, Hero to Lu. Lucullus, Demetrius
to Pompey, Auge the bondmaid to Demetrius (though she was thought to be the base daughter of
Pompey,) Hipparchus the slaue of Antonius, Menas and Menecrates of Sex. Pompeius, and an infinite
sort of others, whom I cannot reckon vpon; and yet they all being by their masters enfranchised,
became wonderfull rich by the bloudshed and goods of Romane citizens, in that licentious
time of proscriptions. Well, this was the marke of slaues set out by companies in the market to
be sold: and this is the opprobrious and reprochful note, to twit those by, that in their fortunes
are growne insolent. And yet we in our daies haue knowne the same persons to climbe vnto the
place of highest honour and authority, in so much, as we haue seene with our owne eies the Se-
nat (by commandement from Agrippina the Emperesse, wife to Claudius Caesar) to decree vnto en-
franchised slaues, the robes of Pretours, with the badges and ornaments to that dignity belong-
ing; yea, and such to bee sent againe as it were with the axes and knitches of rods decked with
Lawrell, into those countries to gouerne, from whence they came at first poore slaues with their
feet chalked and marked for the market.

CHAP. XIX.

¶ Of the earth of Galata, and Clupea: of the Balearie earth,
and Ebusitana.

OVER and aboue those before rehearsed, there be other sorts of earth, hauing a property by
themselves, which I haue named heretofore, but in this place I am to set downe their na-
ture and vertues also. There is a kind of earth comming out of the Isle Galata, and about
Clupea in Affricke, which killeth scorpions: like as the Balearike and Ebusitane earth, is the
death of other serpents.

THE

THE XXXVI. BOOKE OF THE HISTORIE OF NATURE, WRITTEN BY C. PLINIUS SECVNDVS.

The Proem.

CHAP. I.

¶ The natures and properties of Stones: The excessive expence in columnes and buildings of Marble.

IT remains now to write of the nature of stones, that is to say, the principal point of all enormous abuses, and the very height of wastful superfluities, yea though we should keep silence, and say nothing either of precious stones and Amber, or of Chryttall and Cassidonie. For all things els which we haue handled heretofore euen to this Booke, may seem in some sort to haue been made for man; but as for mountaines, Nature had framed them for her owne selfe; partly to strengthne (as it were) certaine ioints within the veines and bowels of the earth; partly to raine the violence of great riuers, & to break the force of surging waues and inundations of the sea; and in one word, by that substance and matter whereof they stand, which of all others is most hard, to restraine and keep within bounds that unruly element of the water. And yet notwithstanding, for our wanton pleasures and nothing els, we cut and hew, we load and carry away those huge hills and inaccessible rockes, which otherwise to passe only ouer, was thought a wonder. Our Ancestors in times past reputed it a miracle, and in manner prodigious, that first *Annibal*, and afterwards the *Cimbrians*, surmounted the Alps: but now, euen the same mountaines wee pierce through with picke-axe and mattocke, for to get out thereof a thousand sorts of marble; wee cleaue the capes and promontories: we lay them open for the sea, to let it in; downe we goe with their heads, as if wee would lay the whole world euen, and make all leuell. The mightie mountaines set as limits to bound the frontiers of diuers countries, and to separate one Nation from another, those wee transport and carrie from their native seat: ships wee build of purpose for to fraught with marble: the cliffes and tops of high hills they carrie too and fro, amid the waues and billowes of the sea, and neuer feare the danger of that most fell and cruell element: wherein verily wee surpasse the madnesse and vanitie of those, who search as high as the clouds for a cup to drink our water cold; and hollow the rocks that in manner touch the heauen, and all to drink out of yce. Now let euery man thinke with himselfe what excessive prices of these stones hee shall heare anone, and what monstrous pieces and masses hee seeth drawne and carried both by land and sea; let him consider withall, how much more faire and happy a life many a man should haue without all this, and how many cannot chuse but die for it, whensoever they go about to doe, or if I should speake more truely, to suffer this enterprize: also, for what vse else, or pleasure rather, but one, that they might lie in beds and chambers of stones that forsooth are spotted, as if they neuer regarded how the darknesse of the night bereaueth the one halfe of each mans life of these delights and ioies. When I ponder and weigh these things in my mind, I must needs think great shame, & impute a great fault to our forefathers that liued long since, & blush in their behalfe. Lawes were enacted, and prohibitions published by the Censors, and those remaining vpon record,

¶ The bibatur
glacie, for they
held Chryttall
to be a kinde
of yce.

A cord, forbidding expressly, That neither the kernelly part of a Bores neck, nor dormice, & other smaller matters than these to be spoken of, should be serued vp to the boord at great feasts: but as touching the restraint of bringing in marble, or of sailing into forraine parts for the same, there was no act or statute ordained.

CHAP. II.

¶ Who was the first that shewed Marble stones in Columnes, or any publicke workes at Rome.

BVt some man haply might reply againe vpon me, and say: what need was there of any such ordinance, considering there was no marble in those daies brought in from strange countries? Vnto whom I answer, That it is a meere vnruth, for euen our progenitors, of whom I speake, saw well enough how in that yere when *M. Scavrus* was *Edile*, there were not fewer than 360 pillars of marble transported to Rome, for the front and stage of a Theater, which was to continue a small while, and scarcely to be vsed one moneth to an end: and yet no law there was to checke and controule him for it. But it may be inferred againe, the Magistrates winked hereat, because he did all this for a publicke pleasure to the whole citie, during the plaies exhibited by him in his *Edileship*: marrie that is it that I would haue, What reason I pray you had they so to doe? By what means more doe abuses and inormities creepe into a citie or state, than by a publicke president giuen? for I assure you it was nothing else but such examples at the first that brought those other things, I meane, yvorie, gold, jewels, and precious stones, to be vsed by priuat persons, so commonly as they be, in their houses, plate, and ornaments. And what haue we left and reserued at all for the very gods to haue, since that we lay so much vpon our selues? but say that in those daies they did tolerat this excesse in *Scavrus*, because of the pastimes he did exhibit to the whole city; What, were they silent also and made no words, when the said *Scavrus* caused the biggest of all these columnes (yea those that were fortie foot high within twain, and the same of *Lucullan* black marble) to be erected and placed in the court before his owne house in mount *Palatine*? And least any man should say, that this is done in secret and huckster mucker, know he, That when these pillars were to be carried vp into the mount *Palatine* where his house stood, the *Bailife* that had the charge of the publick sinkes vaulted vnder the ground, dealt with *Scavrus* for good securitie, yea, and demanded cautions and sureties for satisfying of all harmes and dammages that might be occasioned by their carriage, so huge and haueie they were. Considering then this bad example, so prejudiciall to all good manners, and so hurtfull to posterity, had it not bin better for the city to haue cut off these superfluities by wholesome laws and edicts, than thus to permit such huge and proud pillars to be carried vnto a priuat house vp into the *Palatine* mount, euen vnder the nose of the gods, whose images were but of earth, and hard by their temples that had for their couers and louers no better than such as were made of potters clay?

CHAP. III.

¶ The first man who had at Rome for his owne vse, pillars of Marble brought from forraine Lands.

NEither can it be alledged for excuse of this tolleration in *Scavrus*, that hee tooke the vantage and spied his time when the city of Rome was not ware of any such matter toward, as hauing not been acquainted beforetime with the like, and therefore he stale vpon them with these superfluous pompes, as doubting nothing lesse than such new deuises, and therefore hauing no time to prevent and stay them: for long before this, *L. Crassus* that great Orator, who was the first that enriched his house (within the same *Palatium*) with pillars of ourlandish marble, although they were but of the Quarry in *Hymettus* hill, and neither more in number than six, nor carying in length about 12 foot apiece, was reprobued and reproched for this pride and vanity by *M. Brutus*, who among other hot words and biting terms that passed interchangeably between them, taunted him by the name of *Venus Palatina*. Certes, considering how all good orders and customs otherwise were trodden vnder foot, we are to presume thus of our pcedecessors, That when they saw other injunctions and prohibitions as touching diuers abuses crept in, take

temple are commended, as few like vnto them for workmanship: like as the other images which G be aduanced vp to the very top of the lantern of the foresaid temple, are thought to be excellent pieces; howbeit, for that they stand so high and cannot well be discerned, lesse speech there is of them. As touching that *Hercules*, in the honour of whom the Carthaginians were won euery yere to sacrifice the flesh of mankind, it is an image not regarded; for he hath no place in any temple or chappell, neither is he erected vpon pillar, no nor so much as vpon a base, but standeth vpon the bare ground, just ouer-against the entrie to those galleries in Rome, called *Ad Nationes: howbeit, the workmanship of this *Hercules* is not to be despised. There stood also beneath, the nine Muses called *Thestiades* vnder the temple of *Felicity*, and as *Varro* saith, one *Iunius Pisticulus* (by place a gentleman of Rome) was enamored vpon one of them, so beautifull they were made: and yet to this day, *Pasticules* cannot look enough thereupon, but hath the same in great admiration: who also wrote five books, comprising all the famous and principall pieces of worke that are to be found in the world. This *Pasticules* was borne in the marches and coasts of Italy called *Græcia*, and together with the townes of that tract, was made a *Romane* free denizen, being himselfe also a good cutter in stone, hee made that image of *Iupiter* in *Yvory* which standeth in the chappell of *Metellus*, in the way which leaderh into [*Mars*] field. It happened vpon a time, that being about the Arsenall, where certaine wild beasts were, newly brought out of *Affricke*, hee looked in at a grate to behold a lyon and to take out the counterfeite of him; but as hee was ingrauing in stone according to the patterne, behold, out of another cage a panther brake loose, to no small danger of that most curious and painfull workman: it is said, that hee made many works; but in particular which were of his doing, it is not precisely set down. Moreover, *M. Varro* doth highly magnifie *Arcefilaus*, of whose handy worke hee saith that hee had a lionesse in marble, and certaine winged *Cupids* playing with her: of which, some seemed to hold her fast bound, others forced her to drinke out of a horne others againe would seeme to shooe her with their sockes; and all this prettie anticke worke was of one entire stone. The same *Varro* writeth, that *Copenius* made the images of the fouretee Nations, which are about the galleries or theatre of *Pompeius*. I finde also by my reading, that *Canachus* (whom I commended for a good founder or imageur in brasse, in my catalogue of such artisans) wrought in marble likewise and cut many faire statues: neither is it meet, that *Sauos* and *Batrachus* should be forgotten, who wrought the chappells that are within the close or cloister belonging to the galleries of *Octavia*, notwithstanding they were themselves *Lacedæmonians* borne. Some also are of opinion, K that they were exceeding rich men, and that of their owne purfes they defraied the charges of building those chappells, hoping to haue had the honour to be immortalized with the inscriptions in the forefront thereof: which being denied them, yet in another place and after another sort, they made meanes to eternize their name; for they deuised in the foot or base of every pillar (as it appeareth yet at this day) to cut the forme of a * frog and a lizard, to represent thereby their owne names. Moreover, I cannot conceale from you one pretty thing to be obserued, and which we all know to be true, That in one chappell of *Iupiter*, all the pictures therein, as also all the ceremoniall seruice, thereto belonging, are respectiue altogether to the fœminine sex: the which happening at first by meere chance, continued afterwards: for when the temple of *Iuno* was finished, the porters who had the carriage of the images ordained there to stand, mistooke their markes and carried thither those which were appointed for the chappell of *Iupiter*; and contrariwise those for *Iuno*, into the chappell of *Iupiter*; which beeing once done, was not altered againe, but taken for a presage, and religiously euer after kept, as if the very gods themselves had so ordered and appointed it, and made a counterchange: which is the reason also, that in the foresaid chappell of *Iuno*, there is that kinde of seruice which was meant for *Iupiter*.

To conclude, there haue been certaine workemen that haue growne to great name, by cutting and grauing in small pieces of marble; and namely, *Myrmecides* deuised to inchase in marble, a charriot and foure horses, and a man to driue the same, in so smal a roome, that a poor flie might couer all with her little wings. As for *Callicrates*, he cut in stone the similitude and proportion of pismires in so narrow a compasse, that a man cannot easily discern the feet and other parts of the body.

CHAP.

A

CHAP. VI.

¶ When first began Marble stones to be used in building of priuat houses. Who began at Rome to parget and couer walls with thin leaues of Marble. In what ages each kinde of Marble came into use and request. Who inuented cutting of Marble into thin plates: the deuise and manner thereof. Of sand proper for building.

THus far forth haue I discoursed of the cutters and ingrauers of marble, and of those excellent artificers, who haue bin most renowned. In which treatise I remember wel, that the diapred and spotted marble all this while was of no regard: for all the antique pieces which I haue rehearsed, were made of the marble of *Thasos*, of the Islands *Cyclades*, as also of *Lesbos*; and yet this inclineth to a blackish or blewish colour somewhat more than the rest. As for marble spotted in sundry colours, as also of the ordering, workmanship and vse of any kinds of marble in building, *Menander*, who in his time was most curious of all others in discussing all such superfluitie, dealt first therein, but seldome medled he withall. Howbeit, true it is, that at length pillars of marble were taken vp to be vsed in temples, not vpon any pride, brauerie, or magnificence (for as yet they knew not what such things meant) but for that it was thought, that they could not be erected nor beare vpon any thing stronger: and in that manner was begun the temple at *Athens* of *Iupiter Olympias*, out of which, *Sylla* brought those columnes which serued C for his house and pallace in the Capitoll. Howbeit, euen in *Homers* time a difference there was made betwene ordinary stone and marble: for this Poet saith plainly, that *Paris* caught a rap vpon the mouth with a marble stone: and yet whensoever he extolled and fetterh out in the highest degree the most stately pallaces of kings and princes, he neuer makes mention of any other matter to adorne them withall, but of *Brasse*, *Gold*, *Electrum*, *Siluer*, and *Yvory*, and not one word of Marble. But, as I take it, the first time that these marbles of sundry spots and colors were discovered, was in the quarries of the Islanders of *Chios*, by occasion that they digged for stone to fortifie their city with walls, whereupon *M. Cicero* plaies merily vpon them with a pleasant conceit; for when they made shew to all that came, and among the rest to him, what walls they had built of marble, and seemed to take great pride in their sumptuous and magnificent building; What ado is here (quoth *Cicero*) I would haue maruelled much more at your wall, and thought you had done a greater deed, if you had built it out of the quarry of *Tyburnum*. Certes, D if marble had bin of any name and credit in old time, painters had not bin so highly honored as they were, nay, had there bin (thinke ye) any reckoning made of them at all?

As touching the manner of slitting marble into thin plates, therewith to couer and seel as it were the outsidess of walls, I wot not well whether the inuention came from *Caria*, or no. The palace of *Mausolus* K, of *Caria*, built at *Halicarnassus*, is the antientest building that I can find in any record, garnished, set out and enriched with marble of *Proconnesus*, notwithstanding all the wals were reared of brick. This prince changed his life in the second yere of the 100 *Olympias* which fel out to be the 302 yere after the foundation of the city of *Rome*. As for our Romans, E *Cornelius Nepos* writeth, that *Mamurra*, borne at *Formia*, a gentleman of *Rome*, and sometime a Prouost ouer the Pioners, Masons, Smiths, and Carpenters vnder *Cæsar* in *France*, was the first who couered all the walls throughout his house which he had vpon mount *Coelius*, with leaues of marble. Now when I speak of *Mamurra*, you must not be offended, and think that I ascribe the inuention hereof to a mean person; for I tell you, this is that *Mamurra*, whom the Poet *Catullus* my countryman of *Verona*, so tainted and reuiled in his verses; this is the man, whose house before said, testifieth better by prooffe and effect, than *Catullus* could by his Poeticke expresse, That he had laid vpon it and gathered into it all the riches of *Gallia Comata*: which was as much to say as all *France*, saue only *Prouance*, *Languedoc*, *Sauoy*, and *Dauphine*. And well it might be so, for *Cornelius Nepos* before named addeth moreover and saith, that he was the first man, who F caused the pillars of his house to be of marble, & had not one of other matter, neither were the sleight and slender, but solid & masse, euen hewn out of the quarries either of *Carysus* or *Luna*. But after him, in proesse of time, *M. Lepidus* who was ioined companion in the Consulship to *Catullus*, was the first man known to lay the sils, lintels, & checks of his dores thorowout his hous with *Numidian* marble; being Consul in the 666 yere, reckoning from the foundation of *Rome*: but

*So named, by occasion of the statues of 14 nations there erected, as appeareth a little after.

*For in Greek *Batrachos* is a frog, and *Sauos* a lizard.

but well shent and rebuked he was for his labor. And verily, this was the first Numidian marble G as far as I can find by any mention or token at all, brought ouer to Rome; not to serue in pillars only and pannels in the seeling of walls, as *Mamurra* imploied his Carystian marble, but in * middle workes, and in the basest of all, namely, in dore sils, lentils, and jambes. After this, *Lepidus* some foure yeares, succeeded *Consull. L. Lucullus*, who, as it should seeme by that which fell out, gaue the name to Lucullan marble, for that he was so much delighted therien: he brought it first to Rome, and had a speciall fancy thereto, notwithstanding it were black otherwise: whereas all other men esteemed better of other coloured marble, or els spotted. This marble growes in an Island lying within the riuer Nilus, and no marbles (as many kinds as there be) took name of him that loued them, but it alone. But among these men that were given to build with marble, *M. Scourus* was the first man, as I take it, that for the stage and forefront of his Theatre, made the wals of marble: but whether the same were of slit and sawne marble, or laid with good found square ashler or no (as the temple of *Iupiter Tonans* in the Capitoll hill, is at this day built) I am not able to say for certaine: for as yet I do not reade or find by any sign, that Italy knew how to slit marble into leaues. But surely, whosocuer deuised that inuention, to saw marble stone, and to slit it into leaues for to serue the turne of riotous and waittful persons, had a perillous head of his own, and a shrewd. But would you know the cast of slitting marble? It is done with a kind of sand, and yet a man would think that it were the saw alone that doth the deed; for when there is an entry once made by a very smal line or trace, they strew the said sand aloft al the length thereof: then they set the saw to it, and by drawing it to and fro, the sand vnder the teeth thereof, maketh way downwards still, & so the stone, as hard as it is, they cut through in a trice: now for this purpose the Æthyopian sand hath no fellow: and to this passe forsooth we are come, that we cannot haue marble to serue our turns, vnlesse we send as far as into Ethyopia. may, we must bee provided of sand to slit our marble with, out of India; from whence in times past, during the antient discipline of Rome, it was thought too much and a shamefull thing, to fetch rich pearles. And yet this Indian sand is commended in a second degree; but the Æthyopian is the foster and better simply; for that sand curteth smooth and cleane as it goeth, and leaues no race at all in the work; the Indian maketh not so euen and neat plates, howbeit, they that polish marble, fit themselves with this sand when it is burnt and calcined, for if they rub their leaues and plates therewith, it will make them slick & fair; for otherwise, if it be not calcined to a fine powder, of it self it is churlish and rugged, which is the fault likewise of the sand that commeth from Naxos and Coptis, which commonly is called the Egyptian sand; for these sands verily were vsed in old time to the cutting of marbles. Afterwards they met with a sand as good as the best, and went no farther than to a certain bay or creek in the Adriatick sea or Venice gulf, which being left bare when the tide is gone, they may at a low water easily discern to haue bin cast vp by the floud. And now adaies our sawyers of marble, make no more ado, but take the first sand they come by, (it makes no matter out of what riuer it be) this serues their turne well enough, and thus they abuse and deceiue the world, although few chapmen there bee that know what losse there is by their marble leaues sawne in that sort: howbeit, such grosse sand as that, first makes a wider slit in the main stone, and by consequence spendeth and consumeth more of the marble; again, there is more work and labour about the polishing thereof, the saw and sand before said leaueth the faces of the stone so rugged and vneuen: and by this meanes the plates become sleight and thin before they can be imploied. To conclude, the sand from Thebais in high Egypt, is very good to polish withall: like as the grit that commeth of grauelly stones or pumish ground, serueth very well for the said purpose.

CHAP. VII.

¶ Of Whetstones and Grindstones, comming out of Naxos and Armenia. Of diuers kindes of Marble.

FOR polishing of statues and images made of Marble; for cutting, filing, and trimming of precious stones, Naxium serued a long time, and was commended before any other stone: for by this word Naxium I vnderstand the whet-stones and grinde-stones that come out of the Island Cyprus. but afterwards, those which were brought from Armenia, woon the name from them, and were esteemed better.

As

A As for the sundry sorts of Marble and their colours, to discourse of them in generall, were needlesse, they are so well and easily knowne: and to reckon them all in particular, were endlesse, they be in number to many and infinit: for what corner of the world is there, where you shal not find one marble or other different from the rest? And yet in my Cosmography, I haue already written of the best and most excellent kinds of marble, as I had occasion to speak of the nations and countries where they be found. Howbeit, this would be noted, that all sorts of marble bee not found in quarries and rocks, that stand vpon veines thereof: for much you shal meet with, lying ebbe in the ground, and the same scattering by pieces here and there. But the green marble that commeth from Lacedæmon, is esteemed most precious, and to be more gay and pleasant than all other. As touching the marbles called Augustum and Tiberium, they were found in B Egypt first after that sort lying loose and scattered, during the time that *Augustus* and *Tiberius* were Emperors of Rome, of whom they took their name. And albeit these marbles bee flecked and spotted, yet they differ from the Serpentine marble called Ophites; for that the speckles in Ophites, do resemble those in a serpents skin, whereupon it took that name: whereas the other two be distinguished with spots after a diuers sort: for Augustum hath veines curled, after the manner of waues, running round as it were like whirle pooles; and Tiberium spreadeth rather a broad in strakes, winding yet and turning after the order of whitish haire. Neither be there any pillars found of the foresaid Serpentine marble, vnlesse they be very small. And of this marble there be two kinds: the white, which is gentle and soft: the blacke, which is churlish and hard. Both of them are said to ease the head-ache, and to cure the sting of serpents, if they be but carried about one in pieces, either hanging at the neck, or otherwise tied to any part. Some there be who prescribe the whiter kind to be applied accordingly for the phrensie and lethargy: howbeit against serpents, there be who commend especially about the rest, that which of the colour of ashes they commonly call * Tephria. As touching the marble of Memphis or great Caire in Egypt, named thereupon Memphites, it is of the nature of these * precious stones, rather than of quarries. The vse herof is to be ground into powder, & with vinegar to be reduced into a liniment, for to be applied to those parts that are to be cauterized or cut: for it so astonieth and benummeth the member, that it feeleth no pain, either by the searing iron or the Chyrurgians lancet. The Porphyrite marble, which also comes out of Egypt, is of a red colour: of which kinde, look which hath white spots or streaks running among, is called thereupon Leucostictos: And D quarries there be in Egypt, standing wholly vpon this marble, which yeeld so sufficient, cut and hew therout as big and as huge pieces as you will. *Triarius Pollio*, Procurator general vnder *Claudius Caesar*, in the prouince of Egypt, brought for the Emperor certain statues of this Porphyry, out of Egypt: which new deuise of his was not very well liked and accepted, for no man tooke example by him afterwards to do the semblable. The Egyptians also found in Æthyopia another kind of Marble, which they call Basaltes, resembling yron as well in colour as hardnes: and thereupon it took the name. The greatest piece of this marble that euer was found, *Vespasian Augustus* the Emperor dedicated in his temple of Peace, and it was a statue resembling the riuer Nile, with 16 little children playing about it, whereby is signified the number of cubits, to which height the said riuer riseth when it is at the highest. It is said also, that within the temple of *Serapis* in Thebes, a city of high Egypt, there is another statue not vnlike to this marble Basaltes, and many think it was made for *Memnon*, & by report, euery day at the Sun-rising, so soon as the raies or beames do beat thereupon, it seemeth to cracke or cleaue. As for * Onyx, our antient writers were of opinion, That it was found in those daies vpon the mountains of Arabia, and no where els: yet *Sudines* saith, that it is gotten in Germany. *Cornelius Nepos* affirmeth, That there was at first great wonder made at the drinking cups of this stone: and afterwards, at the feet of tables and beds, of chaires and stools likewise thereof: howbeit, afterwards (quoth he) *L. Lentulus Spinter* shewed at Rome wine vessels, as big as good barrels, such as came out of the Isle Chios with wine: but within fve yere after by his saying, hee saw pillars also, and those 32 foot long, all of Onyx or Chalcedonie. But in proceffe of time this stone altered and varied much: F for *Cornelius Balbus* brought foure small pillars thereof, and shewed them in his Theatre for a strange and miraculous sight. And in my time I haue seen of them about thirty, much fairer and bigger, which went to the making of a Summer parlour for pleasure, that *Callistus*, one of the enfranchised slaues of *Claudius Caesar* (a man wel known for his exceeding riches and power) built for his owne selfe.

Here Pliny remembreth himselfe, and makes a third kind of Ophites as *Discor*, did before him, *Diop*, saith it is no bigger than a little pebble or grauel stone

For rather Onyx, chiesse Cassidonic

CHAP

CHAP. VIII.

¶ Of the stone called *Alabastrites*: likewise, of *Lygdinus* and *Alabandicus*.

THis Onyx stone, or Onychitis aforesaid, some name *Alabastrites*; whereof they vse for to make hollow boxes & pots to receiue sweet perfumes and ointments, because it is thought that they will keepe and preserue them excellently well, without corruption. The same being burnt and calcined, is very good for diuers plasters. This *Cassidony* or *Alabastr* is found about Thebes in Egypt, and Damascus in Syria: and this *Alabastr* is whiter than the rest: Howbeit, the best and principall simply is that which cometh out of Carmania: next to it in goodnesse is that of India: and then the *Alabastr* of Syria and Asia. The least esteemed of all other, is brought out of Cappadocia, and no beauty or lustre it hath at all. In sum, come it from what country it will, those pieces which stand most of a yellowish colour, like hony, spotted also in the head and nothing transparent, goe for the best. And generally throughout, look where you meet with any in colour white, or resembling horne, is rejected for naught, like as whatfoeuer of it is like glasse.

As touching the stones *Lygdinus*, found in the mountaine *Taurus*, many are of opinion, that they be well neare as good as the former, for to keepe odoriferous ointments: and those for bignesse and capacity, exceed not bowls and good broad platters: passing faire and white they be: and in times past were wont to be brought only out of Arabia. Moreover, there be two kinds I besides of Marble, well esteemed both, and in great price, notwithstanding standing in nature they be very contrary: the one is called *Coraliticus*, found in Asia, you shal not light vpon any about two cubites long: in whitenesse they come passing neare vnto yvorie, and otherwise also they haue a certaine resemblance vnto it. The other called *Alabandicus*, after the name of the country that yeeldeth it, is contrariwise blacke: howbeit, there is of it to be found growing in *Miletus*, but not altogether so blacke, for it inclineth or declineth rather to a purple colour. This stone of *Miletus* will resolute in the fire, and commonly they vse to melt it for drinking cups, in manner of glasses. To come now to the Thebaicke marble, marked it is with certain drops here and there of a golden colour: and naturally it is found growing in that part of *Africke*, which consisteth vpon the *Aegyptians*, and lyeth vnder their iurisdiction. A peculiar propertie it hath by *K* a secret in Nature, respectiue vnto the eies, to serue for to grinde collyries with, that is to say, those pouders which are appropriat to the diseases of that part. But about *Syene*, in the province of Thebaies, there is a marble (thereupon called *Syrenites*) which sometime they named *Pyrrhopæcilos*: the kings of Egypt in times past (as it were vpon a strife and contention, one to exceed another) made of this stone certaine long beames, which they called *Obelisks*, and consecrated them vnto the Sun, whom they honoured as a god: And indeed, some resemblance they carry of Sun-beames, when they are made to the forme of *Obelisks*, and the very Egyptian name implieth so much. The first that euer began to erect these *Obelisks*, was *Mitres*, king of Egypt, who held his royall seat and court in *Heliopolis*, the citie of the Sunne; where hee was admonished in a dreame by a vision, so to doe: and thus much may appear by the inscription of certaine letters engrauen vpon the said *Obeliske*: for those Characters, figures, and formes that wee doe see incised in them, be the verie * letters that the Egyptians vse themselves. After him, other princes also set vp more of these *Obelisks* in the aboue named citie: and namely king *Sochis* for his part, foure in number, those carrying in length eight and fortie cubits apiece. And *Ramises* (in whose reigne Troy was woon by the Greekes) erected an *Obeliske* fortie cubits long, in the said city: but being departed from thence (for that he took pleasure in another city, where sometimes stood the royal pallace of king *Meneus*) he pitched on end another *Obeliske*, which carried in length * a hundred foot wanting one, and on every side foure cubits square.

¶ *Undecim*, by the Gr. word, is all An. lo. p. 11. v. 11. 12. 13. 14. 15. 16. 17. 18. 19. 20. 21. 22. 23. 24. 25. 26. 27. 28. 29. 30. 31. 32. 33. 34. 35. 36. 37. 38. 39. 40. 41. 42. 43. 44. 45. 46. 47. 48. 49. 50. 51. 52. 53. 54. 55. 56. 57. 58. 59. 60. 61. 62. 63. 64. 65. 66. 67. 68. 69. 70. 71. 72. 73. 74. 75. 76. 77. 78. 79. 80. 81. 82. 83. 84. 85. 86. 87. 88. 89. 90. 91. 92. 93. 94. 95. 96. 97. 98. 99. 100. 101. 102. 103. 104. 105. 106. 107. 108. 109. 110. 111. 112. 113. 114. 115. 116. 117. 118. 119. 120. 121. 122. 123. 124. 125. 126. 127. 128. 129. 130. 131. 132. 133. 134. 135. 136. 137. 138. 139. 140. 141. 142. 143. 144. 145. 146. 147. 148. 149. 150. 151. 152. 153. 154. 155. 156. 157. 158. 159. 160. 161. 162. 163. 164. 165. 166. 167. 168. 169. 170. 171. 172. 173. 174. 175. 176. 177. 178. 179. 180. 181. 182. 183. 184. 185. 186. 187. 188. 189. 190. 191. 192. 193. 194. 195. 196. 197. 198. 199. 200. 201. 202. 203. 204. 205. 206. 207. 208. 209. 210. 211. 212. 213. 214. 215. 216. 217. 218. 219. 220. 221. 222. 223. 224. 225. 226. 227. 228. 229. 230. 231. 232. 233. 234. 235. 236. 237. 238. 239. 240. 241. 242. 243. 244. 245. 246. 247. 248. 249. 250. 251. 252. 253. 254. 255. 256. 257. 258. 259. 260. 261. 262. 263. 264. 265. 266. 267. 268. 269. 270. 271. 272. 273. 274. 275. 276. 277. 278. 279. 280. 281. 282. 283. 284. 285. 286. 287. 288. 289. 290. 291. 292. 293. 294. 295. 296. 297. 298. 299. 300. 301. 302. 303. 304. 305. 306. 307. 308. 309. 310. 311. 312. 313. 314. 315. 316. 317. 318. 319. 320. 321. 322. 323. 324. 325. 326. 327. 328. 329. 330. 331. 332. 333. 334. 335. 336. 337. 338. 339. 340. 341. 342. 343. 344. 345. 346. 347. 348. 349. 350. 351. 352. 353. 354. 355. 356. 357. 358. 359. 360. 361. 362. 363. 364. 365. 366. 367. 368. 369. 370. 371. 372. 373. 374. 375. 376. 377. 378. 379. 380. 381. 382. 383. 384. 385. 386. 387. 388. 389. 390. 391. 392. 393. 394. 395. 396. 397. 398. 399. 400. 401. 402. 403. 404. 405. 406. 407. 408. 409. 410. 411. 412. 413. 414. 415. 416. 417. 418. 419. 420. 421. 422. 423. 424. 425. 426. 427. 428. 429. 430. 431. 432. 433. 434. 435. 436. 437. 438. 439. 440. 441. 442. 443. 444. 445. 446. 447. 448. 449. 450. 451. 452. 453. 454. 455. 456. 457. 458. 459. 460. 461. 462. 463. 464. 465. 466. 467. 468. 469. 470. 471. 472. 473. 474. 475. 476. 477. 478. 479. 480. 481. 482. 483. 484. 485. 486. 487. 488. 489. 490. 491. 492. 493. 494. 495. 496. 497. 498. 499. 500. 501. 502. 503. 504. 505. 506. 507. 508. 509. 510. 511. 512. 513. 514. 515. 516. 517. 518. 519. 520. 521. 522. 523. 524. 525. 526. 527. 528. 529. 530. 531. 532. 533. 534. 535. 536. 537. 538. 539. 540. 541. 542. 543. 544. 545. 546. 547. 548. 549. 550. 551. 552. 553. 554. 555. 556. 557. 558. 559. 560. 561. 562. 563. 564. 565. 566. 567. 568. 569. 570. 571. 572. 573. 574. 575. 576. 577. 578. 579. 580. 581. 582. 583. 584. 585. 586. 587. 588. 589. 590. 591. 592. 593. 594. 595. 596. 597. 598. 599. 600. 601. 602. 603. 604. 605. 606. 607. 608. 609. 610. 611. 612. 613. 614. 615. 616. 617. 618. 619. 620. 621. 622. 623. 624. 625. 626. 627. 628. 629. 630. 631. 632. 633. 634. 635. 636. 637. 638. 639. 640. 641. 642. 643. 644. 645. 646. 647. 648. 649. 650. 651. 652. 653. 654. 655. 656. 657. 658. 659. 660. 661. 662. 663. 664. 665. 666. 667. 668. 669. 670. 671. 672. 673. 674. 675. 676. 677. 678. 679. 680. 681. 682. 683. 684. 685. 686. 687. 688. 689. 690. 691. 692. 693. 694. 695. 696. 697. 698. 699. 700. 701. 702. 703. 704. 705. 706. 707. 708. 709. 710. 711. 712. 713. 714. 715. 716. 717. 718. 719. 720. 721. 722. 723. 724. 725. 726. 727. 728. 729. 730. 731. 732. 733. 734. 735. 736. 737. 738. 739. 740. 741. 742. 743. 744. 745. 746. 747. 748. 749. 750. 751. 752. 753. 754. 755. 756. 757. 758. 759. 760. 761. 762. 763. 764. 765. 766. 767. 768. 769. 770. 771. 772. 773. 774. 775. 776. 777. 778. 779. 780. 781. 782. 783. 784. 785. 786. 787. 788. 789. 790. 791. 792. 793. 794. 795. 796. 797. 798. 799. 800. 801. 802. 803. 804. 805. 806. 807. 808. 809. 810. 811. 812. 813. 814. 815. 816. 817. 818. 819. 820. 821. 822. 823. 824. 825. 826. 827. 828. 829. 830. 831. 832. 833. 834. 835. 836. 837. 838. 839. 840. 841. 842. 843. 844. 845. 846. 847. 848. 849. 850. 851. 852. 853. 854. 855. 856. 857. 858. 859. 860. 861. 862. 863. 864. 865. 866. 867. 868. 869. 870. 871. 872. 873. 874. 875. 876. 877. 878. 879. 880. 881. 882. 883. 884. 885. 886. 887. 888. 889. 890. 891. 892. 893. 894. 895. 896. 897. 898. 899. 900. 901. 902. 903. 904. 905. 906. 907. 908. 909. 910. 911. 912. 913. 914. 915. 916. 917. 918. 919. 920. 921. 922. 923. 924. 925. 926. 927. 928. 929. 930. 931. 932. 933. 934. 935. 936. 937. 938. 939. 940. 941. 942. 943. 944. 945. 946. 947. 948. 949. 950. 951. 952. 953. 954. 955. 956. 957. 958. 959. 960. 961. 962. 963. 964. 965. 966. 967. 968. 969. 970. 971. 972. 973. 974. 975. 976. 977. 978. 979. 980. 981. 982. 983. 984. 985. 986. 987. 988. 989. 990. 991. 992. 993. 994. 995. 996. 997. 998. 999. 1000.

CHAP.

CHAP. IX.

¶ Of three *Obelisks*. The first of Thebes in high Egypt: the second of great Alexandria in Egypt: and the third which standeth at Rome in the large Cirque or Shew-place.

IT is said, that *Ramises* abouenamed kept 20000 men at work about this *Obeliske*. The King himselfe in person, when it should be reared on end, fearing lest the engines deuised to raise it, and hold the head thereof betwixt heauen and earth, in the rearing should faile and not be able to beare that monstrous weight, because hee would lay the heauier charge vpon the artificers that were about this enterprife, vpon their vtmost perill, caused his own son to be bound to the top thereof; imagining withall, that the care of the engineers who vnderooke the weighing vp this *Obeliske*, ouer the young prince, for feare of hurting him, would induce them also to be the more heedfull to preserue the stone. Certes, this *Obeliske* was a piece of work so admirable, that when *Cambyses* had woon the city where it stood, by assault, and put all within to fire and sword, and burnt all before him, as far as to the very foundation & vnderpinning of the *Obeliske*, commanded expressly to quench the fire: and so in a kind of reuerence yet vnto a masse and pile of stone, spared it, who had no regard at all of the city besides. Other *Obelisks* there be twaine, the one erected by *K. Smarres*, the other by *Egyphtus*, both without characters, and the same are 48 cubits in height apiece. At Alexandria, *K. Ptolomeus* surnamed *Philadelphus*, set vp another *Obeliske* 80 cubits high, the which king *Metabris* had caused to be hewed out of the quarry, plaine without any work; but much more difficultie there was in carying it from the quarry, & setting it vpright, than there had bin labor in the hewing: some write, that *Satyrus* a great architect & engineer, conueied it to Alexandria by means of flat bottoms or sleds. But *Calixenus* saith, that one *Phanix* did the deed, who caused a trench to be cut from the riuer Nilus, and to be carried with water as far as to the place where the *Obeliske* lay along: then he deuised two broad barges, prepared & well fraught with smal squares of the same stone, a foot euery way, to the double poise or weight of the *Obeliske* it selfe in proportion, by reason whereof the vessels hauing their full load, might come vnder the *Obeliske* iust as it lay hollow ouerthwart the head of the fosse, with either end resting vpon the banks: which done, he began to discharge the vessels vnderneath, & to throw out the stones werewith they were laden, by meanes whereof, as they were lightened, they rose vp higher and higher to the very *Obeliske*, and receiued the charge ordained for them. He writes moreover, that there were six other like to it hewed out of the same mountain, & the workmen who cut and squared them had fifty talents for a reward. But the foresaid *Obeliske* was afterwards by the abouenamed king, erected in the haven of *Arfinoe*, in testimonie of loue to *Arfinoe* his wife and sister both. But for that it did hurt to the ship-docke there, one *Maximus* a gouernor of Egypt vnder the Romans, remoued it from thence into the market place of the said city, cutting off the top of it, intending to put a filiall thereupon gilded, which afterwards was forelet and forgotten. Two *Obelisks* more there were in the haven of Alexandria neere to the temple of *Caesar*, which were hewed out of the rocke by *Mesphes* king of Egypt, being 42 cubits high. But about all other difficultie, it passeth, what a do there was to transport them by sea to Rome: and verily, the ships prepared of purpose therefore were passing faire and wonderfull to see to. As for one of the said ships which brought the former *Obeliske*, *Augustus Caesar* the Emperor of famous memorie, had dedicated it vnto the harbor or haven of *Puteoli*, there to remain for euer as a miracle to behold, but it fortunately was consumed with fire: the other, wherein *C. Caesar* had transported the second *Obeliske* into the riuer, after it had bin kept safe for certaine yeares together, to be seen (for that it was the most admirable Carrick that euer had bin known to float vpon the sea) *Claudius Caesar* late Emperour of Rome caused it to be brought to Ostia, where for the safetie and securitie of the haven he sunk it, and thereupon, as a sure foundation, he raised certaine piles or bastions like turrets or sconces, with the sand of *Puteoli*: which being done, a new care and trouble there was to bring the *Obeliske* vp the riuer *Tiberis* to Rome. Which being effected, it appeared well by that experiment, that vpon the riuer *Tiberis* a vessel draweth as much water full as Nilus. As touching the said *Obeliske* which *Augustus Caesar* late Emperor erected in the great shew-place or cirque at Rome, it was first cut out of the rock by

* *Scampt*.

* Whom some
take to be *A-*
mafis.

* *Senneseferus* King of Egypt, in the time of whose reign *Pythagoras* sojourned in Egypt; & the same contains 125 foot nine inches, besides the foot or base of the said stone. As for the other, standing in *Mars* field, being 9 foot lower than it, hewed and squared it was by commandement from *Sesostris* K. of Egypt. In the characters ingrauen in both of them a man may see all the philosophy and religion of the Egyptians, for they contain the interpretation of nature.

CHAP. X.

¶ Of that Obelisk at Rome which standeth in *Mars* field, and serueth for a *Gnomon*.

AND as for that Obelisk which standeth in *Mars* field, *Augustus Caesar* deuised a wonderfull means that it should serue to mark out the noon tide, with the length of day and night, according to the shadowes that the Sun doth yeeld by it: for hee placed vnderneath at the foot of the said Obelisk, according to the bignes and length thereof, a pauement of broad stone, wherein a man might know the sixt houre or mid-day at Rome, when the shadow was equall to the Obelisk; and how by little and little, according to certain rules (which are lines of brasse inlaid within the said stone) the daies do increase or decrease. A thing no doubt worth the knowledge, and an inuention proceeding from a pregnant wit. *Manlius* a renowned Mathematician & Astronomer, put vnto the top of the said Obelisk a gilded ball, in such sort, that all the shadow which it gaue fell vpon the Obeliske, and this cast other shadowes more or lesse, different from the head or top of the Obeliske aforesaid. The reason whereof (they say) was vnderstood from the sundry shadowes that a mans head yeelds. But surely for these thirty yeares past, or thereabout, the vse of this quadrant aforesaid hath not been found true: and what the reason of it should be I know not; whether the course of the Sun in it self be not the same that hertofore, or be altered by some disposition of the heauens; or whether the whole earth be somewhat removed from the true centre in the midst of the world (which I heare say is found to be so in other places) or that it proceed by occasion of the earthquakes which haue shaken the city of Rome, and so haply wrested the *Gnomon* from the old place: or lastly, whether by reason of many inundations of *Tyber*, this huge and weighty Obelisk hath settled and sunk down lower (and yet it is said, the foundation was laid as deep vnder ground as the obelisk it selfe is aboue ground.)

CHAP. XI.

¶ Of the third Obelisk in the *Vaticane*.

THERE is a third Obelisk at Rome, standing within the cirque or shew-place of the two Emperors *C. Caligula* and *Nero*: and this is the only Obeliske known to haue bin broken in the rearing. This was hewn and erected in Egypt by *Nuncoreus* the son of *Sesostris*: which *Nuncoreus* caused another to be set vp of 100 cubits high, and consecrated it vnto the Sun, after hee had recovered his sight vpon blindness, being so aduertised by the Oracle, which remaines at this day.

CHAP. XII.

¶ Of the Egyptian Pyramides, and of *Sphinx*.

HAVING thus discoursed of the Obelisks, it were good to say somewhat of the Pyramids also in Egypt; a thing I assure you that bewraith the foolish vain-glory of the Kings in that countrey, who abounding with wealth, knew not what to doe with their money, but spent it in such idle and needlesse vanities. And verily most writers doe report, That the principall motiues which induced them to build these Pyramids, was partly to keepe the Common people from idleness, partly also because they would not haue much treasure lying by them, lest either their heirs apparant, or other ambitious persons who aspired to be highest, should take occasion thereby to play false and practise treasons. Certes a man may obserue the great follies of those princes herein, That they began many of these Pyramids, and left them unfinished

A may appeare by the tokens remaining thereof. One of them there is within the territory vnder the jurisdiction of *Arsinoe*; two within the prouince that lieth to the gouernment of *Memphis*, not far from the Labyrinth, whereof also I purpose to speake: there are other twaine likewise in the place where sometimes was the lake *Moeris*, which was nothing else but a mighty huge fort intrenched by mans hand in manner of a more or poole; but the Egyptians (among many other memorable and wonderfull works wrought by their princes) speake much of these two * *Pyramides*, the mighty spires and steeples whereof (by their saying) do arise out of the very water. As for the other three which are so famous throughout the world (as indeed they are notable marks to be kenned a far off by sailers, and directions for their course) these are scituate in the marches of *Affricke* vpon a craggy and barren mountaine, betwene the city *Memphis* and a cer-

B taine Island ordiuison of *Nilus* (which as I haue said before) was called *Delta*, within foure miles of *Nilus* and six from *Memphis*, where there standeth a village hard vnto it named *Bustis*, wherein there be certaine fellows that ordinarily vse to clime vp to the top of them. Over against the sayd *Pyramides* there is a monstrous rocke called *Sphinx*, much more admirable than the *Pyramides*, and forsooth the peasants that inhabit the countrey esteemed it no lesse than some diuine power and god of the fields and Forrests: within it, the opinion goeth, that the body of *K. Amasis* was intombed; & they would bear vs in hand, that the rock was brought thither, all and whole as it is; but surely it is a mere crag growing naturally out of the ground; howbeit wrought also with mans hand, polished and very smooth and slippery. The compasse of this rocks head (resembling thus a monster) taken about the front, or as it were the forehead,

C containeth one hundred and two foot, the length or heighth 143 foot; the heighth from the belly to the top of the crowne in the head, ariseth to 62 foot. But of all these *Pyramides*, the biggest doth consist of the stone hewed out of the Arabicke quarries: it is said, that in the building of it there were 366000 men kept at worke twentie yeares together; and all three were in building three score and eighteene yeares and foure moneths. The writers who haue made mention of these *Pyramides*, were *Herodotus*, *Euhemerus*, *Darius* the Samian, *Arifagoras*, *Dionysius*, *Artemidorus*, *Alexander Polyhistor*, *Butorides*, *Anisthenes*, *Demetrius*, *Democritus*, and *Apion*: but (as many as haue written hereof) yet a man cannot know certainly and say, This *Pyramid* was built by this king: a most iust punishment, that the name and authors of so monstrous vanity, should be buried in perpetuall obliuion: but some of these Historiographers haue reported, that there were

D a thousand and eight hundred talents laid out only for radish, garlick, and onions, during the building of these *Pyramides*. The largest of them taketh vp eight acres of ground at the foot, foure square it is made, and euery face or side thereof equall, containing from angle to angle eight hundred fourescore and three foot, and at the top five and twenty: the second made likewise foure cornered, is on euery side euen, and comprehendeth from corner to corner seven hundred thirty and seven foot: the third is lesse than the former two, but far more beautifull to behold, built of *Ethiopian* stones; it carrieth at the foot in each face betwene foure angles, three hundred three score and three foot. And yet of all these huge monuments, there remaine no tokens of any houses built, no apparence of frames and engins requisite for such monstrous buildings; a man shall find all about them far and neare, faire sand and small red grauell, much like

E vnto *Lentill* seed, such as is to be found in the most part of *Affricke*. A man seeing all so cleane and euen, would wonder at them how they came thither; but the greatest difficultie moouing question and maruell, is this, What meanes were vsed to carry so high as well such mightie masses of hewen squared stone, as the filling, rubbish, and mortar that went thereto; for some are of opinion, that there were deuised mounts of salt and nitre heaped vp together higher and higher as the worke arose and was brought vp; which being finished, were demolished, and so washed away by the inundation of the riuer *Nilus*: others thinke, that there were bridges reared with bricks made of clay, which after the worke was brought to an end, were distributed abroad and imploied in building of priuat houses; for they hold, that *Nilus* could neuer reach thither, lying as it doth so low vnder them when it is at the highest, for to wash away the heaps and mounts aboue said. Within the greatest *Pyramid* there is a pit 86 cubits deep, and thither (some thinke) the riuer was let in. As touching the heighth of these *Pyramides* & such like, how the measure should be taken, *Thales Milesius* deuised the meanes, namely, by taking just length of a shadow when it is meet and euen with the bodie that casteth it. These were the wonderfull *Pyramides* of Egypt, whereof the world speaketh so much. But to conclude this argument,

Ddd

That

* *Herodotus* saith, they were 250 foot high aboue the water, and as many deepe vnder

That no man should need to marvell any more of these huge workes that kings haue built, let G him know thus much, that one of them, the least (I must needs say) but the fairest and most commended for workmanship, was built at the cost and charges of one *Rhodope*, a very strumpet: this *Rhodope* was a bondslawe together with *Asiopo* a Philosopher in his kind, and writer of morall fables, with whom she serued vnder one master in the same house: the greater wonder it is therefore and more miraculous than all I haue said before, that euer she should bee able to get such wealth by playing the harlot.ouer and about the Pyramides abovesaid, a great name there is of a tower built by one of the kings of Egypt within the Island Pharos, and it keepeth & commands the hauen of Alexandria, which tower (they say) cost 800 talents the building. And here because I would omit nothing worth the writing, I cannot but note the singular magnanimity of *K. Ptolome*, who permitted *Softratus* of Gnidos (the master workman and architect) to graue H his owne name in this building. The vse of this watch-tower, is to shew light as a lanthorne, and giue direction in the night season to ships, for to enter the hauen, & where they shall auoid bars and shelues, like to which there be many beacons burning to the same purpose, and namely, at Puteoli and Rauenna. This is the danger onely, lest when many lights in this lanterne meet together, they should be taken for a star in the skie; for that a far off such lights appeare to sailers in manner of a star. This engineer or master workman before said, was the first man that is reported to haue made the pendant gallery and walking place at Gnidos.

CHAP. XIII.

¶ Of the Labyrinths in Egypt, Lemnos, and Italy.

Since wee haue finished our Obelisks and Pyramides, let vs enter also into the Labyrinths, which we may truly say, are the most monstrous workes that euer were deuised by the head of man: neither are they incredible & fabulous, as peraduenture it may be supposed; for one of them remaineth to be seen at this day within the iurisdiction of Heracleopolis, the first that euer was made, to wit, three thousand and six hundred yeares ago, by a king named *Petefuccas*, or as some thinke *Tithoes*: and yet *Herodotus* saith, it was the whole worke of many KK. one after another, and that *Psammerichus* was the last that put his hand to it and made an end thereof: the reason that moued these princes to make this Labyrinth, is not resolued by writers, but diuerse causes are by them alledged: *Demoteles* saith, that this Labyrinth was the roiall pallace and seat of king *Motherudes*: *Lycias* affirmeth it to be the sepulchre of *K. Maris*: the greater part are of opinion, that it was an ædifice dedicated expressly and consecrated vnto the Sun, which in my conceit commeth nearest to the truth. Certes, there is no doubt made that *Dadalus* tooke from hence the pattern and platforme of his Labyrinth which he made in Crete; but surely he expressed not above the hundreth part thereof, chusing onely that corner of the Labyrinth which containeth a number of waies and passages, meeting and incountring one another, winding and turning in and out euery way, after so intricat manner and so inexplicable, that when a man is once in, he cannot possibly get out againe: neither must wee thinke that these turnings and returnings were after the manner of mazes which are drawne vpon the pavement and plain floore of a field, such as we commonly see serue to make sport and pastime among boies, that is to say, L which within a little compasse and round border comprehend many miles; but here were many dores contriued, which might trouble and confound the memorie, for seeing such variety of entrees, allies, and waies, some crossed & encountred, others flanked on either hand, a man wandred still and knew not whether he went forward or backward, nor in truth where he was. And this Labyrinth in Crete is counted the second to that of Egypt: the third is in the Isle Lemnos: the fourth in Italy: made they were all of polished stone, and besides vaulted ouer head with arches. As for the Labyrinth in Egypt, the entree thereof (whereat I much maruell) was made with columns of stone, and all the rest stuffed so substantially and after such a wonderfull maner crouched and laid by art of Maſonrie, that impossible it was they should in many hundred yeres be disjointed and dissolued, notwithstanding that the inhabitants of Heracleopolis did what they could to the contrary; who for a spight that they bare vnto the whole worke, annoied and impeached it wonderfully. To describe the site and plot thereof, to vnfold the architecture of the whole, and to rehearse euery particular thereof, it is not possible; for diuided the building is into sixteene regions or quarters, according to the sixteene seuerall governments in Egypt (which they

A they call *Nomos*) and within the same are contained certain vast & stately pallaces which bear the names of the said iuridictions, and be answerable to them: besides, within the same precinct are the temples of all the Egyptian gods: ouer and about, fifteen little chappels or shrines, euerie one enclosing a *Nemesis*, to which goddesse they be all dedicated: to say nothing of many Pyramides forty ells in height apiece, and euery of them hauing six walls at the foot, in such sort, that before a man can come to the Labyrinth indeed which is so intricat & inexplicable, & wherein (as I said before) he shall be sure to lose himselfe, he may make account to bewearie & tyred out: for yet he is to passe ouer certain lofts, galleries, & garrets, all of them so high that he must clime staires of ninety steps apiece ere he can land at them; within the which, a number of columns and statues there be, all of porphyrit or red marble, a world of images and statues B representing as well gods as men, besides an infinit sort of other pieces pourtraied in monstrous and ougly shapes, and there erected. What should I speake of other rooms and lodgings which are framed and situat in such manner, that no sooner are the dores and gates opened which lead vnto them, but a man shall heare fearfull cracks of terrible thunder: furthermore, the passages from place to place are for the most part so conueighed, that they be as dark as pitch, so as there is no going through them without fire light: and still be we short of the Labyrinth, for without the main wall thereof, there be two other mighty vpright wals or wings, such as in building they call *Prætor*; & when you are passed them, you meet with more shrouds vnder the ground, in manner of caues and countermines vaulted ouer head, and as dark as dungeons. Moreouer, it is said, that about 600 yeares before the time of *K. Alexander* the Great, one *Circamnos* (an eunuch or C groome of *K. Nestis* chamber) made some small reparations here about this Labyrinth, & neuer any but hee would go about such a piece of work. It is reported also, that while the main arches and vaults were in rearing (and those were made all of foure square ashler stone) the place shone all about and gaue light with the beams and plancher made of the Egyptian *Acacia* ladden in oile. And thus much may serue sufficiently for the Labyrinths of Egypt and Candy.

The Labyrinth in Lemnos was much like to them, only in this respect more admirable, for that it had a hundred and forty columns of marble more than the other, all wrought round by turners craft, but with such dexterity, that a very child was able to weld the wheele that turned them, the pins and poles wherby they hung were so artificially poysed. The master deuisers and architects of this Labyrinth, were *Zmilus*, *Rbolus*, and a third vnto them, one *Theodorus* who was D borne in the same Island. Of this, there remaine some reliques to be seene at this day; whereas a man shall not find one smal remnant either of the Italian or Candian Labyrinths: for meet it is that I should write somewhat also of our Labyrinth here in Italy, which *Porſena* K. of Tuscane caused to be made for his own sepulchre; and the rather, because you may know that forein KK. were not so vain in expences, but our princes in Italy surpassed them in vanity: but for that there go so many tales and fables of it which are incredible, I think it good in the description thereof to vse the very words of my author *M. Varro*: King *Porſena* (quoth he) was interred vnder the citie Clusinum in Tuscane, in which very place he left a sumptuous monument or tombe built all of square stone; thirty foot it carried in bredth on euery side, and fifty in height; within the base or foot whereof (which likewise was fouresquare) he made a Labyrinth, so intricat, that if a E man were entred into it without a bottom or clue of thread in his hand, and leaving the one end thereof fastned to the entry or dore, it was impossible that euer he should find the way out again. Vpon this quadrant there stood fixe Pyramides or steeples, foure at the foure corners, and one in the mids, which at the foot or foundation caried 75 foot euery way in bredth, & were brought vp to the height of 150: these grew sharpe spired toward the top, but in the very head so contriued, that they met all in one great roundle of brasse which wrought from one to the other, & couered them all in manner of a cap, and the same rising vp in the mids with a crest most stately; from this couer there hung round about at little chains, a number of bells or cimbals, which being shaken with the wind, made a jangling noise that might be heard a great way off, much like to that ring of bells which was deuised in times past ouer the temple of *Iupiter* at Dodona: I & yet are we not come to an end of this building mounted aloft in the aire, for this couer ouer head serued but for a foundation of 4 other Pyramides, and euery one of them arose a hundred foot high about the other worke, vpon the tops whereof there was yet one terrace more to sustaine fixe Pyramides, and those shot vp to such a monstrous height, that *Varro* was ashamed to report it: but if we may giue credit to the tales that go currant in Tuscane, it was equall to the

* Which was 250 foot 250 that the whole was 500 foot.

whole * building vnderneath. O the outrageous madnesse of a foolish prince, seeking thus in a vaine glorious mind to be immortalized by a superfluous expence which could bring no good at all to any creature, but contrariwise weakened the state of the kingdome! And when all was done, the artificer that enterprised and finished the worke, went away with the greater part of the praise and glory.

CHAP. XIII.

¶ Of a garden made vpon Terraces. Of a citie standing all vpon vaults and arches from the ground. And of the temple of Diana in Ephesus.

WE reade moreover of gardens made in the aire; nay it is recorded, that a whole city (and namely Thebes in Egypt) was built so hollow, that the Egyptian KK. were wont to lead whole armies of men vnder the houses of the said city, and in such sort as none of the inhabitants could beware thereof, yea and sodainly appeare from vnder the ground: a maruelous matter I assure you, but much more wonderfull in case the riuer Nilus also ran thorow the mids of the said towne. But surely of this opinion I am, that if this be true, *Homer* no doubt would haue written of it, considering he hath spoken so much in the praise and commendation of this city, and especially of the * hundred gates that it had. But to speake of a stately and magnificent work indeed, the temple of *Diana* in Ephesus is admirable, which at the common charges of all the princes in Asia was * two hundred and twenty yeres a building. First and foremost, they chose a marsh ground to set it vpon, because it might not be subiect to the danger of earthquakes, or feare the chinkes and opening of the ground: againe, to the end that so mighty and huge building of stone worke should stand vpon a sure and firme foundation (notwithstanding the nature of the soile giuen to be slipperie and vnsteadfast) they laid the first couch and course of the ground worke with charcole well rammed in manner of a pauement, & vpon it a bed of wool-packs: this temple carried in length throughout, four hundred twenty and siue foot, in breadth two hundred and twenty: in it were a hundred and seuen and twenty pillars, made by so many KK. and euery one of them threescore foot high; of which, six and thirtie were curiously wrought and engrauen, whereof one was the handiwork of *Scopas*; *Chersiphron* the famous architect was the chiefe deuiser or master of the workes, and who vndertooke the * rearing thereof: the greatest wonder belonging thereto was this, How those huge chapters of pillars, together with their frizes and architraues, being brought vp and raised so high, should be fitted to the sockets of their shafts: but as it is said, he compassed this enterprife and brought it to effect, by the meanes of certaine bags or sacks filled with sand; for of these he made a soft bed as it were raised about the heads of the pillars, vpon which bed rested the chapters, and euer as he emptied the nethermost, the foresaid chapters settled downward by little and little, and so at his pleasure he might place them where they should stand: but the greatest difficultie in this kind of worke, was about the very frontispiece and maine linte-tree which lay ouer the jambes or cheekes of the great dore of the said temple; for so huge and mighty it was, that hee could not weld it to lay & bestow the same as it ought, for when he had done what he could, it was not to his mind, nor couched and settled in the right place: whereupon the workman *Chersiphron* was much perplexed in his mind, and so wearie of his life, that he purposed to make himself away: but as he lay in bed in the night season, and fell asleep all wearie vpon these dumps and desperat cogitations, the goddesse *Diana* (in whose honor this temple was framed, and now at the point to be reared) appeared sensibly vnto him in person, willing him to be of good cheare and resolute to liue still, assuring him that she her self had laid the said stone of the frontispiece, and couched it accordingly: which appeared true indeed the morrow morning, for it seemed that the very weight thereof had caused it to settle iust into the place, and made a joint as *Chersiphron* would haue wished it. As touching all the other singularities belonging to this temple, and namely the gorgeous ornament that set it out, they would require many volumes to decipher and particularize vpon them; and when all is done, little or nothing pertinent they are to the illustration of Natures worke, which is the principall marke I aime at.

CHAP.

CHAP. XV.

¶ Of the proud temple in Cyzicum. The fugitive stone. The echo which resoundeth seven times to one cry. Of a great building without pin or naile of yron. The sumptuous and admirable adifices in Rome.

HERE is at this day a temple standing at Cyzicum, wherein the mason had bestowed threds of gold in all the joints vnder euery stone throughout, and those were all faire polished: within this temple, prince *Cyzicus* (who caused it to be built) minded to dedicat the image of *Iupiter* in yvorie, and of *Apollo* in marble, setting a crowne vpon his head. Certes, these joints thus enterlaced with most fine and dainty threads, gaue a wonderfull grace and beautie to the whole Church, by sending and breathing (as it were) from them certaine raies, which by reuerberation cause all the images therein to haue a glittering lustre: in such sort, that ouer and aboue the deuise and wittie inuention of the workman, the very matter also (although it be close couched and hidden betwene each stone) commendeth the price and riches of the worke.

Within the said towne there is a stone called the Fugitive and Runaway: The braue knights of Greece called Argonauts, who accompanied prince *Iason* in his voyage for the golden fleece, after they had vsed it for an anchor, left it there: but for that this stone was ready many times to run away and be gone out of their Prytaneum (for so they call their publick hall) they foudred it fast with lead. In the same city neer vnto that gate which is called Thracia, there stand seuen turrets, which doe multiply a voice, and send backe many againe for one: this miraculous rebounding of the voice, the Greekes haue a pretty name for, and call it Echo. True it is, that this repercuSSION and redoubling of the voice, proceedeth otherwhiles from the nature of the place, and most of all in vallies lying betwene hills; but at Cyzicum it cometh by fortune, and no such reason can be giuen thereof. At Olympia the like is wrought by art, for there is a gallerie there made of purpose, which after a wonderfull manner deliuereth the same voice which it receiueth, seven times backe, whereupon they call it Heptaphonon. Moreover, in Cyzicum there is a faire and large building, which (because they keep courts and sit in counsell there) is named Buleuterion: the same is built in such sort, as there goeth not one pin or naile to all the carpentry thereof: and the stories are so laid, that a man may take away the beams and rifiers without any prop or shoure to support them, yea and bestow them againe fast enough without laces to bind them. After which manner, the wooden bridge at Rome was so framed ouer the riuer Tyberis; and a matter of religion and conscience was made thereof, to maintaine it so, in remembrance of the difficultie in taking it apieces and breaking it downe, at what time as *Horatius Cocles* made the place good against the power of *K. Porfena*.

And now since the coherence of matters hath brought me to Rome, methinks I should not doe amisse to proceed vnto the miraculous buildings of this our city, to shew the docilitie of our people, and what prooffe there is of their progresse in all things, during the space of nine hundred yeres; that it may appeare how not only in magnanimitie and prowess they haue conquered the world, but in magnificence also of stately and sumptuous buildings surmounted all nations of the earth: and as a man shall find this singularity and excellencie of theirs in the particular survey of euery one of their stately and wonderfull adifices as they haue bin reared from time to time, so if he put them all together and take a generall view of them at once, he shall conceiue no otherwise of their greatnesse, than of another world assembled (as it were) to make shew in one place: for if I should reckon among great workes (as needs I must) the grand cirque or shew-place built by *Caesar* Dictator, which took vp of ground three stadia or furlongs in length, and one in breadth, containing also in adifices and rooms foure acres of iugera, wherein were bestowed to sit at ease and behold the sight with pleasure, two hundred and threescore thousand persons: what tearme shall I giue, but of Stately and magnificent buildings, either vnto the royall pallace of *Paulus* *Emilius*, enriched with goodly pillars of Sinadian marble out of Phrygia, most admirable to behold; or to the sumptuous Forum of *Augustus* *Caesar* late Emperour, or yet the temple of Peace built by the Emperour *Vespasianus* *Augustus*, now liuing, the goodliest and fairest buildings that euer were: what should I speake of the temple * *Pantheon*, made by *Agrippa* to the honor of *Iupiter* Reuenger? as also how before this time, *Valerius* of *Ofria* the architect or engineer, made a rouse over the great Theatre at Rome against the time that

D d d 3

Libo

* The round church of No-
ster dame, now
at Rome.

L. Libo exhibited his solemnitie of games and plaies to the people? Wonder we at the dispences **G** that *K.K.* were at about their Pyramides: and wonder we not rather that *Julius Caesar* Diētator disbursed for the purchase of that plot of ground only and no more wherein he built his Forum, a hundred millions of sesterces? And if there be any here that take pleasure to hoord up money, and be loth to part with a penny, and loue not to be at charges and lay forth ought, wil they not make a wonder when they heare that *P. Clodius* (whom *Milo* slew) paid for the house wherein he dwelt, fourteene millions and eight hundred thousand sesterces? surely if they donot, I do; and take it to be as foolish an expence and as wonderfull, as that of the *K.K.* in *Ægypt* about named: likewise when I consider the debts that *Milo* himselfe ought, and which amounted to seuentie millions of sesterces, I count it one of the most prodigious enormities that a mans corrupt mind can bring forth. But old men maruelled euen in those daies at the mighty thick rampiers that *K. Tarquinius Priscus* caused to be made, the huge foundations also of the Capitoll that he laid, the vaulted sinks also and draughts (to speake of a piece of worke the greatest of all others) which he deuised, by vndermining and cutting through the seuen hills whereupon Rome is seated, and making the city hanging as it were in the aire between heauen and earth, like vnto Thebes in *Ægypt*, whereof erewhile I made mention; so as a man might passe ouer the streets & houses with bores. But how would they be astonied now, to see how *M. Agrippa* in his *Ædileship*, after he had been Consull, caused seuen riuers to meet together vnder the city in one main channell, and to run with such a swift streame and current, that they take all afore them whatsoeuer is in the way, and carry it downe into Tyber: and being otherwhiles encreased with sodaine shoures & land-floods, they shake the pauing vnder them, they flank the sides of the wals about them: sometimes also they receiue the Tyber water into them when he riseth extraordinarily, so as a man shall perceiue the streame of two contrary waters affront and charge one another with great force and violence within vnder the ground: And yet for all this, these water-workes afore said yeeld not a jot, but abide firme & fast, without any sensible decay occasioned therby, Moreouer, these streames carrie downe eftsoons huge and heauie pieces of stones within them, mighty loads are drawne ouer them continually, yet these arched conduits neither settle and stoupe vnder the one, nor be once shaken with the other, down many an house falls of it selfe, and the ruins beat against these vaults: to say nothing of those that tumble vpon them with the violent force of skarefires, ne yet of the terrible earthquakes which shake the whole earth about them: yet for all these injuries, they haue continued since *Tarquinius Priscus*, almost eight hundred yeres inextinguishable. And here by the way I will not conceale from you a memorable example which is come into my mind by occasion of this discourse, and the rather, for that euen the best & most renowned Chroniclers who haue taken vpon them to pen our Romane history, haue passed it ouer in silence: When this *K. Tarquinius* surnamed *Priscus*, caused their vaults vnder the ground to be made, and forced the common people to labour hard therat with their own hands, it happened that many a good Roman citizen being now ouer-toiled in this kind of work (which whether it were more dangerous or tedious, was hard to say) chose rather to kill themselves for to be rid of their irksome and painfull life; in such sort, that daily there were people missing, and their bodies found after they were perished. This king therefore, to preuent farther mischief, and to prouide that his works begun might be brought to an end, deuised a remedy which neuer was inuented before, nor practised afterwards, and that was this, That the bodies of as many as were thus found dead, should be hung vpon jebets, exposed not onely to the view of all their fellow citizens to be despised as cursed creatures, but also to the wild and rauinous fowles of the aire to be torne and deuoured. The Romans (as they are the only nation vnder heauen impatient of any dishonor) seeing this obiekt presented before their eies, were mightily abashed, and as this mind of theirs had gained them victory many a time in desperat battels, so at this present also it guided & directed them: and being (as they were) dismayed at this disgrace, they made account no lesse to be ashamed of such an ignominie after death, than they now blushed thereat in their life. But to return again vnto these sinks and water-workes of ours vnder the ground: *K. Tarquinius* afore-named, caused them to be made so large and of such capacitie, that a good wain load of hay might passe within them. But al that euer I haue said already is nothing or at leastwise very little, in comparison of one wonderful thing which I am content to set down before I come to our new and moderne buildings: In that yeare when *M. Lepidus* and *Q. Catulus* were Consuls at Rome (according as I find all the best writers to agree) there was not a fairer

* H.S. millier.

* At Rome.

A and more sumptuous house in all Rome, than that wherein *Lepidus* himselfe dwelt: but verily before five and thirty yeres were come and gone, there were a hundred houses and more, brauer than it by many degrees. Now, if a man list by this reckoning to make an estimat of the infinite masse of marble, as well in pillars as square Ashler, the rich and curious pictures, besides other sumptuous furniture, meet indeed for a king, which must of necessitie be employed in a hundred such houses, as might not onely compare with that most beautifull and gorgeous house of *Lepidus*, but also exceed the same; as also the infinit number of other houses afterwards euen vntil this day, which haue gone beyond those hundred in sumptuosities: VVhat would he say, and to what an vnmeasurable proportion will all this arise? Certes, it cannot be denied, but fire (which burneth many a stately pallace) doth say well to the plucking down of mans pride, & punishing such wastfull superfluities; and yet these & such like examples, will not reforme the abuses that reign in the world: neither wil this lesson enter into our heads, That there is ought vnder heauen more fraile, mortall, and transitory, than man himselfe. But what do I stand vpon those glorious edifices, when two pallaces only haue surpassed them all in costlines and magnificence. Twice in our time we haue seen the whole pourprise of Rome to be taken vp, for to make the pallaces of two Emperours, *C. Caligula*, and *Nero*: and as for that of *Nero* (because there might bee nothing wanting of superfluitie in the highest degree) he caused it to be all guilded, and called it was, The golden pallace. For why? those noble Romans who were the founders of this our Empire, dwelt (no doubt) in such glorious and stately houses; those I mean who went from the very plough taile, or out of their country cabins (where they were found at repast by the fire side) C to manage the wars, to atcheeue braue feats of armes, to conquer mighty nations, and to return with victory triumphant into the citie; such, I say, as had not so much free land in the whole world as would serue for one of the cellars of these prodigals. And here I cannot but think with my selfe, how little in proportion to the magnificent buildings of these daies were those plots of grounds which in old time the whole state gaue vnto those inuincible captains by publick degree for to build them houses vpon, and how many of such places would go to one of these in our time, and yet this was the greatest honour that they could deuise to bestow vpon those valiant and hardy knights, as it may appeare by **L. Valerius Publicola*, the first consull that euer was at Rome, and had companion with him in that gouernment *L. Brutus*, who had no other reward in recompence of his good seruice to the Commonweale, and so many demerits; as also by his D brother who in the same Consulship defeated the Samnites twice: where it is worth the noting that in the patent this branch went withall, That they were allowed to open the gates of their houses outward, so as the doores might be cast to the street side: this was in those daies the most glorious and honourable shew that such mens houses made, euen those who had triumphed ouer the enemy. Howbeit, as sumptuous in this kind, as either *C. Caligula* or *Nero* was, yet shal they not enjoy the glory of this fame, though you put them two and two together: for I wil shew, that al this pride & exceffe of theirs in building their pallaces (princes though they were & mighty monarchs) came behind the priuat works of *M. Scantius*: Whose example in his *Ædileship* was of so ill consequence, as I wot not whether euer there were any thing that ouerthrew so much all good manners and orderly ciuility: in such sort, as hard it is to say, whether *Sylla* did more damage E to the state, in hauing a son in law so rich & mighty, than by the proseription of so many thousand Romane citizens. And in truth, this *Scantius* when he was *Ædile*, caused a wonderfull piece of worke to be made, and exceeding all that euer had been knowne wrought by mans hand, not only those that haue been erected for a moneth or such a thing, but euen those that haue bin destined for perpetuities; and a theatre it was: the stage had three lofts one above another, wherein were there hundred and threescore columnes of marble; (a strange and admirable sight in that citie, which in times past could not endure six small pillars of marble, hewed out of the quarry in mount Hymettus, in the house of a most honourable personage, without a great reproch and rebuke giuen to him for it;) the base or nethermost part of the stage, was all of marble; the middle of glasse (an excessive superfluitie, neuer heard of before or after;) as for the vppermost, the F boards, planks, and floores were guilded; the columnes beneath, were (as I haue said before) fortie foot high, wanting twaine; and between these columnes (as I haue shewed before) there stood of statues and Images in brasse to the number of three thousand. The theatre it selfe was able to receiue fourescore thousand persons to sit well, and at ease. Whereas the compasse of *Pompeies* Amphitheatre (notwithstanding the city of Rome so much enlarged, and more peopled in his time)

* Publius, out of Livie.

* For Sylla married the mother of Scantius

* L.C. 47.

time) was deuised for to contain no greater number than fortie thousand seats at large. As touching the other furniture of this Theatre of *Scaurus* in rich hangings, which were cloth of gold: painted tables, the most exquisite that could be found: plaiers apparrell and other stufte meet for to adorne the stage, there was such abundance thereof, that there being caried back to his house of pleasure at Tusculum the surplussage therof, ouer and aboue the daintiest part, wherof he had daily vse at Rome, his seruants and slaues there, vpon indignation for this wast and monstrous superfluitie of their master, set the said country house on fire, and burnt as much as came to a hundred millions of sesterces. Certes, when I consider and behold the monstrous humours of these prodigall spirits, my mind is drawn away stil from the progresse of mine intended iourny, and forced I am to digresse out of my way, and to annex vnto this vanity of *Scaurus* as great follie of another, nor in masonry and marble, but in carpentry and timber: and *C. Curio* it was, he who in the ciuile warres betwene *Cesar* and *Pompey*, lost his life in the quarrell of *Cesar*. This gentleman, desirous to shew pleasure vnto the people of Rome at the funeral of his father deceased, as the manner then was, and seeing that he could not outgo *Scaurus* in rich and sumptuous furniture (for where should he haue had such a father in law again as *Sylla*? Where could he haue found the like mother to dame *Metella*, who had her share in all forfeitures and confiscations of the goods of outlawed citizens? and where was it possible for him to meet with such another father as *M. Scaurus*, the principall person of the whole city so long together, who parted stakes with *Marinus* in pilling and polling of the prouinces, and was the very receptacle & gulf which receiued and swallowed all their spoiles and pillage?) and *Scaurus* himselfe verily, if he might haue had all the goods in the world, could not haue done as he did before, nor make I like Theatre, againe, by reason that his house at Tusculum was burnt, where the costly and rich furniture, the goodliest rare ornaments which he had gotten together from all parts of the world were consumed to ashes: by which fire yet this good hee got and prerogative aboue all other, That no man euer after him was able to match that sumptuositie of his Theatre. This gentleman (I say) *Curio*, al things considered, was put to his shifts, & deuised to surpass *Scaurus* in wit, since hee could not come neere him in wealth. And what might his inuention be? Certes, it is worth the knowledge, if there were no more but this, that we may haue ioy of our own conceits and fashions, and call our selues worthily, as our manner is, **Majores*, that is to say, superiour euery way to all others. To come then to *C. Curio*, & his cunning deuise, he caused two Theatres to be framed of timber, and those exceeding big, howbeit so, as they might be turned about as a man would haue them, approach neere one to the other, or be removed farther asunder as one would desire, & all by the means of one hooke apiece that they hung by, which bare the weight of the whole frame, the counterpoise was so euen, & all the whole therefore sure and firme. Now he ordered the matter thus, that to behold the feuerall stage plaies and shews in the forenoone before dinner, they shall be set back to back, to the end that the stages should not trouble one another: and when the people had taken their pleasure that way, he turned the Theatres about in a trice against the afternoone, that they affronted one another: and toward the latter end of the day, and namely, when the fencers and sword-plaiers were to come in place, he brought both the Theatres nearer together (and yet euery man sat stil & kept his place, according to his rank and order) in so much, as by the meeting of the horns and corners of them both together in compass, he made a faire round Amphitheatre of it: and there in the midst betweene, he exhibited indeed vnto them all jointly, a sight and spectacle of sword-fencers fighting at sharpe, whom he had hired for that purpose: but in truth, a man may say more truly, that he caried the whole people of Rome round about at his pleasure, bound sure enough for stirring or remoouing. Now let vs come to the point, and consider a little better of this thing. What should a man wonder at most therein, the deuise or the deuise it selfe? The workman of this fabrick, or the master that set him on worke? Whether of the twaine is more admirable, either the venturous head of him that deuised it, or the bold heart of him that vndertook it: to command such a thing to be done, or to obey and yeeld to goe in hand with it? But when we haue said all that we can, the follie of the blind & bold people of Rome went beyond all: who trusted such a ticklish frame, & durst sit there, in a seat so moueable. Loe where a man might haue seen the body of that people, which is commander and ruler of the whole earth, the conquerour of the world, the disposer of kingdoms and realmes at their pleasure, the deuise of countries and nations at their wil, the giuer of lawes to forreinstates, the vicegerent of the immortall gods vnder heauen, and representing their

* The Romans delighted much in this word *Majores*, as may appear by their *Mores Majorum*, &c.

A their image vnto all mankind: hanging in the air within a frame at the mercy of one only hook, rejoicing and ready to clap hands at their owne danger. What a cheape market of mens liues was here toward! What was the losse at Cannæ to this hazard, that they should complaine so much as they do of Cannæ? How neere vnto a mischiefe were they, which might haue happened hereby in the turning of a hand? Certes, when there is newes come of a city swallowed vp by a wide chinke and opening of the earth, all men generally in a publicke commiseration doe grieue thereat, and there is not one but his heart doth earne, and yet, behold the vniuersall state and people of Rome, as if they were put into a couple of barks, supported between heauen and earth, and sitting at the deuotion only of two pins or hooke. And what spectacle do they behold, a number of fencers trying it out with vnrebat swords? nay ywis, but euen themselves rather entered into a most desperat fight, and at the point to break their necks euery mothers son, if the scabbard failed neuer so little, & the frame went out of joint: Now surely by this prooff, *Curio* had gotten a good hand ouer the people of Rome, & no Tribunes of the Commons with all their Orations could do more: from that time forward he might make account to be so gracious, as to lead all the tribes after him in any suits, and haue them hanging in the air at his pleasure. What a mighty man with them might he be (thinke you) preaching vnto them from the Rostra? What would not he dare to propose, hauing audience in that publick place before them who could perswade them thus, as he did, to sit vpon such turning and ticklish Theatres. And in truth, if we wil consider this pageant vpright, we must needs confesse & may be bold to say, that *Curio* had all the people of Rome to perform a braue skirmish and combat indeed to honor and solemnize the funerals of his father before his tombe. And yet here is not all: for he was at his change and variety of magnificent shewes: and when he perceiued once that the hooke of his frames were stretched ynough and began to be out of order, hee kept them still close together round in forme of a perfect Amphitheatre, and the very last day of his funeral solemnities, vpon two stages just in the midst, he represented wrestlers and other champions to performe their deuoir, and then all on a suddaine causing the said stages to be disjointed and hailed one from another a contrary way, he brought forth the same day the fencers and sword players who had wooen the prize, and with that shew made an end of all. See what *Curio* was able to do! And yet was he neither king nor *Cesar*: he was not so much as a generall or commander of an army; nay, he was not named for any great rich man: as whose principall state depended vpon this, That when the great men of the city, *Cesar* and *Pompey*, were skuffling together by the eares, he knew well how to fish in a troubled water. But to leaue *Curio* & such as he was, with their foolish and idle expences, let vs come to the miraculous workes that *Q. Marcius Rex* performed, and that to some good purpose: which if we consider & esteeme aright, passe all the other before rehearsed. This gentleman when he was Pretor, hauing commandement & commission both from the Senat, to repaire the conduits to the waters of Appia, Anio, and Tepula, which serued Rome, did not that only, but also conueighed a new water into the city, which of his owne name he called Martia: and notwithstanding that he was to pierce certaine mountains, & make trenches quite through them vnder the ground, for to bring the water thither from the Spring, yet he persoumed all within the time of his Pretourship. As for *Agrippa*, whiles he was *Ædile*, besides the conduits from all other fountains which he scoured, repaired, and caused to keep their currant: he brought another of his own to the city, which is known by the name of *Virgo*: he made seuen hundred pooles for receipt of waters: a hundred and fise conduits, yelding water at rockes and spoutes, besides a hundred and thirtie conduit heads in the fields, and the most of them built strongly with vaults, and adorned right stately. Moreover, vpon these workes of his he erected statues & images, to the number of three hundred, partly of brasse and partly of marble, besides foure hundred pillars of marble, and all within the compass of one yeare. And if wee may beleue his owne speech, discoursing of the acts done by him during his *Ædileship*, hee addeth moreover and saith, That the plaies and games which he exhibited that yeare, for to doe the people pleasure, continued threecore daies together, wanting one: that hee caused a hundred threecore and ten baines or stouues to be made within the city, wherein people of all sorts and degrees might bathe and sweat of free cost, and not pay a denier: the which remain at this day, and haue brought with them an infinit number of others. But of all the conduits that euer were before this time, that which was last begun by *C. Caligula Cesar*, and finished by *Claudius Cesar* his successeur, passeth for sumptuousnesse: for they commanded the waters from the two foun-

tains, Curtius & Caruleus, whose heads were 40 miles off: and these they carried before them with such a force and to such an height, that they mounted up to the top of the highest hills of Rome, and served them that dwelt thereupon. This work cost three hundred millions of festerces. Certes, if a man would well and truly consider the abundance of water that is brought thereby, and how many places it serves, as well publicke as priuat, in baines, stews, and fishpools, for kitchins and other houses of office, for pipes and little riuers to water gardens, as well about the citie, as in manors and houses of pleasure in the fields neere the city, ouer and besides, what a mighty way these waters be brought, the number of arches that of necessitie must be built of purpose for to conueigh them; the mountaines that be pierced and mined through to giue way together, with the vallies that are raised and made euen and leuell with other ground: he will confesse, that there was neuer any desseine in the whole world enterprised and effected, more admirable than this. In the ranke of these most memorabell workes of man, I may well raunge the mountaine that was digged through by the same *Claudius Caesar*, for to void away the water out of the lough or meere Fucinus, although this work was left vnfinished for hatred of his *successour: which I assure you cost an incredible and inenarrable sum of mony, besides the infinit toil and labour of a multitude of workemen and labourers so many yeres together, as well to force the water which came vpon the pioners from vnder the ground with deuise of engines and windles vp to the top of the hill, whereas it stood vpon meere earth, as to cut and hew through hard reggs and rockes of flint: and all this by candlelight within the earth, in such sort that vnlesse a man had bin there to haue scene the manner of it, vnpossible it is either to conceiue in mind or expresse with tongue the difficultie of the enterprise. As for the peere and haue at Ostia (because I would make an end once of these matters) I will not say a word thereof, nor of the waies and passages cut through the mountaines, ne yet of the mighty piles and damns to exclude the Tuscane sea, for the Lucrine lake, with so many rampiers and bridges made of such infinit cost. Howbeit, among many other miraculous things in Egypt, one thing more I will relate out of mine author *Papyrius Fabianus*, a great learned Naturalist, namely, That marble doth grow daily in the quarries, and in very truth, the farmers of those quarries, and such as ordinarily do labour and dig out stone, doo asseure no lesse; who vpon their experience doe assure vs, that looke what holes and caues be made in those rockes and mountaines, the same will gather againe and fill vp in time: which if it be true, good hope there is, that so long as marbles do liue, excesse in building will neuer die.

CHAP. XVI.

¶ *The sundry kinds of the Load-stone, and the medicines thereto depending.*

NOW that I am to passe from marbles to the singular & admirable natures of other stones; who doubts but the Magnet or Loadstone will present it self in the first place? for is there any thing more wonderfull, and wherein Nature hath more trauelled to shew her power, than in it? True it is, that to rockes and stones she had giuen *voice (as I haue already shewed) whereby they are able to answer a man, nay, they are ready to gainsay and multiply words vpon him. But is that all? what is there to our seeming more dull than the stiffe and hard stone? And yet behold, Nature hath bestowed vpon it, sence, yea & hands also, with the vse thereof. What can we deuise more stubborne and rebellious in the own kind, than the hard yron, yet it yeelds, and will abide to be ordered: for loe, it is willing to be drawne by the load stone: a marvellous matter that this mettall, which tameth and conquereth all things els, should run toward I wot not what, and the nearer that it approacheth, standeth still as if it were arrested, and suffereth it selfe to be held therewith, nay, it claspeth and clungeth to it, and will not away. And hereupon it is, that some call the load-stone * *Sideritis*, others *Heracleos*. As for the name *Magnes* that it hath, itooke it (as *Nicander* saith) of the first inuentor and deuiser thereof, who found it (by his saying) vpon the mountaine *Ida* (for now it is to be had in all other countries, like as in *Spaine* also;) and (by report) a neat-heard he was: who, as he kept his beasts vpon the foresaid mountaine, might perceiue as he went vp and downe, both the hob-nailes which were in his shooes, and also the yron picke or graine of his staffe, to sticke vnto the said stone. Moreover, *Sotacius* ascribeth and setteth downe fise sundry kinds of the load-stone: the first which commeth out of *Ethyopia*; the second, from that *Magnesia* which confineth vpon *Macedonie*, and namely,

A namely, on the right hand, as you go from thence toward the lake *Boebeis*, the third is found in *Echium*, a town of *Boeotia*, the fourth about *Alexandria*, in the region of *Troas*, and the fift in *Magnesia*, a country in *Asia Minor*. The principall difference obserued in these stones, consists in the sex (for some be male, others female;) the next lieth in the colour. As for those which are brought out of *Macedonie* and *Magnesia*, they be partly red, and partly blacke. The *Boeotian* loadstone standeth more vpon red than black: contrariwise, that of *Troas* is black, and of the female sex, in which regard it is not of that vertue that others be. But the worst of all comes from *Magnesia* in *Natolia*, and the same is white: neither doth it draw yron as the rest, but resembles the pumish stone. In sum, this is found by experience, That the blower any of these loadstones be, the better they are and more powerful. And the *Ethyopian* is simply the best, in so much, as it is worth the weight in siluer: found it is in *Zimiri*, for so they call the sandy region of *Ethyopia*, which country yeeldeth also the sanguine load-stone, called *Hematites*, which both in color resembleth blood, and also if it be bruised, yeeldeth a bloody humour, yea and otherwhiles that which is like to saffron. As for the property of drawing yron, this blood-stone *Hematites* is nothing like to the loadstone indeed. But if you would know and try the true *Ethyopian Magnet*, it is of power to draw to it any of the other sorts of loadstones. This is a generall vertue in them all, more or lesse, according to that portion of strength which Nature hath indued them withal. That they are very good to put into those medicines which are prepared for the eies: but principally they do repress the vehement flux of humors that fall into them: beeing calcined and beaten into powder, they do heale any burne or scald. To conclude, there is another mountaine C in the same *Ethyopia*, and not far from the said *Zimiri*, which breedeth the stone *Theamedes* that will abide no yron, but rejecteth and driueth the same from it. But of both these natures, as well the one as the other, I haue written oftentimes already.

CHAP. XVII.

¶ *Of certaine stones which will quickly consume the bodies that be laid therein. Of others againe that preserue them a long time. Of the stone called Assius, and the medicinable properties thereof.*

WIThin the Isle *Scyros* there is a stone (by report) which so long as it is whole & sound will swim and fote vpon the water, breake the same into small pieces, it will sink. Near vnto *Assos*, a city in *Troas*, there is found in the quarries a certaine stone called *Sarcophagus*, which runneth in a dire & veine, and is apt to be clouen and so cut out of the rocke by flakes. The reason of that name is this, because that within the space of forty daies it is knowne for certaine to consume the bodies of the dead which are bestowed therein, skin, flesh, and bone, all saue the teeth. And *Mutianus* mine author affirmeth, that looke what mirrors, *currycombs, cloth, or shooes soeuer be cast into the said coffins with the dead, they will turn all into stone. Of this nature there be stones in *Lycia*, and in the East countries, which if they be hung or applied to liuing bodies also, will eat and fret them away. Yet the stone called *Chernites*, resembling E yvorie, is more mild and gentle: for keepe it will and preserue dead bodies without consuming them at all, & in a sepulchre or coffin of this stone, the body of *K. Darius* (they say) was bestowed Touching the stone called *Porus*, like it is vnto the marble of *Paros* for white colour and hardness, howbeit nothing so weighty. *Theophrastus* writeth, That there be found in *Egypt* certain cleare and transparent stones, and those he saith bee like vnto the *Serpentine marble Ophites*: haply such there were in his time, for now are there none of them to be found; but as they are gone, so there be new come in their place. As for the stone *Assius*, in tast it is saltish, but singular good to allay the paine of the gout, if the feet onely be put into a trough or hollow vessell made of that stone. Moreover, all griefes, pains, and infirmities of the legs, will be healed in such quarries: whereas in all mettall mines, the legs take harm. Furthermore, this stone yeeldeth in the top F of the quarrie a certain light substance, apt to be reduced into a soft powder, which they call the floure of the said stone, and is as effectuall as the stone it selfe in some cases. Like it is for all the world to a red pumish stone. If it be mixt with *Cyprian* brasse or copper, it cures the accidents of womens breasts; but being incorporat with pitch or rosin, it discusseth the kings euill, and any biles or bitches. The same reduced into a lioch to be licked down leasurly, serueth well in a phthy-

* *Strigilis*. He meaneth those that be used in baines to scritch off the scurf, and filthinesse of our bodies.

* *i. The eccho.*

* *ashest* in Greek is yron.

phthysicke: and tempered with hony, it healeth vp old vlcers and skinneth them cleane: and yet this property it hath, to eat away any excrescence of proud flesh. The same is good for the bitings of wild and venomous beasts. Such morimals or sores as scorne ordinary cures & be full of suppuration, it drieth. Finally, there is an excellent cataplasme made with it and beane flour put together, for the gout.

CHAP. XVIII.

¶ Of Yvorie minerall, digged out of the ground. Of stones that are of a bony nature, and such, as their veines represent Date-trees within: and of other kinds of stone.

Theophrastus and Mutianus aboue named, are verily persuaded, That there be some stones which ingender others. And as for Theophrastus, he affirmeth, That there is a minerall Yvorie found within the ground, as well black as white: also, that there be bones growing within the earth, yea, and stones of a bony substance. About Munda, a city in Spaine, where Caesar dictator defeated Pompey, there are found stones resembling Date-trees, breake them as often as you will. There be also certaine black stones, whereof there is as great account made as of marbles: like as the stone also of the cape Tanara. And such black stones (Varro saith) be more firm and hard which come out of Africa, than those of Italy; and contrariwise, that there be white stones harder to be wrought by the Turner, than the marble of Paros: the said Varro affirmeth, that the flint of Luna may be slit with the saw, whereas that of Tusculum will cracke and flie in pieces in the fire; also, That the darke and dusky Sabine stone, if it be sprinkled with oil, will burne of a light fire: moreover, That about Volfinij there haue been found quernes or hand mill-stones framed ready for worke, yea, and some we haue seen to turne about and grind of their owne accord; but such haue bin taken for prodigies. And since I am fallen vpon the mention of such mill-stones, there is not a country in the world affoordeth better of that kinde than Italy doth: neither do such grow in the rocke, and are hewed forth, but be entire stones of themselves apart: and yet in some provinces there are none of them to be had at all. And in this kind there be of a more free and softer grit, which being smoothed and polished with a slicke stone, may seem a far off as if they were Serpentine marble; and verily, there is not a stone wil indure better, or lie longer in building. For thus you must thinke, that all stones bee not of one and the same nature to abide rain and weather, heat of Summer and cold in Winter alike; for some be more durable than others, like as we find in sundry kinds of timber. Finally, there be stones also, which may not away with the raies of the Moon: which in continuance of time wil gather rust, yea, and with oile will change their white colour.

CHAP. XIX.

¶ Of Curalium or Pyrites, i. the Marcasin: and the medicinable vertues thereof. Of the stone Ostracite, and the Amiant: together with the properties seruing in Physicke: also, of the stone Melitites, and the vertues thereof. Likewise of the Geat, and the effects that it worketh in Physick, Of Spunges. Lastly, of the Phrygian stone, and the Nature of it.

The mill-stone Curalium, some call Pyrites, because it seemeth to haue great store of fire in it: howbeit, there is another fire stone going vnder the name of Pyrites or Marcasin, that resembleth brasse ore in the mine. And they say, that of it there is found great plenty in the Isle Cypros, and in those mines which are about Acarnania, where a man shal meet with one in colour like silver, and another like gold. These stones be calcined many & sundry waies: some boile them two or three times in hony, so long, vntill all the liquor be consumed: others burne them first in fire of coales, then they calcine them with hony, and afterwards wash them, after the maner of brasse. These stones thus prepared, are good in Physick, namely, to heat, to dry, to discusse, to subtiliat grosse humors, and to mollifie all schirrhosities or hard tumors. The same are much vsed also crude and vncalcined (being reduced into powder) for the kings euill, and scellions. Moreover, in the rank of these Marcasines, some range certaine stones, which we call quicke fire-

A fire-stones, and of all others they be most ponderous: these be most necessarie for the espials belonging vnto a camp, if they strike them either with an iron spike or another stone, they will cast forth sparks of fire, which lightning vpon matches dipt in brimstone, dry puffs or leaues, will cause them to catch fire sooner than a man can say the word.

As touching the stones Ostracite, they haue a resemblance to oyster shels, whereof they took their name: vied they are much in stead of a pumish stone to smooth and slick the skin: taken in drink they stanch any flux of blood; and in forme of a liniment applied with hony, they heale the vlcers in womens breasts, and assuage their paine.

The * Amiant stone is like Alum, & being put into the fire, loseth nothing of the substance: a singular propertie it hath to resist all enchantments and forceries, such especially as Magicians do practise. As for Gades, the Greeks haue giuen it this significant name, because it containeth inclosed within the belly, a certaine earth, a medicine soueraine for the eies, as also for the infirmities incident as well to womens paps, as mens genitoirs.

The stone Melitites hath that name, because if it be bruised or braied, it yeeldeth from it a certaine sweet juice in manner of honey: the same being incorporat in wax, is good to cure the flegmatick wheales, and other pusses or specks of the body; it healeth likewise the exulceration of the throat: applied with wool, it takes away the chilblanes or angry bloudi falls called E-pinytides: also the griefe of the matrice it easeth in the same manner.

The Geat, which otherwise we call Gagates, carrieth the name of a towne and riuer both in Lycia, called Gages: it is said also, that the sea casteth it vp at a full tide or high water into the Island of Leucola, where it is gathered within the space of twelue stadia, and no where els: black it is, plaine and euen, of an hollow substance in manner of a pumish stone, not much differing from the nature of wood, light, brittle, and if it be rubbed or bruised, of a strong sauer. Looke what letters are imprinted in it into any vessell of earth, they will neuer be got out again: whiles it burneth it yeelds a smel of brimstone: but a wonderful thing it is of this jeat stone, that water will soone make it to flame, and oile will quench it againe: in burning, the perfume thereof chaseth away serpents, and recouers women lying in a trance by the suffocation or rising of the mother: the said smoke discouereth the falling sicknesse, and bewraeth whether a yong dam-fell be a * maid or no: being boiled in wine, it helpeth the tooth-ache, and tempered with wax it cures the swelling glandules called the Kings euil. They say that Physitians vse this yet stone much in their forceries, practised by the means of red hot axes, which they call Axinomantia, for they affirme, that being cast thereupon, it will burn and consume, if what we desire and wish shall happen accordingly.

As for Spunges, I mean by them in this place certain stones found in Spunges, and the same also do ingender naturally within them. Some there be who call them Tecolithos, because they are good for the bladder, in this respect, that they breake the stone, being drunk in wine.

As concerning the Phrygian stone, it beareth the name of the country where it is ordinarily found, and it groweth in hollow lumps in manner of a pumish stone: the order is to steep it well in wine before it be calcined, and in the burning to maintain the fire with blast of bellows, vntil it wax red; then to quench it again in red wine, continuing this course three times: & being thus prepared, it is good only to scoure cloth, and make it ready for the Dier to take a colour.

CHAP. XX.

¶ Of the red bloud-stone Haematites, and the fine sorts thereof: also of the blacke sanguine stone called Schistos.

The bloud-stone Schistos and Haematites both haue great affinitie one with another. As for the bloud-stone Haematites, a meere mineral it is, and found in mines of metall: being burnt it comes to the colour of Vermilion: the manner of calcining it is much after that of the Phrygian stone, but wine serueth not to quench it. Many sophisticate it with Schistos, and obtrude the one for the other: but the difference is soon known, for that the right Haematites hath red veins in it, and besides is by nature fraile and easie to crumble: of wonderful operation it is to help bloud-thotten eies: the same giuen to women to drink, staieth the immoderat flux that followes them: they also that vse to cast vp bloud at the mouth, find helpe by drinking it with the juice of a pomgranat: in the diseases likewise of the bladder it is very effectual;

Ecc

and

* It is taken for Alum de plume.

* If she drinke it fasting, presently it prouoketh vrin, if she be a pure virgin.

and being taken in wine, it is souerain against the sting of serpents. In all these cases the bloud-stone Schistos is effectual, but weaker only it is in operation: and yet among these sanguine or bloud-stones, those are taken for the best and most helpfull which in colour resemble saffron; & such haue a peculiar resplendent lustre by themselves. This stone being applied to weeping and watery eyes with womans milk, doth them much good, and is souerain also to restrain and keep them in, if they be ready to start out of the head. And this I write according to the mind and opinion of our modern writers. But *Sotacus* a very antient writer hath deliuered vnto vs five kinds of bloud-stones, besides that *Hæmatites* called *Magnes*, or the Load-stone: among which he giues the chiefe prize and principall praise to the *Æthiopian*, for that it is so souerain to be put into medicines appropriat to the eyes; as also into those which for their excellent operation be called *Panchresta*. A second sort he saith is called *Androdamas*, black of colour, and for weight and hardnesse surpassing all the rest, whereupon it took that name, and of this kind there are found great store in Barbary. He affirmeth moreover, That it hath a qualitie to draw vnto it silver, brasse, and iron: and for triall whether it be good or no, it ought to be ground vpon the touch called *Basantis*; for it will yeeld a bloody iuice, the which is a right souerain remedie for the diseases of the liver. The third kind of bloud-stone he maketh *Arabick*, for that it is brought out of Arabia: as hard it is as the other, for hardly will there any iuice come from it, though it be put to the grindstone, and the same otherwhile is of a Saffron colour. The fourth sort he saith is called *Elatites*, so long as it is crude; but being once calcined, it is named *Miltites*: a very excellent thing for burns and scaldings, and in all cases much better than any ruddle whatsoeuer. In the fift place he reckons that which is called *Schistos*: this is held to be singular for repressing the flux of bloud from the hemorrhoid veins. But generally of all these bloud-stones he concludes thus, That if they be puluerised, and taken in oile vpon a fasting stomach to the weight of 3 drams, they be right souerain for all fluxes of bloud. The same author writes of another *Schistos* which is none of these *Hæmatites*, and this they call *Anthraxes*: and by his saying, found there is of it in *Africk*, black of colour, which if it be ground vpon a whetstone or grindstone with water, yeelds toward the nether end or side thereof that lay next the ground, a certaine blacke iuice; but on the other side of a saffron colour: and he is of opinion, that the said iuice is singular for those medicines appropriat to the eyes.

CHAP. XXI.

¶ Of the foure kinds of the *Ægle-stone*, *Aëtius*: of the stone *Callimus*: of the stones *Samus* and *Arabus*: and of *Pumish* stones.

THE *Ægle-stones* called *Aëtites* be much renowned in regard of the very name they carry: found they are in *Ægles* nests, as I haue shewed already in my tenth book, & it is said that they be two together, to wit, the male and female: also, that without them the *Ægles* cannot hatch, which is the reason that they neuer haue but two young *Ægles* at one aire. Of this *Ægle-stone* there be foure kinds; for one sort thereof is bred in *Africk*, and is very small & soft, containing within it as it were in a wombe, a certaine clay which is sweet, pleasant, and white; the stone it selfe is brittle and apt to crumble, and this is thought to be the female sex. The second, which is taken for the male, groweth in Arabia, hard this is, and resembleth a gall-nut in fashion, and the same otherwhile is of a reddish colour, hauing inclosed within the belly thereof, another hard stone. The third is found in the Island *Cypros*, for colour much like to those that be engendred in *Africke*, otherwise bigger, and made more flat and broad than they: The rest be vsually round in manner of a globe. This hath also within the wombe a sweet sand and other small grauelly stones, but it selfe is so tender that a man may crumble it betwixt his fingers. The fourth kind is named *Taphiusus*, for that it is bred neere vnto the cape *Leucas*, in a place neere *Taphiusa*, on the right hand as men saile from the said *Taphiusa* toward *Leucas*: there is found of it in riuers, but the same is white and round: within the belly of it there is another stone called *Callimus*, and there is not a thing more tender than it. But to come to the properties of these *Ægle-stones*: They are commended as singular for women with childe, or four-footed beasts that are with yong; for being hung about their necks, or otherwise tied vnto any part within the skin of a beast sacrificed, they will cause them to go out their full time, but removed

A remoued they must not be but at the very time of deliuerance, for otherwise the very wombe or matrice would slip out withall; and vnlesse they be remoued then, they shall neuer be deliuered. Within the same Isle *Samos* (wherin we praised the goldsmiths earth *Tripoly*) there is a stone likewise called *Samius*, very good to burnish and polish gold: the same serueth also in physicke together with milk, for vlcers of the eyes, being applied in manner aforesaid; and in that sort it cureth also their weeping and watring which hath continued a long time: the same being taken in drinke, helpeth the infirmities and other accidents of the stomach; it cureth the dizziness of the head, & restoreth those to their right senses again who be troubled in their brain. Some are of opinion, that it is wholsome to be giuen to those that are subject to the falling sickness, or difficulty of making water: besides, it is one of the ingredients that go to the making of those medicines which be called *Acopa*: for to know whether it be good, see that it be passing white and heauy withall. It is said, that if a woman weare it hanging or tied about her, it will keep her from vntimely slips of her abortiue fruit, and withall containe the matrice though it were giuen to fall downe too low.

Touching the stone *Arabus*, like it is to *pyoric*, a proper thing for dentifrices, if it be calcined and reduced to pouder: a peculiar property it hath besides, to cure the hemorrhoids, being applied thereto in lint, so that there be fine linnen clothes laid afterwards thereupon.

I must not ouerpasse in silence, the treatise of *pumish* stones and their nature: I am not ignorant that in architecture and masonrie, they vse to call by the name of *Pumices* or *Pumishes* those hollowed stones or bricks as if they were eaten into, which hang downe from those vaulted buildings which they call *Musca*, to represent a caue or hollow vault artificially made. But to speake more properly of those *Pumishes* which are vsed by women for to smooth and slicken their skin, yea, and by your leaue by men also in these daies; also for to polish books, as *Catullus* saith, the best of them are found in *Melos*, *Seyros*, and the Islands of *Ætolia*: and those ought to be very white, and according to their proportion exceeding light: the same should bee also as spongiuous as is possible, and dry without, easie to be beaten to pouder, & in the rubbing between the fingers not apt to yeeld from them any sand. As for their medicinable vertues, they do extenuate and dry, after 3 calcinings, so that regard be had in the torrifying, that it be done with cleane charcoles that burn cleare, and that they be euery time quenched with whitewine: which done, they are to be washed like to *Cadmia* or the *Calamine* stone; and being dried again, they would be laied vp in some dry place which is in any wise dank or giuen to gather mouldinesse. The pouder of this stone is commended principally in medicines for the eyes, for a gentle mundificatiue it is, and clenseth the vlcers and sores incident to them: it doth incarnate hollow skars & maketh them euen with the rest about them. Some, after the third burning, suffer them to coole of themselves, and not by quenching: and chuse rather to beat them afterwards with some sprinkling of wine among: they enter likewise into those emollitiue or lenitiue plasters which are deuised for the sores of the head or vlcers in the priuities. The best dentifrices for to cleanse or whiten the teeth, be made of the *pumish*. *Theophrastus* writeth, that great drunkards who drink for a wager, vse to take the pouder of the *pumish* stone before-hand; for then they may, nay they must quaffe lustily indeed, for vnlesse they be filled with drinke, they are indangered by the foresaid pouder. To conclude, he saith, that so exceeding refrigeratiue it is, that if new wine do work or purge neuer so much, cast but a little *pumish* stone into it, you shall see it giue ouer immediatly.

CHAP. XXII.

¶ Of stones which be good for Apothecaries to make their mortars of: of soft stones: of the glasse-stone: of slims and the shining stone *Phengites*: of whetstones and grindstones: of other stones that serue in building, which resist the violence of fire and tempests.

OUR antient writers in old time were carefull to finde stones fit for mortars, and not onely to serue Apothecaries for to beat and puluerize their drugs, or painters to grinde their colours, but the cooks also in the kitchen for to pouder their spices: and in very truth, they preferred the *Ephesian* marbie before all others: and next to it, that of *Thebais* in high *Ægypt*, which I called before *Pyrrhopœilon*, though some there be that name it *Psaronium*: in a

third degree they place a kinde of Chalazius named Chrysites; but the Physitians make most account of that kind of whetstone which they call Bafanites, because this stone sendeth nothing from it, for all the stamping and punning that is made in it. As for such stones as yeeld a certaine moisture from them, they are supposed to be good for cie salues; and therefore in that regard the Æthiopian marble is best esteemed for that purpose. As for the marble of Tænara, of Carthage called Poenicum, and the bloud-stone Homatites, they are al good (they say) for those compositions which stand vpon safron: but that Tænarian marble which is blacke, as also the white marble of Paros, is not so good for Physitians, who rather chuse the Alabastrite of Egypt, or the white Serpentine marble: for this kind of Ophites it is whereof they make their vessells and barels. In the Island Siphnus there groweth in the quarries, a stone, which they vse to hew hollow, and by Turners craft make vessels for the kitchin good to boile viands in: also very handy for platters and dishes to serue vp meat to the table; much like to the green stone that cometh from Comus in Italy, which wee see ordinarily imploied to those vses: but this propertie hath the Siphnian stone by it selfe, that if it be once heat with oile, it beginneth to look blacke and waxes hard withal, being otherwise naturally exceeding soft: such difference there is among stones. For on the further sides of the Alps there be stones found exceeding soft: and in the province Belgica or Picardy, they haue a certaine white stone, which they slit through with a saw as they do timber, yea and with much more facility, wherewith they make plates that serue to couer their houses in manner of slates or tiles, both on the sides and also in gutter and ridge, yea and if they list, to make fine work vpon the roofs that may shine like to peacocks feathers, which they call Pauonacea: and verily this kind of stone is apt also to be clouen.

Specularis lapis

As touching * Talc (which also goeth in the name of a stone) it is by nature much more easie to be clouen into as thin flakes as a man will. This kind of glasse stone, the hither part of Spaine only in old time did afford vs, & the same not all throughout, but within the compasse of a 100 miles, namely about the city Segobrica: but in these daies we haue it from Cypros, Cappadocia, and Sicilie, and of late also it hath been found in Barbary: howbeit, the best glasse stone comes from Spaine and Cappadocia, for it is the tendrest and carrieth largest pannels, although they be not altogether the clearest, but somewhat dusky. There be also of them in Italy about Bononia, but the same be short and small, full of spots also and joined to pieces of flint; and yet it seemeth that in nature they be much like to those that in Spaine beed digged out of pits which they sink to a great depth. Moreover, there is found of this Talc betweene other stones inclosed in a rocke and lying vnder the ground, which must be hewed out if a man would haue them. But for the most part, this Talc lieth in manner of a vein in the mine by it selfe, as if it were perfectly cut already by nature; and yet was there neuer any piece knowne to be aboute five foot long. Some are of opinion, that it is a liquid humour of the earth congealed to an yce after the maner of CrySTALL. Certes, that it groweth hard into the nature of a stone, may appeare euidently by this, That when any wild beafts are chanced to fall into such pits where this glasse stone is gotten, the very marow of their bones (after one winter) will be conuerted and turned into a stony substance like to the Talc it selfe. Otherwhiles there is found of this kinde which is blacke: but the white is of a strange and wonderfull nature, for being (as it is well knowne) tender and brittle, nothing more, yet it wil indure extreme heat and frozen cold, and neuer cracke; nay you shal neuer see it decay for age, keep it so long as you wil, so that it may escape outward injuries: notwithstanding we doe see many stones in building laied with strong mortar and cement, yet subiect to age. There hath beene deuised another vse also of Talc in smaller pieces, namely, to pauer therewith the floore of the great shew-place or cirque in Rome, during the running of chariots and other feats of actiuitie there performed, to the end that their whitenesse might giue a more louely glosse to commend the place. In the daies of Nero late Emperour, there was found in Cappadocia a stone as hard as marble, white and transparent, and shining through, yea euen on that side where it hath certaine reddish streakes or spots: in which regard, (for that it is so replendent) it hath found a name to be called Phengires. Of this stone, the said Emperour caused the temple of Fortune to be built called Seia (which king Seruius had first dedicated) comprised within the compasse of Neros golden house: and therefore when the doores stood open in the day time, a man might see within, the day light, after the manner of glasse stones; yet so, as if all the light were within-forth onely, and not let in from the aire thorough the windowes. Moreover, king Tubawriteth, that in Arabia there is a certaine stone found,

which

A which likewise shineth as glasse, whereof the inhabitants of those parts do make their mirrors or looking-glasses.

It remaineth now, that I should proceed to those stones which are by workmen imploied to good and necessary vses: first of all, to those which serue to whet tools and instruments of yron, of which there be many sorts: Those of Candie, for a long time were of greatest name & most in request: in a second degree were those accounted which came from the mountaine Targetus in Laconia: but both the one and the other serue for no vse, without oile. But among the grindstones and whetstones which are occupied with water, those of Naxos were in greatest price and most commended; next to them, those of Armenia, whereof I haue already written. The stones of Cilicia wil do wel enough either with water or oile, it skills not whether: but the whetstones,

B that come from Arsinoe, are onely vled with water. There bee found in Italie whetstones, which with water will giue a wonderfull keene edge; also beyond the Alps, and such they call Passernices. In a fourth rank are to be reckoned those stones which serue for a mans spittle, and such be the bones that Barbers occupie for to sharpen their raifors; but they are of little or no vse at all because they be so soft and brittle: and of this kind, the chiefe are sent out of the higher part of Spain from the country Flamminitana. As for other stones whereof I haue not written already, they be all naught for building, so soft they be, and by that means nothing durable: and yet in some countries they haue none other to build withall, as namely at Carthage in Africk, notwithstanding the wals of the houses there are subiect to the waters of the sea, are pinched and pierced with winds, yea and beate with rain and weather; against which inconueni-

C nces the inhabitants are forced to keep their wals with pitching, for otherwise (the stones are so tender and soft) the ordinary parget of lime would fret and eat them: wherupon there goeth a pretty speech of the Carthaginians, that they do contrary to all others, in that they vse pitch to their houses, and lime to their wines; for in truth they tun vp their new wines with lime. There be found moreover about Rome other soft stones, to wit, in the territories belonging to Fidena and Alba: in Liguria likewise, Vmbria, and Venice, they haue a white free stone, which may be easily cut with a toothed saw: these are very tractable and easie to be wrought, and wil last reasonable well, but within house only, for if the weather lie vpon them, if the rain beat, and the pinching frost come, they will pill and skale, yea and break into pieces; neither be they durable against the breath and vapor of the sea. The Tyburtine stones, they will indure all other things

D well enough, only they may not abide hot vapors, for if the heat of summer take them, they will gape and be ready to cleaue in sunder. As for flints, the black, and in some places the red also, are much commended: in certaine countries, the white be very good; as namely, those in the quarries about Anicia within the territory of Tarquinij about the lake neere vnto Volfinij: also along the tract of Statona, there be good building stones that wil take no harm by fire; these are commonly vled for those monuments and memorials wherin ought to be ingraued, for they continue a long time, and are not the worse for age: Of this kind of stone, the founders make their moulds for to melt bras in. Moreover, there is a kind of Greene stone, which wonderfully cheeth and scorneth all fire, but in no place is there plenty thereof to be had: and wheresoeuer it is found, it groweth not in manner of a rock or quarrie, but lieth scattered here and there. Of the

E rest that hitherto are not named, the pale stone is not good for building, and seldome will it serue to make mortar of. The round pebbles are lasting enough, and will indure any hardnesse, but surely in building nothing trusty, vnlesse they be knit and bound with strong mortar and couched well together. Those that are gathered out of riuers make no sure building, for they seeme alwaies to relent and be moist: but for such stones as these, and generally for all those that we doubt, the only remedy is to dig them out of the ground in Summer, to let them haue two yeres seasoning in lying abroad and taking all kinds of weather before they be imploied in building; and look how much thereof hath caught harme by this means, the same will serue very well in ground works and foundations: and that which continueth still sound, you may be bold to put it in building, yea, in open works without dore. The Greekes haue a kinde of wall which they make of hard pebbles or flint couched euen and laied in order by line and leuell, like as we do in bricke wals: and this kind of building they call in Mafonrie Isodomon: but in case they be not euen laied nor ranged streight, but that some part of the wall is thicker than others, they terme it Pseudisodomon. A third manner they haue which they name Emplecton, namely, when the front onely of the wall is smooth and euen, for otherwise within they huddle & fill

one with another. Moreouer, to lay a wal artificially and to bind the stones wel, they ought in alternatiue course to ride and reach one ouer another halfe, so that the joint may fall out in the mids of a stone both aboue and vnder; a necessarie point to be considered in the very mids of a wal if it be possible: if not so, yet in any case toward the sides & ends thereof: as for the middle of the wall within, it would be well stuffed and filled with any rubbish, rammel, and broken stones. There is a kind of net-work building in Masonry called Dictyocheton, ordinarily vsed in Rome, but subiect it is to cracke and chinke. In sum, a wall would be built by rule and square, by line and leuell, and answerable to the plumb.

CHAP. XXIII.

¶ Of Cisterns, and Lime: of sundry sorts of Sand: of the tempering of Sand and Lime together for mortar: of faults in Masonrie: of Pargetting and other Rough-casting: of the proportion of Columnes and Pillars.

FOR to make good cisterns which might hold water, the mortar that goeth thereto ought to be made of fine parts of fine pure sand and grauelly together, to two parts of the most strong and binding lime that may be gotten; provided alwaies that the fragments of flint which are to be imploied herein, be small, and exceed not the weight of one pound a piece: this done, not only the bottome or pauing, but the side-walls and the ends, ought to be rammed downe hard with yron beetles: howbeit, for to keep good and cleare water, it were the better way to haue alwaies two cisterns together, that in the former the water may settle and cast down all the grounds to the bottome, and to the cleare water only passe into the other as if it were strained through a fine colander. As touching lime, *Cato Censorius* disalloweth that which is made of diuers stones, or of sundry colours: and to speake a truth, white stones are better to make lime than the hard, and such is more meet to lay stone withall in Masonrie; howbeit the lime which commeth of hollow and fistulous stones, is thought to serue better for to couer and parget walls. The lime which commeth of flint, is rejected both for the one and the other: also the lime made of stones digged out of the ground, is farre better than of pebbles gathered from riuier sides: that which commeth of millstones is most profitable, for it is more fatty and glutinous than others. A strange and wonderfull matter it is, that any thing after it hath bin once burnt and calcined, should be set on fire againe with water. And thus much of Lime.

As touching Sand, there be three kinds thereof: the one is digged out of pits in the ground, and this requireth a fourth part of lime to be put vnto it in making mortar: a second commeth out of riuier sides or the sea shore, and this would haue a third part: and if there be besides another third part of potsherd beaten to powder and put thereto, the stuffe or mortar will be the better. Between the Apennine hill and the riuier Po, there is no sand digged out of the ground, ne yet any sea sand at all. And verily, the greatest reason that cities fall to decay and be so ruinated, is this, for that the mortar being robbed of the due proportion of lime, hath not that binding as it ought, and so the walls built therewith are not fodred accordingly. Also, this would be obserued, that mortar the elder that it is, the better it is found for building. Moreouer, in the old laws which prouide for the perpetuities of houses in antient time, we find it expressly set down, that the undertaker to build a house at a certain price, shall vse no mortar vnder three yerres of age: and this was the reason that in those daies a man should not see any rough-cast or parget to rise or chawne illfaoueredly as now they do: and in truth, vnlesse there be laid vpon wals three coats or couches (as it were) of mortar made with sand and lime, and two courses ouer them of other mortar made of marble grit and lime tempered together, the wals will not be permanent nor otherwise faire and resplendent as they ought to be: and look where wals be dampish and giuen to sweat a certaine salt humor or sal-petre, it were very well to lay a ground vnderneath of mortar made of the powder of potsheds and lime wrought together. In Greece they haue a cast by themselves, to temper and beat in mortars, the mortar made of lime and sand wherewith they meane to parget and couer their walls, with a great wooden pestill. As for the mortar made of marble-grit and lime together, the true marke to know whether it haue making sufficient for building, is this, namely, if it will not sticke to the shouell that worketh it, but will come out of the heap neat and clean: but contrariwise, in whiting and fret work, the lime being foked and wet in water, ought to cleaue fast like glew; neither ought it to be tempered with water, but in the grosse

A grosse masse or lumpe. At Elis there standeth a temple consecrated to the honour of *Minerva*, wherein *Pamphus*, the brother of *Phidias*, vsed a parget (as they say) which he tempered with milk and saffron together; and therefore at this day, if a man wet his thumb with spittle, and rub it against the wall, he shall perceiue both the smell and tast of saffron to remaine still.

As touching pillars in any building, the thicker they stand one to another, the bigger & grosser they seem to be. Our architects and masons make foure sorts of them: for they say, that such pillars as beare in compasse or thicknesse toward the foot, as much as commeth to the sixt part of the height, be called Dorique: those that carry but a ninth part, are Ionique: such as haue a seuenth part, be Tuscanique. And as for the Corinthian pillars, their proportion is answerable to the Ionique; onely this is the difference, that the Chapters of the Corinthian pillars arise in height to as much as the compasse at the base taketh vp: in which regard they seem more slender than others. As for the height of the Ionick chapter, it is iust the third part of the thicknes. The proportion ordinarily in old time for the height of pillars, was answerable to the third part of the breadth of the temple. In the temple of *Diana* at Ephesus, the inuention was first practised to pitch the footfall of pillars vpon a quadrant or square below, and to set chapters vpon their heads. And as touching the proportion, it was thought sufficient in the beginning, if a columnne contained in compasse or thicknesse the eight part of the height; also, that the square of the quadrant vnder the base, should containe halfe the thicknesse of the pillar: finally, that the pillars should be smaller by one seuenth part in the head, than at the foot. Ouer and besides these pillars, there be others also of the Atticke fashion, and those be made with foure corners, and the sides are equall.

CHAP. XXIII.

¶ The medicinable properties of Lime. Also, as touching the Maltha vsed in old time, and of Plastre.

MUCH vse there is of Lime also euen in Physick: but then there must be chosen that which is quick and vnqueint. Such lime is caustick, discussive, and extractiue: the same also is proper to repress corrosiue vlcers that begin to spread and run far. If the said lime be tempered with vinegar and oile of roses, it maketh an excellent healing plastre, which will skin vp a sore clean. The same if it be incorporat with swines greafe or liquid rosin and hony together, serues also to set bones in ioint: & the same composition is likewise good for the kings euil.

Concerning Maltha, it was wont to be made of quick and new lime: for they took the Lime-stone and quenched it in wine, which done, presently they punned it with swines greafe and figs; hereof they made ordinarily two couches: and being thus tempered and laid, it was thought to be the fastest whitening that could be deuised, and in hardnesse to exceed a stone. But looke whatsoeuer is to be pargetted with this Maltha or mortar thus prepared, ought first to be rubbed thoroughly with a size of oile.

Of neare affinity to lime is plastre, whereof be many kinds: for there is a kind of plastre artificiall, and namely in Syria and about *Thurium*, made of stone calcined in manner of lime: and there is of it that is digged out of the ground naturally, as namely, in the Isle *Cyprus*, and about the *Perrhoebians*. Neare *Thymphaea*, a city in *Ætolia*, it lieth very ebbe and as it were euen with the ground: as for the stone that is to be burnt for it, the same ought to be not vnlike to the stone *Alabastrites*, or at leastwise to that which stands much vpon marble. In Syria they chuse for this purpose the hardest, and they burne the same with cow dung, that it may the sooner be calcined. But the best plastre of all other is known (by experience) to be made of the Talc or the glasse stone aforesaid, or at leastwise of such as haue the like flakes as Talc. Plastre must be wrought and driuen presently whiles it is wet and will run, for nothing in the world wil so soon thicken and dry: and yet when it hath bin vsed already, it may be beaten again to powder, & serue the turn in new workes. Plaster serueth passing wel to white wals or feeling; also for to make little images in fretwork, to set forth houses; yea, and the brows of pillars and wals, to cast off rain. To conclude, I may not forget that which befell to *C. Proculus*, a great fauorit and follower of *Augustus Caesar*, who in an extreame fit of the paine of the stomacke, dranke plastre, and so killed himselfe wilfully.

CHAP.

CHAP. . XXV.

¶ *Sundry kindes of paved floores : and when at first they began to be used at Rome. Of open terraces paved. Of Greekish pavements. And the first inuention of arched or embowed roofes.*

THe deuise of paved floores arose first from the Greeks, who made them with great art, and curiously, in regard of the painting in sundry colours which they bestowed therupon: but these braue painted floores were put downe, when pavements made of stone and quarrels came in place: the most famous workman in this kind, was one *Sofus*, who at Pergamus wrought that rich pavement in the common hall, which they call *Asaroton* cecon, garnished with bricks or small tiles enealed with sundry colours: and he deuised, that the worke vpon this pavement should resemble the crums and scraps that fel from the table, and such like stuffe as commonly is swept away, as if they were left still by negligence vpon the pavement. Among the rest, wonderfull was his handiworke there, in pourtraying a Doue drinking, which was so liuely expressed, as if the shadow of her head had dimmed the brightnesse of the water: there should a man haue seen other Pigeons sitting vpon the brim of the water tankard, pruning themselves with their bills, and disporting in the Sunshine. The old paved floores, which now also are much used especially vnder rooffe and couwert, howsoeuer they came from barbarous countries, were in Italy first parted and beaten downe with heauie rammers; as we may collect by the verie name it selfe, *Pauement*, which comes of *Pavire*, i. to ram downe hard. As for the manner of paving with small tiles or quarrels ingrauen, the first that euer was seen at Rome, was made within the temple of *Iupiter Capitolinum*, and not before the third Punicke war begun. But ere the Cimbrian wars began, such pavements were much taken vp in Rome, and men tooke great delight and pleasure therein, as may appeare sufficiently by that common verse out of *Lucilius* the Poet.

Ante Pavimenta ata emblemata vermiculata, &c.

Before the Pavements checker-wrought in painted Marquetry, &c.

As touching open galleries and terraces, they were deuised by the Greeks, who were wont to couer their houses with such. And in truth, where the country is warme, such deuises doe well: howbeit, they are dangerous and deceitfull, where there is store of rain and frost. But for to make a terrace so paved, necessary it is first to lay two courses of boords or planks vnderneath, and those crosse and ouerthwart one the other: the ends of which planks or boords ought to be nailed, to the end they should not twine or cast asofide; which done, take of new rubbish two third parts, and put thereto one third part of shards stamped to powder, then with other old rubbish mix two fiew parts of lime, and herewith lay a couch of a foot thicknesse, and be sure to ram it hard together. Ouer which there must be laid a coator course of mortar, six fingers bredth thick, and vpon this middle, couch broad square paving tiles or quarrels, and the same ought to enter at least two fingers deep into the said bed of mortar. Now for that this floore or pavement must rise higher in the top, this proportion is to be obserued, that in every ten foot it gain an inch and a halfe. After which, the pavement thus laid is to be plained and polished diligently with some hard stone: and aboue al, regard would be had, that the planks or boorded floor were made of oke. As for such as do cast or twine any way, they be thought naught. Moreouer, it were better to lay a course of flint or chaffe between it and the lime, to the end, that the said lime might not haue so much force to hurt the boord vnderneath. Requisite also it were to put vnderneath round pebbles among. After the like maner be the spiked pavements made of flat tiles & shards. And here I must not forget one kind of paving more, which is called *Grecanicke*, the manner wherof is thus. The Greeks after they haue well rammed a floore which they mean to pave, lay therupon a pavement of rubbish, or else broken tile shards; and then vpon it, a couch of charcoale well bearen and driuen close together, with sand, lime, and small cindres well mixed together: which done, they do lay their paving stuffe to the thicknesse of halfe a foot, but so euē, as the rule and square will giue it; and this is thought to be a true earthen paved floore of the best making. But if the same be smoothed also with a hard sliche stone, the whole pavement will seem all black: as for those pavements called *Lithostrata*, which be made of diuers coloured squares couched in workes,

A works, the inuention began by *Syllaes* time, who used thereto small quarrels or tiles at *Preneste* within the temple of *Fortune*, which pavement remains to be seen at this day. But in processe of time pavements were driuen out of ground-floores, and passed vp into chambers, and those were seeled ouer head with glasse: which also is but a new inuention of late deuised: for *Agrippa* verily in those baines which he caused to be made at Rome, annealed all the potterie worke that there was, and enamelled the same with diuers colours: whereas all others be adorned only with whiting; & no doubt he would neuer haue forgotten to haue arched them ouer with glasse if the inuention had bin practised before, or if from the wals & partitions of glasse which *Scaturus* made vpon his stage, as I said before, any one had proceeded also to rooffe chambers therewith. But since I am fallen vpon the mention of glasse, it shall not be impertinent to discourse somewhat of the nature thereof.

CHAP. XXVI.

¶ *The first inuention of glasse, and the manner of making it. Of a kind of Glasse, called Obsidianum. Also of sundry kindes of Glasse, and those of many formes.*

THere is one part of Syria called *Phœnice*, bordering vpon *Iurie*, which at the foot of the mount *Carmel*, hath a meere named *Cendeuia*, out of which the riuer *Belus* is thought to spring, and within fiew miles space, falleth into the sea, near vnto the colony *Ptolemais*: **C** This riuer runneth but slowly, and seemeth a dead or dormant water, vnwholesome for drinke, howbeit, used in many sacred ceremonies with great deuotion; full of mud it is, and the same very deepe ere a man shall meet with the firm ground: and vnlesse it be at some spring tide, when the sea floweth vp high into the riuer, it neuer sheweth sand in the bottom; but then, by occasion of the surging waues, which not only stir the water, but also cast vp & coure away the grosse mud, the sand is rolled too and fro, and being cast vp, sheweth very bright and cleare, as if it were purified by the waues of the sea: and in truth, men hold opinion, That by the mordacity and astringent quality of the salt water, the sands become good, which before serued to no purpose. The coast along this riuer which sheweth this kind of sand, is not aboue halfe a mile in all, and yet for many a hundred yeare it hath furnished all places with matter sufficient to make glasse. **D** As touching which deuise, the common voice and fame runneth, that there arriued sometimes certain merchants in a ship laden with nitre, in the mouth of this riuer, & being landed, minded to seeth their victuals vpon the shore and the very sands: but for that they wanted other stones, to serue as treuets to beare vp their pans and cauldrons ouer the fire they made shift with certaine pieces of sal-nitre out of the ship, to support the said pans, and so made fire vnderneath: which being once asire among the sand and grauell of the shore, they might perceiue a certaine cleare liquor run from vnder the fire in very streams, and hereupon they lay came the first inuention of making glasse. But afterwards (as mans wit is very inuentiue) men were not content to mix nitre with this sand, but began to put the Load-stone among, for that it is thought naturally to draw the liquor of glasse vnto it, as well as yron. Then they fell to calcine and burne in many other places shining grauell stones, shels of fishes, yea, and sand digged out of the ground, for to make glasse therewith. Moreouer, diuers authors there be who affirme, That the Indians vse to make glasse of the broken pieces of Crystall, and therefore no glasse comparable to that of India. Now the matter wherof glasse is made, must be boiled or burnt with a fire of dry wood, and the same burning light and cleare without smoke, and there would be put thereto brasse of Cyprus, and nitre, especially that which cometh from *Ophyr*. The furnace must bee kept with fire continually, after the manner as they vse in melting the ore of brasse. Now the first burning yeeldeth certaine lumps of a fatty substance, and blackish of colour. This matter is so keene and penetrant whiles it is hot, that if it touch or breath vpon any part of the body, it will pierce and cut to the very bone ere one be aware or do feele it. These masses or lumps be put into the fire againe, and melted a second time in the glasse houses, where the colour is giuen that they shall haue: and then some of it with blast of the mouth, is fashioned to what form or shape the workman will: other parcells polished with the Turners instrument, and some againe engrauen, chafed, and embossed in manner of siluer plates: in all which feats, the Sidonians in times past were famous artificers: for at Sidon were deuised also mirroirs or looking glasses. Thus much as touching

ching the antique maner of making glasse. But now adaies there is a glasse made in Italy of a certain white sand, found in the riuier Vulturnus for six miles space along the shore towns, from the mouth where he dischargeth himselfe into the sea, and this is between Cumes and the lake Lucrinus. This sand is passing soft and tender, whereby it may be reduced very easily into fine powder, either to be beaten in mortar or ground in mill: to which pouder the manner is to put three parts of nitre, either in weight or measure, and after it is the first time melted, they vse to let it passe into other furnaces, where it is reduced into a certain masse, which, because it is compounded of sand and nitre, they call Ammonitrum: this must be melted againe, and then it becomes pure glasse, and the very matter indeed of the white clear glasses: & in this sort throughout France and Spain the maner is to temper their sand, & to prepare it for the making of glasse. Moreover, it is said, That during the reigne of *Tiberius* the Emperor, there was deuised a certain temper of glasse, which made it pliable and flexible to wind and turne without breaking: but the * artificer who deuised this, was put downe, and his work-houie, for feare lest vessels made of such glasse should take away the credit from the rich plate of brasse, siluer, and gold, and make them of no price: and verily, this bruit hath run currant a long time (but how true, it is not to certain.) But what booteth the abolishing of glasse-makers, seeing that in the daies of the Emperor *Nero* the art was growne to such perfection, that two drinking cups of glasse (and those not big, which they called *Pterotos*) were sold for 6000 sesterces.

*It is said, that
when a supplie
to this empe-
ror came be-
fore him, and
shewed to him
a glasse whole
and found
which had bin
of purpose bro-
ken before, hee
caused him pre-
sently to be
put to death.
*Cel. Rhodig.
l. 29, cap. 30.*

There may be ranged among the kinds of glasses, those which they call *Obsidian*, for that they carry some resemblance of that stone, which one *Obsidius* found in *Aethyopia*; exceeding blacke in colour, otherwhiles also transparent: howbeit, the sight therein is but thicke and dusky. It serueth for a mirrour to stand in a wall, and instead of the image yeeldeth back shadows. Of this kind of glasse many haue made jewels in maner of precious stones: and I my selfe haue seene masseue pourtraictures made thereof, resembling *Augustus* late Emperor of famous memory, who was wont to take pleasure in the thicknes of this stone, inso much as he dedicated in the temple of *Concord* for a strange and miraculous matter, foure Elephants made of this *Obsidian* stone. Also *Tiberius Caesar* sent back again to the citizens of *Heliopolis*, a certain image of prince *Menelaus*, found among the moueable goods of one who had bin lord gouernor in *Aegypt*, which he had taken away out of a temple, among other cerimoniall reliques: and the said statue was all of the laier, called *Obsidian*. And by this it may appeare, That this matter began long time before to be in vse, which now seemeth to be renewed again and counterfeited by glasse that resembleth it so neare. As for the said *Obsidian* stone, *Xenocrates* writeth, That it is found naturally growing among the Indians, within *Samnium* also in Italy, and in *Spaine* along the coast of the Ocean. Moreover, there is a kind of *Obsidian* glasse, with a tincture artificiall, as blacke as laier, which serueth for dishes and platters to hold meat: like as other glasse, red throughout, and not transparent, called for that colour *Hæmatinon*. By art likewise there be vessels of glasse made white and of the colour of *Cassidony*, resembling also the *Iacinth* and *Saphire*, yea, & any other colors whatsoever. In sum, there is not any matter at this day more tractable and willing either to receiue any forme or take a color, than glasse: but of all glasses, those be most in request and commended aboue the rest, which be white, transparent and cleare throughout, comming as neare as it is possible to *Crysell*. And verily, such pleasure do men take now adaies in drinking out of faire glasses, that they haue in maner put downe our cups and boules of siluer or gold: but this I must tell you, that this ware may not abide the heat of the fire, vnlesse some cold liquor were put therein before: and indeed, hold a round bal or hollow apple of glasse full of water against the Sun, it will be so hot, that it is ready to burne any cloth that it toucheth. As for broken glasses, well may they be glued and soldered againe by a warme heat of the fire, but melted or cast again they cannot be whole, vnlesse a man make a new furnace of pieces broken one from another: like as we see there be made counting rundles thereof, which some call *Abaculos*, whereof some are of diuers and sundry colors. Moreover, this would be noted, That if glasse and sulphur be melted together, they will fonder and vnite into a hard stone. To conclude, hauing thus discoursed of all things that are knowne to be done by wit or art, according to the direction of Nature, I cannot chuse but maruell at fire and the operations thereof, seeing that nothing in a manner is brought to perfection but by fire; and thereby any thing may be done.

¶ The wonderfull operations of fire: the medicinable properties that it hath; and the prodigious significations obserued thereby.

Fire receiueh sundry sorts of sand & earth, out of which it doth extract and melt one while glasse, another while siluer, in this place vermilion, in that diuers sorts of lead and tin; sometime Painters colours, and another while matters medicinable. By fire, stones are resolued into brasse; by fire iron is made, and the same is tamed likewise therewith: fire burneth and calcineth stone, whereof is made that mortar which bindeth all worke in masonry. As for some things, the more they be burnt, the better they are; and of one and the same matter a man shall see one substance ingendred in the first fire, another in the second, and another also in the third. As for the coles that go to these fires, when they be quenched they begin to haue their strength and after they are thought extinct and dead they are of greatest vertue. This element of Fire is infinit, and neuer ceaseth working, inso much as it is hard to say whether it consume more than it ingendreth. The very fire also is of great effect in physick; for this is known for certain by experience, there is not a better thing in the world against the pestilence (occasioned by the darkness of the Sun, and the want of cleare light from him) than to make fires and perfumes in diuers sorts, either to clarifie or to correct the aire; according as *Empedocles* and *Hippocrates* haue testified in diuers places. *M. Varro* writeth, that fire is good for convulsions, cramps, and contusions of the inward parts: and for this purpose I will alledge the very words he useth: the Latine word *Lix* (quoth he) is nothing else but the ashes of the hearth; and hereupon comes *Lixiuum cinis*, i. Lie ashes, which being drunk is medicinable; as we may see by fencers and sword-plaiers, who after they haue done their flourishing, and be ready to enter into fight at sharpe, reftesta themselves with this potion. Furthermore it is said, That a cole of oke wood being reduced into ashes and incorporat with hony, cureth the carbuncle, which is a pestilent disease, whereof two noblemen at Rome, both Consuls in their time, died of late, according as I haue shewed already. See the wonderfull power in nature, that things despised and of no account, as ashes and coles, should afford remedies for the health of man! But before I make an end of fire, and the hearth where it burneth, I will not passe one admirable example commended vnto vs by the Roman Chronicles: in which we reade, That during the reign of *Tarquinius Priscus* king of Rome, there appeared all on the sudden vpon the hearth where hee kept fire, out of the very ashes, the genital member of a man, by vertue whereof, a wench belonging vnto *Tanaquil* the queen, as she sate before the said fire, conceiued and arose from the fire with childe; and of this conception came *Servius Tullus* who succeeded *Tarquin* in the kingdome. And afterwards, while hee was a yong childe, and lay asleep within the court, his head was seen on a light fire, whereupon he was taken to be the son of the domestical spirits of the chimney. Which was the reason, that when he was come to the crown, he first instituted the *Compitalia*, and the solemne games in honour of such house-gods or familiar spirits.

THE XXXVII. BOOKE OF
THE HISTORIE OF NATVRE,
WRITTEN BY C. PLINIUS
SECVNDVS.

The Proem.

to the end that nothing might be wanting to this historie of mine concerning Natures works, there remaine behind nothing but pretious stones wherein appeareth her Maiessty, brought into a narrow and streight roome: and to say a truib, in no part of the world is she more wonderfull, in many respects; whet her you regard their varietie, colours, matter, or beauty, which are so rich and pretious, that many make conscience to seale with them, thinking it unlawfull to engraue any print in them, or to diminish their honour and estimating on by that means. Some of them are reckoned inestimable, or valued at all the goods of the world besides, in somuch as many men thinke some one pretious stone or gem sufficient to behold therein the very perfection of Nature, and her absolute worke. Touching the first inuention of wearing such stones in jewels, and how it tooke first root, and grew afterwards to that height as all the world is in admiration thereof, I haue already shewed in some sort in my treatise of Gold and Rings. And yet I will not conceale from you that which poets fable of this matter, who would beare vs in hand, that all began at the rocke Caucasus, whereunto Prometheus was bound fast, who was the first that set a little fragment of this rocke within a peece of iron, which being done about his finger, was the ring, and the foresaid stone the gemme: whereof the Poets make much foolish moralization.

CHAP. I.

¶ Of the rich precious stones of Polycrates the Tyrant, and King Pyrrhus. The first Lapidaries or Cutters in pretious stones. And who was the first that had a case of rings and gems at Rome.

Prometheus hauing giuen this precedent, brought other stones into great price and credit, in somuch as men were mightily inamoured vpon them: and Polycrates of Samos, the puissant prince and mighty monarch ouer all the Islands and coasts thereof, in the height of his felicitie and happy estate, which himselfe confessed to be excessive, being troubled in his mind, that he had tasted of no misfortune, and willing after a sort to play at Fortunes game, one while to win, and another while to lose, and in some measure to satisfie her inconstancie, was perswaded in his minde that he should content her sufficiently in the voluntarie losse of one gem that he had, and which he set so great store by: thinking verily, that this one hearts griefe for parting from so pretious a jewell, was sufficient to excuse and redeeme him from the spightfull enuy of that mutable goddesse. Seeing therefore the world to come vpon him still, and no soure sorrowes intermingled with his sweet delights, in awearinesse of his continual blessednesse, he imbarkeed himselfe and sailed into the deep, where wilfully he flung into the sea a ring from his finger, together with the said stone so pretious, set therein. But see what ensued! A mighty fish euen made as a man would say for the king,

A king, chanced to swallow it down as if it had bin some bait, which being afterwards caught by fishers, & thought to be of an extraordinary bignes, was brought as a present into the kings palace, and so sent into the kitchen, where the cook found within the belly thereof the foresaid ring of his lords & masters. Oh the subtiltie of she Fortune, who all this while twisted the cord that another day should hang Polycrates! This stone (as it is wel known) was a Sardonyx: & if we may beleue it, the very same it is, which at Rome is shewed in the temple of Concord, where Augusta the Empreffe dedicated it as an oblation, enchased within a golden borne: and verily if it be the same, one of the least Sardonyches it is among many other there which be preferred before it.

Next to this stone of Polycrates, there goeth a royall name of the gem which Pyrrhus K. of Albanie had, him I mean, who warred against the Romans: for (by report) an Agath he had, wherein a man might see the nine Muses, and Apollo with his harpe, liuely represented, not by art and mans hand, but euen naturally imprinted: for the veins and streaks of the stone were so disposed, that a man might distinguish euery one of the Muses asunder, & ech one distinguished by their feuerall marks and ornaments. Setting aside these two gems aboue-named, we do not read in authors of any great reckoning made of such iewels; vnlesse wee speake of one Ismenias a famous minstrell, who had the name to weare many of them ordinarily about him, and those very gay and glittering: and surely his vanity that way was such, that there goeth a notable tale of him; for meeting vpon a time in a merchants hand with an Emerald in the Island Cyprus, wherein ladie Amymon was engrauen, and whereof the price was at first held at six deniers in gold, he made no more ado but cauled the mony to be paid presently: but the merchant being a man of some

conscience, and thinking indeed the price to high, gaue two of them back again vnto Ismenias: whereat being ill apaid, I do shew you, (qd. he) for this bating of the mony hath much empai- red the worth of the stone. This Ismenias (as it is thought) was the first who brought vp the order that all such musicians and minstrels as himselfe, should be known by their gems, and esteemed skilfull in that art according as they were set out therewith more or lesse. And in very truth, Diosdorus a great minstrell, who liued in those daies with him, vsed likewise to be in his change and variety of pretious stones, because he would not seeme any way to come behind Ismenias. There was a third also as vaine as the best, a musician in that age named Nicomachus, who loued to haue a number of gems about him, but no iudgement hee had in the world to chuse them.

These examples which offer themselves by fortune to me in the beginning of this my booke, may serue to pull downe their plumes who stand so much vpon the vaine ostentation of these stones, when they shal see how all the pride they take herein, smelleth but of the vain humor of some odd minstrels. But to return againe to Polycrates his gem, at this day it is to be seen within the temple of Concord, whole & found. And not only in the time of Ismenias, but also many yeres after, it should seem that Emeralds were wont to be cut and engrauen. This opinion also may be confirmed by the act & edict of K. Alexander the Great, which forbad expressely, That no man should be so hardy as to engraue his image in pretious stone, but Pyrgoteles, who (no doubt) was simply the best in that art. After him, Apollonides and Cronius were of great fame: & principally one Dioscorides, who counterfeited in stone the liuely forme of Augustus Caesar, the which serued the Emperors his successors as a signet to seale withall. Sylla Dictator was wont alwaies to signe

with a seale representing K. Iugurtha, tied & bound as he was yellected to him. We read in Chronicles also, that a certaine Spaniard of Intercatia, whose father Scipio Emilianus slew in single fight, vsed afterwards no other seale but that which represented this combat: whereupon grew this merry conceit of Stilo Praconinus, who asked, What this Spaniard would haue done if his father had killed Scipio? Augustus late Emperour of worthy memory, vsed at the beginning to seale with the image Sphinx vpon his signet: and verily in the casket of his mothers jewels, two of these he found so like one to the other, that one could not be known and discerned from the other: & as he was wont to weare one of them about him whersoever he went, so in his absence (during the ciuile wars which he leuiued against M. Antonius) his friends who managed his affairs at Rome, signed with the other Sphinx, all those letters & edicts which passed in his name,

for the performance of some demands which those times did require. And from hence it came, that those who receiued any such letters or edicts, containing some matter of difficulty, were wont pleasantly and merrily to say, That the said Sphinx came euer with some hard riddle or other that could not be expounded. Moreover, the frog, wherewith Macenas vsed to seale, was alwaies terrible to those who receiued any letters signed therewith; for euermore they were sure

fff

vpon

upon the receipt of it to make some paiement of impost or taxes leuied vpon them. But *Augustus* C
Cesar, to auoid the obloquie that arose by his *Sphinx*, gaue ouer sealing therewith, and signed
 euer after with the image of *K. Alexander* the Great.

As touching a cabinet or case for many rings and such jewels, which they call by a forreine
 Greeke name *Dactyliotheca*, the first that euer was known to haue any such at Rome, was *Scau-*
rus, whose mother *Sylla* the Dictator married: and for a long time there was no other besides;
 vntill *Pompeius* the Great met with the jewel-casket of *K. Mithridates*, which among many other
 rich oblations, he presented in the Capitoll; and by the relation of *M. Varro* and other approued
 authors of that time, it was much preferred before that of *Scaurus*: in imitation of whole exam-
 ple, *Cesar* Dictator consecrated in the temple of *Venus Genitrix*, six such like cabinets or caskets
 of rings and jewels: and *Marcellus* sonne to *Octavia*, dedicated one in the temple Palatine of *A-*
pollo. Finally, this is to be obserued, that the said victorie of *Pompeius* which he atchieued ouer
K. Mithridates, set mens teeth at Rome a watering after pearls and precious stones; like as the
 conquests obtained by *L. Scipio* and *Cn. Manlius*, brought them into loue with siluer plate curi-
 ously enchaſed and imbossed: also with rich hangings of cloth of gold, siluer, and tiffue, toge-
 ther with beds and tables of brasse; euen as the brassen statues and vessels of Corinthian brasse,
 and the curious painted tables, came in request vpon the victorie that *L. Mummius* gained ouer
Achaëa.

CHAP. II.

¶ Of Iems and precious stones that Pompeius shewed in his triumph. The nature of Crystall, and
 the medicinable properties thereof: the sumptuous and superfluous expences in vessels
 made of it. The first inuention of Cassidoine vessels, and the excess that
 way: the nature and properties of those Cassidoins. And
 what vnto the writers in old time haue
 deliuered as touching Amber.

TO the end that it may appeare more evidently, what the triumph of Pompey wrought in this
 respect, I will put downe word for word what I find vpon record in the registers that beare
 witnesse of the acts which passed during those triumphs. In the third triumph therefore
 which was decreed vnto him (for that he had scoured the seas of pyrats and rousers, reduced Na-
 tolia and the kingdom of Pontus vnder the dominion of the Romans, defeated kings and nati-
 ons, according as I haue declared in the seuenth booke of this my history) he entred Rome the
 last day of September, in the yere when *M. Piso*, and *M. Messala* were Consuls, on which day there
 was carried before him in shew, a chesse-boord with all the men, and the same boord was made
 of two precious stones, and yet it was 2. foot broad and 4. foot long: and left any man should
 doubt hereof and thinke it incredible, considering no jems at this day come neare thereto in
 bignesse, know he, That in this triumph hee shewed a golden Moone weighing thirtie pounds,
 three dining-tables also of gold, other vessell likewise of masse gold and precious stones as
 much as would garnish nine cup-boords; three images of beaten gold representing *Minerva*,
Mars and *Apollo*; coronets made of stones to the number of three and thirtie; a mountaine made
 of gold foure square, wherein a man might see red deare, Lyons, fruit-trees of all sorts, and the
 whole mountaine inuironed and compassed all about with a vine of gold: moreouer, an oratorie
 or cloſet consisting of pearle, in the top or lower whereof there was a clocke or horologe: Hee
 caused also to be borne before him in a pompous shew, his owne image made of pearles, the
 pourtraiture (I say) of that *Cn. Pompeius*, whom regall maiestie and ornaments would haue bet-
 ter beſeemed; and that good face and venerable visage so highly honoured among all nations
 was now all of pearles; as if that manly countenance and ſeueritie of his had bene vanquished
 and riotous excess and superfluitie had triumphed ouer him, rather than hee ouer it. O Pompey,
 ô *Magnus*, how could this title and surname *Le-grand*, haue continued among those nations,
 if thou hadst in thy first victorie triumphed after this manner! What, *Magnus*, were there
 no means else but to seek out pearles (things so prodigal, superfluous, and deuised for women,
 and which it had not beſeemed Pompey once to weare about him) and therewith to pourtray
 and counterfeit thy manly visage! And was this the way indeed to haue thy selfe ſceme pre-
 cious: doth not that pourtraiture come nearer vnto thee and resemble thy person farre liker,
 which

A which thou didst cause to be erected vpon the top of the Pirænean hills? Certes, a foule shame
 and ignominious reproch it was to be shewed in this manner, nay, to say more truly, a wonderfull
 prodegie it was, presaging the heauie ire of the gods; for so men were to belecue and evidently
 to conceiue thereby, that euen then and so long before, the head of Pompey made of orient pearle,
 euen the richest of the Leuant, should be so presented without a bodie. But setting this aside,
 how manlike was all the rest of his triumph, and how answerable to himselfe! For first and fore-
 most, giuen freely by him vnto the chamber of the citie, there were a thousand talents, second-
 ly, vpon his lieutenants and treasures of the campe, who had performed to good seruice in de-
 fending the sea-coasts, he bestowed two thousand Sestertia apiece: thirdly to euery souldiour
 who accompanied him in that voiage, he allowed fiftie Sestertia. Well, this superfluitie yet of
 Pompeius triumph, serued in some sort to excuse *Caius Caligula* the Emperour, and to make his
 delicacie and excess to be more tollerable, who ouer and besides all other effeminate tricks and
 womanly deuises, whereof he was full, vsed to draw vpon his legs little buskins or slippers made
 of pearle: Pompeius precedent (I say) in some measure justified Nero the Emperour, who made of
 rich and faire great pearles, the scepters and maces, the visors also and masks which players
 vied vpon the stage, yea and the very bed-roumes which went with him as hee trauielled by the
 way: So as wee seeme now to haue lost that vantage and right which we had to find fault with
 drinking-cups enriched with pearles, yea and much other household stufte and implements gar-
 nished therewith, since that whereſoeuer we go from one end of the house to the other, we seeme
 to passe through rings, or such jewels at leastwise which were wont to beautifie our fingers on-
 ly: for is there any superfluitie els, but in regard and comparison hereof it may seeme more tol-
 lerable and lesse offense? But to return vnto the triumph of Pompey: this victorie of his, brought
 into Rome first our cups and other vessels of Cassidoine, and Pompey himselfe was the first who
 that very day of his triumph presented vnto *Iupiter Capitolinus*, six such cups: and presently
 from that time forward men also began to haue a mind vnto them, in cupboords, counting ta-
 bles, yea and in vessell for the kitchen, and to serue vp meat in: and verily, from day to day the
 excess herein hath so far ouergrowne, that one great Cassidoine cup hath been sold for * four-
 score sesterces, but a faire and large one it was, and would containe well three sextars [*id est*,
 halfe a wine gallon.] There are not many yeres past, since that a noble man who had been Con-
 ſull of Rome, vsed to drinke out of this cup, and notwithstanding that in pledging vpon a time
 a lady whom he fancied, he bit out a piece of the brim thereof (which her sweet lips touched)
 yet this iniurie done to it, rather made it more esteemed and valued at a higher price, neither
 is there at this day a cup of Cassidoine more pretious or dearer than the same. But as touching
 other excess of this personage, and namely how much he consumed and deuoured in superflu-
 ities of this kind, a may may estimat by the multitude of such Cassidoine vessels found in his ca-
 binet after his death, which *Nero Domitius* tooke away perforce from his children: and in truth,
 such a number therewere of them, that being set out to the shew, they were sufficient to furnish
 and take vp a peculiar theatre, which of purpose he caused to be made beyond the Tyber in the
 gardens there: and enough it was for Nero to behold the said theatre replenished with people at
 the plaies which he exhibited there in honor of his wife the Empreſſe *Poppæa*, after one child-
 bed of hers, where among other musiciens, he sung voluntary vpon the stage before the plaies
 began. I saw him there my selfe to make shew of many broken pieces of one cup which he cau-
 sed to be gathered together full charily, as I take it, to exhibit a spectacle wherat the world
 should lament and cry out in detestation of Fortune, no lesse ywis, than if they had bin the bones
 and reliques of king *Alexander* the Great his corps to be laid ſolemly in his sepulchre; and
 herein he pleased himselfe not a little. *Titus Petronius*, late Conſull of Rome, when he lay at the
 point of death, called for a faire broad-mouthed cup of Cassidoine, which had cost him before-
 time three hundred thousand sesterces, and presently brake it in pieces in harred and despight
 of Nero, for feare lest the same prince might haue seized vpon it after his disease, and therewith
 furnished his own boord. But Nero himselfe (as it became an Emperour indeed) went beyond
 all others in this kind of excess, who bought one * drinking cup that stood him in three hun-
 dred thousand sesterces, a memorable matter (no doubt) that an Emperour, a father and patron
 of his country, should drinke in a cup so deare. But before I proceed any farther, it is to be noted,
 that we haue these rich Cassidoine vessels [called in Latine *Murrina*] from out of the Leuant:
 for found they be in many places of the East parts, and those otherwise not greatly renowned,

but most within the kingdom of Parthia: howbeit, the principall come from out of Carmania. G
The stone whereof these vessels be made, is thought to be a certaine humour thickened and baked as it were within the ground by the naturall heat thereof. In no place shali a man meet with any of these stones larger than small tablements of pillars or counting-boards; and seldom are they so thicke as to serue for such a drinking cup as I haue spoken of already: resplendant they are in some sort, but that brightnesse is not pearcing, and to say a truth, it may be called rather a polishing glosse or lustre, than a radiant and transparent clearenesse: but that which maketh them so much esteemed, is the variety of colours; for in these stones a man shall perceiue certaine vains or spots, which as they be turned about resemble diuers colours enclining partly to purple and partly to white: he shall see them also of a third colour composed of them both, resembling the flame of fire: Thus they passe from one to another as a man holdeth them; in so much as their * purple seemeth to stand much vpon white, and * their milkie white to beare as much vpon the purple. Some esteemed those Cassidoine or Murrhene stones richest, which represent as it were certain reuerberations of sundry colours meeting all together about their edges and extremities, such as we obserue in rainbowed: others are delighted with cerataine fatterie spots appearing in them; and no account is made of them which shew either pale or transparent in any part of them, for these be reckoned great faults and blemishes. In like maner if there be scene in the Cassidoine any spots like corns or graines of salt: if it containe resemblances of werts, although they beare not vp but lie flat as they doe many times in our bodies: finally, the Cassidoine stones are commended in some sort also for the smell that they do yeeld.

As touching Cryfall, it proceedeth of a contrary cause, namely of cold; for a liquor it is congealed by extreame frost in maner of yce; and for the prooffe hereof, you shall find cryfall in no place els but where the winter snow is frozen hard: so as we may boldly say, it is very yce and nothing els, whereupon the Greeks haue giuen it the right name Crytallos, i. Yce. We haue this cryfall likewise out of the East-parts, but there is none better than that which India sends to vs. Ingendred it is also in Asia, and namely about Alabanda, Ortosia, and the mountains adioyning, but in request it is not no more than that which is found in Cyprus: howbeit, there is excellent cryfall within Europe, and namely vpon the crests of the Alps. King *Tuba* writeth, that in a certaine Island lying beyond the red sea ouer-against Arabia, named *Neron, there growes cryfall: as also in another thereby, which yeeldeth the *Topaze precious stone; where, *Pythagoras* (lieutenant or gouernour vnder king *Ptolome*) digged forth a piece which carried a cubit in length. *Cornelius* * *Bocchus* affirmeth, that in Portugall vpon certaine exceeding high mountaynes, where they sinke pits for the leuell of the water, there be found great cryfall quarters or masses of a wonderfull weight. But maruellous is that which *Xenocrates* the Ephesian reporteth, namely, that in Asia and Cyprus there be pieces of cryfall turned vp with the very plough, so ebb it lieth within the ground; an incredible thing, considering that before-time no man beleeued that euer it could be found in any place standing vpon an earthly substance, but only among clifffes and craggs. It soundeth yet more like a truth, which the same *Xenocrates* writeth, namely, that oftentimes it is carried down the streame running from the mountaynes. As for *Suides*, hee saith confidently, that cryfall is not engendred but in places exposed onely to the South: and verily this is most true, for you shall neuer meet with it in waterish countries lying Northerly, be the climat neuer so cold, no though the riuers be frozen to an yce euen to the very bottome. Wee must conclude therefore of necessity, that certaine coelestiall humours, to wit, of raine and some small snow together, do concurre to the making of cryfall: and hereupon it comes, that impatient it is of heat, and vnlesse it be for to drinke water or other liquor actually cold, it is altogether reiected: but strange it is, that it should grow as it doth, six angled: neither is it an easie matter to assigne a sound reason thereof, the rather for that the points be not all of one fashion; and the sides betweene each corner are so absolute euen and smooth, as no lapidarie in the world with all his skill can polish any stone so plain. The greatest & most weightie piece of cryfall that euer I could see, was that which *Livia Augusta* the Emperresse dedicated in the Capitoll, which weighed about fiftie pounds. *Xenocrates* mine authour aboue-named, affirmeth, that there was scene a vessell of cryfall as much as an Amphore: and some besides him doe say, that there haue beene brought out of India, cryfall glasses containing foure sextars a piece. Thus much I dare my selfe auouch, that cryfall groweth within certaine rockes vpon the Alps, and those so steep and inaccessible, that for the most part they are constrained to hang

A by ropes that shall get it forth. They that be skilfull and well experienced therein, go by diuers markes and signes which direct them to places where there is crystall, and where also they can discerne good from bad; for this you must think, there be many imperfections and faults therein; as namely, when it is rough or rugged in hand, rustie like yron, cloudie and full of speckes: otherwhiles there is a secret hidden fistulous vicer as it were within: there lieth also in it a certain hard knurre, which is brittle and apt to breake into small crumbs, besides the corn or grain therein called Sal. Some pieces of crystall you shall haue which carry a certain red rust: others be full of hairy strakes, a man would imagin they were fo man rists; but cunning artificers can hide this last imperfection when they cut and engrave the piece that hath it: for in truth, if a crystall be pure and cleare of it selfe, much fairer it is plain, than so wrought and engrauen; and such crystals the Greeks call Acenteta; but about all, when they look not like the froth of clear water: last of all, this is to be considered, that the heauier crystall is in proportion, the better account there is made of it. Moreover, I read of certaine Phyticians who are of opinion, that there is not a better and more wholesome cautery for any part of the body that requireth cauterising or burning, than a ball or pomander of crystall held opposit between the member and the Sun beams. But will you heare of another notorious example of folly and madnesse in these crystals as well as in Cassidouns? There are not many yeres since a dame of Rome, and thence none of the richest, who bought one boll or drinking cup of crystall, and paid 150000 sesterces for it. As for Nero the Emperour (of whom I spake erewhile) when vnhappy news was brought vnto him of a great ouerthrow and a field lost to the danger of his owne state and the common-wealth, in the height of his rage and a most furious fit of anger, caught vp two crystall drinking cups and past it them all to pieces: his spight was belike at all the men liuing in that age, & better means he could not deuise to plague and punish them, than to preuent that no man else should drinke out of those glasses: and in very truth, a crystall being once broken, cannot by any deuise whatsoever be reunited and made whole againe as before. We haue at this day cups and vessels of glasse that come passing neere vnto crystall: but wonderfull it is, that notwithstanding our glasses be so like, yet they haue not abated and brought downe the price of crystal, but rather caused it to be far dearer.

In the next degree to cryſtall wee are to place Amber, a thing that hitherto I heare women only ſet daintie ſtore by, and adorne themſelues withall: ſtrange it is, that l'Amber, Caſſidoine, and Cryſtall, ſhould thus be in equall requeſt with ſine pretious ſtones; marie for Caſſidoine and Cryſtall, in ſome reſpects verily they may ſeeme to deſerue a higher rounge, and namely, in regard that both of them are ſo appropriat for to drink water or cold liquor out of ſuch cups: but as for Amber, our delicates and wantons haue not yet deuifed any probable reaſon why there ſhould be ſuch a reckoning made of it: but ſurely it is the folly and vain curioſity of the Greeks that hath giuen acceaſion thereof, and brought it into ſo great a name. And here I muſt beſeech the readers to beare with me in this my diſcourſe as touching the firſt originall of Amber; for I thinke it not impertinent to deliuer what marueiles and wonders the Greeks haue broached as touching this thing, that the age and poſterity enſuing may yet be acquainted with their fabuloſities: firſt and formoſt therefore, many of their Poets, yea, and as I ſuppoſe, the chiefe and principall of them, to wit, *Aſchylus, Philoxenus, Nycander, Euripides*, and *Saſyrus*, tell vs a tale of the ſiſters of young price *Phaëton*, who weeping piteouſly for the miſerable death of their brother who was ſmitten with lightning, were turned into Poplar trees, which in ſtead of tears yeelded euery yere a certain liquor called Electrum [*id eſt*, Amber] which iſſued from them where they grew along the riuier Eridanus, which we call Padus, *id eſt*, the Po: and the reaſon why the ſame was named Electrum, is this, becauſe the Sun in old time was vually called * Elector in Greeke. But that this is one of their loud lies, it appears evidently by the teſtimony of all Italie. But ſome of theſe Greek writers and ſuch as would ſeem to be more ſpeculatiue and better ſcene in the works of Nature than their fellowes, haue told vs of certain Iſlands that ſhould lie along the coaſt within the Venice gulfe, called Electrides, forſooth becauſe that amber is there gathered, by reaſon that the foreſaid riuier Po falls into the ſea among them: howbeit wel known it is, that there were neuer yet Iſlands ſo named within that tract; no nor any Iſlands at all neere to that place, into which the riuier Padus could poſſibly bring any thing at all down his ſtreames: As for *Aſchylus* the foreſaid Poet, who ſaith that the riuier Eridanus is in Iberia, that is to ſay, Spaine, & otherwiſe that it is called Rhodanus, as alſo for *Euripides* and *Apollonius*, who ſay that

e *morning out*
e *of our beds.*

Rhosne & Po both meet in one, and discharge themselves together into the said Venice gulfe, G they shew their grosse ignorance in Cosmography, and description of the world, and therefore they would be rather pardoned if they knew not what Amber was. Those that write more modestly than the rest (and yet can lie as well as the best) beare vs in hand, that about the sides of the foresaid Venice gulfe or Adriatick sea, vpon rockes otherwise inaccessible, there grow trees which yerey at the rising of the Dogstar do yeeld forth this Amber in manner of a gum. *Theophrastus* contrariwise affirmes, that Amber is digged out of the ground. As for *Chares*, he saith, that *Phaeton* died in *Aethyopia* neere vnto the temple of *Iupiter Ammon*, which is the reason of a chappell there wherein hee is shrined, as also of an oracle much renowned; in which quarters (quoth he) amber is engendred. *Philemon* would make vs beleue, that Amber is minerall, and that within Scythia in two places it is gotten forth of the earth, in the one it is found white & of the colour of wax, which they call *Electrum*; in the other it is reddish or tawny, and that is named *Sualternicum*. *Demosthenes* calls Amber, *Lyncurion*, for that it commeth of the vrine of the wild beaft named Onces or Lynxes: the which is distinct in colour, for that which proceedeth from the male is reddish and of a fiery colour; the other which passeth from the female, is more weake in colour, and enclineth rather to whitish. Some giue it the name *Langurium*, and make report of certaine beasts in *Italie* named *Languria*. *Zenobemus* teacheth the same beasts *Langas*, and by his saying, they liue about the Po. *Sudines* talketh of a tree in *Liguria*, which should beare this Amber: of whose opinion also was *Metrodorus*. *Sotacus* was verily persuaded, that it run downe from certaine trees in *Brittaine*, and those he thereupon called *Electrides*. *Pitheas* affirmeth, that in *Almaine* there is the arme of the Ocean called *Mentonomon*, along which there inhabit certaine people named *Gutti*, for the space of six thousand *stadia*; from which, within one daies sailing, there lyeth an Island called *Abalus*, into which at euery Spring tide, there is cast vp by the waters of the sea at a high water, a great quantitie of Amber; and it is taken for nothing else but a certain excrement congealed and hardened, which the sea in that season purgeth and sendeth away. The inhabitants of those parts (saith he) vse it for their ordinarie sewell to burne, and doe sell it to the Saxons and other Dutch, their next neighbours. *Timaeus* accorded with him, saue only that he would haue the said Island to be called *Baltia*. *Philemon* was of this mind, that Amber would neuer flame if it were set on fire. *Nicas* would haue vs conceiue, that it should be a certaine iuice or humour proceeding (I wot not how) from the raies of the Sun, and yet he maketh a reason thereof, imagining that the said beames should be exceeding hot toward the Sun-setting, which rebounding from the earth, leaue behind them a certain fatty sweat in that part of the Ocean; and the same afterwards is cast vp with tides into the Sea-shore and sands of the Germanes. He writeth also, that in *Egypt* it is engendred after that manner, where it is called *Sacal*: as also among the Indians, who make more account of it than of frankincense. Semblably in *Syria*, the women (saith hee) make wherues of it for their spindles, where they vse to call it *Harpax*, because it will catch vp leaues, straws, & fringes hanging to cloaths. *Theophrastus* reporteth, that the ocean casteth vp amber at tides, to the capes of the *Pyrenæan hills*: which *Xenocrates* also beleue, who is the last that hath written of Amber, and such like. There is at this day liuing, *Asarubas*, who hath reported, that neer vnto the *Atlanticke* sea there is the lake *Cephisis*, which the *Mores* call *Electrum*, and the same being chased and heat throughly by the Sun, casteth vp from the mud thereof, Amber, floating aloft vpon the water. *Ancistras* maketh report of a place in *Affrike* named *Cicyone*, as also of the riuer *Cratthis*, which floweth out of a lough and runneth into the sea; in which lake or lough, there liue certain kinds of foule which he names *Meleagrides* and *Penelopes*: herein amber is engendred (by his saying) after the same manner as before I shewed in the lake *Electris*. *Theomentes* saith, that neere vnto the great *Syrtis* where the hort-yard and garden of the *Hesperides* lieth, a man shall find, that amber falleth out of the said garden into a lake beneath, and then the virgins attending vpon that place, come ordinarily to gather it. *Ctesias* affirmeth, that among the Indians there is a riuer called *Hypobarus*, (which word signifies as much, as bearing all good vessels) it runneth out of the North and falleth into the East sea, neere vnto a wild mountain, full of trees that beare amber. He addes moreouer & saith, that those trees are called *Aphytacon*, by which denomination is meant, most delightfom sweetnes. *Mithridates* writeth, that toward the coast of Germany there lies an Island, and the same named *Oseriæta*, replenished with woods of Cedar trees yeelding Amber, which runs from them into rocks. *Xenocrates* is of opinion, That Amber

* or Banomania.

* *aphibus*, some read *aphibus*, in Summer.

* or rather *Electris*, as appeareth in literature.

A was called in Italy not only *Succinum*, but also *Thieum*: whereas the Scythians name it *Sacrium* (for there also it is engendred); also he saith, that others think it is engendred in *Numidia*. But I wonder most at *Sophocles* the Tragicall Poet (a man who wrote his Poësies, with so graue and lofty a stile, and liued besides in so good reputation; being otherwise borne at Athens, and descended from a noble house, emploied also in the managing of state affaires, as who had the charge & conduct of an army) that he should go beyond all others in fabulous reports, as touching Amber: for he sticketh not to auouch, That beyond *India* it proceedeth from the tears that fall from the eies of the birds *Meleagrides*, wailing & weeping for the death of *Meleager*. Who would not maruell, that either himselfe should be of that belife, or hope to persuade others to his opinion? For what child is there to be found so simple and ignorant, who will beleue, that birds should keep their times to shed tears euery yere so duly, and especially so great drops and in such quantitie, sufficient to engender Amber in that abundance? Besides, what congruities are there, that birds should depart as far as to the Indians and beyond, for to mourn and lament the death of *Meleager* when he died in Greece? What should a man say to this? Are there not many more as goodly tales as these, which Poets haue sent abroad into the world? And their profession of Poetry, that is to say, of faining and deuising fables, may in some sort excuse them. But that any man should seriously and by way of history deliuer such stuffe, as touching a thing so rife and common, brought in euery day in abundance by merchants which were ynough to conuince such impudent lies, is a meere mockerie of the world in the highest degree; a contempt offered vnto all men, and argueth an habit of lying, and an impunitie of that vice intollerable.

CHAP. III.

¶ Of the true originall and generation of Amber. The sundry kinds thereof. The excessse and superfluitie of people, as touching Amber. The medicinable properties that it affordeth. Of *Lyncurium*, and the vertues that it hath in *Physicke*.

B Vt to leaue Poets with their tales, and to speake resolutely and with knowledge, of Amber, D knowne it is for certain, That engendered it is in certaine Islands of the Ocean Septentrio-nall, where it beateh vpon the coasts of Germany: and the Almanes call it *Glessum*. And in very truth, in that voyage by sea which *Germanicus Cesar* made into those parts, our countrymen named one of those Islands *Glessaria*, by reason of the Amber there found; which Island the Barbarians call *Austraia*. It is engendred then in certaine trees, resembling Pines in some fort, and issueth forth from the marrow of them, like as gum in *Cherrie* trees, and rosin in Pines. And verily, these trees are so full of this liquor, that it swelleth & breaketh forth in abundances which afterwards either congealeth with the cold, or thickeneth by the heat of Autumn. Now if at any time the sea rise by any extraordinary tide, and catch any of it away out of the Islands, then verily it is cast a shore vpon the coast of Germany, where it is so apt to roule, that it seemeth (as it were) to hang and settle lightly vpon the sands, whereby it is the more easily gotten. E And for that our ancestours heretofore in old time beleueed that it was the iuice of a tree, they called it therefore in Latine *Succinum*. That it comes from trees of a Pine kind, may appeare by this, That if a man rub it, he shall find the smell of Pine-wood: also, for that when it burneth, the flame, and fume (both) resembleth that of Torch-wood. The Germanes make great traffick thereof, and bring it into *Pannonia*, and so from thence vnto vs, through our prouinces [of *Istria* and *Venice*]; for from *Pannonia*, the Venetians first (who confine next vpon the marches thereof, and whom the Greekes call *Heneri*) receiued it by way of merchandise in the maritime port townes along the *Adriaticke* sea, and so by that means brought it into name and request: which ordinary traffick may be the reason which gave occasion to the foresaid tale that runes of the Po and the *Poplars* about it, that should weep Amber. And euen at this day the country dames F of *Lumbardie*, and those parts beyond the Po, vse to weare faire carkanets & collers of Amber-beads to adorne themselves especially, and in some sort for the health also of their bodies: for persuaded they are, that it withstands the inflammation of the Amygdals & other accidents of the throat and chawes: for that the people of that country are subject to poghes vnder their throat, about those fleshie parts neere vnto it, by reason of sundry kinds of waters which breed those

* For the perspicuitie and brightness, like unto glasse.

* This disease is called *Bronchitis* or *Hernia gutturalis*, ordinary in Sauiuy and those parts about Geneva.

those infirmities. The foresaid coast of Germany is almost six hundred miles from Carnuntum in Pannonia, and yet of late daies much frequented by merchants from all quarters. Certes, a Gentleman of Rome discouered those parts, by occasion that he was sent thither by commission from *Julianus* (who had the charge vnder *Nero* for furnishing of the solemne plaies and fights of sword-fencers) to buy vp good store of amber. This gentleman I say surueied diligently all those coasts, & saw the maner of the whole traffick for that commodity, yea & brought into Rome such plenty thereof, that the great nets and cordage (which for defence of the outstanning and open gallerie within the Theatre were opposed against the wild beasts, there to be baited and to fight) were buttoned & set out with Amber, the armour likewise, the bieres, & other furniture for burial of those fencers which should happen there to be killed, yea, & in one word, all the apparel and prouision for one day to the setting out of those pastimes and disports, stood most of Amber. The greatest piece of Amber that he brought ouer, weighed 13 pounds. Moreover, it is held for certain, That it is to be found among the Indians. *Archelaus*, who sometime reigned as king in Cappadocia, writeth, That from thence it is brought rude and vnclean, with pieces of bark sticking within it: but the way to scoure and polish it, is to seeth it in the grease of a sow that sucketh pigs. That it doth destil and drop at the first very clear & liquid, it is euident by this argument, for that a man may see diuers things within, to wit, Pismires, Gnats, and Lizards, which no doubt were entangled and stuck within it when it was green and fresh, and so remained enclosed within as it waxed harder. Many kinds there be of amber. The white is most redolent and smells best: but neither that, nor yet those pieces which are coloured like wax, be of any price. The high coloured Amber, namely that which is of a deepe yellow enclining to red, is much more esteemed, and the rather if it be cleare and transparent, provided alwaies that the glittering thereof be not too ardent. Commendable it is in Amber, and sheweth it to be rich, if it represent fire in some sort: but it must not be too too fiery. But the excellent Amber is that which is called *Falerum*, for the colour which it carrieth, resembling the wine *Falerum*: and the same is cleare and transparent, with a gay lustre that pleaseth & contenteth the eye very well. And yet some there be, who delight more in that Amber which looks with a mild yellow like to boiled and clarified hony. But this I am to giue you to vnderstand, That there may be giuen vnto Amber what tincture or colour a man will: but commonly they vse thereto the suet of Kids and the root of Orchanet: and no maruaile, since that some haue deuised also to enrich it with a purple dye. To come vnto the properties that Amber hath, if it be well rubbed and chaufed between the fingers, the potentiall facultie that lies within, is set on work, and brought into actual operation, whereby you shall see it to draw chaffe strawes, dry leaues, yea, and thin rinds of the Linden or Tillet tree, after the same sort as the load stone draweth yron. Moreover, take the shavings scraped from Amber, and put them into lamp-oile, they will burne and maintaine light both longer and also more cleare than weekes or matches made of the very tire and best of flax. As touching the estimation that our delicats and wantons make thereof: Some there be, who for their pleasure will giue more for a puppet or image made of Amber to the likenes and proportion of man or woman, be it neuer so little, than for the liuely and lusty body indeed of a tall man and valiant souldior. But what should I say to such? Certainly they deserue to be well chastised for their peruers iudgment, & one rebuke is not sufficient. Yet can I hold better with them who take pleasure in other things, & me thinks they haue some reason therof: for Corinth vnsell, there is good cause that a man should set his mind therupon, in regard of the singular temper of the brasse, with some proportion of siluer and gold: in pieces of metall ingrauen, enchaufed and embossed, the curious art and the witty deuise seen vpon the worke may well rauish the spirit of the buyer, and draw him on to giue a round price: Touching the cups made of Cassidonic and Crystal, I haue shewed already, wherein lies their grace, and what may enamour a chappman and cause him to bid well and offer frankly for them: Faire pearles and goodly vniones are commended, for that our braue dames enrich their borders therewith, and set out the attire of their heads: gems and pretious stones adorne and beaurifie our fingers: in sum, there is no superfluitie that we haue, but grounded it is either vpon some colourable vse that wee may pretend, or els vpon some gallant shew that it makes: As for this Amber, I see nothing in the world to commend it; only it is a mind that folk haue to take affection to it, they know not wherefore, euen of a delicat and foolish wantonneffe. And in truth, *Nero Domitianus*, among many other fooleries and gauds wherein he shewed what a monster he was in his life, proceeded so far, that he made

A made a sonnet in praise of the hair of the Empreffe *Poppaea* his wife, which he compared to Amber, and as I remember, in one staffe of his dittie he tearmed them *Succina*, i. Ambre: and from that time our dainty dames and fine ladies haue begun to fet their mind vpon this colour, and haue placed it in the third ranke of rich tincture: whereby we may see there is no superfluitie and disorder in the world, but it hath a pretence or cloake of some pretious name or other. And yet I will not disgrace Amber too much: for why? there is some good vse thereof in Physicke. But I must tell you againe, our women regard not that one whit; that is not it wherfore they take so great a liking to Ambre. True it is that a collar of Ambre beads worne about the neck of yong infants, is a singular preseruatiue to them against secret poyson, & a countercharme for witchcraft and forcerie. *Callistratus* saith, That such collars are very good for all ages, and namely to preferue as many as weare them against fantastickall illusions and frights that driue folke out of their wits: yea and Amber, whether it be taken in drinke, or hung about one, cures the difficulty of voiding vrin. This *Callistratus* brought in a new name to distinguish yellow Ambre from the rest, calling it *Chryselestrum*, which is as much to say as gold Ambre. And in very truth, this Amber is of a most louely and beautifull colour in a morning. This property it hath besides by it selfe, that it will catch fire exceeding quickly, for if it be neer it, you shall see it will soon be of a light fire. He saith of this yellow Amber, that if it be worn about the neck in a collar, it cures teauers, and healeth the diseases of the mouth, throat, and jawes: reduced into powder and tempered with hony and oile of roses, it is soueraign for the infirmities of the ears. Stamped together with the best Artick hony, it makes a singular eie-salue for to help a dim sight: puluerized, and the powder thereof taken simply alone, or els drunk in water with masticke, is soueraign for the maladies of the stomacke. Furthermore, Amber is very proper to falsifie many pretious stones which are commended for their perspicuity and transparent clearenesse, but specially to counterfeit Amethysts, by reason that I haue already said, it is capable of any tincture that a man would giue it. The froward peeuishnes of some Authors who haue written of *Lyncurium*, enforceth me to speak of it immediately after Amber: for say that it be not *Elestrum* or Amber, as some would haue it, yet they stand stiffly in this, that it is a pretious stone; many they hold, that it commeth from the vrine of an Once, by reason that this wild beast so soon as it hath pissed, couereth it with earth, vpon a spight and enuie to man, that he should haue no good thereby: They affirme moreover, That the Once stone or *Lyncurium* is of the same colour that Ambre. D ardent which resembleth the fire, & that it serueth well to be engrauen: neither by their saying doth it catch at leaues only and strawes, but thin plates also of brasse and yron: and of this opinion was *Dimacles* and *Theophrastus*. For mine own part I hold all to be mee re vntruths: neither do I think, that in our age there hath been a man who euer saw any pretious stone of that name. What euer also is written as touching the vertues medicinable of *Lyncurium*, I take them to be no better than fables, namely, that if it be giuen in drinke, it will send out the stone of the bladder: if it be drunk in wine, it will cure the jaundise presently, or if it be but carried about one, it will do the deed: but ynough of such fantastickall dreames and lying vanities, and time it is now to treat of those precious stones, wherof there is no doubt made at all, and to begin with those that by all mens confession are most rich and of highest price. In which discourse I will not prosecute this theame only, but also (for to aduance the knowledge of posterity in those things that may profit this life) I meane estfoones to haue a sling at Magicians for their abominable lies and monstrous vanities, for in nothing so much haue they ouerpasted themselves as in the reports of gems & pretious stones, exceeding the tearms and limits of Physick, whiles vnder a color of faire and pleasing medicines, they hold vs with a tale of their prodigious effects and incredible.

CHAP. IIII.

¶ Of Diamants and their sundry kinds. Their vertues and properties medicinable. Of Pearles.

THE Diamant carrieth the greatest price, not only among pretious stones, but also aboue all things els in the world: neither was it knowne for a long time what a Diamant was, vnlesse it were by some kings and princes, and those but very few. The only stone it is that we find in mines of metall. Very seldome it is, and thought a miracle to meet with a diamant in a veine of gold, & yet it seemes as though it should grow no where but in gold. The writers of ancient time

time were of opinion that it was to be had in the mines only of Æthiopia, and namely between G the temple of *Mercurie* and the Island *Meroë*, affirming moreover, that the fairest Diamant that euer was found, exceeded not in bignesse a Cucumber seed, whereunto also it was not vnlike in color. But in these daies there be known six sorts of Diamants. The Indian is not engendred in mines of gold, but hath a great affinity with Cryfall: and groweth much after that manner; for in transparent and cleere color it differeth not at all, neither yet otherwhiles in the smooth sides and faces which it carrieth between six angles, pointed sharpe at one end in manner of a top, or els two contrary waies lozengewise (a wonderful thing to consider) as if the flat ends of two tops were set and joined together: and for bignesse it hath bin knowne of the quantity of an Hazel-nut or Filbard kernill. The Diamants of Arabia be much like to the Indian, only they are lesse; H they grow also after the same order: As for the rest, they are of a more pale and yellow color, te- stifying out of what country and nation they come, for they breed not but in mines of gold, and those the most excellent of all others. The triall of these Diamants is vpon a smiths Anuill: for strike as hard as you will with an hammer vpon the point of a Diamant, you shall see how it scorneth all blowes, and rather than it will seeme to relent, first flieth the hammer that smiteth, in pieces, and the very anuill it selfe vnderneath cleaueth in twaine. Wonderful and inenarrable is the hardnesse of a Diamant: besides it hath a nature to conquer the fury of fire, nay, you shall neuer make it hot, doe what you can: for this vntameable vertue that it hath, the Greekes haue giuen it the name *Adamas*. One of these kinds the said Greekes call *Cenchron*, for that it is as big ordinarily as the miller seed: a second fort they name *Macedonicum*, found in the mine of gold near *Philippi*; and this is that Diamant, which for quantity is compared to the Cucum- I ber seed: After these, there is the *Cyprian Diamant*, so called because it is found in the Isle *Cy- prus*; it enclineth much to the color of brasse, but in cases of Physick (as I will shew anon) most effectual: Next to which I must range the *Diamant Sideritis*, which shines as bright as Steele, whereupon it tooke that name: in weight it passeth the rest, but in nature it is farre vnlike; for it will not abide the hammer but breake into pieces; besides, another adamant will pierce it, and bore a hole quite through it: which also may be said of the *Cyprian Diamant*: so as to speak in one word, these two last rehearsed, may go only vnder the name of Diamants: for otherwise they are but bastards, and not true Diamants. Moreover, as touching the concord and discord that is R between things naturall, which the Greekes call *Sympathia* and *Antipathia* (whereof I haue so much written in all my bookes, and endeauored to acquaint the readers therewith) in nothing throughout the world may we obserue both the one & the other more euidently, than in the Di- amant: For this inuincible mincral (against which neither fire nor Steele, the two most violent and puissant Creatures of natures making, haue any power, but that it checketh & despiseth both the one and the other) is forced to yeeld the ganteler and giue place vnto the bloud of a Goat, this only thing is the means to break it in sunder, howbeit care must be had, that the Diamant be sleeped therein whiles it is fresh drawn from the beast before it be cold: & yet when you haue made all the sleeping you can, you must haue many a blow at the Diamant with hammer vpon the anuill: for euen then also, vnlesse they be of excellent prooffe & good indeed, it wil put them to it, and break both the one & the other: But I would gladly know whose inuention this might be to soake the Diamant in Goats bloud, whose head deuised it first, or rather by what chance I was it found out & known? What coniecture should lead a man to make an experiment of such a singular and admirable secret, especially in a goat, the filthiest beast one of them in the whole world? Certes I must ascribe both this inuention, & all such like to the might and beneficence together of the diuine powers: neither are we to argue & reason how and why nature hath done this or that: sufficient it is that her will was so, & thus she would haue it. But to come againe to the Diamant, when this prooffe taketh effect to our mind, so that the Diamant once crack, you shall see it break & crumble into so small pieces, that hardly the eie can discerne the one from the other. Wel, lapidaries are very desirous of Diamants & seek much after them: they set them into handles of yron, & therby they with facility cut into any thing, be it neuer so hard. More- into L over, there is such a naturall enmity between Diamants & Loadstones, that if it be laid neere to a piece of yron, it will not suffer it to be drawn away by the loadstone: nay, if the said loadstone be brought so neere a piece of yron, that it haue caught hold thereof, the Diamant, if it come in place, will cause it to let goe the hold. The Diamant hath a property to frustrate the malicious ef- fects of payson; to drine away those imaginations that set folke besides themselves; & to expell

vaine

A vaine feares that trouble and possesse the mind: which is the reason that some haue called it *A- nachites*. *Merodorus Scepheus* affirmeth, That the Diamant is found in Germanie and the Island *Baltia*, wherein Amber is ingendred: but as far as euer I could reade, he is the onely man that saith so. This Diamant also of *Almaine* he preferreth before those of *Arabia*, howbeit no man doubteth that he lieth stoutly. After the precious Diamants of *India* and *Arabia*, wee in these parts of the world esteeme most of pearles: but as touching them, I haue written sufficiently in my ninth booke, where I discoursed of such matters as the seas do yeeld.

CHAP. V.

B ¶ Of the Emeraude, and the sundry sorts thereof. Of greene gems or precious stones, and such as be light some and cleere all shorow.

E Emeraude for many causes deserue the *third place: for there is not a colour more pleasing to the eie. True it is, that we take great delight to behold greene herbes and leaues of trees, but this is nothing to the pleasure wee haue in looking vpon the Emeraude, for compare it with other things, be they neuer so green, it surpasseth them all in pleasant verdure. Besides, there is not a gem or precious stone that so fully possesseth the eie, and yet neuer contenteth it with facietie. Nay, if the sight hath bin wearied and dimmed by intenuie poring vpon any thing els, the beholding of this stone doth refresh and restore it againe, which lapidaries well know, that cut and ingraue fine stones; for they haue not a better means to refresh their eies than the Eme- C raude, the mild green that it hath doth so comfort and reuiue their wearines and lassitude. More- over, the longer and farther off that a man looketh vpon Emeraude, the fairer and bigger they seeme to the eie, by reason that they cause the reuerberation of the aire about them for to seeme green: for neither Sun nor shade, ne yet the light of candle, causeth them to change and lose their lustre: but contrariwise, as they euer send out their own raies by little & little, so they en- D tertain reciprocally the visual beams of our eies; and for all the spissitude and thicknesse that they seeme to haue, they admit gently our sight to pierce into their bottome: a thing that is not ordi- nary in water. The same are shaped many times hollow, thereby to gather, vnite, and fortifie the spirits that maintain our eie-sight. In regard of these manifold pleasures that they shew to our eies, by generall consent of all men spared they are, and lapidaries be forbidden expressely D to cut and ingraue them: and yet the Emeraude of *Scythia* and *Ægypt* be so hard, as they cannot be pierced or wounded by any instrument: moreover, when you meet with a table Emeraude hold the flat face thereof against any thing, it will represent the said object to the eie, as well as a mirroir or looking glasse. And verily, *Nero* the Emperor was wont to behold the combats of fen- cers and sword-plaiers in a faire Emeraude. Now this first & foremost is to be noted, that of Eme- raude there be 12 kinds. The fairest and richest of all other, be those of *Tartarie* and called they are *Scythick*, of the nation *Scythia* from whence they came: and in truth, there be none fuller and higher in colour or haue fewer blemishes: and looke how far Emeraude goe beyond other precious stones, so far do the *Scythian Emeraude* surpass all others. The *Bactrian Emeraude*, as they are the next neighbors, so they come nearest in goodnesse to the *Scythicke*: found these be in chinks and joints (as it were) of rocks in the sea, and gathered (by report) about the dog daies, E when the North-east Etesian winds do blow: for then they glitter and shine within the earth that is grown about them, by reason that the said winds (which in those parts are strong) remoue the sand away from them, and cause them to be seen: but these by report be far lesse than those of *Scythia*. In a third place follow the Emeraude of *Ægypt*, & they be gotten out of certain crag- gy hills and cliffes about *Coptos*, a towne in high *Ægypt*. As for all others, they be found ordi- narily in brasse mines: that is the reason that the Emeraude of the Isle *Cypros* be held for chiefe and principall among those nine: and yet their singular commendation lieth not in any clear or mild colour that they haue, but their onely grace consisteth herein, that they seeme moist with a certaine fattinesse, and on which side soeuer a man do view them, they resemble the liquid wa- F ter of the sea, for transparent they be and shining withall, that is to say, they send out a colour of their own, & withall, through their perspicuity receiue the penetrant beams of our eies. It is reported, That in the same Isle *Cypros*, about the sepulchre of *Hermias* a pety king there, and near vnto the sea sides where were pooles and stewes of great fishes kept to be salted, there stood in old time a lion of marble, in the head of which Lion were set certain faire Emeraude in stead of eies,

* To wit, after
Diamant and
Pearles.

eyes, looking opposit into the sea but they glittered and pierced so deep into the water, that the G
 Tunies vpon that coast were affraid therat, & fled from the nets and other instruments that the
 fishers laid to take them withall: who maruelled a long time at this strange accident: but in the
 end knowing what the matter was, they changed the eies of the foresaid Lion, and remoued the
 Emeralds. But requisit it is that I should set down the imperfections & defaults of Emeralds,
 for that a may so easily be deceived and beguiled in the choise of them: First therefore all
 Emeralds be subiect to some blemishes, and yet as we obserue in men, they haue their parti-
 cular defects by themselves, according to the nation where they be found; for those of Cypr
 haue not an vniforme verdure, but you shal see in one and the same stone a mixture (as it were) of
 diuerse greenes, more or lesse in sundry parts: neither keep they euer that rich greene after one
 tenour, which we see in the Scythian Emeralds.ouer and besides, in some you shal meet with H
 a cloud or shadow running between, which doth impeach the cleare color: neither is the same
 commendable, if it be ouer bright. These faults are the cause that Emeralds are distinguisht by
 diuers names and kinds: for some be darke, and those be called blind: others be thicke, without
 any clearnesse or perspicuity at all. And some again are discommended and rejected for diuers
 little clouds, which also are different for the shade aforesaid: for this little cloud wherof I speak,
 is a fault in whitenesse, when as in viewing of an Emerald it looketh not green all through, but
 either the eiesight meeteth with some white in the way, or else at leastwise in the bottom. And
 thus much as touching the faults in colour. But in the very body and substance of the Emerald
 there be others obserued, to wit, when there appear either hairy streaks, or congealed specks re-
 sembling cornes of salt, or els spots of lead. Next to the Cyprian Emeralds, there is reckoning I
 made of the Æthyopian, which as king *Iuba* mine authour doth report, are found in Æthyopia,
 from Coptos in Egypt three daies journey: These be of a chearefull and liuely green, but hardly
 shal you find any of them clear, pure, and of one colour. Among these, *Democritus* raungeth the
 Hermionian Emeralds and the Persian: of which, the former seeme to swell out as if they were
 embossed and fattie withall: the Persian are not transparent, & yet of a pleasant greene and vni-
 forme, contenting the eie-sight well enough, though it cannot pierce and enter into them; and
 much like they be to the glowing eies of cats & panthers, for we may perceiue them to glitter
 and shine, and yet they be not translucent. These Emeralds in the Sun lose their lustre and be-
 come dim, but in the shade they shine gallantly, yea, and cast from them their beautifull raies
 farther than any other. And yet the general fault in all these, is this, if they shew the color either K
 of gall or the skie; likewise if in the Sun they glitter and shine cleare, but yet appear not green:
 These imperfections are perceiued ordinarily and most of all in the Atticke Emeralds, found
 in siluer mines at a place called Thoricos, yet are not these so grosse and fattie as others, and al-
 waies they seeme more beautifull afar off than neer at hand: these are subiect ordinarily to the
 fault called Plumbago, that is to say, in the Sun they looke with a leaden hew: Moreouer, this
 peculiar quality they haue by themselves, that some of them wear & decay with age, in so much
 as by little and little their liuely green decaie; and besides, in the Sun they lose their lustre.
 After the Atticke Emeralds, those of Media be accounted the greenest, and otherwhiles they L
 resemble the green Sapphire. These seem to be ful of waues, and to containe within them diuers
 shapes and figures of many things, as for example, poppie heads, birds, wings, and finnes, *locks
 of haire, and such like. Such Emeralds as are not found naturally greene, may be made better
 and receiue their perfection, by washing them in wine & oile. In one word, there is not a greater
 Emerald to be found than those of Media. As touching Carchedonian Emeralds, I wor not wel
 whether they be now out of al request & knowledge, since their mines of brasse haue failed them;
 and yet were they alwaies (at their best) the smallest of all others, and bare the lowest price: the
 same were brittle & easie to be broken, their color also was not settled but vncertain & change-
 able, resembling for all the world the greene feathers in Peacockes tails, or the downe of Pige-
 ons neckes; as a man held and turned them one way or other they shined more or lesse, being
 otherwise of themselves full of veines and skales. A speciall fault there was, wherto these Eme-
 rauds were subiect, which lapidaries called Sarcion, that is to say, a certain carnosity or fleshi-
 nesse incident vnto gems. Gathered they were in a certaine mountaine neere vnto Carchedon,
 which thereupon was named Smaragdites. K. *Iuba* hath left in writing, That the Emerald cal-
 led Cholos, serued the Arabians much in their buildings: for to adorn and beautifie their hou-
 ses, they were wont to enclose & set the same in the wals like as the white marble, which the Æ-
 gyptians

* Capillorum,
not carminum

A gyptian name Alabastrites. He reporteth moreouer, that there be many other Emeralds neere
 by, taken forth of the mountain Taygetus in Laconia, and those therefore be named Laconick,
 and much like they are to those of Media. He speaketh likewise of others in Sicilie. Reckoned
 there is in the ranke of Emeralds, a certain gem brought from Persia, named Tanos; howbeit of
 an vnpleasant green it is, and foule within: as also the stone Chalcosmaragdos, that comes out
 of the Isle Cyprus, which hath in it certain veins of brasse that trouble the green colour. *Theo-
 phrastus* reporteth, that he hath read in the books and records of the Ægyptians, That a king of
 Babylon sent as a present to one of their kings, one entire Emerald foure cubits long and three
 broad. Also, that there had bin within the temple of *Iupiter* among them, an Obeliske made of
 foure Emeralds, which obelisk notwithstanding was forty cubits long, & caried in bredth four
 cubits in some places, and two in others. He addeth moreouer, that while he wrote his historie,
 there was at Tyros within the temple of *Hercules*, a pillar standing of one Emerald, vnlesse hap-
 ly it were some bastard Emerald; for such (quoth he) are found, and namely in Cyprus there was
 seen naturally growing, a stone, whereof the one halfe was a plaine Emerald, the other a Iasper,
 as if the humor had not bin fully transformed and conuerted into an Emerald. *Apion* the Gram-
 marian, synnamed * Plitkonices, wrote not long before, who hath left recorded, That there remai-
 ned still within the labyrinth of Ægypt, the gyant-like image of their god *Serapis* nine cubits
 tall, and of one entire Emerald.

* Content-
ous, or Vicio-
rious.

Moreouer, many are of opinion, that Berils are of the same nature that the Emerald, or at
 leastwise very like: from India they come as from their native place, for seldome are they to be
 found elsewhere: lapidaries by their art and cunning know how to cut them into six angles, and
 to polish them smooth; for otherwise their lustre, which is but sad, would be dull and dead in-
 deed, vnlesse it were quickened and reuiued by the repercussion of these angles: for be they poli-
 shed neuer so much any other way, yet haue they not that liuely glosse which those six faces giue
 them. Of these Beryls those are best esteemed which carry a sea-water greene, and resemble the
 greenesse of the sea when it is cleare. Next to them are those called Chrysoberylli: these be
 somewhat paler, and their lustre tendeth to the colour of gold. A third kind there is approaching
 neere to this, but that it is more pale (how soeuer some do think it is no kind of Beril, but a gem
 by it self) and this they call Chrysoprasos. In a fourth degree are placed the Berils named Iya-
 cinthozontes, because they incline somewhat to the Iacinth. And in a fift such as are much of a
 D sky colour, wherupon they are named Æcroides. After them be the Beryls Cerini, for that they
 seem like wax: then the Oleagini, that is to say, of an oile colour. And in the last place bee the
 Crystalline, which are white, and come very neere to crystals. All the sort of these Beril stones
 haue these faults, to wit, white hairy streaks or lines in them, yea and other filthy ordure; being
 of themselves without these imperfections apt to shed their colour, which soon fadeth. The In-
 dians take a wonderfull pleasure in long Beryls, and commend them for the only stones & gems
 in the world; as if they cared not to be set in gold, but chose rather to be worn without it: and
 in truth in that regard their maner is to bore holes through them, and then to file them vp into
 chains and collars with haire of elephants: howbeit when they meet with some excellent Be-
 ryls indeed, which are come to their absolute goodnesse and perfection, they think it not good
 E to pierce such, but presently they tip them with gold, that is to say, they set vnto their heads cer-
 tain knobs in maner of bosses which comprehend and inclose the same. And in very truth, they
 delight to cut their Berils into long rolls or pillastres in maner of cylindres, rather than after
 the maner of other gems, because their principal grace and commendation lies in their length.
 Some are of opinion, that the Beril groweth naturally cornered and with many faces; and they
 hold those Beryls to be richest, which being bored through along, haue their white pith taken
 forth, for to giue them a better lustre of gold put vnto them; by the reuerberation wherof the
 ouermuch perspicuitie of the stone may seem more corpulent and in some sort corrected.ouer
 and about the faults already noted, subiect they are also to those imperfections which be inci-
 dent to the Emeralds, yea and besides to certain specks called Pterygia. It is thought, that Be-
 ryls be found likewise in these parts of the world, to wit, about the kingdome of Pontus. As for
 F the Indians, after that crystal was once found out, they deuised to sophisticate and falsifie other
 gems therewith, but Beryls especially.

Ggg

CHAP.

CHAP. VI.

¶ Of the pretious stone Opalus, and all the sundry kindes. The faults in them, and the means to try which be good. Also diuers sorts of other gems and pretious stones.

THe stones called Opales differ little or nothing otherwhile from Beryls, and yet the same sometimes are nothing at all like them, neither is there a gem that they will giue place to, vnlesse it be the Emeraud : India is the only mother of them : lapidaries therefore & those who haue written books of pretious stones, haue giuen vnto them the name and glory of greatest price ; but especially for the difficultie in finding them out and chusing them, which is inenarrable : for in the Opal you shal see the burning fire of the Carbuncle or Ruby, the glorious purple of the Amethyst, the Greene sea of the Emeraud, and all glittering together, mixed after an incredible manner. Some Opals cary such a resplendant lustre with them, that they are able to match the brauest and richest colours of painters ; others represent the flaming fire of brimstone, yea and the bright blaze of burning oile. The Opal is ordinarily as big as a silberd Nut. And here comes to my mind an historie among vs as touching the Opal, worth remembrance : for there is at this day to be seene one of these Opals, for the which gem *Marcus Antonius* proscribed and outlawed one *Nonius* a Senator of Rome, the sonne of that *Struma Nonius* (at whom the stomack of *Catullus* the Poet did rise so much, seeing him as he did, sit in a stately chaire of Ivory called *Curulis*) and grandfather to that *Servilius Nonianus* whom I my selfe haue seene Consul. Now the said Senator when he was driuen to fly vpon this proscription, took no more of all the goods which he had, but onely a ring wherein this Opall was set, which (as it is well known) had bin valued sometime at 20000 Sesterces. But as the cruell and inordinate appetite of *Antony* (who for a Jewell onely outlawed and banished a Roman Senator) was wonderfull on the one side, so the peeuishnesse and contumacie of *Nonius* was as strange on the other side, who was so far in loue with that gem which cost him his proscription, and rather than to part with it suffered himselfe to be turned out of house and home : and yet the very wild beasts are better aduised than so, who are content to bite off those parts of their bodies and leaue them behinde for the hunters, seeing themselves in danger of death for them. In the Opall there be obserued also diuers blemishes and imperfections, as wel as in other stones ; namely, if the colour resemble the floure of that herb which is called *Heliotropium*. Turnsole : also if it look like crystal or haile, likewise if there be a spot comming between in maner of a grain or kernel of salt : if it be rough in handling, or if there be certain small pricks or spots represented to the eyes : neither is there any pretious stone that the Indians can counterfeit so well by the meanes of glasse, as this ; inso much as hardly a man shall discerne the naturall Opal from the false, when they haue done withall. But the only triall is by the Sun, for if a man hold an Opall betwixt his thumbe and finger, against the beams of the Sun, if it be a counterfeit, he shall find those diuers colours which shewed therein, to runnall into one and the same transparent colour, and so to rest in the body of the stone ; whereas the brightnesse of the true Opal oftfoons changeth, and sends forth the lustre to and fro more and lesse, yea and the glittering of the light shineth also vpon the fingers. This gem, for the rare and incomparable beauty and grace that is in it, most Writers haue called *Pederos*.

There is also another kind of Opalos apart by it self, according to the opinion of some, who say it is called by the Indians *Sangenon*. It is said that that there be Opals in Egypt and in Arabia, like as in the kingdom also of Pontus ; but such of all other beare the lowest price. In *Galatia* likewise, and in the *Illes Thrasos* and *Cyprus* : for albeir they haue the lovely beaurie of the Opalus, yet their lustre is nothing so liuely and lightsome, and seldome shal you meet with any of them that is not rugged : their chief colours stand much vpon brasse and purple ; the fresh verdure of the green Emeraud is away, which the true Opal doth participate. This is generally held, that they are more commendable which be shadowed as it were with the colour of wine, than delaid with the cleannesse of water.

Thus far forth haue I written of gemmes and pretious stones which be esteemed principall and most rich, according to the decree generally set downe and pronounced by our nice and costly

A costly dames : for we may conclude vpon this point more certainly, going by their sentence, than grounding vpon the iudgement of men : for men (kings especially and great men) make the price of each gem according to their feuerall fancies. *Claudius Caesar* the Emperour made no reckoning of any but the Emeraud and the Sardonyx, and these ordinarily he wore vpon his fingers : but *Scipio Africanus* (as saith *Demosthenes*) tooke a liking to the Sardonyx before him, and was the first Roman that vsed it ; and euer since, this gem hath bin in great request at Rome : in regard of which credit, I will range it next to the Opall. In old time the Sardonyx, as may appeare by the very name, was taken for the pretious stone which seemed to be a * *Cornalline* vpon white, that is to say, as if the ground vnder a mans naile were flesh, and both together transparent and cleare : and in very truth, the Sardonyx of India is such, according to *Ismenias*, *Demosthenes*, *Zenathemis*, and *Sotacus*. As for these two last named, they verily doe name all the rest that are not cleare and shew not through them, Blind Sardonyches, such as the Arabian be ; and these haue carried away the name of Onyx, without any mention or apparence at all of the Sarda or Cornalline : and these stones haue begun of late to be knowne and distinguished by their sundry colours ; for some of them haue their ground blacke or much vpon azure and the naile of a mans hand : for it hath bin generally thought and beleueed, that such hath a tincture of white, and yet not without a shew of purple, as if the said white enclined to a vermillion or Amethyst. *Zenathemis* writeth, that these stones were not set by among the Indians ; notwithstanding otherwise they were so large and bigg, as thereof they made ordinarily sword handles and dagger halts : and no maruaile, for certaine it is, that in those parts land flouds comming downe with a streame from the hills, haue discovered such and brought them to light. He saith also, that they were at the beginning highly accepted of in those parts ; for that there is not in maner a stone engrauen, that will imprint the seale vpon wax cleanly without plucking the wax away, but it ; and through our persuasions, the Indians also grew into a good conceit of them, and tooke pleasure in wearing the same : and verily, the common people of India make holes through them, and so weare them enfiled as carkans and collars about their neckes only. And hereupon it commeth, that those are taken to be Indian Sardonyches or Cornallines which be thus bored through. As for the Arabick, excellent they are thought to be which are environed with a white circle, and the same very bright and most slender : neither doth this circle shine in the concavities or in the fall of the gem, but glittereth onely in the very bosses ; and besides, the very ground thereof is most blacke. True it is, that the ground of these Sardons is found in the Indian stones to resemble wax or horne, yea within the white circle, in so much as there is a resemblance in some sort of a rainbow, by means of certain cloudie vapors seeming to proceed from them ; and verily the superficial face of this stone is redder than the shels of Lobsters. As touching those that be in colour like to hony or lees (for this is taken to be an imperfection and fault in Cornallines) they be all rejected ; likewise if the white circle that girderth it about spread and do not gather round and compact together : semblably, it is counted a great blemish in this gem, if it haue a veine of any other colour (but that which is naturall) growing out of square : for the nature of this stone is such, like as of all things els, not to abide any strange thing to disturbe the feat therof. There be also Armeniacke Cornallines, which in all respects else are to be liked, but for the pale circle that claspeth them.

By occasion of this stone Sardonyx, I am put in mind for the names sake, to write of the gem Onyx also : for notwithstanding there be a stone so called in *Carmania* (which is the *Cassidoin*) yet there goeth also a gem vnder that name. *Sudines* saith, that the pretious stone Onyx hath a white in it resembling the naile of a mans finger : it hath likewise (quoth hee) the colour of a Chrysolith, otherwise called a Topase, of a Cornalline also, and a Iasper. *Zenathemis* affirmeth, that the Indian Onyx is of diuers and sundry colours ; to wit, of a fiery red, a blacke, a * *horne* grey ; hauing also otherwhiles certaine white strakes or veines in fashion of eies compassing it about ; and in some of them you shall see white streaks or veines likewise to goe crosse and by as betweene them. *Sotacus* maketh mention moreouer of an Arabian Onyx, but it differeth from others (saith hee) in this respect, That the Indian Onyx hath certaine sparkes in it, and the same enuironed and compassed about with white circles either single or many fold, farre otherwise than the Indian Sardonyx ; for in the former, the white seemed to be pointed pricks, but in these they bee compleat circles. As for the Arabian Onyches, there bee found of them blacke, with white circles. *Satyrus* reporteth furthermore, that the Indian Onyx is fleshie ; that in one

* Whereof haply they be called Cornallines.

part it resembleth a Rubie otherwise called a Carbuncle, in another a Chrysolith, and an Amethyst, yet he maketh no account of such: but the true Onyx indeed (quoth hee) hath very many veins, and those of sundry colors; garnished also it is with circles as white as milk: and albeit the colors of the veins be inexplicable as a man casteth his eie vpon them feuerally, yet meeting as it were all in one, they make a good confort and yeeld a lustre most pleasing to the sight. Now that I haue treated of the Onyx, I must not deferre to say somewhat also of the nature of Sarda, which maketh the other half of the stone Sardonyx, and so by that means (as it were by the way) to discourse of those gems that are of an ardent and fiery colour.

CHAP. VII.

¶ Of Carbuncles or Rubies, and their sundry kinds: of their defaults and imperfections: of the meanes to trie them. Of other precious stones resembling the fire.

* For the Greeks call them *σφαιρα*.

* These are called yet by Lapidaries, Alabandines, or Almadines.

* As one would say, more like some ordinary stone than a precious gem.

Among these red gems, the Rubies otherwise called Carbuncles, challenge the principall place, and are esteemed richest: they haue their name in Greeke of the * likenesse vnto fire, and yet fire hath no power of them, which is the reason that some call them *Apyroti*. As touching their kinds: there be Rubies of India, and Rubies of the Garamants, which carry the name also of *Carchedonij*, i. Carthaginian, in regard of excellency, by reason of the wealth and puissance of the city Carthage the Great. In this ranke, some doe place the Ethiopian Rubies and the Alexandrian, which are found indeed among the cliffes of the hill Orthosia, but trimmed & brought to their perfection by the * Alabandians. Moreouer, in all sorts of Rubies, those are taken for the male which shew a quick red more fire-like than the rest; and contrariwise female, such as shine not so bright but after a faint manner. In the male it is obserued, that some seeme to flame more cleare and pure, others are darker and blacker: there be againe that shine brighter than the rest, yea, and in the sun giue a more ardent and burning lustre: but the best simply be those which are called *Amethystizontes*, that is to say, that in the end of their fire resemble the blew violet color of the Amethyst. The next in goodnesse to them, are those which they call *Syrticæ*; and such do glitter and shine of their own nature: by reason whereof, they are discovered soon wheresoeuer they lie, by the reuerberation of the sun-beams. As touching the Indian Rubies, *Satyrus* saith, they are not found cleare, but for the most part foul; howbeit, after they be scoured, their brightnesse is most fiery. He affirmeth moreouer, that the Ethiopian Rubies are greasie and shine not out, but seeme to haue a fire burning within as if it were infolded in some thing about it. *Callistratus* holdeth opinion, that if a Carbuncle or Rubie be laid vpon a thing, it ought to yeeld certain white clouds, in the edges and extremities of the glittering that it makes; but if it be held vp or hung in the aire, it flameth & burneth out fire red: and hereupon it is, that most men haue called it the white Carbuncle; like as they haue named those Indian Rubies * *Lithizontes*, which shine more faintly & with a brownish or dusky flame. As for the Carchedonian Rubies, *Callistratus* saith, they be far lesse than others, whereas of the Indians some are so big, that being made hollow they wil contain the measure of one sextar. *Archelaus* writes, that the Carchedonian rubies be blacker than others to see too, but if they be quickened as it were with fire or sun, or be held bowing forward, they are more ardent and fiery than any other: the same in a shady house, seeme purple; in the open aire, flaming; against the raies of the sun, sparkling: he auoucheth moreouer, that the fiery heat thereof is so actual, that if a man seal with them, though it be in a shadowie and coole place, they will melt the very wax that is stamped therewith. Many authors haue written, that the Indian Rubies be whiter than the Carchedonian; and contrarie to the nature of the Carchedonian, if they be bended forward, they lose much of their viuacitie, and be dimmer and more dull by that means: also, that in the Carchedonian Rubies which be male, there are seene certain raies as it were of starres twinkling within; whereas the female contrariwise, sparckle all their fire without-forth: that the Alabandines be more darke and blackish than others, and withall rough in hand. It is said moreouer, that there be certaine stones growing in Thracia, of the same colour that Rubies, and which will not be chafed and made hot in the fire. *Theophrastus* writeth, that there be Rubies found about *Orchomenus* in the country of Arcadie, as also in the Isle Chios: and as for the Orchomenian, they be of a blacker kinde, and serue to make mirrors of. The Trezenian Rubies (by his saying) are

M

A of diuers colours and spotted with white specks comming in among: and the Corinthian Rubies be more pale and whiter than the rest. *Bocchus* writeth, that there be brought Rubies from Maris and Lisbon in Portugall; but with much adoe and great difficultie they are found, by reason of the clay wherein they be inlapped, in certain deserts and Forrests burnt with the Sun. In sum, there is not a harder thing than to discern these sundry kinds of Rubies one from another; they are so easie to be counterfeited and falsified by the art and skill of lapidaries & goldsmiths, who haue a cast to lay some foile vnder, to make them for to shine and glitter like fire. Men say, that the Ethiopians haue a deuise to steep their dusky and dark Rubies in vinegar; for in 14 daies they will be pure and glister, yea, and continue so 14 moneths after. There is a way to counterfeit Rubies with false glasse stones, which they will make seem Rubies as like as is possible; but the grinding vpon a mill soone discovereth the fraud, like as it doth in any other artificiall and sophisticated gems whatsoeuer; for their matter is more soft and brittle withall than the fine and pure stones indeed: also the false Rubies are detected by the hardnesse of the powder that is fetched from them, & the weight; for these glasse Rubies be farre lighter: and otherwhiles a man shall see in these falsified Rubies certaine little risings in manner of blisters or bladders, which shinelike siluer. Moreouer, there is found in Thesprotia a certaine minerall Rubie called *Anthraxitis*, resembling coles of fire: but whereas some authors haue written, that such grow in Liguria, I take it to be a meere vntruth, vnlesse haply in times past such might be found there. It is said also, that there be of these kind of Rubies, which are compassed about with a white veine, and their colour is ferie as well as of the rest before named: but this peculiar property they haue by themselves, That being cast into the fire, they seeme dead and doe lose their lustre: contrariwise, if they be well sprinkled and drenched with water, they seeme to glow, yea and to flame out againe.

There is a stone much like to this, called *Sandaistros*, which some name *Garamantires*, growing among the Indians in a place likewise so named. It is engendred also in that part of Arabia which regardeth the South Sun. The chiefe grace and commendation of *Sandaistros*, is to bee cleare, and to haue certaine drops as it were of gold like stars shining within, that is to say, alwaies in the body of the stone, and neuer in the coat or out side: in regard of which starre-like specks, there is attributed some religious matter to these stones, for that they represent in some sort to them that behold them, the seuen stars called *Hyades*, both in number and also in order and manner of disposition: which is the reason, that the wise men of Assyria named *Chaldei*, doe obserue them with much deuotion. Moreouer, these *Sandaistros* are distinguished by the tex, for the male seeme to haue a more sad and deep colour, and by the reuerberation of their fire within giue a tincture to those things that they touch or lie neer to: and the Indian verily of this kind are said to dim the eie-sight. As for the female *Sandaistros*, they carry not such an ardent shew of fire, but are more pleasant to the eie, as beeing attractive rather than burning. Some writers there be, who prefer the Arabian *Sandaistros* before the Indian, saying that the Arabian are like to the Chrysolithes that be somewhat smokie. As for *Ismerius*, he affirmeth, that the *Sandaistros* are so tender that they cannot bee polished: in a great errour therefore bee they who call this stone *Sandaresos*: but all authors herein accord, That the more stars do make apparence in them, so much better is the price. Furthermore, this is to be noted, that the nearnesse in name, otherwhiles is the cause of errour; as we may see by *Sandafer*, which *Nicander* called *Sandaterion*, others *Sandaferon*: and in truth, this *Sandafer* some take to bee *Sandafter*, and the *Sandafter* indeed, *Sandaresos*, which is found likewise amongst the Indians, bearing the name of the place where it groweth: in colour it resembleth an apple, or else Greene oile: and in truth, no account is there made of it.

As touching *Lychnites*, so called for the resemblance that it hath to the blaze of a candle lighted, which giueth a singular grace to it, and maketh it very rich, it may be ranged wel among these ferie and ardent stones: found this is about *Orthosia* and throughout all *Caria* and the places adjoining, but the most excellent come from the Indians, which some haue thought and said to be the milder kind of Carbuncle or Rubie balais. In a second degree of worth and account vnto this *Lychnites*, is *Ionis*, so called of the March violet which in colour it doth very much resemble.

Ouer and besides, I find other sorts of Rubies different from those aboue named; for some of them hold of the fresh and glorious purple of *Lac*, others stand as much vpon the Scarlet or Crimseu:

Crimsen: which being chaufed in the sun, or otherwise set in a heat by rubbing with the fingers, will draw to them chaffe, straws, threads, and leaues of paper. The common Grenat also of Carhedon or Carthage, is said to do as much, although it be inferior in price to the former. These Grenats are found vpon the hills amongst the Nasamons, and as the inhabitants are of opinion, are ingendred by means of a certaine diuine dew or heauenly showre: found they are twinkling against the moon-light, and especially when she is in the full. In times past, all the trafficke of the Grenats was at Carthage, whereupon they took the name of Carhedon. But *Archelaus* saith, that there be of them in Egypt also about the city Thebes; howbeit, such are brittle, full of veins, and like to a cole going out and ready to die. I find, that drinking cups haue been made of this stone, as also of the former, called Lychnites. Generally, all rubies be very hard for to be cut; and this ill quality they haue, That they neuer do scale cleane, but ordinarily plucke some of the wax away with the signet: contrariwise, the Cornalline or Sarda, signeth very faire without any of the wax sticking to it: this Sarda giueth part of the name to the Sardonyx: the gem it selfe is very common, found first about * Sardis; but in truth, the principall is that which commeth from about Babylonia, out of certaine quarries of stone, where it was found sticking within another stone in manner of the heart. After this manner, it is said, that the Persians had sometime minerall Cornallines, but the mine now doth fade: howbeit, there be of them in many other places besides, to wit, in Paros and Assos. The Indians send vnto vs three feuerall kindes, to wit, the red, the fatty (called therupon Demium) & the third which ordinarily haue a ground of siluer-foile laid vnder them to giue a lustre. The Indian Sardes or Cornallines are transparent and carry a through light with them: the Arabian be more thicke: there be found of them also about Egypt, but they haue commonly a ground of gold-foile. These gems likewise are distinguished by the sex, for the male haue a more bright and orient lustre; the female are not so resplendent, but shine as it were through a grosse & fatty matter. In old time, there was not a precious stone in greater request, than the Cornalline: & in truth, *Menander* & *Philemon* haue named this stone in their * Comedies, for a braue and proud gem: neither can we find a precious stone that maintaineth the lustre longer than it, against any humor wherein it is drenched; and yet oile is more contrary to it than any other liquor. To conclude, those that be of the colour of honey, are rejected for nought; howbeit, if they resemble the colour of earthen pots, they be worle than those.

* A city, whereupon it tooke the name, and now of Sardinia the Isle, as some thinke.

* *Menander* & *Philemon* in their Comedies: speaking of the Emerald and Cornalline.

CHAP. VIII.

¶ Of the * Topaze, and the sundry kinds of it. Of * Callais: and of other Greene precious stones not transparent.

* Some take it for our Chrysolith.

* It is thought to be our Turquois.

THE Topaze or Chrysolith, hath a singular green colour by it selfe, for which it is esteemed very rich; and when it was first found, it surpassed all others in price: they were discovered first in an Isle of Arabia called Chiris, wherein certaine rouchers (Troglydytes) being newly landed, after they had bin driuen thither by tempest and vrged with famine, began to feed vpon herbs and dig for roots; and by that meanes met with the Topaze stone: This is the opinion of *Archelaus*. But *K. Iuba* reporteth, that there is an Island within the red sea called Topazas, distant from the continent 300 stadia, the which is oftentimes so mistie, that sailers haue much ado to find it; whereupon it tooke that name: for in the Troglydytes language (saith he) Topazin is as much to say, as to search or seek for a thing. It is said, that the first that tooke a liking vnto the stone, was queene *Berenice* the mother of *Ptolome* the second, and that by the meanes of *Philemon* (lieutenant generall to her son in those countries) who presented one of them to the said queen. Of which Chrysolit, *Ptolomeus Philadelphus* K. of Egypt, caused the statue of his wife *Arfinoe* to be made, 4 cubits long; and in the honour of the said queene his wife, dedicated it in a chappell named the Golden temple. The moderne writers do report, that there be found of these Chrysolits about Alabastrum a towne in Thebais, a prouince in high Egypt; and two kinds they make thereof, to wit, *Prasoides*, and *Chrysopteros*: which later commeth neare to that golden Berill called *Chrysoprasson*, for that the colour thereof resembleth fully the juice of *Porret*; and of all precious stones it is the largest: this property it hath aboue all other gems, That only it comes vnder the file to be polished for noble men; whereas all other be scoured by the grindstones coming out of *Naxos*. This stone will weare with vsage.

This

A This stone in regard of colour may be accompanied with the Turquois called Gallais, for a certain green it hath inclining to yellow. It is found beyond the farthest parts of India among the inhabitants of the mountaine Caucasus, to wit, the Phicarians and Afdates; they grow vnto a very great bignesse, but the same is fistulous and full of filth. The purest and richest of this kind be those of Carmania. But in both countries they be found in ycie clifles hardly accessible, where you shall see them bearing out after the manner of bosses like vnto eies: they stick to those crags & rocks so lightly, that a man would say that saw them, how they grew not naturally out of the rocke, but were onely set too by mans hand. And for that the place where they doe grow, is so steep that a horseman is not able to ride vp to them, and because the people of that country be loth to climb so high with their feet, being otherwise acquainted ordinarily to the horseback, besides, in regard of the danger in venturing to climb for them, therefore they reach them a far off with slings, and so driue them down, with all the hard mosse about them: and in very deed, a commodity this is of great reuenue, & besides, the rich men know not the like Jewell to weare about their necks. By a collar or chaine of these Turquoises, men are judged wealthy more or lesse; and this is the glory that they take from their childe hood, to be able to say, that thus many Turquoises they haue pulled and cast downe by that manner of slinging. And yet in the practise of this feat, all sped not alike; for some you shall haue to throw downe many faire Turquoises at the first sling; and many for it again who weary their armes and course after them, & yet cannot get one Turquois. This (I say) is the maner of chasing or hunting Turquoises: and when they be gotten, they must come into the lapidaries hands to be cut and formed to what fashion you will; and in truth they be otherwise brittle and easie to be wrought vpon. The best Turquois is that which approacheth nearest to the grasse green of an Emerald, howbeit, all the grace that they haue, seems to come from outward help: being set in gold, they looke most beautifull; neither is there a precious stone that becommeth gold better. The fairer that a Turquoise is, the sooner loseth it the colour by oile, ointment, or wine: contrariwise, the baser that they be, the better do they hold their own and maintain their lustre. Neither shall you meet with any precious stone more easie to be falsified and counterfeited with glasse, than a Turquoise. Lastly, some writers affirme, That they be found in Arabia, within the nest of certain birds called Melacoryphi, which is as much to say as blacke-cops.

D As touching green stones, there be many more kinds: but of the baser sort we reckon one of a Porret colour, which we call *Prasius*, and the first kind of it is all green, whereas the second hath vpon the green, certaine red spots like bloud, which cause it to seem vnpleasant to the eie, and rough in hand: the third is Greene, but yet parted with three white strakes.

The stone *Chrysoprassus*, i. the sea water or Horehound green, is preferred before the other: in some sort it resembleth the green juice of a Leek, but it declineth somewhat from the Topaze, as if it were between it and gold. Some of these are so great and big, that there be drinking cups made thereof, after the fashion of boats: but pilastres or round staues in manner of cylindres or rolls, are very quickly framed of such stones. These be found among the Indians: like as another stone, which is called * Nilios: A weak lustre it hath, and will not long continue, for looke but a while wisely vpon it, you shall perceiue it soone to fade. *Sudines* saith, That there be of them found in Syverus, a riuer that passeth through the country of Attica: in colour it resembleth a smokie Topaze, or otherwhiles that of a honny colour. *K. Iuba* reporteth, That it is bred in Ethiopia, and namely about the bankes and sides of a riuer which we call Nilus, whereupon it commeth to be named Nilios.

There is a stone called *Molochites*, for that the Greene colour which it hath, commeth neare vnto a Mallow, and is more mild than the rest whereof I haue spoken. Commended it is highly in signets to scale faire: and besides it is supposed to be by a naturall vertue that it hath, a countercharme to preserue little babes and infants from all witchcrafts and sorceries.

A kind of Iasper likewise there is of a Greene colour, and the same oftentimes is transparent: and although there be many other stones go beyond it in riches, yet it retaineth still the ancient glory and honor that it had. A gem it is, common to many other countries: India yeeldeth it vnto vs like to an Emerald. That of Cyprus is very hard, and of a greyish fatty colour, betweene white and Greene. The Persians send vs a Iasper like vnto the skie or aire, and thereupon it is called *Aerizusa*: and such a one is that which commeth from the Caspian hills. The Iasper about the riuer *Thermodoon* is blew as Azure. In Phrygia you shall haue it purple: in Cappadocia

* Thought to be the Almain Chrysolit.

Cappadocia partly purple and partly blew, but no kind of lustre hath it at all. Out of Amisus, a city in Pontus, we haue Iaspers brought, much like to the Indian: and the Iasper of Chalcedon is muddy and troubled. But it were better to set downe their degrees in goodnesse, rather than to stand vpon the countries from whence they are transported. The best Iasper then is that esteemed which standeth much vpon purple or Lac: the second is incarnat, or of a rose colour: the third resembleth the Emerald in greenesse. To euery one of these seuerall kinds, the Greekes haue imposed significant names. And in a fourth place the Greekes haue ranged another called Borea, like to the morning skie in the time of Autumne; and this may well be called Aerizufa. There is a Iasper in colour like to the Sarda, the Cornalline, as also resembling much the violets: there be as many more sorts behind, which I haue not touched, but subject they be al to blemishes, as namely being blew or like to Cryстал or *waterie steame. Last of all, we haue a Iasper called Terebinthizufa by the Greekes, but as I take it very vnproperly, as if it were compounded of many gems of one and the same kind; and therefore the better sort of such are inclosed within a circle of gold, yet so as they be open both aboue and beneath, neither is any thing but the edges only compassed with gold. The faults or imperfections of the Iasper be these, If the lustre indure not long, notwithstanding it glitter a far off; also if it shew a spot like vnto a graine of salt, besides all other which I haue already named in the rest. Moreouer, Iaspers may be falsified by the meanes of glasse: and this is soone detected, namely, when they cast a reuerberation of their lustre outwardly, and hold it not within. To conclude with the stones called Sphragides, they are not much vnlike to the Iaspers. And this gift they haue aboue all the rest, that they make the best signets, and seale fairest.

CHAP. IX.

¶ Sundry kinds of Iaspers.

OF diuers sorts of Iaspers, al the East part (by report) are most affected to that which is like the Emerald, and they carrie it ordinarily about them as a countercharme. The same if it be compassed round about with one white crosse line in the midst, is called Grammatias; if with many Polygrammos. And here by the way I can hold no longer, but my mind serues me very well to challenge the Magitians, who haue giuen it out, That this stone is very good for those to haue about them who are to make some publick speech or solemne Oration to the people. Moreouer, we haue a Iasper called Onychopuncta & Iasponyx, which seemeth to inclose a cloud within it, & in some sort to resemble the snow. This Iasper is fashioned like to a Star, and beset with diuers reddish points: a man that saw it, would say it were a kind of Megarian salt. There is besides a Iasper which seemeth as if it were infected with smoake, and this is called Capnias. Concerning the bignesse of the Iasper, I haue seene one of them nine inches long, which serued for to represent the visage of Nero the Emperour, standing ready armed with a cuirace.

As touching the precious stone Cyanos, I must speake of it apart, notwithstanding I haue of late mentioned and applied it to one of the names of the Iasper, to wit, that with the blew colour. The best Cyanos is that of Scythia; the next commeth from Cypros: and in the last place we are to reckon the Egyptian. This stone is very apt to be counterfeited, and especially by tincture: the inuention whereof is ascribed to a king of Egypt, who was highly honoured for being the first that gaue a colour to it. Distinguished these stones also are by the sex, for there be of them both male and also female. Otherwhiles you shall perceiue a certaine powder in them as it were of gold, and yet not like to that of Saphires: for the Saphire also glittereth with marks and pricks of gold. Saphires are likewise sometime blew: mixed also with purple, although that be very seldome: the best are among the Medes, yet in no place be they transparent. Moreouer, they are vntoward for to be cut and engrauen, by reason that the lapidaries shall meet with certaine hard knots of Cryстал comming here and there betweene. The blewest are thought to be the male.

Next after these, I am to range those stones that bee of a purple colour, and such as decline somewhat from them, and yet seem to depend of them: of which, I must place in the first ranke as principally, the Amethysts of India: and of them there be found in a part of Arabia, which bordereth vpon Syria, and is called Petra: also in Armenia the lesse, in Egypt, and in France:

A but the foulest and of most base account, be those of Thasos & Cyprus. The reason of the name Amethyst, is generally thought to be this, that notwithstanding it approach very neer to the colour of wine, yet before it thoroughly tast therof, it turneth into a March Violet color: and that purple lustre which it hath, is not altogether fiery, but declineth in the end to the color of wine. There is not one of these Amethysts, but it is transparent with a violet colour. Easie they are al to be cut and engrauen. And as for the Indian Amethysts, they haue the full and rich colour of the Phoenicean purple die; and in truth, the diers wish that they may but giue a tincture aspleurable to it. Verily this purple colour is pleasing to the eie, neither doth it strike or pierce the sight so forcible as the Rubies do. In a second ranke are to be ranged the Amethysts inclining to the Iacinths, the color of which stone the Indians call Sacon, like as the gem it selfe Sacodian. B Now if the color be more weak and feeble, they call it Sapinos: and this Amethyst in a third degree is named Paranites in the marches of Arabia, which name it taketh of the people. The fourth kind resembleth the colour of wine. The fifth declines neer to Cryстал, saue only that toward the bottom thereof, it standeth of a certaine whitish purple: but this is nothing esteemed, for the excellent Amethyst indeed being held vp in the aire, ought to shine in manner of a Ruby, and to carry a certain purple lustre, mildly participating of the incarnat rose color. Such Amethysts as these some chuse rather to call Pæderotes, like as a kind of Opale; others, Aærotetes: many giue them the name of Venus gems, for the great grace that they haue, & decent loueliness which they seem to shew both in fashion and colour, especially without forth. The Magitians, as vain herein as in all other things, seem to bear vs in hand that they haue a special vertue to withstand drunkenesse, whereupon they should be called Amethysts: neither stay they so, but tel vs, that if the name of the Moon and the Sun be engrauen in them and so worn about the neck hanging, either with the hairs of a Cynocephalus head, or els swallows feathers, they are a souveraigne remedy against charms and forceries that be practised, with poisoning. Nay they would make vs beleue that there is a way to vñe them, which wil cause men to be gracious with princes who haue any negotiation with them, and that by the means thereof they shal find easie access to their presence, and fauor in their eies. Also, by their saying, they are offorce to auert haile and such like distemperature of the weather, yea, and to turn away Locusts, so there bee a charm in maner of a praiser said withall, the form whereof they also do prescribe & shew: and no maruell, for they haue promised the like of Emeralds, if there were inchafted in them the forme either of Eagles, or the flies named Beetils. In setting down which toies and vanities, they shew well enough in what contempt they haue mankind, and how they are disposed to mocke the world.

It followeth now by good order to speak of the Iacinths, which, albeit they differ much from Amethysts in some respect, yet in lustre they approach very neare: and this is only the difference between them, that the braue violet colour, which in the Amethyst is full and rich, in the Iacint is delaied and weaker. The Iacint also at the first sight is pleasant and acceptable, but the louely beauty therof vanisheth away before it haue giuen a man enough. And so far is it off from contenting the eie fully and satisfying the pleasure therof, that it fades sooner than the dainty flour of that name, Hyacinthus, so quickly doth the lustre passe away, in manner before it come to the eie. Aethyopia furnisheth vs with Iacinths & Chrysolithes both, which are transparent and carry the colour of gold: howbeit those of India bee preferred before them; they of Baetria likewise, if they be not spotted and flecked with diuers colors. The worst of all others, be the Arabian: for they be not only skewed in colour, but also foule and troubled: and look what radiant lustre they haue, interrupted it is with a cloud of spots: and if any chance to be clear otherwise, yet a man that looketh on them, would say they were full of their owne dust. The best are those, which being laid to gold, cause it to looke whitish in manner of silver, in comparison to them. Such as be cleare and transparent, Goldsmiths vse to set within a hoope of gold, so as they may be seen both beneath and aboue. The rest had need of a ground of Latton soile to giue them a lustre: howbeit, now adaies those that are not skilfull lapidaries haue taken vp a custome to call some Iacints Chryselestri, which incline to the color of a base gold called Electrum, the which in a morning are more beautifull and glorious to the eie, than all the day after. Those Iacints that come from Pontus, are knowne by their lightnesse: some of them be hard and of an Orange red, others be soft and foule. Barchus mine author reports, That they be found in Spaine also, in that place where he saith they sink pits for to leuel water, and out of which the peasants doe

*or Citrine Iacynth.

take forth crystal. He affirmeth also, That he hath seen a *Chrysolith of twelue pound weight. G Moreover, there be certain Iacincts which haue a white veine comming between, and those are called Leucocrysi. And of this kind some be named Capnia, because they be smokie. You shall find of them like vnto glasse beads, and yet of a shining yellow in manner of Saffron. And verily false Iacincts there be counterfeited by glasse so artificially, that a man shall hardly discern them by the eie: howbeit handle and feele them, you shall soone find the deceit; for the fine Iacincts indeed are colder naturally than those that be counterfeited. Among these Iacincts, I may range wel ynough those stones which are called Melichrysi, which shew as if cleare hony shone through gold. These we haue from India: but of all other they are most subiect to injurie and will soonest breake. The same country yeeldeth also a gem called Xystion, whereof there is such plentie, that the very common people doweare them.

*Of which name there is Opalus & the Amethyst.

If we should speake of white stones, the principall of them all is the gem named Pederos; H And yet considering that vnder this name there passe other *fair & beautiful stones (such a prerogative hath the word to signifie some excellencie of louelines) there may be question made, how it can be properly vsed for one gem, or one colour; yet surely there is a kinde of pretious stone by it selfe called Pederos, and the same worth the looking on; and there seem to meet together a skie color, and the same in his manner greenish vpon a cleare and transparent Crystal: accompanied therewith a purple and a certain yellow and bright gold colour of Muskadel, and the same is alwaies the last colour that appeareth outwardly and giueth the lustre: and yet a man that beheld this stone, would say that the head thereof were crowned with a chaplet of purple: and as it appeareth to haue these colours confounded all together, so it seemeth as if euery one had a seuerall lustre by it selfe. A more pure and clearer gem there is not againe: comfortable to the head & pleasing to the eie. The best simply of this kind we haue from the Indians, who call it Argenon. In a second degree to it is that of Egypt, where it is called Senites. Of a third sort there be in Arabia, but those are rough. Those of Natolia and the kingdome of Pontus, are not so radiant and quicke as the others: and yet from Galatia, Thracia, and Cyprus, we haue such as be more feeble than they. If you would know what faults be incident to these Pederotes particularly: they carry otherwhiles a languishing lustre; troubled they be with vnaturall colours; and generally subiect they are to all the defects and imperfections of others.

*Gira sole.

In the second place of white gems, is *Asteria to be counted: a wonderfull propertie it hath in Nature, for which it deserues to be chiefe; for that it keepeth enclosed within a certain light K in manner of the apple in the eie: which according as a man doth hold or turne, hee shall see how it will send and transfuse it from the owne place; one would thinke that it walked within and shifted from place to place. And the same, if it be opposed against the beames of the Sun, casteth forth bright and white raies of the owne, in manner of a starre, whereupon it tooke the name Asterias: and very hard it is to be engrauen. Those which come out of India be preferred before them of Carmania.

In like manner a white pretious stone there is called Astrios, approaching neer to Crystal: this is engendred among the Indians and along the coasts of Pallene: From the verie centre within, there shineth a kind of star in manner of a full Moone in the height of her brightness. Some giue this reason of the name, that being held against any stars, it receiueeth from them a L light and sendeth the same from it againe in manner of beams. And they hold that the best be in Carmania, and there is not another gem againe lesse subiect to blemishes and imperfections than it. As also that a worse kind thereof is called Ceraunias: and the worst of all other resembleth the blase or flame of lampes and candles.

As touching Astroites, many make great account of it: and such as haue written more diligently thereof, doe report, That Zoroastres hath highly commended it and told wonders thereof in art Magicke.

Sudines speaketh of another gem called Astrobolos, and saith it is like vnto a fish eie, and casteth forth white glittering raies against the Sunne.

Among white pretious stones may be reckoned that which they call Ceraunia, which is apt M to receiue light and lustre both from Sunne and Moone and other starres. It selfe looketh like Crystal cleare, howbeit, the lustre that commeth from it seemeth to be of a blue Azure color: and Carmania is the natieue place thereof. Zenas hemis confesseth, That it is a white gem, and hath within a starre-like fire, which seemeth to run too and fro and change place, according as a man turneth

A turneth it. He affirmeth also, that the foresaid Ceraunia will become dull and dusky; which if they be foked for certain daies together in vinegar and sal-nitre, will recouet their light and conceiue a new fire in manner of a star, which will continue for so many months as they lay daies infused, & after that lose their lustre again. Sotach hath set down two kinds more of Ceraunia; to wit, the black and the red, saying, that they resemble halberds or ax heads. And by his saying, the black, such especially as be round withall, are endued with this vertue, that by the means of them cities may be forced, and whole naues at sea discomfited; and these (forsooth) hee called Betuli, whereas the long ones be properly named Ceraunia.

It is said there is one more Ceraunia yet, but very geason it is; and hard to be found, which the Parthian Magitions set much store by, and they only can find it, for that it is no where to be B had but in a place which hath bin shot with a thunderbolt.

Next after the Ceraunia, there is a stone named Iris: digged out of the ground it is in a certain Isle of the red sea, distant from the city Berenice 60 miles. For the most part it resembleth Crystal; which is the reason that some haue termed it the root of Crystal. But the cause why they call it Iris is, That if the beams of the Sun strike vpon it directly within house, it sendeth from it against the wals that be near, the very resemblance of a rainbow both in form and colour, and oftsoons it will change the same in much variety, to the great admiration of the beholders. For certain it is known, that six angles it hath in manner of Crystal; but they say that some of them haue their sides rugged, and the same vnequally angled, which if they be laid abroad against the Sun in the open aire, do scatter the beams of the Sun that light vpon them to & fro; C also that others do yeeld a brightness from themselves, and thereby illuminat all that is about them. As for the diuers colours which they cast forth, it neuer hapneth but in a dark or shadowy place: whereby a man may know, that the varietie of colours is not in the stone Iris, but comes by the reuerberation of the wals. The best Iris is that which represents the greatest circles vpon the wall, and those which be likest to rainbowed indeed. There is another gem called Iris, like to this in all respects, but that it is exceeding hard. Horns saith, that if it be calcined and puluerised, it is a singular remedie against the biting of Ichneumones: also, that naturally it is to be found in Persis.

Much like in form and shape to Iris, but not of the same effect, is there another stone called Zeros: a man that sees it would take it to be a crystal, with a black strake parting it ouerthwart. D Thus hauing laid abroad the pretious stones & jewels which are distinguished by sundry kinds of principal colors, I wil proceed to the rest, and discourse of them alphabetically.

CHAP. X.

¶ Of certaine gems digested in order according to the Alphabet.

T He Agat was in old time of great estimation, but now it is in no request. Found it was first in Sicily neere to a riuer called likewise Acharis, but afterwards in many other places. It exceeds in bignesse, and is full of varietie in colours, whereby it hath gotten many names; E for called it is Phasachates, Cerachates, Sardachates, Hamachates, Leucachates, and Dendrachates, as if the veins thereof resembled a little tree. As touching the Agath, called Antachates, as it burneth you shall haue it to smel like vnto Myrrh. Also there is an Agath of a reddish colour resembling coral, and thereupon called Coralloachates: and the same is beset with certain spots or drops of gold in manner of the Saphyr: of which kind there is passing great plentie in Candy, where they call it the holy or sacred Agat; for people are persuaded that it auaileth much against the sting of venomous spiders and scorpions: which propertie I could very well beleue to be in the Sicilian Agaths, for that so soone as Scorpions come within the aire and breath of the said prouince of Sicilie, as venomous as they be otherwise, they die thereupon. The Agats likewise found among the Indians haue the same operation, and besides doe represent many other miracles; for you shall find imprinted naturally in them the forme and proportion of riuers, woods, and laboring horses: a man shall see in them coaches and little Chariots or horse-litters, together with the furniture and ornaments belonging to horses. As for physicians; they make their grinding stones thereof for fine pouders. And it is holden for a truth, that only to behold and looke vpon an Agath, is very comfortable for the eies. If they be but held

in the mouth, they quench and allay thirst. The Phrygian Agats haue no part of green in them. G Those that be found about Thebes in Egypt are without red and white veins: howbeit, these also be effectually against scorpions. Of the same credit likewise are the Cyprian Agats. Some hold opinion, that the singular grace and commendation of an Agat, is to be clear and transparent like glasse. There be found of them in Thrace, & about the mountain Oeta, in the hill Perassus, in Lesbos and Messene, and such haue floures imprinted in them like those which grow in the highwaies and paths by the fields: also in the Island of Rhodes. But the Magitians observe diuers other sorts; and as for those that be like vnto a Lions skin, they haue the name to be powerfull against scorpions. In Persia they are persuaded, That a perfume of such Agaths turneth away tempests and all extraordinarie impressions of the aire, as also stayeth the violent streame and rage of riuers. But to know which be proper for this purpose, they vse to cast them H into a cauldron of seething water; for if they coole the same, it is an argument they be right, but to be sure that they may do good, they must bee worne tied to the haire of a Lions mane: for as touching those Agates which seeme to haue the print of an Hyenes skin, the Magitians cannot abide them, as causing discord in an house. But they hold, That the Agath of one simple colour causeth those wrestlers to be inuincible who haue it about them. And a proof hereof they take by seething it in a pot full of oile, with diuers painters colours; for within one two houres after it hath siuered and boiled therein, it will bring them all to one entire colour of vermilion. Thus much of Achates or the Agath. The stone which is named Acopis resembleth Sal-Nitre: hollow and light it is in manner of the pumish stone, howbeit spotted with golden spots or drops in manner of starres. Seeth this gently in oile, and therewith anoint the body, it I ridderth away all wearinesse and lassitudes, if wee may beleue the Magitians. The stone Alabastrites is found about Alabastrum a city in Egypt, and Damasco in Syria, white of colour it is, and intermeddled with sundry colours. This beeing calcined with Sal-gem and reduced into powder, is said to correct a stinking breath and strong sauer of the teeth. In the gessiers of cocks there be found certaine stones, called thereupon Alestorix, which in shew resemble Cryfall, and be as big as beans. Milo that great Wrestler of Croton vfed to carry this stone about him, whereby he was inuincible in all the seats of strength or aitiuitie that hee tried, as Magitians would seem to persuade vs. Androdamas is a stone of a bright colour like siluer, and in manner of a Diamant, square, and alwayes growing in a table Lozenge-wise. The Magitians suppose, that it tooke that name of repressing the anger and furious violence of men. As touching K Argyrodamas, whether it be the same or another stone, Authors haue not resolved. Antipathes is a stone all blacke, and nothing at all transparent. You shall find whether it bee a true stone or no by seething it in milke, for no sooner is it put in, but it causeth the milke to look like Myrrh. The Magitians would haue vs to thinke, That it is good against Witchcraft and eye-biting especially. Arabica is passing like vnto Ivoire, and for Ivoire might it go, but that it is so hard, which bewraith it to be a stone. It is thought, that as many as haue it about them shall finde ease of the paine of the sinues. The stone Aromatites is thought principally to grow in Arabia, and yet it is found in Egypt about Pyra: but wherefoeuer it is to be had, a hard stone it is, in colour and smell both resembling Myrrhe: in which regard it is much vfed of queenes and great ladies. Asbestos is ingendred within the mountaines of Arcadia, and is of an iron gray L colour. As for Aspilate, Democritus saith, that it is bred in Arabia, and of a fiery colour: which by his saying, ought to be tied with camels haire, and so hung fast about them that be troubled with the schirrosities of the spleen: also (if he say true) it is found in the nest of certain Arabian birds. Another also of that name groweth there in the cape Leucopetra, but it is of a siluer colour, and glittereth withall: excellent to be worne about one against the phantastickall feares and imaginations in the night season. The same Democritus saith, That in Persis, India, and the mountaine Ida, there is a stone found named Artizoe, glistering bright as siluer, three fingers thicke, formed in manner of a Lentil, and of a pleasant and delectable sauer: The Sages of Persia neuer go about the election and ordering of a King, but they thinke it necessarie to haue it about them. As for the Augites, many be of opinion, that it is no other stone than Callais, to M wit, the Turquois. Amphirane is a stone knowne by another name also, Chryfocolla: found it is in that part of India where the Pismires-Volant do take out gold; where it resembls gold, and is in fashion four-square. It is reported constantly, that it hath the same force naturally that the Loadstone hath, but that it draweth gold to it as well as iron. Aphrodisiace is partly white, and

A and partly reddish. Asyros being once heat at the fire, will continue a seuen-night after hot: blacke it is and ponderous, hauing certaine veins that diuide it: it is thought to be good against cold. As touching Egyptilla, Tacchus taketh it for a white stone, with a veine partly of a Sard or Cornalline, and partly blacke, passing through it ouerthwart: howbeit the common sort take Egyptilla to be blew, with a black mote in the bottome.

As for the stone Balanites, there be two kinds thereof; to wit, of a greenish colour, and resembling Corinth brasse: the former commeth from Coptos, the other out of the region Troglodytica; and they haue a fierie vaine cutting them just in the mids. The same Coptos sendeth other stones to vs besides, to wit, those which be called Batrachitæ; the one like in colour to a frog, a second to * yvory, the third is of a blackish red. * Baptes, howsoever otherwise it be soft and tender, yet an excellent odor it hath. The stone called Belus eie is white, and hath within it a black B apple, the mids wherof a man shall see to glitter like gold: this stone for the singular beautie that it hath, is dedicated to Belus the most sacred god of the Assyrians. There is another stone named Belus, growing (as Democritus saith) about Arbela, to the bigesse of a wall-nut in manner and forme of glasse. As for Baroptenus or Baroptis, it is black, interlaced as it were with certain knots, both white and also of a sanguine red, after a strange and wonderfull manner. Botrytes is found sometime black, otherwhiles red, & like it is to a cluster of grapes when it beginneth first to knit. As for it which is more like to the hair of women, Zoroastres calleth it * Botrychites. * Bucardia resembls an oxe heart, and is to be found onely about Babylon. Brotia is shaped in manner of a Tortoise head: it fallieth with a crack of thunder (as it is thought) from heaven: and if we wil beleue it, quencheth the fire of lightning. Bolæ are found after a great storm or tempest, resembling a clod.

Cadmitis were the very same which they call Ostracitis, but that otherwhiles it is compassed about with certain blew bubbles. Callais comes very neere to the Saphir, but that it is whiter, and resembls rather the water of the sea about the shore. Capnites (as some thinke) is a kind of stone by it selfe, beset with many wreaths, and those seeming to smoke, as I haue said already in due place: the naturall place of it is Cappadocia and Phrygia: in some sort it is like yvory. As touching Callainæ, it is commonly said, that they be found alwaies many joined together. Catochites is a stone proper to the Island Corsica in bignes it exceedeth ordinary precious stones; a wonderfull stone, if all be true that is reported thereof, and namely, That if a man lay his hand thereupon, it will hold it fast in manner of a glewie gum. Catopyrites groweth in Cappadocia. D Cepites or Cepocapites, is a white stone, and the veins therein seem to meet together in knots; and so white and cleare withall, that it may serue as a mirrour to shew ones face. Ceramites in colour resembls an earthen pot. As for Cinædiæ, they be found in the braine of a fish named Cinædus: white they be and of a long fashion, and of a wonderfull nature, if wee may beleue that which is reported of the euent which they signifie; and namely, that according as they bee cleare or troubled in colour, they do presage either storms or calm at sea. Cerites is like to wax; and Circos, vnto wreaths or circles. Corfoides, is made in manner of a gray peruke of haire: Corallo-achates, vnto a Corall set with gold spots: Corallis, to Vermillion, and is ingendred in India and Syene. Craterites hath a colour betwene the Chrysolith and the base gold Electrum, E of an exceeding hard substance. Crocallis doth represent a cherry. Cyssites is engendred about Coptos, and is of a white color: it seemeth as it were to be with childe, for something stirs and ratleth within the belly if it be shaken. Calcophonos is a blacke stone: if a man strike vpon it, he shall perceiue it to ring like a piece of brasse: and the Magitians would persuade those that play in Tragœdies to carry it about them continually. As for the stone Chelidonia, there be two sorts of it: in colour they do both resemble the Swallow, and of one side which is purple, you shall see black spots intermingled here and there among. Chelonia is no more but the very eie of an Indian Tortoise: of a most strange nature by the Magitians saying, and working great wonders, but they will lie most monstrously: for they would promise and assure vs, That after one hath well rinsed or washed his mouth with hony, and then lay it vpon the tongue, hee shall presently haue the spirit of prophesie, and be able to foretell of future things all a day long, either in the full or change of the Moon: but if this be practised in the wane of the Moon, he shall haue this gift but onely before the Sunne-rising: vpon other daies, namely while the moone is croissant, from six of the clock or sun-rising six houres after. Moreover, there be certaine stones called Chelonitides, because they be like to Tortoises, by which these Magitians would seeme F

to tell vs by way of prophesie and reuelation, many things for to allay tempests and stormes: G but especially the stone of this kinde which hath golden drops or spots in it, if together with a flie called a beetle it be cast into a pan of seething water, it will auert tempests that approach. Chlorites is a stone of a grasse green colour, according as the name doth import; and by the saying of Magitians, it is found in the gester of the bird called Motacilla or Wagtaile, yea and is ingendred together with the said bird. They giue direction (forsooth as their manner is) to in-chafe or inclose it with a piece of yron, and then it will doe wonders. Choaſpites taketh that name of the riuer Choaſpes, green it is and reſplendent like burniſhed gold. Chryſolampis is found in Æthiopia; all the day long of a pale colour, but by night it glowes in manner of a cole of fire. Chryſopis is ſo like to gold, as a man would take it for no other. The ſtones called Cepionides, grow in Æolis about Atarne, a little village now, but ſometimes a great town: they haue H many colours, and be transparent; ſometimes in manner of glaſſe, otherwhiles like Cryſtall or the laſper: ſuch alſo as be not cleare through, but ſoule and thick within, are notwithstanding ſo pure and neat without, that they will repreſent a man or womans viſage as wel as a mirrour or looking glaſſe.

D Daphnias is a ſtone, whereof Zoroaſtres writeth, and namely that it is good againſt the falling ſickeſſe. Diadochus is like to Berill. Diphris is of two kinds, the white and the black, the male and the female; wherein may be perceiued very diſtinctly, thoſe members that diſtinguiſh the ſex, by reaſon of a certain line or vein of the ſtone. Dionyſias is a blacke ſtone and hard withall, hauing certain red ſpots intermingled: if it be ſtamped in water, it giueth the taſt of wine, and is thought to withſtand drunkenneſſe. Draconites or Dracontia, is a ſtone ingendred in the brains L of ſerpents, but vnleſſe it be cut out whiles they be aliue, namely after their heads be chopt off, it neuer grows to the nature of a precious ſtone, for of an inbred malice and enuie that this creature hath to man, if perceiuing it ſelfe to languish and draw on toward death, it killeth the vertue of the ſaid ſtone: and therefore they take theſe ſerpents whiles they be aſleepe, and off with their heads. Sotacus (who wrote that he ſaw one of theſe ſtones in a kings hand) reports, that they who go to ſeek theſe ſtones ſe to ride in a coach drawn with two ſteeds, and when they haue eſpied a dragon or ſerpent, caſt in their way certain medicinable drugs to bring them aſleepe, and ſo haue means and leiſure to cut off their heads: white they are naturally & tranſparent, for impoſſible it is by any art to poliſh them, neither doth the lapidary lay his hand to them.

E Encardia is a precious ſtone, named alſo Cardifca: one fort there is of them, wherein a man K may perceiue the ſhape of an heart to beare out: a ſecond likewiſe there is ſo called, of a greene colour, and the ſame doth repreſent alſo the forme of an heart: the third ſheweth the heart only black, for all the reſt is white. Enorchis is a faire white ſtone; the ſame being diuided, the fragments thereof do reſemble a mans genetours, whereof it took that name. As touching Exhebenus the ſtone, Zoroaſtres ſaith, that it is moſt beautifull and white, and therewith goldſmiths ſe to burniſh and poliſh their gold. As for Eriſtalis, being of it ſelfe a white ſtone, ſeemes as a man holdeth it to wax red. Erotulos, which ſome call Amphicoe, others Hieromnemnon, is commended much by Democritus, for ſundry experiments in prophesying and foretelling fortunes. Eumeces groweth in the Baſtrians country, like to a flint; being laied vnder a mans head lying aſleep vpon his bed, it repreſenteth by viſions and dreams in the night all that hee is deſirous to L know, euen as well as an oracle. As for Eumetres, the Aſſyrians call it the ſtone or gem of Belus the moſt ſacred god among them, & whom they honor with greateſt deuotion: as green it is as a leeke, and ſerueth very much in their ſuperſtitious inuocations, ſacrifices, and exorcifms. Eupetalos hath foure colors, to wit, of azur, fire, vermillion, and an apple. Euteros is like the ſtone of an oliue, chamfered in manner of winkle ſhells, but very white it is not. Eurotias ſeemeth to haue a certain mouldines that couers the black vnderneath. Eufebes ſeemeth to be that kind of ſtone whereof (by report) was made the ſeat in Hercules temple at Tyros, where the gods were wont to appear and ſhew themſelues. Merouer, any precious ſtone is called Epimelas, when being of it ſelfe white, it is ouercaſt with a blacke colour aloft.

G The gem Galaxias, ſome call Galaſtites, like vnto thoſe laſt before-named, but that it hath M certain veins either white or of a bloud color running between. As for Galaſtites indeed, it is as white as milk, and therupon it took that name. Many there be who call the ſame ſtone Leucas, Leucographias, & Synnephites, which if it be bruifed yeeldeth a liquor reſembling milk, both in color and taſt; & in truth, it is ſaid, that it breeds ſtore of milke in nources that giue ſuck: alſo that

A that if it be hung about the necks of infants, it cauſeth ſaliuation; but being held in the mouth, it melteth preſently. Merouer, they ſay, that it hurteth memory and cauſeth obliuion: this ſtone cometh from the riuer Achelous. Some there be, who call that Emeraud Galaſtites, which ſeemeth as it were to be bound about with white veins. Galaicos is much like to Argyrodamus, but that it is ſomewhat ſouler: commonly they are found by two or three together. As for Gaſidanes, we haue it from the Medians, in colour it reſembleth blades of corne, and ſeemes beſet here and there with ſoures: it groweth alſo about Arbelæ: this gem is ſaid likewiſe to be *conceiued with young, and by ſhaking to bewray and confeſſe a child within the wombe, and it doth conceiue euery three moneths. Gloſſi-petra reſembleth a mans tongue, and groweth not vpon the ground, but in the eclipse of the Moone falleth from heauen, and is thought by the B magicians to be very neceſſary for pandors and thoſe that court faire women: but we haue no reaſon to beleue it, conſidering what vaine promiſes they haue made otherwaies of it: for they beare vs in hand, that it doth appeaſe winds. Gorgonia is nothing els but Coral: the name Gorgonia groweth vpon this occaſion, that it turneth to be as hard as a ſtone: it aſſuageth the trouble of the ſea and maketh it calme: the magicians alſo affirme, that it preſerueth from lightning and terrible whirlewinds. As vaine they be alſo in warranting ſo much of the hearbe Guniane, namely, that it will worke reuenge and puniſhment vpon our enemies.

The pretious ſtone Heliotropium, is found in Æthiopia, Affricke, and Cyprus: the ground thereof is a deepe green in maner of a leeke, but the ſame is garniſhed with veins of bloud: the reaſon of the name Heliotropium is this, For that if it be throwne into a pale of water, it chan- C geth the raies of the Sun by way of reuerberation into a bloudie colour, eſpecially that which cometh out of Æthiopia: the ſame being without the water, doth repreſent the body of the Sun, like vnto a mirrour: and if there be an eclipse of the Sun, a man may perceiue eaſily in this ſtone how the moone goeth vnder it, and obſcureth the light: but moſt impudent and palpable is the vanity of magitians in their reports of this ſtone; for they let not to ſay, that if a man carrie it about him, together with the herbe Heliotropium, and beſides mumble certaine charmes or prayers, he ſhall goe inuiſible. Semblably, Hephæſtites is of the nature of a looking-glaſſe, for although it be reddiſh or of an orange colour, yet it ſheweth ones face in it: the meanes to know this ſtone whether it be right or no, is this: in caſe being but into ſcalding water, it preſently cooleth it; or if in the Sun it will ſet on fire any dry wood or ſuch like fewel: this ſtone is D found growing vpon the hill Corycus. Horminodes is a ſtone ſo called, in regard of the greene colour that it hath reſembling the herbe Clarie; for otherwhiles it is white, and ſometime againe blacke, yea and pale now and then; howbeit hooped about it is with a circle of golden colour. Hexecontalithos, for bigneſſe is but ſmall, and yet for the number of colours that it hath, it got this name: found it is in the region of the Troglodytes. Hieracites changeth colour all whole alternatiuely by turns; it ſeemeth to be blackiſh among kites feathers. Hamnites reſembleth the ſpawne of fiſhes: and yet ſome of them be found as it were compoſed of nitre, and otherwiſe it is exceeding hard. The pretious ſtone called Hammons-horne, is reckoned among the moſt ſacred gems of Æthiopia: of a gold colour it is, and ſheweth the forme of a rams horne: the magicians promiſe, that by the vertue of this ſtone, there will appeare dreames R in the night which repreſent things to come. Hormeſion is thought to be one of the loweſt gems that a man can ſee, for a certaine fiery colour it hath, and the ſame ſpreadeth forth beams of gold, and alwaies carrieth with it in the edges a white and pleaſant light. Hyenia tooke the name of the Hyens eie: ſound they are in them when they be aſſailed and killed: and if we may giue credit to Magitians words, if theſe ſtones be put vnder a mans tongue, hee ſhall preſently prophesie of things to come. The bloud-ſtone Hamatites is found in Æthiopia principally, & thoſe be ſimply the beſt of al others, howbeit there are of them likewiſe in Arabia and Affricke: in colour it is like vnto bloud, and ſo called: a ſtone that I muſt not ouerpaſſe in ſilence, in regard of my promiſe that I made to reprove the vanities and illuſions of theſe impudent & barbarous magicians who deceiue the world with their impoſtures: for Zacharias the Babylonian, in thoſe books which he wrote to king Mithridates, attributeth vnto gems all the deſtinies and fortunes that be incident vnto man: and particularly touching theſe bloud-ſtones, not contented to haue graced them with medicinable vertues reſpectiue to the eies and the liuer, he ordained it to be giuen vnto thoſe ſor to haue about them, who carry any Petition to a king or great prince, for it would ſpeed and further the ſuit: alſo in caſe of law matters it giueth good iſſue

and sentence on their side, yea and in wars, victory ouer enemies. There is another of that kinde, called by the Indians Henui, but the Greekes name it Xanthos: of a whitish colour it is vpon a ground of a yellow tawnie.

I The stones called Idæi. Daçtily, be found in Candy: of an yron colour they be, and resemble in forme the thumb of a mans hand. As touching Icteria, there be foure kinds thereof, to wit one like to a pale coloured bird called the Lariot, and therefore is thought to be good against the jaundise: a second there is of the same name, but more enclining to a swert color: the third resembleth a green leafe, broader than the former, weighing little or nothing, and is besides full of pale and wan veins: the fourth is of the same colour, but it hath blacke veins running too and fro. The stone called *Impiters* gem, is white, light, and tender. The stone *Indico* taketh name of those nations from whence it commeth; the colour outwardly is somewhat reddish, and if it be rubbed, there commeth from it a certain purple humor in manner of a sweat. There is another of that name, but it is white, and sheweth like vnto dust or powder. The same Indians haue another gem called Ion, for that it resembleth the colour of the March violet; but seldome shall a man see it with a fresh and gay blew indeed.

L The stone *Lepidotes* doth represent scales of fishes in sundry colours. *Lesbias* taketh name of the Isle *Lesbos* the native place thereof: howbeit they are found in India likewise. *Leucophthalmos*, is otherwise reddish or tawnie, howbeit in that colour it carrieth the forme of an eie, both for white and blacke. *Leucopetalos* sheweth white in manner of snow, and yet the same is garnished with a lustre of gold. *Libanocrus* in colour resembleth frankincense, but a liquor or moisture it yeeldeth answerable to hony. *Limoniates* seemeth to be all one with the *Emeraud*. **I** As touching the vntuous stone *Liparis*, I find this only written of it, That a stinke or perfume thereof fetcheth forth any venomous vermine. The stone *Lysimachus* is like vnto the marble of *Rhodes*, and hath in it certaine veines or streakes of gold: This stone must be polished vpon marble: and when all the superfluities be fetched off, it is found to grow narrow pointwise. *Leucochrysos* seemeth to be made of a *Chrysolith*, hauing white veins or streakes betweene.

M A gem there is called *Memnonia*, but I haue not read the description thereof. As for *Media*, it is a blacke stone, and found it was first by that famous *Atedea*, of whom the Poets write so many fables, yet certaine veins it hath of a golden colour: a kind of sweat issueth from it yellow as saffron, and in tast much resembling wine. *Meconites* doth represent expressly, poppy heads. The stone *Mitras* we had from the Persians, and the mountains along the red sea: many colours **K** it hath, and against the Sun it glittereth diuersly. *Meroctes* is green like vnto a lecke, and yet if you rub it, you shall see a humour come from it like to milke. The Indian stone *Morion* (which is most blacke and yet transparent) They call *Pramnion*: if it be intermingled with the fiery red of the Carbuncle or Rubie, they call it *Alexandrinum*; like as the Cyprian, *Morion*, which hath a shew of the *Sarda* or *Cornalline*: found there be of them in *Tyrus* and *Galatia*. *Xenocrates* reporteth, that vnder the *Alpes* also they be gathered. These be the gems that be fitted for to engraued the forme of any thing from a pattern. As for *Myrrhites*, it hath the colour of *Myrrhe*, and the forme of a fine pretious stone: it yeeldeth the smell of a sweet perfume or ointment, and being rubbed giueth a saour also of *Nard*. As touching *Myrmecias*, it is blacke, and hath certain risings in it like to werts. *Myrsinites* in colour resembleth hony, and in odour the myrtle. **I** *Mesoleucos* is a gem diuided just in the mids with a white line: contrariwise, *Mesomelas*, when there is a blacke line cutteth through any other colour in the midst.

N *Nasamonites* is in colour like to bloud, howbeit certaine blacke veins it hath. *Nebrites* is a stone consecrate to god *Bacchus*: it tooke that name of the resemblance which it hath to those skins of deere that he was wont to weare: there be others of the same kind, but blacke they are. The gem *Nympharena* keepeth the name of a city and nation in *Persia*, and it resembleth the teeth of a water-horse.

O *Orca* is the barbarous name of a certaine pretious stone, which is very pleasant vnto the eie: wherein concur together blacke, yellow, Greene, and white. *Ombria*, which some call *Notia*, is said to fall from heauen in formes, showers of raine, and lightening, after the manner of other stones, called thereupon *Ceraunia* and *Brontia*: and the like effects are attributed to it, as be reported of *Brontia*: and thus much moreover, That so long as it lieth vpon the hearth of an altar, the * libaments will not burne that be offered thereupon. *Orites* is in forme round as a globe: some call it *Siderites*, it will abide the fire and feele no harme thereby. *Ostracias* or *Ostracites* is made

* As the haire growing in the forehead, and such things, whereof assay was giuen first to the fire.

A made in manner of a shell, and is exceeding hard. A second kind there is of it resembling an *Agath*, but that an *Agath* in the polishing seemeth to looke greasily, which the *Ostracias* doth not. And the harder kind of this stone is of that power, that the fragments thereof will serue to engraued other gems. As for *Ostracites*, it took the name of an *Oystre* shell, which it doth represent. The Barbarians haue a pretious stone, which they call *Ophicardelos*, blacke of colour, and the same enclosed with two white lines or circles. As touching the stone *Obsidianus*, I haue written sufficiently in the book going next before: and yet there be certain gems of that name, and carrying the same color, not only in *Ethiopia* and *India*, but also in *Samnium*, as some are of opinion, yea, and in the coasts of the Spanish Ocean.

Panchrus, according to the name, seemeth to consist (in manner) of all colours. *Pangonius* is **B** no longer than a mans finger: it differeth from *CrySTALL* in this onely, that it hath more angles in number, whereupon it got the name. As for *Paneros*, what manner of stone it is *Metrodorus* hath not set down, howbeit he reciteth an elegant verse of queen *Tamaris*, which together with the stone she consecrated to *Venus*: whereby is giuen to vnderstand, That by the meanes thereof she became fruitfull and bare children: Some there be who call this gem *Pansebaston*. Now concerning the gems of *Pontus*, knowne by the name of *Pontica*, there be many sorts of them. One is full of stars, garnished with bloody or blacke specks in maner of drops; and this is counted among the sacred stones: another in stead of starres hath strakes and lines onely of the same colours: and there be of them again which represent the forme of mountaines and vallies. The gem *Phloginos*, which is called likewise *Chrysites*, is found in *Egypt*, and is likened vnto the **C** *Ostracias* of *Attica*. *Phoenicites* tooke the name of the similitude that it hath to a *Dart*. And *Phycites* was so named, because of the likenes it hath to the sea weed or le^guice, named *Phycos* in Greeke. *Perileucos* is a stone, so called by occasion of a whitish lace that seemeth to go from the mouth of the gem downe to the very bottome. The gems *Pæantides*, which some name *Gemonides*, are said to conceiue and to bring forth other little stones: but a singular vertue they haue to help women that be in trauell of child-birth. Such be found in *Macedonie*, neere vnto the monument or sepulchre of *Tiresias*, and that which they bring forth, seemeth like vnto water growne to be congealed into yce.

The Sunnes gem is white, and after the manner of the Sunne, whose name it beareth, it casteth forth shining raies round about on euery side. *Sagda* is a stone, which the *Chaldeans* find **D** sticking to ships, and they say it is Greene as *Porrets* or *Leekes*. *Samothracia* the Island yeelds vs a pretious stone of the owne name, blacke of colour, light in hand, and like to [rotten] wood. As for *Saurites*, it is found (by report) in the belly of a green Lizard, slit open with the edge of a cane or reed. *Selenites* is a pretious stone, white & transparent, yeelding from it a yellow lustre in manner of hony, and representing within it the proportion of the Moone, according as she groweth toward the full, or decreaseth in the wane against the change: This admirable stone is thought to be found in *Arabia*. *Siderites* is much like to yron: and supposed it is, That if it be brought among them that are at some variance or controuersie already in law, it will breed discord and maintain dissention still. Of this *Siderites* is made another stone, which is engendered in *Ethiopia*, called *Sideropœcilos*, for the sundry spots therein. *Spongites* is like vnto a **E** sponge, euen as it carrieth a name respectiue vnto it, *Synodontites* commeth from the braine of certaine fishes called *Synodontes*. The stones *Syrtitæ* be found in the shore of the *Syrtes* in *Barbary*, yea, and in *Lucania*, shining with the colour mixt of saffron and hony, but within they containe certaine starres, which haue but a dim and dusky light. The stone *Syringites* is hollow throughout in manner of a pipe, and is like vnto a straw betweene two joints.

Trichrus that commeth out of *Affricke* is blacke, howbeit if it be rubbed it yeeldeth three kinds of humours from it; to wit, from the root or bottome blacke, out of the mids like bloud, and in the head white. *Telirrhizos* is of an ash colour or reddish, and yet the bottome thereof is a louely & slightly white. *Telicardios* is much esteemed in the realme of *Persia*, where it is engendered: in colour it resembleth the heart, and they call it there in their language, a Spot. The stone *Thracia* is of three kinds; the first green, the second more pale, and the third full of spots of bloud. *Tephritis*, although otherwise it be of the color of ashes, yet it represents a new Moon croissant and tipped with hornes. *Tecolythus* seemeth like to the stone or kernell of an Olive: It is not raunged in the number of pretious stones, but whosoever licke thereof, shall find, That it will breake the stone and expell it. The stone called *Venus* haire, is exceeding black and shining; **F**

how it maketh a shew of red haire sprinkled among.

Veientana is a gem proper vnto Italie, found about Veij, a citie in Tuscane: this stone is blacke and crossed through the middest with a white path.

Zanthenes (as *Democritus* writeth) is found ordinarily in Media: in colour it resembleth base gold Elestrum: and if a man doe stampe it in Date wine and Saffron together, it will relent in manner of wax, and cast a most sweet and pleasant smell. Zmilaces is a stone which the riuer Euphrates yeeldeth, like to the marble of Proconnesus, but that in the middest it hath a grenish colour. Finally, Zoronifos is engendered in the riuer Indus: commonly it is called the Magicians gem: more of it I find not written.

CHAP. XI.

¶ Of certaine pretious stones, taking their names from the members of mans body, from beasts also and other things.

* It taketh the name of the kidneys.

BESIDES those gems comprehended vnder the Alphabet, there be more pretious stones also comprised after other sorts of distinction, according to diuers significant varieties: for some there be which bear the names of certain members of the body; as for example, Hepatites, of the liuer, Steatites, of the sundry sorts of fat, grease or tallow of each beast. Adad * Nephros is a stone worshipped among the Egyptians, so is Theudaetylos also. As for Adad, hee is the chiefe god among the Assyrians. The stone Triophtha^mos groweth together with the Onyx stone, and representeth three eies of a man together.

* Hyopis balmo

There be gems take their names likewise of beasts, to wit, Carcinias of the colour which the sea-crab hath; Echites, of a Viper; Scorpites, either of the color or form of a Scorpion; Scarites, of the fish Scaurus; a Gilthead; Triglites, of the Barble; Agopththalmos, of a Goats eye; like as another, for the resemblance that it hath to the * eie of a swine. Geranites tooke name of a cranes color, euen as Hieracites of the Hawkes of Faulcons color. Astitites resembles the color of that Ægle which hath a white taile. Myrmerites sheweth the forme of a Pismire creeping within the stone; so doth Cantharias, of Beetles. Lycophthalmos hath the resemblance of a Wolves eie, and consists of 4 colours; the outward parts are tawnie, enclining to a blood red, in the middest there is a black, enclosed within a white circle, as like to the said eie as possibly can be. The stone Toas is like to a Peacock, euen as the gem Chelonia to the Tortoise. In Hammo-chrysos there is a resemblance of sand, as if sand & gold were entermingled. Cenchrites is made like to the graines or seeds of Millet scattered here and there. Dryites hath a great affinity with the stock of a tree: and the same will burn after the manner of wood. Cissites is white, and in that white shining seemeth to be clasped euery where with leaues of yvie. Narcissites likewise is distinguished and parted with veines of yvie. Cyamea is black, but being broken, it yeelds out of it a resemblance of a Beane. Pyren is so called by reason of an oliue stone or keruill which it resembleth: within this stone there appeare otherwhiles as it were fish bones. Chalazias as it carrieth the name of haile, so it representeth as well the color as the shape thereof; but as hard it is as the Diamant: It is reported also, that if it be put into the fire, yet it wil continue cold & not alter a whit. The fire stone Pyrites is verily black: but rub it with your finger, you shal find it to burne. Polyzonos is a black stone of it selfe, but many white fillets it hath about it. Astrapias is white or blue like Azur, yet from the middest thereof iheir seeme to shoot raies of lightening. In the stone Phlegontis there appeare a burning flame within, and neuer commeth forth. In the Granat named Authracitis, there is a shew otherwhiles of sparkles running to & fro. Enhydros is euermore absolutely smooth and white, containing within a certain liquor that moueth too and fro if a man shake it, as he may perceiue in egges. Polytrix is a greene stone, bedecked with fine veines in manner of the haire of ones head: but (by report) it will make the haire to shed off as many as carry it about them. Of a Lions skin, Leontios beareth the name: like as Pardalios of a Panther. The golden color in the Topaze gaue it the name Chrysolith: so the grasse green of a Leeke was occasion of the name Chrysoprasos: and of hony was deuised the colour and name Melichrus, although there be many kinds of it. As for Melichloros it is of two colours, partly yellow, and partly resembling hony. Crocias is yellow as Saffron: and Polia sheweth a certaine greynesse in manner of Spart. As for Spartopolios the blacke, it sheweth like gristly veins to the other, but much harder. Rhodites took name of the Rose: Melites of the apple, the colour wher-

or

A of it shews: Chalcites of brasse; and Sycites of a fig. I see no proportion or reason at all between the stone Borsycites and that name; this stone is blacke and branching, and the leaues are white, or red like blood; no more than I do in Gemites, which representeth (as it were) engrauen in the stone, white hands clasped one within another. As for Ananchitis, it is said, That spirits may be raised by it in the skill of Hydromantie: like as by Synochitis, the ghosts which are raised, may be kept about still. What should I speake of the white Dendritis, which if it be buried in the ground vnder a tree that is to be fallen, the edge of the axe that heweth it, will not turne or wax blunt. There be a number of other, and those in nature more prodigious than the rest: for which the Barbarians haue deuised strange names, professing to vs, that they were stones indeed. for mine owne part it shall suffice that I haue disproued their lies in these abouenamed.

B

CHAP. XII.

¶ Of new stones, and those naturall. Of such as be counterfeit and artificiall. Of diuers formes and shapes of gems.

THESE grow still precious stones vnlooked for euery day, that bee new and haue no names, such as that in Lampfacus, where one was found in the gold mines so faire and beautifull, that it was thought a present worth sending to K. Alexander the Great, as *Theophrastus* writeth. As touching the stones Cochlides, which now are most common, they seeme rather artificial than naturall: and verily it is said, That in Arabia there be found of them huge masses which are sodden in hony 7 daies and nights together continually; by which means, after that all the earthy and grosse refuse of this stone is taken away, the stone it selfe remaineth pure and fine: and then comming vnder the lapidaries hand, they be diuided into sundry veines, and reduced into drawne or inlaid worke of Marquetage, as he will himselfe. And herein is seen the cunning of the cutter, for that it is so vendible, & euery mans mony. In old time they were made of that bignesse, that the KK. of the East had their horses set out therewith, not only in their frontals, but also in the pendants of their caparisons. And verily, al other precious stones being decocted in hony, look faire and neat with a pleasant lustre: but principally the Coricks, which abhor all things els that are more eager than hony. Moreover, this is to be noted, that our lapidaries haue a tearme for those stones which are of diuers colors, and they call them Physes, as if they had not another vsuall name for them: & this they do in the subtilty of their wit, to make them seem more wonderful by these strange words of art, as if they would vendit them for their very wonders of Natures worke: whereas indeed there be an infinit number of names, deuised all by the vain Greeks, who knew not how to make an end, which I purpose not to rehearse; and verily, after I had discoursed of the noble and rich stones, I contented my selfe in some sort to specifie those of a baser degree, such I mean as were more rare than others, & to distinguish them that were most worthy to be treated of. But this eftsoons would be remembered, that one & the selfe same stone changeth the name, according to the sundry spots, marks & werts that arise in them: according also to the manifold lines drawn in them, the diuers veins running between, and the variety of colors therein obserued. It remains now to set downe some generall obseruations indifferent to all sorts of gems, and that after the opinion of the best approoued and experienced authors in this kind. Any stones that be either hollow & sunk in, or bearing out in bosse or belly be nothing so good as those which cary an euen and leuell table. The long fashioned gems are most esteemed: next to them such as be formed like to lintil seed: after them those that beround in manner of a targuet: and as for such as be made with many faces & angled, they be of a other least accounted of. To discern a fine & true stone from a false and counterfeit, is very difficult, forasmuch as there is an inuention to transform true gems into the counterfeit of another kind. And in truth men haue deuised to make Sardonches by setting and glewing together the gems named Ceraunia, & that so artificially, that it is vnpossible to see therein mans hand: so handsomely are couched, the black taken from this, the white from that, & the vermilion red from another, according as the riches of the stone doth require, & all those in their kind most approued. Moreover, there be in my hands certain books of authors extant, whom I wil not nominate for all the good in the world, wherein is deciphered the manner and means how to giue the tincture of an Emeraud to a Crytall, & how to sophisticat other transparent gems; namely, how to make a Sardonyx of a Cornalline, & in one word, to transform one stone into another: & to say a truth, there is not any fraud or deceit in the world turneth to greater gain and profit than this.

CHAP.

LEt other writers teach how to deceiue the world by counterfeiting gems, for mine own part I will take a contrary course, and shew the means how to find out false stones that be thus sophisticat: for surely, wanton and prodigall though men and women bee in the excessive wearing of these jewels, yet meet it is they should be armed and instructed against such counsellers. And albeit I haue already touched somewhat respectiue as I treated of the chiefe & principall gems, yet I will adde somewhat more to the rest: first and formost therfore this is obserued, That all stones which be transparent, ought to haue their triall in a morning betimes, or at the farthest (if need so require) within foure hours after morning light, but in no wise later. Now there be diuers experiments that serue for this purpose, to wit, the weight of a ston, for commonly the fine gem indeed is heauier than the other: secondly, the very body and substance is to be considered; for it is an ordinary matter to see in the ground and bosome of falsified stones certain little pushes as it were rising out; to feele them rough in hand outwardly; also to perceiue their filaments not to continue their lustre surely, and to beare it out to the very eie, but commonly in the way to vanish and be spent. But the most effectiual prooffe of all, is to take a little fragments, to be ground afterward vpon a plate of yron: but lapidaries wil not indure this triall; they refuse also the experiment made by the file: furthermore, the fragment of the black Agath or Geat, wil not rase or skarifie true gems. Item, False stones if they be pierced or ingrauen, will shew no white. Such difference there is moreouer in stones, that some scorne all ingrauing with an yron punson: others likewise cannot be cut but with the instrument or grauer bent & turned back: but there is not one but may be ingrauen with the Diamant. And verily, the most material thing herein, is to heat the grauing Steele or punson.

As touching riuers that afford precious stones, Acesines and Ganges are the chiefe; and of all lands, India is the principall.

And now hauing discoursed sufficiently of al the works of Nature, it were meet to conclude with a certain general difference between the things themselves, and especially between country and country. For a finall conclusion therefore go through the whole earth and all the lands lying vnder the cope of heauen, Italy wil be found the most beautiful & goodliest region vnder the Sun, surpassing all other whatsoeuer, and worthily to be counted the chiefe and principall in euery respect: Italy (I say) the very lady and queen, yea, a second mother next to dame Nature of the world: chiefe for hardy men, chiefe for faire and beautifull women, enriched with captaines, souldiers, and slaues: flourishing in all arts and sciences, abounding with noble wits and men of singular spirit; scituate vnder a climat most wholesome and temperate, seated also commodiously (by reason of the coasts so full of conuenient hauens) for traffick with all nations, wherein the winds are most comfortable (for it extendeth it selfe and lieth to the best quarter of the heauen, euen in the midst just between East and West;) hauing waters at command, large forests & faire, and those yeelding most healthful air; bounded with mighty rampiers of high mountains, stored with wild beasts, and those harmlesse: finally, the ground so fertile for corn, the soile so battle for herbage, as none to it comparable. In summe, whatsoeuer is necessary and requisit for the maintenance of this life is there to be had, in no place better: all kind of corne and grain, wines, oile, wooll, linnen, woollen & excellent beoufs, as for horse-flesh, I haue alwaies heard, euen from the mouth of those that be professed runners in the race with horse and charriot, That the breed of Italy passeth al others: for mines of gold, silver, brasse, & yron, it gaue place to no country whatsoeuer, so long as it pleased the state to imploy it that way; and in lieu of those rich commodities which it hath still within her womb, she yeeldeth to vs variety of good liquors, plenty of al sorts of corn, and abundance of pleasant fruits of all kinds. But if I should speake of a land after Italy (setting aside the monstrous and fabulous reports that go of India) in my conceit Spaine is next in all respects, I meane those coasts which are inuironed with the sea.

FINIS.

An Aduertisement.

WHereas in the former edition this page was stuffed full of Errata, which were occasioned by reason of the various matter and words used in this Historic, not common obvious in other Authors; such care in this second Edition hath beene taken, as that they have all beene amended, whereby the Readers paines to mend, or be offended with them, is taken away. This I thought good to give notice of, least any should thinke them omitted, not amended.
